NEWTONIAN PHILOSOPHY.

NEWTONIAN PHILOSOPHY, the doctrine of the univerſe, and, particularly, of the heavenly bodies; their laws, affections, &c. as delivered by ſir Iſaac Newton.

The term Newtonian philoſophy is applied very differently; whence have ſprung divers confuſed notions relating to it.

Some authors, under this philoſophy, include the whole corpuſcular philoſophy conſidered as it now ſtands corrected and reformed by the diſcoveries and improvements made in ſeveral parts of it by ſir Iſaac Newton, in which ſenſe it is that s'Graveſande calls his Elements of Phyſics, "Introductio ad Philoſophiam Newtonianam." And in this ſenſe the Newtonian is the ſame with the new philoſophy, and ſtands contradiſtinguiſhed to the Carteſian, the Peripatetic, and the ancient corpuſcular.

Others, by Newtonian philoſophy, mean the method or order which ſir Iſaac Newton obſerves in philoſophizing, *viz.* the reaſoning and drawing of concluſions directly from phenomena, excluſive of all previous hypotheſes; the beginning from ſimple principles; deducing the firſt powers and laws of nature from a few ſelect phenomena, and then applying thoſe laws, &c. to account for other things. (See *Law of* NATURE.) And, in this ſenſe, the Newtonian philoſophy is the ſame with the experimental philoſophy; and ſtands oppoſed to the ancient corpuſcular.

Others, by Newtonian philoſophy, mean that in which phyſical bodies are conſidered mathematically, and by which geometry and mechanics are applied to the ſolution of phenomena. In which ſenſe, the Newtonian is the ſame with the mechanical and mathematical philoſophy.

Others, again, by Newtonian philoſophy, underſtand that part of phyſical knowledge which ſir Iſaac Newton has handled, improved, and demonſtrated, in his Principia.

Others, laſtly, by Newtonian philoſophy, mean the new principles which ſir Iſaac Newton has brought into philoſophy; the new ſyſtem founded on them; and the new ſolutions of phenomena thence deduced; or that which characteriſes and diſtinguiſhes his philoſophy from all others; which is the ſenſe in which we ſhall chiefly conſider it.

As to the hiſtory of this philoſophy, we have but little to ſay: it was firſt made public in the year 1686, by the author, then a fellow of Trinity college, Cambridge; and in the year 1713 republiſhed, with conſiderable improvements. Several other authors have ſince attempted to make it plainer; by ſetting aſide many of the more ſublime mathematical reſearches, and ſubſtituting either more obvious reaſoning, or experiments, in lieu of them; particularly Whiſton, in his Prælect. Phyſ. Mathemat.; s'Graveſande, in Element. et Inſtit.; and Dr. Pemberton, in his View; and Maclaurin, in his excellent work, intitled "An Account of ſir Iſaac Newton's Philoſophical Diſcoveries."

Notwithſtanding the great merit of this philoſophy, and the univerſal reception it has met with at home, it gained ground at its firſt publication but ſlowly abroad; Newtonianiſm had ſcarcely two or three adherents in a nation; but Carteſianiſm, Huygenianiſm, and Leibnitzianiſm, maintained their ground, till the force of truth prevailed. And it is now held in the utmoſt veneration both at home and abroad.

The philoſophy itſelf is laid down principally in the third book of the Principia. The two preceding books are taken up in preparing the way for it, and laying down ſuch principles of mathematics as have the neareſt relation to philoſophy: ſuch are the laws and conditions of powers. And theſe, to render them leſs dry and geometrical, the author illuſtrates by ſcholia in philoſophy, relating chiefly to the denſity and reſiſtance of bodies, the motion of light and ſounds, a vacuum, &c.

Strahan and Preſton,
New-ſtreet Square, London.

In the third book he proceeds to the philoſophy itſelf; and from the ſame principles deduces the ſtructure of the univerſe, and the powers of gravity, by which bodies tend towards the ſun and planets; and from theſe powers, the motions of planets, and comets, the theory of the moon, and the tides.

This book, which he calls "De Mundi Syſtemate," he tells us was firſt written in the popular way; but conſidering, that ſuch as are unacquainted with the ſaid principles would not conceive the force of the conſequences, nor be induced to lay aſide their ancient prejudices; for this reaſon, and to prevent the thing from being in continual diſpute, he afterwards digeſted the ſum of that book into propoſitions, in the mathematical manner; ſo as it might only come to be read by ſuch as had firſt conſidered the principles; not that it is neceſſary a man ſhould maſter them all; many of them, even the firſt rate mathematicians would find a difficulty in getting over. It is enough to have read the definitions, laws of motion, and the three firſt ſections of the firſt book: after which the author himſelf directs us to paſs on to the book "De Syſtemate Mundi."

The ſeveral articles of this philoſophy are delivered under their reſpective heads; as SUN, MOON, PLANET, COMET, EARTH, AIR, CENTRAL, CENTRIFUGAL, and CENTRIPETAL *Force*, RESISTANCE, MEDIUM, MATTER, SPACE, ELASTICITY, GRAVITY, &c. A general idea, or abſtract of the whole, we ſhall here lay before the reader, to ſhew in what relation the ſeveral parts ſtand to each other.

The great principle on which the whole philoſophy is founded, is the power of gravity. This principle is not new: Kepler, long ago, hinted it in his "Introduct. ad Mot. Martis." He even diſcovered ſome of the properties of it, and their effects in the primary planets; but the glory of bringing it to a phyſical demonſtration was reſerved to the Engliſh philoſopher. See GRAVITY.

His proof of the principle from phenomena, together with the application of the ſame principle to the various other appearances of nature, or the deducing thoſe appearances from that principle, conſtitute the Newtonian ſyſtem; which, drawn in miniature, will ſtand thus:

I. The phenomena are, 1. That the ſatellites of Jupiter do, by radii drawn to the centre of the planet, deſcribe areas proportionable to their time; and that their periodical times are in a ſeſquiplicate ratio of their diſtances from its centre; in which the obſervations of all aſtronomers agree. 2. The ſame phenomenon holds of the ſatellites of Saturn with regard to Saturn; and of the moon with regard to the earth. (See MOON.) 3. The periodical times of the primary planets about the ſun are in a ſeſquiplicate ratio of their mean diſtances from the ſun. But, 4. The primary planets do not deſcribe areas any way proportional to their periodical times about the earth; as being ſometimes ſeen ſtationary, and ſometimes retrograde with regard to it.

II. 1. The powers by which the ſatellites of Jupiter are conſtantly drawn out of their rectilinear courſe, and retained in their orbits, do reſpect the centre of Jupiter, and are reciprocally as the ſquares of their diſtances from the ſame centre. 2. The ſame holds of the ſatellites of Saturn with regard to Saturn; of the moon with regard to the earth, and of the primary planets with regard to the ſun.

III. The moon gravitates towards the earth, and by the power of that gravity is retained in her orbit; and the ſame holds of the other ſatellites with reſpect to their primary planets; and of the primaries with reſpect to the ſun. See GRAVITY and MOON.

As to the other ſecondary planets, their phenomena, with reſpect to their primary ones, being of the ſame kind with thoſe of the moon about the earth, it is argued by analogy, that they depend on the ſame cauſes; it being a rule or axiom in which all philoſophers agree; that effects of the ſame kind have the ſame cauſes. Again, attraction is always mutual, *i. e.* the re-action is equal to the action: conſequently, the primary planets gravitate towards their ſecondary ones; the earth towards the moon, and the ſun towards them all. And this gravity, with regard to each ſeparate planet, is reciprocally as the ſquare of its diſtance from its centre of gravity.

IV. All bodies gravitate towards all the planets; and their weights towards any one planet, at equal diſtances from the centre of the planet, are proportional to the quantity of matter in each.

For the law of the deſcent of heavy bodies towards the earth, ſetting aſide their unequal retardation from the reſiſtance of the air, is this, that all bodies fall equally in equal times; but the nature of gravity or weight, no doubt, is the ſame on the other planets as on the earth. Suppoſe, *e. gr.* ſuch bodies raiſed to the ſurface of the moon, and together with the moon, deprived at once of all progreſſive motion, and dropped towards the earth; it is ſhewn, that in equal times they would deſcribe equal ſpaces with the moon; and, therefore, that their quantity of mattter is to that of the moon, as their weights to its weight. Add, that ſince Jupiter's ſatellites revolve in times that are in a ſeſquiplicate ratio of their diſtances from the centre of Jupiter, and conſequently at equal diſtances from Jupiter, their accelerating gravities are equal; therefore, falling equal altitudes in equal times, they will deſcribe equal ſpaces, juſt as heavy bodies do on our earth. And the ſame argument will hold of the primary planets with regard to the ſun. And the powers by which unequal bodies are equally accelerated are as the bodies, *i. e.* the weights are as the quantities of matter in the planets. And the weights of the primary and ſecondary planets towards the ſun are as the quantities of matter in the planets and ſatellites. And hence are ſeveral corollaries drawn relating to the weights of bodies on the ſurface of the earth, magnetiſm, and the exiſtence of a vacuum; which ſee under VACUUM, WEIGHT, and MAGNETISM.

V. Gravity extends itſelf towards all bodies, and is in proportion to the quantity of matter in each.

That all the planets gravitate towards each other has been already ſhewn; likewiſe, that the gravity towards any one, conſidered apart, is reciprocally as the ſquare of its diſtance from the centre of the planet; conſequently, gravity is proportional to the matter in them. Farther, as all the parts of any planet, A, gravitate towards another planet, B; and the gravity of any part is to the gravity of the whole, as the matter of the part to the matter of the whole; and re-action equal to action; the planet B will gravitate towards all the parts of the planet A; and its gravity towards any part will be to its gravity towards the whole, as the matter of the part to the matter of the whole.

Hence we derive methods of finding and comparing the gravities of bodies towards different planets; of finding the quantities of matter in the ſeveral planets, and their denſities; ſince the weights of equal bodies revolving about planets are as the diameters of their orbits, directly; and as the ſquares of the periodical times, inverſely; and the weights at any diſtance from the centre of the planet are greater or leſs in a duplicate ratio of their diſtances, inverſely; and ſince the quantities of matter in the planets are as their powers at equal diſtances from their centres; and, laſtly, ſince the weights

weights of equal and homogeneous bodies towards homogeneous ſpheres are, at the ſurface of the ſpheres, as the diameters of thoſe ſpheres; and conſequently, the denſities of heterogeneous bodies are as the weights at the diſtances of the diameters of the ſpheres.

VI. The common centre of gravity of the ſun, and all the planets, is at reſt; and the ſun, though always in motion, yet never recedes far from the common centre of all the planets.

For the matter in the ſun being to that in Jupiter as 1033 to 1; and Jupiter's diſtance from the ſun to the ſemidiameter of the ſun in a ratio ſomewhat bigger; the common centre of gravity of Jupiter and the ſun will be found a point a little without the ſun's ſurface. And, by the ſame means, the common centre of Saturn and the ſun will be found a point a little within the ſun's ſurface; and the common centre of the ſun, and all the planets, will be ſcarcely one diameter of the ſun diſtant from its centre. But the centre is always at reſt; therefore, though the ſun will have a motion this and that way, according to the various ſituations of the planets, yet it can never recede far from the centre. So that the common centre of gravity of the earth, ſun, and planets, may be eſteemed the centre of the whole world.

VII. The planets move in ellipſes that have their foci in the centre of the ſun, and deſcribe areas proportional to their times.

This we have already laid down *à poſteriori*, as a phenomenon; and now, that the principle of the heavenly motions is ſhewn, we deduce it from them *à priori*. Thus, ſince the weights of the planets towards the ſun are reciprocally as the ſquares of the diſtances from the centre of the ſun; if the ſun were at reſt, and the other planets did not act on each other, their orbits would be elliptical, having the ſun in their common umbilicus, and they would deſcribe areas proportional to the times; but the mutual actions of the planets are very ſmall, and may be well thrown aſide. Therefore, &c.

Indeed, the action of Jupiter on Saturn is of ſome conſequence; and hence, according to the different ſituations and diſtances of thoſe two planets, their orbits will be a little diſturbed.

The ſun's orbit too is ſenſibly diſturbed by the action of the moon; and the common centre of the two deſcribes an ellipſis round the ſun placed in the umbilicus; and with a radius drawn to the centre of the ſun, deſcribes areas proportional to the times.

VIII. The aphelia and nodes of the planets are at reſt; excepting for ſome inconſiderable irregularities ariſing from the actions of the revolving planets and comets. Conſequently, as the fixed ſtars retain their poſition to the aphelia and nodes, they too are at reſt.

IX. The axis, or polar diameter, of the planets is leſs than the equatorial diameter.

The planets, if they had no diurnal rotation, would be ſpheres, as having an equal gravity on every ſide; but, by this rotation, the parts receding from the axis endeavour to riſe towards the equator, which, if the matter of which they conſiſt be fluid, will be affected very ſenſibly. Accordingly Jupiter, whoſe denſity is found not much to exceed that of water on our globe, is obſerved by the aſtronomers to be conſiderably leſs between the poles, than from eaſt to weſt. And on the ſame principle, unleſs our earth were higher at the equator than towards the poles, the ſea would riſe under the equator, and overflow all near it.

But this figure of the earth ſir Iſaac Newton proves likewiſe *à poſteriori*; from the oſcillations of pendulums being ſlower and ſmaller in the equatorial than the polar parts of the globe.

X. All the moon's motions, and all the inequalities in thoſe motions, follow from theſe principles: *e. gr.* her unequal velocity, and that of her nodes, and apogee in the ſyzygies and quadratures; the differences in her eccentricity, and her variation, &c. See MOON, QUADRATURE, SYZYGY, &c.

XI. From the inequalities in the lunar motions, we can deduce the ſeveral inequalities in the motions of the ſatellites.

XII. From theſe principles, particularly the action of the ſun and moon upon the earth, it follows, that we muſt have tides; or that the ſea muſt ſwell and ſubſide twice every day. See TIDE.

XIII. Hence likewiſe follow the whole theory of comets; as, that they are above the region of the moon, and in the planetary ſpaces; that they ſhine by the ſun's light reflected upon them; that they move in conic ſections, whoſe umbilici are in the centre of the ſun; and by radii drawn to the ſun, deſcribe areas proportional to the times; that their orbits, or trajectories, are very nearly parabolas; that their bodies are ſolid, compact, &c. like thoſe of the planets, and muſt therefore acquire an immenſe heat in their perihelia; that their tails are exhalations ariſing from them, and encompaſſing them like atmoſpheres. See COMET.

The objections raiſed againſt this philoſophy are chiefly aimed at the principle, gravity; which ſome condemn as an *occult quality*; and others as a *miraculous* and preternatural cauſe; neither of which have any longer room in ſound philoſophy. Others, again, ſet it aſide, as deſtroying the notion of vortices; and others, as ſuppoſing a vacuum. But theſe are all abundantly obviated under GRAVITY, ATTRACTION, VORTEX, VACUUM, and QUALITY.

NEWTOWN, in *Geography*, a ſmall borough-town in the pariſh of Calbourne, and north-weſt half hundred of Weſt-Medina liberty, in the Iſle of Wight, and county of Southampton, England, is ſituated on a ſmall river, to which it gives name, on the north-weſt extremity of the iſland. It was anciently called Francheville, and occurs under that appellation in its original charter, granted by Aymer, biſhop of Wincheſter, and ſubſequently confirmed by Edward II., Edward IV., and queen Elizabeth. At preſent it is only a very trifling place, but the numerous traces of ſtreets, ſtill diſtinctly viſible, ſufficiently indicate its former extent and importance. Many ſmall burgage lands lie on each ſide of the old ſtreets; and in ſome old writings, the names both of High-ſtreet and Gold-ſtreet are frequently mentioned. But though much decayed, Newtown continues to be governed by a mayor and twelve burgeſſes, as a corporate borough, by preſcription. Two members are ſent from hence to ſerve in parliament; a privilege which this town firſt enjoyed in the 27th year of queen Elizabeth. Theſe are elected in the town-hall; the elective franchiſe being veſted in the mayor and burgeſſes holding borough lands, as determined by a committee of the houſe of commons in 1729. The haven of Newtown affords the beſt ſecurity for ſhipping of any about the iſland; and, at high water, is capable of floating veſſels above 500 tons burden. "The water and fiſhery is claimed by the mayor and burgeſſes. They hold a court-leet, and appoint conſtables; but pay a rent to the lord of the manor of Swainſton." Worſley's Hiſtory of the Iſle of Wight. Beauties of England and Wales, by E. W. Brayley, and J. Britton, F.S.A., vol. vi.

NEWTOWN, a market-town in the hundred of Newtown, and county of Montgomery, North Wales, is ſituated on

the ſouth bank of the river Severn, at the diſtance of nine miles ſouth-weſt from Montgomery, and 176 north-weſt from London. It is a pleaſant place; but moſt of the buildings being partly erected with timber, gives it rather an appearance of meanneſs. The market here is held on Tueſday every week, and there are five well-attended fairs annually. The ancient name of this place was Llan-Fair-Ynhedewain, or St. Mary, in the cantref of Cydewain; the increaſe of houſes and population having given origin to its preſent appellation. The woollen trade is carried on here, and in the vicinity, to a conſiderable extent, and many perſons are ſtill employed in the various proceſſes; though it muſt be confeſſed that the number of theſe has been much reduced of late, by the introduction of machinery. Flannel is the chief article of produce, and is ſupplied in every degree of fineneſs. In the church, which is an ancient edifice, not remarkable for its architecture, is an altar-piece painted by Dyer the poet, and an antique font and ſcreen, both of which are ſaid to have been brought from the abbey of Cwmhir, in Radnorſhire. The petty-ſeſſions for the upper diviſion of the hundred are held in this town, which appears to have more than doubled its population ſince 1801. According to the parliamentary returns of that year, the whole pariſh contained only 203 houſes, and 990 inhabitants; but by the late returns (1811), the former are eſtimated at 438, and the latter at 2025 in number. Such are the effects of an increaſing trade, which has no doubt been conſiderably promoted by the canal navigation opened between this town and the Grand Trunk, by means of the Montgomeryſhire canal.

Adjoining to the town ſtands Newtown-Hall, a ſeat of the Prices, of the royal tribe of Elyſtan Glodrydd. The late owner, ſir John Price, was extremely eccentric. He married three wives, and kept the firſt two after their demiſe in an embalmed ſtate, placing them in his chamber, one on each ſide of his bed. The third wife, however, with a becoming ſpirit, refuſed the knight the honour of her hand, till he had removed the defunct rivals, and committed them to a proper place of interment. Caerſws, a ſmall village about five miles weſt from Newtown, is ſuppoſed to have been a Roman ſtation, though not enumerated in any of the Itineraries, as the fields around bear evident traces of ancient ſtreets; and ſome hewn ſtones and bricks, ſuch as the Romans uſed in the conſtruction of their cities, are frequently diſcovered. On the north and weſt ſides there yet remain deep hollows, which, from their arrangement, are conjectured to be portions of the foſſa or ditch, once ſurrounding the precinct of the ſtation. Two encampments are placed in the immediate vicinity; and at the diſtance of a mile is a third, of very large dimenſions, and peculiar conſtruction; all of them undoubtedly Roman. On the ſouth ſide of the laſt is an immenſe mount of a conical ſhape, ſurrounded by a very wide and deep foſſe. The uſe of this appendage cannot well be aſcertained, unleſs it may be conſidered as having been the ſcite of an exploratory tower. At the northern end of the foſſe is an oblong area, varying conſiderably in breadth, and defended on all ſides by a lofty vallum, which conſtitutes the ſcarp ſide of a deep ditch. This leads, at one extremity, by a porta, or entrance way, into a rectangular camp; and at the other is connected, in a ſimilar manner, with the conical mount. The whole is encircled by a large outer rampart and foſſe, ſo that it muſt have been a poſition of very great ſtrength; a circumſtance inferring a more than ordinary degree of importance.

North-eaſt from Newtown, to the weſt of the road leading to Montgomery, ſtand the ruins of Dulforwyn caſtle. This fortreſs occupied the ſummit of a mountainous ridge, exceedingly precipitous, and nearly ſurrounded by a woody dingle. It was built, according to Dugdale, by David ap Llewellyn, a prince who reigned from the year 1240 to 1246; but the works of John Dafydd Rhys aſſign to it a much earlier date, ſtating it to have been erected by Bleddyn ap Cynfyn, ſome time between the years 1065 and 1073. In 1278 it was granted, by Edward I., to Roger de Mortimer, along with the caſtles of Kedewen and Keri, to be held *in capite*, by the ſervice of three knights' fees. The origin of the name of this place, which ſignifies "the meadows of the maiden," has been a ſubject of much curious inquiry among antiquaries. Pennant conſiders it having an alluſion to the legendary ſtory of Sabrina, related by Jeffrey of Monmouth, and ſo finely deſcribed by Milton in his Maſk of Comus. Rowland's Mona Antiqua, 4to. Beauties of England and Wales, vol. xvii. by the Rev. J. Evans.

NEWTOWN *of Ayr*. See AYR *Newtown*.

NEWTOWN, a poſt-town of America, in Fairfield county, Connecticut, pleaſantly ſituated on an elevated ſpot, and ſettled in 1708; 80 miles N.E. of New York.—Alſo, a town on Staten iſland, New York; 9 miles S.W. of New York.—Alſo, a townſhip in Queen's county, New York, including all the iſlands in the Sound oppoſite to the ſame, and containing 2312 inhabitants, of whom 512 are ſlaves; about 8 miles E. of New York.—Alſo, a townſhip in Weſt Cheſter county, New York, of whoſe inhabitants 276 are electors.—Alſo, a poſt-town in Tioga county, New York, ſituated between the ſouth end of Seneca lake and Tioga river, taken from Chemung coaſt on the eaſt, and incorporated in 1792; containing 1333 inhabitants.—Alſo, a townſhip in Glouceſter county, New Jerſey.—Alſo, a poſt-town and ſeat of juſtice in Suſſex county, New Jerſey, about 10 miles S.E. of Sandyſton. It contains a large Preſbyterian church, a ſtone court-houſe, and gaol. The manufacture of iron is carried on in a furnace and four forges. Here is a remarkable cave called the Devil's hole, and in its vicinity are ſeveral ponds, covering from 5 to 100 acres; 108 miles N.E. of Philadelphia.—Alſo, a poſt-town and capital of Bucks county, Pennſylvania; containing a Preſbyterian church, a ſtone gaol, a court-houſe, an academy, and about 40 houſes; ſettled in 1725; 10 miles W. of Trenton.—Two other townſhips of this name are ſituated, the one in Delaware county, the other in that of Cumberland, having 1427 inhabitants.—Alſo, a ſmall town of Virginia, ſituated in Frederick county, between the north and ſouth branches of Shenandoah river; 7 miles S. of Winchеſter.

NEWTOWN *Ardes*, a poſt-town of the county of Down, Ireland, pleaſantly ſituated on the northern extremity of Strangford lough. It was incorporated by James I., and, before the union, ſent two members to the houſe of commons. It is 88 miles N. by E. from Dublin, and 8 E. from Belfaſt.

NEWTOWN *Barry*, a ſmall town or village of the county of Wexford, Ireland. It is ſituated on the river Slaney, on the confines of the county of Carlow, and is ſaid to be one of the prettieſt villages in Ireland. Its fairs are much frequented. It is 48 miles S. by W. from Dublin, and 12 N. by W. from Enniſcorthy.

NEWTOWN *Breda*, a village of the county of Down, Ireland, remarkable for the beauty of its church, which attracts the attention of all travellers. It is $3\frac{1}{4}$ miles S.S.E. from Belfaſt, and 20 N.W. from Downpatrick.

NEWTOWN *Glens*, a poſt-town of the county of Antrim, Ireland, ſituated on Caſhendal or Red bay, in the North Channel.

Channel. It is 109 miles N. by E. from Dublin, and 29 miles N. by E. from Belfaſt.

Newtown *Hamilton*, a poſt-town of the county of Armagh, Ireland, in the diſtrict of the Fews Mountains; 53 miles N. by W. from Dublin, and 12½ miles N. by W. from Dundalk.

Newtown *Limavaddy*, a poſt and market-town of the county of Londonderry, Ireland, which, before the union, was repreſented in parliament. It is ſituated upon the river Roe, and has a good linen market. It is 106 miles N. by W. from Dublin, and 10 miles W. from Coleraine.

Newtown *Mount Kennedy*, a poſt-town of the county of Wicklow, Ireland, adjoining which is the fine ſeat of lord Roſſmore. It is 17 miles S. by E. from Dublin.

Newtown *Stewart*, a poſt-town of the county of Tyrone, Ireland, ſituated on the river Moyle. Near this is Baron's Court, a fine ſeat of the marquis of Abercorn. It is 93 miles N.N.W. from Dublin, and 8 miles S.E. from Strabane.

NEWTYA, a town of Hindooſtan, in Concan; 40 miles N.N.W. of Goa.—Alſo, a town of Hindooſtan, in Bengal; 30 miles E. of Rangpour.

NEW VINEYARD, a town in Kennebeck county, Maine, weſt of Kennebeck river, between Anſon and Strong; 40 miles N.W. of Auguſta.

NEW UTRECHT, a ſmall maritime town of New York, in King's county, Long iſland, oppoſite to the Narrows; 7 miles S. of New York city, and containing 778 inhabitants.

NEW WERKT, a ſmall iſland in the German ſea, at the mouth of the Elbe, near the coaſt of Bremen; 7 miles W. of Cuxhaven.

NEW WINDSOR, a townſhip of Orange county, New York, pleaſantly ſituated on the weſt branch of Hudſon river; 3 miles S. of Newburgh, and containing 2001 inhabitants. The townſhip is famous for a ſcythe manufacture. Its compact part contains about 40 houſes, and a Preſbyterian church; 64 miles N. of New York.

NEW WORK Island, a ſmall iſland near the north-eaſt coaſt of Newfoundland. N. lat. 49° 55′. W. long. 54° 30′.

NEW YEAR'S Harbour, a good harbour on the north coaſt of Staten Land iſland, diſcovered Jan. 1, 1775, whence its name, and affording wood and good water. S. lat. 54° 50′. W. long. 64° 25′.

New Year's *Iſlands*, a group of ſmall iſlands in the South Pacific ocean, on the north coaſt of Staten Land. Captain Cook landed on the moſt eaſterly on the 31ſt of December 1774, and killed a great number of ſeals and birds. Theſe iſlands, ſays captain Cook, are in general ſo unlike Staten Land, eſpecially that on which we landed, that it deſerves a particular deſcription. It ſhews a ſurface of equal height, and elevated about 30 or 40 feet above the ſea, from which it is defended by a rocky coaſt. The inner part of the iſle is covered with a ſort of ſward-graſs, very green, and of a great length. It grows on little hillocks of two or three feet in diameter, and as many or more in height, in large tufts, which ſeemed to be compoſed of the roots of the plant matted together. Among theſe hillocks are a vaſt number of paths, made by ſea-bears and penguins, by which they retire into the centre of the iſle. It is nevertheleſs exceedingly bad travelling; for theſe paths are ſo dirty, that one is ſometimes up to one's knees in mire. Beſides this plant, there are ſome few other graſſes, a kind of heath, and ſome celery. The whole ſurface is moiſt and wet, and on the coaſt are ſeveral ſmall ſtreams of water. The animals found on this little ſpot are ſea-lions, ſea-bears, a variety of oceanic and ſome land-birds. The ſea-lions are not of that kind deſcribed under the ſame name by lord Anſon; but for aught I know, theſe would more properly deſerve that appellation; the long hair with which the back of the head, the neck, and ſhoulders are covered, giving them greatly the air and appearance of a lion. The other part of the body is covered with ſhort hair, little longer than that of a cow or a horſe; and the whole is of a dark brown. The female is not half ſo big as the male, and is covered with a ſhort hair of an aſh or light dun colour. They live, as it were, in herds, on the rocks, and near the ſea-ſhore. As this was the time for engendering, as well as bringing forth their young, we have ſeen a male with 20 or 30 females about him, and always very attentive to keep them all to himſelf, and beating off every other male who attempted to come into his flock. The ſea-bears are not ſo large by far as the lions, but are rather larger than the common ſeal. They have none of that long hair which diſtinguiſhes the lion: theirs is all of an equal length, and finer than that of the lion, ſomewhat like an otter's; and the general colour is that of an iron-grey. This is the kind which the French call ſea-wolves, and the Engliſh ſeals: they are, however, different from the ſeals in Europe and North America. The lions may too, without any great impropriety, be called overgrown ſeals; for they are all of the ſame ſpecies. S. lat. 54° 41′. W. long. 64° 28′. Cook's Second Voyage, vol. ii. chap. 4.

NEW YORK *State*, *County*, *City*, &c. See *New* York.

NEXAPA, or *St. Yago de Nexapa*, a town of Mexico, in the province of Guaxaca; 50 miles E. S. E. of Guaxaca. N. lat. 17° 19′. W. long. 97° 46′.—Alſo, a town of Mexico, in the province of Guatimala; 10 miles S.E. of St. Salvador. N. lat. 13° 56′. W. long. 90°.

NEXELOE, a ſmall iſland of Denmark, near the W. coaſt of Laaland. N. lat. 35° 47′. E. long. 11° 19′.

NEXI, among the Romans, perſons free-born, who, for debt, were delivered bound to their creditor, and obliged to ſerve him, till they could pay the debt.

NEXOE, in *Geography*, a ſea-port town of Denmark, on the E. coaſt of the iſland of Bornholm, with a harbour for ſmall ſhips.

NEXON, a town of France, in the department of the Upper Vienne, and chief place of a canton, in the diſtrict of St. Yriuix; 15 miles S.S.W. of Limoges. The place contains 1781, and the canton 8426 inhabitants, on a territory of 207½ kiliometres, in nine communes.

NEXPA, a town of Mexico, in the province of Guaſteca; 60 miles S.S.W. of Panuco.

NEXT Taker, among *Miners*, is he that hath the next meer in poſſeſſion.

NEXUS *of Matter*. See Cohesion.

NEYBA, in *Geography*, a town of Portugal, in the province of Entre Duero e Minho, which runs into the ſea, five miles S. of Viena.

Neyba, or *Neiva*, a fertile plain on the S. ſide of the iſland of St. Domingo, bounded E. by the bay and river of its name, on the W. by the river of Dames and the pond of Henriquelle; containing about 80 ſquare leagues, and abounding with game, flamingoes, pheaſants, and royal or crowned peacocks. Nine leagues from the weſt bank of the river is the town, containing about 200 houſes, and able to furniſh 200 men capable of bearing arms. The territory produces a ſort of plaiſter, talc, and foſſil ſalt. The river might be rendered navigable for ſmall craft, and the place might afford eligible ſituations for 150 ſugar plantations.

Neyba, or *Neyva*, a town of South America, and

capital of a diſtrict in New Granada, on the Madalena; 120 miles N.E. of Popayan. N. lat. 3° 10′. W. long. 74° 16′.

NEYDORF, a town of Auſtria; ſeven miles W.N.W. of Falkenſtein.

NEYER, a diſtrict or circar of Hindooſtan, between the ſandy deſerts of Cutch and the river Puddar, about 70 miles long and 20 broad.

NEYERN, a town of Bohemia, in the circle of Pilſen; 35 miles S.S.W. of Pilſen. N. lat. 49° 16′. E. long. 13° 2′.

NEYKIRCHEN, a town of Auſtria; ſix miles S.W. of Neuſtatt.

NEYLEAU, a town of Germany, in the principality of Culmbach; eight miles W. of Hof.

NEYMARCK, a town of Auſtria; ſix miles S. of Ips.

NEYMARKT, a town of Auſtria; ſix miles W. of Efferding.

NEYSTADT, a town of Auſtria; eight miles W. of Ips.

NEZ *de Iſbourg*, a cape on the W. coaſt of France, in the Engliſh channel, about a league S. of cape Anderville. N. lat. 49° 40′.

NEZ *de Querqueville*, a cape on the W. coaſt of France, in the Engliſh channel; three miles N.W. of Cherbourg.

NEZENHEIM, a town of Germany, in the county of Limburg; five miles S.E. of Markt Einerſheim.

NEZIN, a town of Ruſſia, in the government of Tchernigov, conſiderable for its fur trade; 28 miles S.E. of Tchernigov. N. lat. 50° 3′. E. long. 31° 52′.

NEZITZA, a river of Ruſſia, in the government of Archangel, which runs into the Frozen ocean; 28 miles S. of Ponoi.

NEZLET *el Gindi*, a town of Egypt, on the right bank of the Nile; ſeven miles N. of Atfieh.

NGAN-CHAN, a city of China, of the firſt rank, in the province of Koei-tcheou; ſituated in a mountainous territory, and containing ſeveral ſubordinate cities with garriſoned forts for keeping in awe the independent inhabitants of the mountains. The vallies and plains are well watered, and need only induſtry to render them productive. N. lat. 26° 12′. E. long. 15° 32′.

NGAN-KING, a city of China, of the firſt rank, in the province of Kiang-nan, and capital of the weſtern part of the province; delightfully ſituated, and governed by a particular viceroy, who keeps a large garriſon in a fort built on the banks of the river Yang-tſe-kiang. The commerce and riches of this country render it very conſiderable, and every thing that is conveyed from the ſouthern part of China to Nan-king muſt paſs through it. The whole country belonging to it is level, pleaſant, and fertile. Under its juriſdiction are ſix cities of the third claſs. N. lat. 30° 37′. E. long. 116° 14′.

NGAN-LO, a city of China, of the firſt rank, in the province of Hou-quang, which is commercial and rich. In its diſtrict are two towns of the ſecond order, and five of the third. N. lat. 31° 14′. E. long. 111° 24′.

NGAN-PIN-TCHING, a ſmall iſland in the Chineſe ſea, near the W. coaſt of Formoſa. N. lat. 23°. E. long. 119° 34′.

NGUIANQUE, a town of Africa, in the kingdom of Hoval; and ſometimes called the capital.

NHAMDIA, in *Ichthyology*, the name of a fiſh caught in rivers of many parts of America, and of a fine taſte. It is of the anguilliform kind, and has a long and fat body, becoming ſmaller toward the tail; its belly is ſoft; its head flat; and its mouth of a parabolic figure, and armed with ſmall teeth; it is uſually of about eight or ten inches long; its tail is forked, and its head is covered with a ſtrong ſhelly coat; this is of a duſky brown; its back and ſides are of a blueiſh-grey; the larger back-fin is of the ſame colour; all the reſt are black; and on each ſide there is a red line reaching lengthways from the gills to the tail.

NHANDIROBA, in *Botany*, an American name, which Plumier adopted from Marcgrave, for the very diſtinct genus called by Linnæus FEUILLEA; ſee that article.

NHANDUAPOA, in *Ornithology*, the name of a Braſilian bird, called alſo *jabiruguacu*, but more frequently known by its Dutch name *ſcurvogel*. See MYCTERIA *Americana*.

NHANDUGUACU, the name of a Braſilian bird of the emeu, or caſſowary kind, a ſpecies of the *ſtruthio*, or oſtrich, in the Linnæan ſyſtem, but ſmaller than the common or African caſſowary. Its body is conſiderably large; its neck long and ſtrong; its legs very long and thick; its wings extremely ſhort, and unfit for flying, but aſſiſting it in running; its feathers are grey, and, on the back, are conſiderably long; it commonly carries its neck bent like a ſwan; its head is ſhaped like that of a gooſe; its back-feathers cover the rump, and make a ſort of tail; it runs as ſwift as a greyhound, and feeds on fleſh and fruits. See STRUTHIO *Rhea*.

NHAQUUNDA, in *Ichthyology*, the name of a ſmall fiſh caught in the American rivers. Its body is oblong, and every where nearly of the ſame thickneſs; its head and mouth are like thoſe of the pike; and its uſual length is about four inches; it can extend its upper lip, and round the opening of its mouth; it has no regular teeth, but its jaws are rough like a file; its tail is covered with a hard ſhelly cruſt; its body is covered with moderately large ſcales, and its back and ſides are of a ſilvery grey; its belly white; it has on each ſide a ſingle row of round black ſpots, of the bigneſs of a pea, and among theſe a number of ſmall blue ones.

NHING-KOUE, in *Geography*, a city of China, of the firſt rank, in the province of Kiang-nan; ſituated on a river which runs into the Yang-tſe-kiang, ſurrounded by woody mountains, and diſtinguiſhed by its manufactories of paper, made of a ſpecies of reed; it has under its juriſdiction ſix cities of the third claſs. N. lat. 31° 2′. E. long. 118° 24′.

NIAB, a town of Arabia, near the coaſt of the Red ſea; 72 miles W.S.W. of Saade.

NIABANI, a river of Weſt Florida, which runs into lake Maurepas, N. lat. 30° 17′. E. long. 90° 26′.

NIABUSSAN, a town of Bengal; 42 miles S.W. of Burdwan. N. lat. 22° 45′. E. long. 87° 25′.

NIAGARA, a town and fort of America, in the ſtate of New York, on the ſouthern ſhore of lake Ontario. The fort is ſituated on the eaſtern ſide of the river, and is now in the poſſeſſion of the United States, and on the oppoſite, or Britiſh ſide, is the town, moſt generally known by the name of Niagara, although it has been named "Newark" by the legiſlature. The original name of the town was Niajara; it was afterwards called Lenox, then Naſſau, and afterwards Newark. This town has been, and ſtill is, the capital of the province of Upper Canada, but it has been propoſed to remove the ſeat of government from this town to Torento, which was deemed a more eligible ſpot for the meeting of the legiſlative bodies, as being further removed from the frontiers of the United States. The projected change, however, was not reliſhed by the people at large, as Niagara is a much more convenient place of reſort to moſt of them than Torento. This change, however, was merely preparatory to another, which was the ſettlement of the ſeat of government in a new city, under the name of London, which

was to have been built on the river formerly called La Trenche, but now denominated the Thames, that runs into lake St. Clair. The fort was built by the French in the year 1725, but was taken by the Engliſh, under ſir William Johnſon, in 1759, and ſurrendered to the United States, according to the treaty of 1796, by the Britiſh. The town of Niagara ſtands on the ſummit of the weſtern bank of the river, about 50 miles from the water's edge, and contains about 70 houſes, a court-houſe, gaol, and a building intended for the accommodation of the legiſlative bodies. The houſes, with few exceptions, are built of wood; thoſe next the lake are rather poor, but at the upper end of the town are ſeveral excellent buildings, inhabited by the principal officers of government. Few places in North America have riſen more rapidly than Niagara, and after acquiring the addition of almoſt all its houſes in five years, it is ſtill enlarging in ſize, on account partly of the increaſe of the back country trade along the ſhores of the lakes, and partly of the ſurpriſing emigrations of people from the ſtates. The quantity of furs collected at Niagara is conſiderable, and the neighbourhood being populous, it is of courſe a place of no ſmall trade; but the town in which this trade is carried on, being on the Britiſh ſide of the line, the few merchants that lived within the limits of the fort immediately croſſed over to the other ſide, as ſoon as it was rumoured that the fort was to be given up. On the margin of Niagara river, about three-quarters of a mile from the town, ſtands a building called Navy-hall, erected for the accommodation of the naval officers on the lake during the winter ſeaſon, when their veſſels are laid up. Oppoſite to it there is a ſpacious wharf to protect the veſſels from the ſea during the winter, and alſo to facilitate the landing of merchandize when the navigation is open. All cargoes brought up the lake, that are deſtined for Niagara, are landed here. Adjoining the wharf are extenſive ſtores belonging to the crown, and alſo to private perſons.

The fort of Niagara ſtands immediately at the mouth of the river, on a point of land, one ſide of which is waſhed by the river, and the other by the lake. Towards the water it is ſtockaded; and behind the ſtockade, on the river ſide, a large mound of earth riſes up, at the top of which are embraſures for guns; on the land-ſide it is ſecured by ſeveral batteries and redoubts, and by parallel lines of faſcines. At the gates, and in different parts, there are ſtrong blockhouſes; and facing the lake, within the ſtockade, ſtands a large fortified ſtone houſe. The fort and outworks occupy about five acres of ground; and a garriſon of 500 men, and at leaſt from 30 to 40 pieces of ordnance, would be neceſſary to defend it properly. The federal garriſon, however, conſiſts only of 50 men. From its ſituation the town commands a fine view of the lake and diſtant ſhores; and as it is ſo much elevated above the level of the water, one might imagine that it muſt be a remarkably healthy place, but it is, in fact, lamentably the reverſe, the inhabitants being very ſubject to the ague. Indeed, not only the town of Niagara and its vicinity are unhealthy places, but almoſt every part of Upper Canada, and of the territory of the ſtates bordering upon the lake, is likewiſe unhealthy. The ſickly ſeaſon commences about the middle of July, and terminates about the firſt week in September, as ſoon as the nights become cold. The moſt common diſorders are intermittent fevers. Weld's Travels, vol. ii. N. lat. 43° 14′. W. long. 79° 1′.

Niagara *River*, a river of Canada, which iſſues from the eaſtern extremity of lake Erie, and after a courſe of 36 miles diſcharges itſelf into lake Ontario. This river forms part of the boundary between the United States and Upper Canada. For the firſt few miles from lake Erie, the breadth of the river is about 300 yards, and it is deep enough for veſſels drawing nine or ten feet water; but the current is ſo extremely rapid and irregular, and the channel ſo intricate, on account of the numberleſs large rocks in different places, that no other veſſels beſide batteaux ever attempt to paſs along it. As you proceed downward, the river widens; no rocks are to be ſeen either along the ſhores, or in the channel, and the waters glide ſmoothly along, though the current continues very ſtrong. The river runs thus evenly, and is navigable with ſafety for batteaux as far as fort Chippeway, about three miles above the falls. For an account of theſe falls, we refer to the article Cataract.

NIAGAW, a town of Bengal; 12 miles S.S.W. of Noony.

NIAGEE, a town of Hindooſtan, in Bahar; 48 miles S.S.W. of Patna.

NIAGUR, a town of Hindooſtan, in the circar of the Ruttunpour; 27 miles N.W. of Ruttunpour.—Alſo, a town of Bengal; 28 miles N.W. of Rogonatpour. N. lat. 23° 45′. E. long. 86° 25′.

NIAK, a town of New York, on the right bank of the Hudſon; 23 miles N. of New York.—Alſo, an iſland on the S.W. coaſt of Eaſt Greenland. N. lat. 59° 45′. W. long. 43° 30′.

NIAKDELSKOI, a town of Ruſſia, in the government of Archangel; 62 miles N.N.W. of Kola.

NIALEL, in *Botany*, Rheede Hort. Malab. v. 4. 37. t. 16, a fine lofty evergreen tree, whoſe fruit, not unlike a bunch of grapes, is ſaid by Rheede to be eſteemed a delicacy. Linnæus has not referred it to any known plant. Juſſieu gueſſes it to be really a ſpecies of *Vitis*.

NIALMA, in *Geography*, a town of Thibet; 76 miles N. of Catmandu. N. lat. 29° 23′. E. long. 85° 27′.

NIANA, a town of Hindooſtan, in Dowlatabad; eight miles W. of Beder.

NIAPAGUR, a town of Bengal; 25 miles N. of Boglipour.

NIAPON, a town of Africa, in Whidah; 10 miles E. of Sabi.

NIARAN Kentchian, a mountain of Thibet. N. lat. 28° 25′. E. long. 83° 44′.

NIAS, a ſmall iſland, near the W. coaſt of the iſland of Sumatra, celebrated for the beauty of its females, who are purchaſed as ſlaves by the Dutch and Portugueſe reſiding in Batavia, and other places. N. lat. 1°. E. long. 97°.

NIASABAD, or Niczabad, a town of Perſia, in the province of Schirvan, with a harbour on the Caſpian ſea; 40 miles S. of Derbend. N. lat. 41° 18′.

NIB, in *Agriculture*, a term applied to the handle of a ſcythe.

NIBBIONE, in *Geography*, a town of Italy, in the department of the Lario; eight miles S.E. of Como.

NIBE, a town of Denmark, in North Jutland; nine miles W.S.W. of Aalborg.

NIBELES, an Abyſſinian inſtrument, a kind of common flute, joined to a bag which receives the wind. This inſtrument ſeems to reſemble the French muſette. Bruce.

NIBIANO, in *Geography*, a town of the duchy of Piacenza; 16 miles S.W. of Piacenza.

NIBU, a town of Japan, in the iſland of Niphon; 165 miles N.W. of Jedo.

NICÆA, in *Ancient Geography*, a town of Bithynia, upon the lake Aſcanius, according to Strabo, who gave it the title of "primaria Bithiniæ urbs." In his time it was of a ſquare figure, and about 16 ſtadia in circumference. It was encompaſſed with a very fertile plain. It was called Antigonia,

Antigonia, by Antigonus, ſon of Philip; but Lyſimachus afterwards called it Nicæa, in compliment to his wife, the daughter of Antipater.—Alſo, a town of the Locri Epicnemidii, in the Maliac gulf, according to Strabo.—Alſo, the ancient name of *Nice*, a town of Italy, on the confines of Liguria. It was a colony from Marſeilles, ſituated on the ſea-coaſt, about a league from the mouth of the Var. It held a diſtinguiſhed rank among the Greek towns of the Gauls, when the Romans undertook the conqueſt of Provence, about 158 years B. C. The ancient Marſilians gave it the name of *Nikh*, which ſignified victory, in commemoration of the advantages which they had gained in this place over the Ligurians. From Strabo we learn that long before his time Nice had a number of veſſels, an arſenal, and many warlike machines, of which the Romans availed themſelves in the conqueſt of Provence. In the time of this geographer, the Marſilians were ſtill maſters of it, but they did not poſſeſs it long after the reign of Tiberius. Many ancient inſcriptions prove that it was under the dominion of the Romans. But although it flouriſhed in the time of the ancient Marſilians, it loſt much of its ſplendour under the Roman emperors; ſo that by the authors of the lower empire it is merely deſcribed as the port of Nice or the caſtle of Nice. Its ſplendour and its commerce vaniſhed together.—Alſo, a town of India, on this ſide the Ganges, on the left bank of the Hydaſpes, over-againſt Bucephala, founded by Alexander after the victory obtained by him over Porus, upon the banks of the ſaid river.—Alſo, a town of the iſland of Corſica, founded by the Etrurians after they had gained the empire of the ſea, and taken poſſeſſion of the iſles adjacent to Etruria.

NICAISE, Claude, in *Biography*, a man of letters, was born at Dijon in 1623. He embraced the eccleſiaſtical profeſſion, and came to Paris, where he entered the univerſity, and ſtudied theology in the college of Navarre. In 1655 he paid a viſit to Rome, where he took prieſts' orders, and formed connections with all the eminent literati and artiſts of that capital. After a reſidence in Italy of ſeveral years, he returned to France, where he devoted himſelf entirely to literary purſuits, and chiefly to correſpondences with the learned of different nations. So great was his occupation of that kind, that he was regarded as the general intelligencer for all matters of lettered curioſity upon the continent. He died in 1701, at the age of ſeventy-eight. He had collected a numerous and well choſen library. He was author of ſeveral pieces, of which the following have been cited with applauſe: "De Nummo Pantheo;" "A Diſcourſe on the Form and Figure of the Syrens;" "A Diſſertation on the Schools of Athens and Parnaſſus," which were two of Raphael's pictures.

NICAMA, or Nigama, *Nega-patnam*, in *Ancient Geography*, a town to which Ptolemy gave the title of metropolis, ſituated near the ſouthern mouth of the river Chaberis, on the coaſt of the peninſula of India, on this ſide of the Ganges, north of the "promontorium calligicum."

NICANDER, in *Biography*, a celebrated Greek phyſician, grammarian, and poet, reſpecting whoſe birth-place, and the era in which he flouriſhed, there is a conſiderable variety of opinion. Suidas informs us, that he was the ſon of Xenophon, of Colophon, a town of Ionia; although he admits, that other writers conſider him as a native of Ætolia. We have, however, the teſtimony of Nicander himſelf, that his birth-place was Claros, a little town in Ionia, near Colophon, and that he was born in the neighbourhood of the temple of Apollo. With reſpect to the age in which he lived, authors are not more agreed. He is commonly ſuppoſed to have flouriſhed about the 160th olympiad, and 140 years before Chriſt, in the reign of Attalus I., king of Pergamus; while others are of opinion, that he was in the zenith of his reputation in the reign of the laſt king of that name, Attalus Philometor, and in that of Ariſtonicus. According to this account he muſt have lived upwards of a century later than is commonly ſtated. He was the author of many works, but the two following alone remain, namely, the poems entitled "Theriaca," and "Alexipharmaca." In the former, he deſcribes the effects of the bites of venomous animals; and in the latter, he treats of their antidotes. Among the works which are loſt, were ſimilar poetical pieces, entitled "Ophiaca," which related to ſerpents, and "Hyacinthia," which was a collection of remedies. Athenæus alſo cites in ſeveral places, ſome poetical works of Nicander upon the ſubject of agriculture, which have been called his "Georgics." Beſides theſe works, he is ſaid to have compoſed five books of "Metamorphoſes," which were the prototypes of thoſe of Ovid, and were cloſely copied in thoſe of Antonius Liberalis; and to have written ſeveral hiſtorical pieces, eſpecially "A Hiſtory of Colophon," a work entitled "Ætolics," and a general hiſtory of Europe; ſo that his various knowledge ſeems to have merited the eulogies which were paſſed upon him in ſeveral epigrams, in the firſt book of the "Anthologia." A great number of editions of the two poems firſt mentioned, in Greek, and in Latin verſions, have been printed, at different times and places. Eloy Dict. Hiſt. Hutchinſon, Med. Biog.

NICANDRA, in *Botany*, named by Schreber in honour of Nicander, of Colophon, an ancient Greek poet, and prieſt of Apollo, who lived about the time of Attalus. His Georgics are greatly commended by Cicero, and are interſperſed with various botanical remarks, though this work is for the moſt part loſt. Of his two poems which are known and remain entire, περι αλεξιφαρμακων, and περι θηριακων, Dioſcorides has made much uſe. Theſe paſſed through various editions during the ſixteenth century. Haller notices a very beautiful manuſcript of Nicander preſerved at Vienna. Schreb. 283. Willd. Sp. Pl. v. 2. 541. Mart. Mill. Dict. v. 3. (Potalia; Aubl Guian. v. 1. 394. Juſſ. 143. Lamarck Illuſtr. t. 348.)—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Gentianæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, turbinate, thick, coloured, cloven into four, broad, concave, obtuſe ſegments; the two oppoſite, outer ones larger; the two inner ſmaller. *Cor.* of one petal; tube very ſhort; limb deeply cloven into ten, oblong, imbricated ſegments, incurved and rigid at the top. Nectary, a membranous, ſhort ring, ſurrounding the baſe of the germen. *Stam.* Filaments ten, very ſhort, connected with the nectary, inſerted into the receptacle; anthers linear, ſquare, acute, erect, approximated. *Piſt.* Germen ſuperior, ovate; ſtyle ſhort; ſtigma peltate, orbicular, ſix-rayed. *Peric.* Berry roundiſh, ſix-furrowed, three-celled. *Seeds* numerous, very ſmall, angulated.

Eſſ. Ch. Calyx turbinate, four-cleft. Corolla of one petal, deeply ten-cleft. Filaments inſerted on the ring of the nectary. Berry ſix-furrowed, three-celled, and many-ſeeded.

1. N. *amara*. Linn. Syſt. ed. Gmel. v. 2. 677. Willd. (Potalia amara; Aubl. Guian. t. 151.)—Native of extenſive foreſts in Guiana, flowering in July or Auguſt, and bearing fruit in October. *Root* perennial, woody and fibrous. *Stem* ſimple, ſtraight, hard, woody, knotty, the thickneſs of a finger. *Leaves* oppoſite, ſtalked, entire, ſmooth, narrow at the baſe, roundiſh and pointed at the end, a foot and half long, about five inches wide, with a protuberant mid-

mid-rib underneath. *Stalks* rounded, attached to a ſheath that embraces the ſtem. *Flowers* terminal, about twenty together on one, two or three ſtalks, each having a partial ſtalk with two ſcales at its origin. The *calyx* is of a golden colour. *Corolla* white. *Fruit* yellow, fleſhy, the ſize of a cherry.

Aublet remarks that every part of the plant is extremely bitter, and that its young twigs are furniſhed with particles of a yellow tranſparent reſin, which is very inflammable, and emits a ſweet ſavour when burnt, ſomething like Benzoin. The leaves and twigs are uſed for an infuſion, to be given in venereal caſes, or where there is a ſuſpicion of poiſon, being, in a large doſe, highly emetic.

NICARACOOL, in *Geography*, a town of Hindooſtan, in Golconda; 55 miles E.S.E. of Hydrabad.

NICARAGUA, a province of Mexico or New Spain, in the domain of Guatemala, bounded on the N. by Honduras, on the E. by the North ſea, on the S. by Coſta Rica, and on the E. by Guatemala, and the Pacific ocean. This is one of the moſt woody provinces of New Spain; but the plains are very fertile. It produces good flax and hemp, and alſo the wood uſed by the dyers in Europe, called Nicaragua wood; but little wheat. It abounds with black cattle and hogs, but ſheep are ſcarce. Balm, cotton, ſugar, American pepper, liquid amber, and turpentine, are plentiful; and together with the produce of the ſilver mines, enable the inhabitants to carry on a conſiderable trade with Panama and Nombre de Dios. Turkeys and alſo parrots are numerous. The country itſelf is ſo pleaſant and ſo productive, that it has been reckoned the garden of America; the hills and ſands of the rivers furniſh gold, whilſt the fields and woods are perfumed with odoriferous plants and flowers, inſomuch that when the Spaniards firſt viſited it, they called it "Mahomet's Paradiſe." The winter in this province is rainy and tempeſtuous, and the ſummer very hot, but healthy. The natives are accounted ſingularly ingenious, eſpecially as muſicians and goldſmiths. The capital of this extenſive province is *Leon;* which ſee. Granada, formerly called Nicaragua, and erroneouſly ſo denominated in our maps, is another little town, on the great lake of Nicaragua.

NICARAGUA *Lake*, the chief lake in Spaniſh North America, which is about 170 Britiſh miles in length, from N.W. to S.E., and about half that breadth. This grand lake is ſituated in the province of the ſame name, towards the ſouth of the iſthmus, and has a grand outlet, the river of St. Juan, to the gulf of Mexico; while a ſmaller ſtream is by ſome ſuppoſed to flow into the Pacific. Under the direction and exertions of an enterpriſing people, this lake might ſupply the long wiſhed-for paſſage, in the moſt direct courſe, from the Atlantic into the Pacific. This lake is navigable for ſhips of the line, and the river of St. Juan is alſo navigable through its whole courſe for large ſhips. On the other ſide the ſpace to be cut, in order to complete the communication, would not exceed, according to the beſt and moſt recent maps, 10 or 12 Engliſh miles, and in order to open a grand navigation, might coſt about 200,000*l.* ſterling. The lake itſelf would afford the ineſtimable advantage of a large internal port, capable of being defended by fortreſſes on both ſides. This lake is remarkable for numerous farms on its ſhores, abounding in horſes and beavers, each having a little port where canoes and barks arrive, and load with great diſpatch. There are ſeveral picturеſque iſlands, ſome of which are volcanic. The water in this lake is ſaid to ebb and flow like the ſea; it abounds with fiſh, but is infeſted with crocodiles.

NICARIA, an iſland of the Grecian archipelago, anciently called "Icaria," on account of the ſon of Dædalus, who fell there in the midſt of his raſh flight, whence, as ſome have ſuppoſed, the ſurrounding ſea took the name of the *Icarian ſea*, which ſee. (See alſo ICARUS.) This is an inconſiderable iſland; its length greatly exceeds its breadth; it is diſcoverable at a very great diſtance; but navigators make no attempt to land here, as it has no harbour. A ſcanty population, want of energy, a ſoil in ſeveral diſtricts unfavourable, and general diſcouragement impreſſed by the government through the extent of its dominion, are circumſtances little calculated to repair the diſadvantage of an iſland, which has no places of ſhelter for ſhipping, and conſequently no great means of trade; ſo that Nicaria may be reckoned among the moſt wretched iſlands of the archipelago.

NICASTRO, a town of Naples, in Calabria Ultra; the ſee of a biſhop, ſuffragan of Reggio; nearly deſtroyed by an earthquake in 1638; 18 miles S. of Coſenza. N. lat. 38° 3′. E. long. 16° 37′.

NICAVA, a town of Japan, in the iſland of Niphon; 160 miles N.W. of Jedo.

NICAUAR, a town of the iſland of Ceylon; 50 miles S.W. of Trincomaly.

NICCA, a town of the iſland of Cherſo, in the Adriatic; 20 miles W. of Cherſo.

NICCOLI, NICCOLO, in *Biography*, a meritorious contributor to the reſtoration of learning in Italy, was the ſon of a merchant at Florence, where he was born in the year 1364. In obedience to his father's commands, he paſſed ſome of the firſt years of his life in commercial purſuits; but as ſoon as he was enabled to follow his own inclinations, he devoted himſelf entirely to literature. He contracted an acquaintance with all the learned men of Florence, and ſo deſirous was he of improvement, that he went to Padua for the ſole purpoſe of copying the Latin works of Petrarch, which were then in very high eſteem. Previouſly to the invention of printing, tranſcribing manuſcripts was a conſiderable part of the labour of a ſcholar, and it is ſaid, that a great number of works, copied or corrected by Niccoli, are ſtill extant. With theſe, and with others which he purchaſed, he formed a ſelect and copious library for that age, and with a liberality ſuperior to that of many collectors, he granted the free uſe of his ſtores to all who wiſhed. He was conſiderably inſtrumental in promoting that diſcovery of ancient authors, which was the moſt important ſervice then to be rendered to letters. Poggio has recorded the pecuniary aſſiſtance afforded to himſelf, in his learned reſearches, by Niccoli, who was alſo the patron of other celebrated ſcholars that flouriſhed in this period: it was chiefly through his influence that Manuel Chryſoloras, Guarino Veroneſe, and Fifelfo, were invited to Florence as public profeſſors. The houſe of Niccoli was, we are informed, the common reſort of the learned. Poggio introduces Niccoli as a prominent figure in his "Dialogue on the Unhappineſs of Princes," and repreſents him as detailing the miſeries of exalted rank. On this ſubject he dilates at conſiderable length, proving, from hiſtory, that the beſt of princes are liable to the bittereſt woes incident to human nature. Gaining courage as he proceeds, he attempts to demonſtrate that eminence of ſtation is unfriendly to virtue, and ſhews that it has frequently happened that men who have adorned a private ſtation by their virtues, have become the diſgrace of human nature when they have been raiſed to the ſummit of power: hence he infers, that as happineſs ſeems to be baniſhed from the palaces of the great, if ſhe reſides any where on earth, ſhe muſt be found in the abodes of private individuals, who have wiſdom to ſet bounds to their deſires, and to dedicate them-

ſelves to the cultivation of their intellectual powers. The conduct of theſe men he propoſes as an object of imitation, and exhorts his friends to the ſtudy of thoſe principles of philoſophy which will render them happy in themſelves, and fearleſs of the power, and independent of the favours of the great. Niccolo Niccoli died at the age of 73, in 1437, and Poggio pronounced over him a funeral oration, in which he gives him almoſt unbounded praiſe. His merits as a benefactor to literature cannot be diſputed, and he conſulted its intereſts after his death, by the bequeſt of his library to the public. This is ſaid to have been the firſt public library opened ſince the times of antiquity; his intention, however, could not have been carried into effect, had not Coſmo de Medicis undertaken to ſatisfy the demands of his creditors, which were numerous. Shepherd's Life of Poggio Bracchiolini. See alſo the article BRACCHIOLINI.

NICE, in *Geography*, a province of Italy, now ſubject to France, bounded on the N. by Piedmont, on the E. and S. by the ſtate of Genoa and the Mediterranean, and on the W. by Provence, to which it was formerly annexed; lying in N. lat. 44°, and E. long. 7° 20′, and being 45 miles from N. to S., and 25 to 50 from W. to E. It contains the following ſix diſtricts or counties: 1. The county of "Tenda," about 12 leagues N.N.E. of Nice, conſiſting of mountains and agreeable vallies, with a ſmall town of the ſame name, on a declivity bathed by a riyulet that has a ſoutherly courſe, and runs into the ſea at Ventimiglia. The paſſage of Tenda acroſs the mountain is more difficult than that of mount Cenis. 2. The county of Broglio, with a ſmall town of the ſame name, lying among the mountains; 30 miles N.N.W. of Nice. This county is ſeparated from France, excepting only where the line of diviſion runs along the ſummits of the mountains, by the rapid Var and the Eſteron. 3. The marquiſate of "Dolce aqua," watered by the Navia, and fruitful in wine and oil; it has a town of the ſame name defended by a fort. 4. The county of "Nice," lying on the ſea-coaſt, in 43° 45′ N. lat. remarkable for the temperature of its climate. (See NICE, below.) 5. The principality of "Oneglia," 45 miles N.E. of Nice, environed by the Genoeſe territories, and divided into three vallies abounding in wine, oil, and fruits. Oneglia is a little trading town on the ſea-coaſt. 6. The valley of "Barcelonetta," yielding good paſture, lies at the N.W. extremity of the principality, on the frontiers of Dauphiné and Provence, ceded by France A. D. 1760. The town of the ſame name, ſeated on an eminence, was founded A. D. 1230 by Raymond Berenger. The country called Nice, formerly belonging to Italy and France, is now annexed to the latter, and forms the department of the Maritime Alps.

NICE, *Nicæa*, *Nexaia*, or *Nizza*, a city and ſea-port of France, and capital of the department of the Maritime Alps, ſituated on a rock near the foot of the Alps, at the mouth of the river Paglione, on the left bank of the Var. It contains a cathedral, eight pariſh churches, and thirteen religious houſes. The town includes 18,475, and the canton the ſame number of inhabitants, on a territory of 22½ kiliometres, in one commune. Towards the W. it is fortified with a wall and ditch, and defended by a caſtle. The ſtreets of the old town are narrow and crooked; but thoſe of the new town are wide and ſtraight, with handſome houſes. The ſuburbs, moſt of which are in ruins, are principally inhabited by foreigners. Its harbour is convenient for ſmall veſſels, but expoſed to the ſouth wind. The adjacent country is pleaſant and delightful, the whole plain being highly cultivated with vines, pomegranates, almonds, oranges, lemons, and all kinds of vegetables. The hills are ſhaded to the top with olive trees, among which villas and country houſes are interſperſed. Winter here is warm and agreeable; in March and April cold eaſt and north-eaſt winds prevail; autumn is uſually wet; and ſummer intolerably hot. The air in general is ſerene, dry, elaſtic, and impregnated with ſalt. At Cimea, two miles from Nice, are the remains of a Roman amphitheatre, temple, aqueduct, bath, &c. The enjoyments furniſhed by this delightful country are not without their alloy. In ſummer the heat is intenſe; and reptiles and vermin abound, ſuch as vipers, ſnakes, and ſcorpions; fleas, bugs, and particularly gnats, become intolerable nuiſances throughout the year. This town was founded by the Phocæans, after they had built Marſeilles, about 500 years B. C., on their return from an expedition againſt the Salii and the Ligurians, and was named *Nicæa*, which ſee. It has undergone many viciſſitudes in the later periods of its decline. It ſuffered very much in the year 1543, when it was beſieged by land by the army of Francis I.; and the Turkiſh fleet, under Barbaroſſa, preſſed on it by ſea: it was taken, pillaged, and nearly reduced to aſhes. Having previouſly changed maſters, the citizens availed themſelves of the liberty granted them by Ladiſlaus, to chooſe their own protector, and took the oath of fidelity to Amadeus VII., count of Savoy. The government was a ſpecies of democracy. The inhabitants are divided into four claſſes, the nobles, the merchants, the artiſans, and the huſbandmen, each claſs electing yearly a conſul, and ten counſellors. In the year 1792 the French took poſſeſſion of Nice, and the inhabitants ſeemed diſpoſed to unite cordially with their new maſters; for in September 1793, when an Engliſh veſſel arrived here with a flag of truce, and a proclamation to the people, exhorting them to accept the royal conſtitution of 1789, the magiſtrates of the city replied, "that French republicans would never become ſlaves, and that no farther anſwer would be made to royaliſts, except from the mouths of cannon." N. lat. 43° 31′. E. long. 7° 18′.

NICE, *Council of*, in *Eccleſiaſtical Hiſtory*, held at Nice in Bithynia A. D. 325, convened by Conſtantine in order to ſettle differences and controverſies which had taken place among the Chriſtians, of which Euſebius has given an account. It was ſummoned by letters conveyed by Conſtantine in 324 into the ſeveral provinces of the empire, together with orders for furniſhing the biſhops with beaſts, or carriages, and for bearing the expences of their journey. The biſhops who met in this council were, according to Euſebius's ſtatement, more than 250, beſide preſbyters and deacons, acolythiſts and others, whoſe number could not be eaſily counted. We have different eſtimates of the number of biſhops who attended on this occaſion. The number generally allowed is that of Theodoret, who reckons them at 318. How long this council ſat is not abſolutely certain. Some have given it a permanence of two or three years; but moſt learned moderns are of opinion, that it ſat ſomewhat above two months, beginning the 19th of June and riſing the 25th of Auguſt. The three points debated and determined in this council were the Arian controverſy, the time of keeping Eaſter, and the affair of Meletius in Egypt. Nothing now remains of this council, but the creed, the ſynodical epiſtle, and 20 canons. This council has received great commendations from many, both ancients and moderns. Epiphanius reckoned the two great benefits which the church received from divine providence by means of Conſtantine, to have been a determination of faith againſt Arians, and a certain rule for keeping Eaſter. Moderns have conſidered this council not only as the firſt ecumenical council, but alſo as the moſt celebrated council, ſince the time of the Apoſtles. It is the moſt famous, and the moſt venerable of all councils;

than which the church has nothing more illuſtrious. It has, however, been cenſured by ſome of former, as well as later ages. As for the Meletian crontroverſy or ſchiſm, which was to be terminated by this council; it requires no partilar mention. As to the time of keeping Eaſter, the council determined that it ſhould be obſerved by all on the Sunday which immediately followed after the 14th of the moon, that happened next after the vernal equinox; which equinox happened that year on the 21ſt day of March. (See EASTER.) But the principal determination of the council of Nice relates to the Arian controverſy. On this determination, the learned, impartial, and candid Lardner makes the following remarks. 1. That their deciſions had not the intended effect; peace and unity were not thereby reſtored to the churches. Notwithſtanding the profeſſions made by many of a high veneration for councils, men do not value them any farther, than they countenance their own particular opinions: and if they are under no reſtraints of external force, they contradict their deciſions without ſcruple. 2. No man, or number of men ſeparate, or united in council, ſince the time of Chriſt and his apoſtles, have any right to decide in matters of faith. It is inconſiſtent with the reſpect due to Jeſus Chriſt, to attempt it: unleſs they can ſhew themſelves to be inſpired, and work miracles, to manifeſt evidently a divine commiſſion. If ſuch a caſe ſhould happen, which is very unlikely, what ſuch perſons propoſe muſt be tried and examined by the doctrine of the goſpel, delivered in the New Teſtament. 3. The introducing of force and authority in matters of a ſpiritual nature, is ſubverſive of true religion and virtue. The council of Nice unqueſtionably introduced authority and force in the church, and the affairs of religion. Or if authority had been introduced before, they now openly countenanced it, and gave it a further ſanction. 4. When this council met, inſtead of deciding by their authority, and enforcing by wordly menaces and recompences any ſpeculative doctrines, they ſhould rather have recommended forbearance and moderation to all parties. See COUNCIL.

NICEA, in *Geography*, a town of European Turkey, in the Morea; 18 miles E.N.E. of Miſitra.

NICENE CREED. See CREED.

NICEPHORIUM, in *Ancient Geography*, *Racca*, a town of Aſia, in Meſopotamia, according to Ptolemy, who places it between Maube and Maguda. Pliny ſays, that Alexander availed himſelf of the advantageous ſituation of this place for building a town; and Steph. Byz. ſays, that it was afterwards re-eſtabliſhed by the emperor Conſtantine. It was ſituated on the eaſtern bank of the Euphrates, near the place where the Billicha diſcharged into this river. M. d'Anville conceives it to have been the place which was called Callinicum or Callinicus, and under the emperor Leon, Leontopolis.—Alſo, a town of Aſia Minor, near the Propontide, which, according to Arrian, was a fortified place, in which were temples.

NICEPHORIUS, a river of Armenia, which, according to Tacitus, watered and guarded the town of Tigranocerta, and diſcharged itſelf into the Tigris.

NICEPHORUS I. in *Biography*, emperor of the Eaſt, ſurnamed "The Logothete," was great treaſurer and chancellor of the empire at the time when a revolt of the nobility from the empreſs Irene diſpoſſeſſed her of the throne, A.D. 802. Nicephorus was inveſted with the purple, and ſolemnly crowned at St. Sophia, while Irene was firſt confined to a monaſtery, and afterwards baniſhed to the iſle of Leſbos. In a ſhort time after his acceſſion he made a treaty with the emperor Charlemagne, and having ſuppreſſed a revolt excited by Bardanes, the governor of one of his provinces, he ſtrengthened his throne by the aſſociation of his ſon Saturacius. The emperor now declared his intention no longer to pay the accuſtomed tribute to the Saracens; the caliph Haroun-al-Raſhid announced his determination of marching an army to enforce it, and accordingly made an incurſion into Phrygia. Nicephorus, on this occaſion, was completely defeated, and with difficulty made his eſcape. Nicephorus made another attempt to free himſelf from this bondage, but after a fruitleſs, and even a diſaſtrous ſtruggle, he agreed to the moſt humiliating terms, *viz.* to pay a yearly tribute in coin, ſtamped with the image of the Saracen, and not to repair his demoliſhed fortreſſes. A violation of this laſt condition produced a new invaſion, in which the Saracens ravaged the provinces with more cruelty than before. Theſe public calamities were aggravated by internal diſcontents and conſpiracies, which were puniſhed by the emperor with extreme rigour, and cauſed his reign to be a perpetual ſcene of ſuſpicion and tyranny. The peace of the empire was diſturbed in 809 by a new enemy, who invaded it on the oppoſite ſide. The Bulgarians entered Mœſia, and ſurpriſing the city of Sardica, put the whole garriſon to the ſword. On the approach of the emperor they retired with their booty beyond his reach. Two years after this, Nicephorus, determined to revenge the inſult, and diſable them from future hoſtilities, penetrated to the centre of the country, and ravaged it in a mercileſs manner with fire and ſword. This conduct, however, drove the enemy to deſpair, and collecting all his force, he made an unexpected attempt upon the emperor's camp, which he forced, and Nicephorus, with his chief officers, and the greater part of his army, were ſlain. Not ſatisfied with the death of the emperor, the barbarian conqueror cauſed his head to be cut off and expoſed on the point of a ſpear; and his ſkull, ſet in gold, ſerved afterwards for his uſual drinking cup. This cataſtrophe took place in July 811. By monkiſh hiſtorians, Nicephorus is repreſented as a monſter of avarice, cruelty, and debauchery. To this they add impiety, which he manifeſted by his favour to heretics, and his contempt for the church of Rome.

NICEPHORUS II., PHOCAS, emperor of the Eaſt, was the ſon of Bardas Phocas, and commander of the imperial army in Aſia. Nicephorus was brought up to the army, and ſucceeded his father in the chief command in Aſia. He defeated the Saracens on various occaſions, and in the reign of Romanus recovered the whole iſland of Crete in a ſeries of actions of ſeven months continuance. After this he was ſent againſt the Saracen caliph of Syria, whom he defeated, and then captured the important city of Beræa. On the death of Romanus he returned to Conſtantinople, where he obtained the honour of a triumph. Finding that he was ſuſpected of ambitious deſigns by the prime-miniſter Joſeph, he requeſted a private audience with him, at which he pretended an averſion for all worldly dignities, and a reſolution to retire to a monaſtic life, ſhewing him, at the ſame time, a hair cloth which he wore next his ſkin. The miniſter, duped by his hypocriſy, ſuffered him to return to the army of the Eaſt, where his fellow-commanders, Zimiſces and Curcuas, perſuaded, or compelled him to aſſume the title of emperor, which was conferred upon him in the year 963. He returned to Conſtantinople, where he was crowned by the patriarch. His warlike diſpoſition was manifeſted in the continual aſſaults which, in perſon or by his generals, he made upon the Saracen power. He ſent Manuel, the natural ſon of his uncle Leo, with a powerful army, on an attempt to expel the Saracens from the iſland of Sicily, but the unſkilfulneſs of the leader cauſed his total deſtruction. His lieu-

tenant and former comrade, John Zimiſces, ſucceeded better againſt the ſame enemy in Cilicia and Cyprus. The emperor, having in the fourth year of his reign beſieged and reduced the cities of Mopſueſta and Tarſus, invaded Syria, took ſeveral towns, and inveſted Antioch itſelf; but on the approach of winter he was obliged to quit it, and return to his capital. Antioch was, however, in a ſhort time afterwards ſurpriſed by one of his generals. This career of victory, ſplendid as it was, produced unpopularity at home, on account of the new taxes which he was forced to impoſe, and at the ſame time he offended his generals by the ſuſpicions with which he requited their ſervices. At length a conſpiracy was formed againſt him, and by the contrivance of the empreſs, Zimiſces, with a band of aſſaſſins, was admitted, by night, into the palace, and Nicephorus, who had once been honoured with the title of the "Morning Star," was cut off A.D. 969, in the 57th year of his age, and the ſeventh of his reign. Univer. Hiſt. Gibbon, vol. x.

NICEPHORUS III., BOTONIATES, emperor of the Eaſt, was a general under Conſtantine Ducas, when he was defeated and taken priſoner in an invaſion of the Scythian Uzians. He was commander of the Aſiatic forces of the empire, when Michael Ducas encouraged him to revolt, and make an alliance with the Turks, whom he had been ſent to oppoſe. He was ſolemnly recogniſed as emperor, and crowned by the patriarch in March 1078. Alexius Comnenus was employed by him againſt three competitors, *viz.* Urſellius, Bryennius, and Baſilacius. All theſe he ſucceſſively reduced, and Nicephorus ſtrengthened his authority by marrying Mary, who had been the wife of Michael Ducas. He was now advanced in years, and having no male iſſue, he was perſuaded, by two favourites, to nominate in his teſtament for his ſucceſſor, a youth who was his relation. The empreſs, however, anxious that her ſon ſhould ſucceed to the empire, determined, with the aſſiſtance of Alexius and Iſaac Comnenus, to depoſe Nicephorus, which ſhe quickly effected, and the emperor quitted the throne, after a reign of three years. He retired to a monaſtery, where he took the habit, and ended his days in obſcurity and peace. Univer. Hiſt. Gibbon, vol. x.

NICEPHORUS, patriarch of Conſtantinople in the beginning of the ninth century, was a native of that city, the ſon of Theodorus, ſecretary to the emperor Conſtantine Copronymus. He became confidential ſecretary to the emperor, and his mother Irene. He attended in his official capacity at the ſecond council of Nice in the year 787, where his talents and influence were zealouſly exerted in defence of image-worſhip. The manners of a court were ill adapted to his mind, and he withdrew into a monaſtery on the Thracian Boſphorus, but not as a member of the religious community. In 806, upon the death of the patriarch Taracius, he was elected his ſucceſſor in that dignity while a layman. In the year 814, an edict having been promulgated by the emperor Leo, the Armenian, for the ſuppreſſion of the worſhip, the patriarch made uſe of all the means in his power to prevent it from being carried into execution. For this he was baniſhed, and he ſpent a great part of his exile in a monaſtery which had been founded by himſelf in the iſland of Propontis, where he was confined till his death in the year 828. He was a man of ſtrong natural abilities, and he had acquired high intellectual endowments. By the Greek and Latin churches he is honoured as a confeſſor. He was author of ſeveral works, of which the moſt conſiderable is "An Abridgment of Hiſtory," commencing with the death of the emperor Mauritius, and ending in the reign of Irene. Another work attributed to him, is "A Chronological Catalogue of all the Patriarchs, Kings, and Princes of the Jews, Kings of Perſia and Macedon, Roman Emperors, &c." He alſo wrote three books, entitled "Antirrhetics," againſt the council held at Conſtantinople, under Conſtantine Copronymus, which aboliſhed the uſe of images. He is ſuppoſed, by Lardner and others, to have been the author of "The Stichometry," which contains a catalogue of the books of ſacred ſcripture, which is of uſe to ſhew that the Jewiſh canon was generally eſteemed ſacred by Chriſtians, and that the other books of the Old Teſtament, which are now deemed "Apocryphal," were not of equal authority, though ſometimes read in the churches, and quoted by Chriſtian writers. It affords likewiſe ſtrong evidence to prove, that there never were any Chriſtian writings eſteemed to be of equal authority with thoſe which are now received by us as ſacred and canonical. A letter of this patriarch to pope Leo, containing his confeſſion of faith, may be found in the ſeventh volume of the Collect. Conciliorum. Lardner. Moreri. Gen. Biog.

NICEPHORUS, CALLISTUS, the ſon of Calliſtus, ſurnamed *Xanthopulus*, a learned monk of Conſtantinople, who flouriſhed in the 14th century, was a very ſtudious man, and was for many years employed in the diligent peruſal of the books in the celebrated library belonging to the church of St. Sophia. While he was a very young man, he undertook to write, in the Greek language, "A New Eccleſiaſtical Hiſtory," collected out of Euſebius, Socrates, Sozomen, and others, and he completed the work before he was thirty-ſix years of age. It was addreſſed to the emperor Andronicus Palæologus the elder, and divided into twenty-three books, extending from the birth of Chriſt to the death of the emperor Leo, *the philoſopher*, in the year 911. Eighteen only of theſe have reached our times, which bring the hiſtory to the death of the emperor Phocas, or the year 610. On account of the elegance of the compoſition, the author has been ſtyled the "eccleſiaſtical Thucydides," while others, from the marvellous tales and fables which are interſperſed in it, have given him the name of the theological Pliny. It is extremely uſeful on account of the light which it throws on many important facts in eccleſiaſtical hiſtory. The only MS. of it yet diſcovered belonged to the library of Matthias, king of Hungary, at Buda, where, on the capture of that city, it became part of the plunder collected by a Turk, who carried it to Conſtantinople, from whence it paſſed to the Imperial library at Vienna. It has undergone ſeveral impreſſions. Beſides this work, Nicephorus wrote "A Catalogue of the Conſtantinopolitan Emperors," and another of the Patriarchs, both in Greek Iambic verſe; and "An Abridgment of the Scriptures," in the ſame kind of verſe. Dr. Hody has attributed to him a ſmall piece, which he publiſhed in Greek and Latin, during his controverſy with Mr. Dodwell, under the title of "Anglicani Schiſmatis Redargutio." Gen Biog.

NICEPHORUS GREGORAS, one of the Byzantine hiſtorians, who flouriſhed in the 14th century, was a favourite of Andronicus Palæologus the elder, who made him librarian of the Conſtantinopolitan church, and ſent him on an embaſſy to the prince of Servia. He followed that emperor after his depoſition, and was with him at his death. After this he went to the court of Andronicus the younger, where he was the cauſe of the refuſal of the Greeks to enter into a conference with the legates of pope John XXII. In the diſputes that took place between Barlaam and Palamas, he took the part of the former, whom he warmly ſupported in the council held at Conſtantinople in 1351. For this he was thrown into priſon, and was not liberated till the return of John Palæologus. Nicephorus wrote eleven books of the Byzantine hiſtory, comprehending a period of 145 years, from

from Theodore Laſcaris I. to the death of the younger Andronicus in 1341. This was printed at Baſil in 1561, with a Latin verſion, by Jerome Wolff. Gregoras alſo wrote the life of his uncle John, metropolitan of Heraclea, and he compoſed *Scholia* on Syneſius "De Inſomniis," which have been publiſhed, beſides other pieces ſtill in MS. Moreri.

NICERON, JOHN FRANCIS, a French mathematician in the ſeventeenth century, was born at Paris in the year 1613. At a very early age he diſplayed a love of learning, and by the progreſs which he made in his elementary ſtudies, afforded a fair promiſe of future excellence. At the age of nineteen he entered the order of Minims, and it was ſoon diſcovered that his genius was decidedly in favour of the mathematical ſciences, to which, after he had completed his theological courſe, he devoted all the time that was not neceſſarily occupied by the duties of his profeſſion. The ſcience of optics was that which principally engaged his attention, and his performances afforded ſatisfactory evidence of his profound ſkill in that branch of natural philoſophy. He became acquainted with Des Cartes, but their intimacy was but of ſhort duration, as Niceron died at the early age of 33, in the year 1646. This event was regarded as a conſiderable loſs to the republic of letters. He was author of many works, of which the following may be mentioned: "Interpretation of Cyphers;" "Curious Perſpective, or artificial Magic produced by the wonderful Effects of Optics, Catoptrics, and Dioptrics," which was introductory to another on the ſame ſubject, but much larger, entitled "Thaumaturgus Opticus, ſive, admirandæ Optices, Catoptrices, et Dioptrices, Pars prima, de iis quæ ſpectant ad viſionem directam," which he left unfiniſhed.

NICERON, JOHN PETER, a man of letters, was born at Paris in 1685: he entered into the congregation of Barnabites, and became in due time profeſſor of the languages, and then of theology. He took prieſts' orders in 1708; but in 1716 he was called to reſide at Paris, where he henceforth occupied himſelf in literary purſuits, to which he had ever been warmly attached. Beſides the ancient learned languages, he was well acquainted with the principal modern ones of Europe, and ſome of his early publications were tranſlations from the Engliſh. The work by which he is principally known, is entitled "Mémoires pour ſervir à l'Hiſtoire des Hommes illuſtrès dans la République des Lettres, avec un Catalogue raiſonné de leurs Ouvrages." The firſt volume of this publication was given to the world in 1727, and the others were printed in ſucceſſion to the forty-third, but the laſt three were not wholly the production of Niceron. The author gave the title of *illuſtrious men* to a great number of perſons having no claims whatever to celebrity, but his reſearches into the hiſtory of publications are reckoned both curious and uſeful. Niceron died at Paris in 1738. He was extremely amiable in his private character, and though his time was chiefly ſpent in the retirement of deep ſtudy, yet when in company he poſſeſſed a fund of cheerfulneſs and animation. His eulogy may be found in the fortieth volume of the memoirs above-mentioned, which was written by the abbé Goujet. Moreri.

NICETAS, ACHOMINATUS, ſurnamed *Choniates*, a modern Greek hiſtorian, was born at Chone, in Phrygia, and filled, in the early part of the 13th century, a dignified ſtation in the court of Conſtantinople. At the capture of that city by the Franks, in 1204, he withdrew, with a young woman whom he reſcued from the enemy, to Nice, in Bithynia, and married her. He died in 1206. He is known as the writer of a period of Byzantine hiſtory from the death of Alexius Comnenus, where Zonaras ceaſes, to the year 1203, being 85 years, in 21 books, which are ſtill extant. They were printed by Jerome Wolff at Baſil in 1557, and were inſerted in the Louvre edition of the Byzantine hiſtorians of 1647. The hiſtory is valued on account of the truth of its facts. Banduri, in his "Imperium Orientale," has printed a ſmall piece by Nicetas on the ſtatues melted down by the Latins when they took Conſtantinople. To Nicetas alſo have been attributed the five firſt books of the "Treaſure of the Orthodox Faith," tranſlated by Morel, and printed in 1580. Moreri.

NICETAS, ſurnamed *Serron*, biſhop of Heraclea in the eleventh century, was author of a commentary upon the oration of Gregory Nazianzen; of many original works, chiefly relating to the Holy Scriptures; and of "Canonical Anſwers" to queſtions propoſed by a certain biſhop, named Conſtantine, which John Leunclavius publiſhed in Greek and Latin.

NICETERIA ATHENAS, Νικητηρια Αθηνας, in *Antiquity*, an Athenian ſolemnity in memory of Minerva's victory over Neptune, when they contended which of them ſhould have the honour of giving a name to the city afterwards called Athens.

NICHABURG, in *Geography*, a town of Perſia, in Khoraſan, famous for a mine of turquoiſe ſtones in its neighbourhood; 30 miles S. of Meſchid.

NICHE, in *Architecture*, a cavity, or hollow place, in the thickneſs of a wall, to place a figure or ſtatue in.

The word comes from the Italian *nicchia*, *ſhell*; becauſe the ſtatue is here incloſed in a ſhell; or, perhaps by reaſon of the ſhell with which the tops of ſome of them are adorned.

Niches are made to partake of all the ſegments under a ſemicircle. They are ſometimes at an equal diſtance from the front, and are parallel or ſquare on the back with the front line; in which caſe they are called ſquare receſſes, or ſquare niches.

The larger niches ſerve for groups of figures; the ſmall ones for ſingle ſtatues, and ſometimes only for buſts.

Great care muſt be taken to proportion the niches to the figures; and that the pedeſtal of the figures be proportioned to the niches.

Niches are ſometimes made with ruſtic-work.

NICHE, *Angular*, that formed in the corner of the building.

NICHE, *Cul de four of a*. See CUL.

NICHE, *Ground*, that which, inſtead of bearing on a maſſive, has its riſe from the ground; as the niches of the portico of the Pantheon at Rome. Their ordinary proportion is to be two diameters in height, and one in width.

NICHE, *Round*, is that whoſe plan and circumference are circular.

NICHE, *Square*, that where they are ſquare.

NICHED COLUMN. See COLUMN.

NICHILIANISTÆ, in *Church Hiſtory*, heretics who maintained that Chriſt had no being.

NICHILS. See NIHILS.

NICHILS, *Clerk of the*. See CLERK.

NICHOLAS I., pope, in *Biography*, called the Great, a native of Rome, the ſon of one Theodore, was ordained ſub-deacon by pope Sergius II., and deacon of the Roman church by pope Leo IV. So high was the reputation which he acquired in theſe offices, that upon the death of pope Benedict III. in 858, he was elected to fill the vacant dignity. When the emperor Lewis II., who had lately left Rome, heard of this event, he returned to that city, and aſſiſted in perſon at the coronation of the new

pontiff. Some days afterwards, being told that the pope, attended by the Roman nobility, was coming to viſit him, he went out to meet him, and after diſmounting took hold of the pope's bridle, and condeſcended to lead his horſe for ſome diſtance on foot, as he did alſo at the pope's departure. One of the firſt objects of importance which engaged the attention of the new pope, was the ſtate of affairs at Conſtantinople, which had divided the eaſtern biſhops into two parties, and ſeemed to furniſh him with a favourable opportunity of exerciſing his power and authority over that rival ſee. The emperor Michael, incenſed againſt the patriarch Ignatius, on not finding him ſufficiently obſequious to his pleaſure, commanded him to be driven from his ſee, declared lawfully depoſed, and ſent into exile. At the ſame time Photius, who was univerſally regarded as a man of extraordinary abilities, and as the rival of the ancients themſelves in every branch of literature, was elected his ſucceſſor, and as he was at that time a layman, he was hurried through the eccleſiaſtical degrees required by the canons, and conſecrated in ſix days. Theſe events occaſioned no little diſturbance in the eaſtern churches, ſome of them adhering to Ignatius, and others as warmly attached to Photius. At a council of biſhops held at Conſtantinople in the year 860, Ignatius was declared unworthy of the patriarchal dignity, and accordingly depoſed and excommunicated. By an oppoſite party, Photius met with a ſimilar treatment. Finding the biſhops thus divided, Photius applied to the pope to procure an approbation of his election. It is not compatible with the limits aſſigned to articles of this ſort, to enter at large into this controverſy, but we may briefly obſerve, that in a council held at Rome in 863, pope Nicholas excommunicated Photius, who had ſupplanted Ignatius in the ſee of Conſtantinople, as an uſurper. When information of this procedure was brought to the emperor Michael, he ſent a letter to his holineſs, filled with the ſevereſt reproaches and menaces, to which Nicholas returned a long reply, conſiſting of anſwers to the various articles, or blaſphemies againſt God and St. Peter, contained in it. All intercourſe from this time was broken off between Conſtantinople and Rome, and Photius propoſed to the emperor the aſſembling of a council at Conſtantinople for the purpoſe of depoſing Nicholas. This was agreed to; a council was convened, and before this aſſembly the pope was arraigned of innumerable crimes, and being pronounced guilty, was ſolemnly depoſed as altogether unworthy of the epiſcopal dignity, and it excommunicated all thoſe who ſhould venture to communicate with him. Photius alſo wrote a circular letter to the patriarchs and biſhops of the Eaſt, charging the Roman church with ſeveral erroneous doctrines, and various practices repugnant to the canons of the univerſal church, and exhorting them to concur with him for the purpoſe of reforming that corrupted church. The taſk of anſwering theſe charges Nicholas devolved on Hincmar and the Gallican biſhops, but, in the mean time, a change of affairs in church and ſtate took place, in conſequence of the murder of the emperor Michael, and Baſil's becoming head of the empire. For on the very next day after this event, Baſil ordered Photius to be depoſed and confined in a monaſtery, and then ſending for Ignatius, he reinſtated him in the patriarchal dignity. Of this important change an account was immediately ſent to Rome, but Nicholas did not live long enough to enjoy the ſatisfaction which the tidings of it would have afforded him. He died in the year 867, after he had preſided over the Roman church nine years and a half. He was reckoned a perſon of conſiderable abilities and learning, and particularly excelled as a canoniſt. By ſome writers he has been compared with Leo I. and Gregory I., (ſee their articles,) and pronounced worthy with them of the ſurname of GREAT. He is commended by Anaſtaſius for his charity to the poor, and for the magnificent preſents which he made to the churches of Rome, particularly to that of St. Peter. The public works of his pontificate, were the repairing of an aqueduct which conveyed water to the Vatican baſilic, and the rebuilding of the city of Oſtia, which was ſtrengthened with new works, to reſiſt the ſudden attacks of the Saracens. About a hundred of his letters have reached our times, which are inſerted in the eighth volume of the Collect. Conciliorum; they have been likewiſe publiſhed ſeparately at Rome.

NICHOLAS II., pope, whoſe original name was Gerard, was a native of Burgundy, became biſhop of Florence; and in January 1059 he was raiſed to the pontificate, when he took the name of Nicholas II. Previouſly to this, John Mincius had aſpired to the papal throne under the title of Benedict X., but finding himſelf too weak to diſpute the claims of Nicholas, he threw himſelf at his feet, entreated his forgiveneſs, and proteſted that he had been compelled to accept the dignity which he now moſt readily laid aſide. Nicholas accordingly abſolved him from all guilt, but diveſted him of his eccleſiaſtical functions, and obliged him to ſpend the remainder of his days in the church of St. Mary at Rome, where he was admitted only to lay-communion. In the firſt year of the pontificate, Nicholas convened a council, to which all the biſhops of Italy, France, and Germany were invited, in order to take into conſideration the beſt means for ſuppreſſing the opinions of the famous Berenger relating to the Euchariſt. (See the article BERENGER.) By the ſame council, a decree was paſſed concerning the election of the pope, confining it to the cardinals, and only leaving to the people, the clergy, and to the emperor, the power of confirming the election which they had made. Several canons were alſo made in it againſt ſimony, inceſtuous marriages of prieſts, and various abuſes, which preceding popes had endeavoured, in vain, to extirpate. During the ſame year in which this council was held, the pope ſent Peter-Damian, cardinal biſhop of Oſtia, and Anſelm, biſhop of Lucca, with the character of his legates, to aſſiſt Guido, archbiſhop of Milan, in correcting ſeveral abuſes which prevailed in that church, and a few days after the council broke up he ſet out for Melfi, the capital of Apulia, where he preſided in perſon, at a council which paſſed many ſevere laws for the ſame purpoſe. While he was at Melfi, he received an embaſſy from the famous Robert Guiſcard, the Norman, who had made himſelf maſter of the whole of Apulia, and ſpread his conqueſts over the greateſt part of Calabria. After a few conferences, it was agreed between them, that the pope ſhould abſolve the Normans from the excommunication which they had incurred, and confirm to Robert and his heirs the dukedoms of Apulia and Calabria, which he had conquered from the Greeks, and alſo the iſland of Sicily, after he ſhould expel the Greeks and Saracens out of it. It was alſo agreed, that the pope ſhould confirm to Richard of Averſa, and his heirs, the city and principality of Capua, out of which he had lately driven the lawful prince. On the other hand, Robert and Richard agreed to acknowledge themſelves vaſſals of the apoſtolic ſee, to ſwear an inviolable allegiance to pope Nicholas and his ſucceſſors, and to pay yearly tribute as a mark of their ſubjection. From Melfi the pope proceeded to Beneventum, where he held another council, and he then ſet out on his return to Rome, attended with a numerous body of Normans, who obliged the inhabitants of Præneſte, Tuſculum, and Nomentum, to ſubmit to the Roman ſee, from which they had revolted; and theſe warriors alſo deſtroyed the ſtrong holds,

and

and put an end to the power of the many petty tyrants that ſurrounded the city of Rome on all ſides. In the year 1060, Nicholas ſent Stephen, cardinal prieſt, into France, as his legate, to reform the abuſes which prevailed in the Gallican church, and had been connived at by the biſhops in thoſe parts. In the following year Nicholas held a council in the Lateran palace, at which were preſent Aldred, archbiſhop of York, and the biſhops elect of Wells and Hereford. Aldred had made a journey to Rome, that he might receive the pall at the pope's hands, who refuſed to grant it, but upon the condition that Aldred ſhould reſign the ſee of Worceſter, which he was deſirous of retaining with the higher preferment. When this council broke up, Nicholas went to Florence, where he died the ſame year, after a ſhort pontificate of two years and a half. He is deſcribed by cardinal Damian as a man of learning, of a very lively genius, and of a great reſolution in the purſuit of any undertaking on which he had determined. He ſays, he was chaſte beyond ſuſpicion, and that his benevolence knew no bounds. Nine of his letters are ſtill extant; one of which is directed to Edward the Confeſſor, king of England, and contains a confirmation of the privileges granted to the church of Weſtminſter, and the reſt chiefly relate to the eccleſiaſtical affairs of France. They are inſerted in the ninth vol. of the Collect. Conciliorum.

Nicholas III., pope, whoſe family name was John Cajetan, was a native of Rome, and deſcended from a branch of the noble family of the Urſini. He was elected to the papacy in November 1277, and immediately after his election he repaired to Rome, in order to be ordained, and upon his being crowned, he took the name of Nicholas, from the ſaint who gave the title to his cardinalate. Before his coronation he wrote to Rudolph, in order, if poſſible, to prevent the war which threatened to break out between him, and Charles king of Sicily. He hoped to perſuade the emperor to ſuſpend his intended march into Italy, and to refer the ſubject in diſpute to the judgment of the apoſtolic ſee. In the year 1278, ambaſſadors arrived at Rome from the Greek emperor Michael Palæologus, and his ſon Andronicus, to confirm the union agreed upon at the council of Lyons between the Greek and Latin churches. On this occaſion, Nicholas received them in the moſt honourable manner, and they ſwore to all the articles which were ſubſcribed by the former ambaſſadors. In the ſame year, Rudolph confirmed to the popes all the grants made, or which were pretended to have been made, by former emperors and the apoſtolic ſee: he alſo obtained the concurrence of all the electors of the empire to his diploma of confirmation. In return for this liberality, the pope obliged the king of Sicily to reſign his vicariate of Tuſcany, declaring that the office was annulled by the lawful election of Rudolph to the dignity of king of the Romans. By depriving Charles of his power in Tuſcany, Nicholas not only rendered an acceptable ſervice to the emperor, but alſo gratified the hatred which he had conceived to the king of Sicily. After this he obliged Charles to reſign the dignity of ſenator of Rome, conferred upon him by pope Clement IV., and then iſſued a bull, forbidding any emperor, king, prince, duke, marquis, count, or baron, &c. from being elected hereafter to that office. The ſame bull ordained that the ſenatorial dignity ſhould not be conferred on any perſon for life, but only for one year; at the end of which another ſhould be choſen, unleſs the pontiff for the time being thought fit to continue the former in his dignity. But, notwithſtanding this bull, Nicholas got the Romans to chooſe him ſenator for life. So far was he carried by his hatred to king Charles, that he became a party in projecting that barbarous conſpiracy formed by John of Procida, and Peter, king of Arragon, to drive Charles out of the iſland, which is known by the name of the "Sicilian Veſpers." Before this conſpiracy was ripe for execution, he died at Suriano, near Viterbo, in the year 1280, after a pontificate of two years, and almoſt nine months. He is praiſed on account of his excellent moral qualities; for his liberality to the poor, and the encouragement of learning and learned men; but he carried the practice of nepotiſm to an extravagant exceſs, beſtowing all the beſt and moſt lucrative employments upon his own relations. He granted many privileges to the religious orders, particularly to the Franciſcans, and in the year 1279, publiſhed that famous bull, called "The Conſtitution Exiit," from the firſt word in it, which confirmed the rule of St. Francis, and contained an accurate and elaborate explication of the maxims it recommended, and the duties it preſcribed. By this edict, the pontiff renewed that part of the rule which prohibited all kinds of property among the Franciſcans, every thing that bore the leaſt reſemblance of a legal poſſeſſion, or a fixed domain; but he granted them the uſe of things neceſſary, ſuch as houſes, books, and other conveniences of that nature, the property of which, in conformity with the appointment of Innocent IV., was to reſide in the church of Rome. To Nicholas III. is attributed a treatiſe "De Electione Dignitatum;" and five of his "Letters" are given in Wadingi Annal. Minor.

Nicholas IV., pope, formerly known by the name of Jerome Aſcoli, deſcended from humble parents, was born at the town whence he took his ſurname, ſituated in the marche of Ancona. He entered, at an early age, into the order of Minorites, and acquired ſuch reputation by his learning and exemplary life, that he was raiſed to the poſt of general of the fraternity. Before he had attained to this honour, pope Gregory X. ſent him on a miſſion to Conſtantinople, for the purpoſe of bringing about a reconciliation and union between the Greek and Latin churches, and from thence into Tartary, to promote the converſion of infidels. Afterwards he was created cardinal by pope Nicholas III., by whom, and by Honorius IV., he was employed on various miſſions. By Martin IV. he was preferred to the biſhopric of Paleſtrina, and on the death of Honorius IV. he was raiſed to the high dignity of pope. At his coronation, out of gratitude to Nicholas III., who had created him a member of the ſacred college, he took the name Nicholas IV. Soon after his election he intereſted himſelf with great zeal in the cauſe of Charles, prince of Salerno, who was kept priſoner by Alphonſus, king of Arragon, and he ſent legates to that monarch to treat about the prince's liberty, and alſo to ſummon Alphonſus to appear at Rome within a limited time. Alphonſus made his peace, but dying almoſt immediately afterwards, his brother James, who ſucceeded him, refuſed to ratify the treaty. At length, in 1292, Nicholas, finding that he paid no regard to his repeated admonitions to ſurrender the iſland of Sicily to Charles, ſolemnly excommunicated him, and all the Sicilians who adhered to him. The pope was equally zealous in eccleſiaſtical affairs as in political. Beſides maintaining the pretenſions and privileges of the church with the moſt reſolute zeal, and, indeed, obſtinate perſeverance, he diſpatched miſſionaries to propagate the Catholic faith among the Sclavonians, the Tartars, the Armenians, and othern Eaſtern nations, and he addreſſed letters in defence of it to the emperor of Ethiopia. But the object which ſeemed to occupy his attention more than every thing elſe, was the deſperate ſtate of the Chriſtians in the Eaſt, who were now reduced to the greateſt extremities of weakneſs

and

and miſery. Tripoli was taken in 1289, and all the inhabitants put to the ſword, or carried into captivity. Ptolemais ſhared the ſame fate, which ſo alarmed the inhabitants of Tyre, Sidon, and the other cities in Syria, that they tranſported themſelves to the iſland of Cyprus. Thus was the Holy Land irrecoverably loſt, nothing being left to the Chriſtians of the Eaſt but this iſland and the Leſſer Armenia. Nicholas, to repair theſe loſſes, endeavoured to ſet on foot a general cruſade. His efforts were vain, and he felt ſo much mortification at the loſs of Paleſtine, that it was thought greatly to contribute to haſten his death, which took place in April, 1292, after he had preſided little more than four years over the Roman church. He is highly commended by contemporary writers for his humility, good temper, and contempt of all worldly grandeur. He was a man of learning, and encouraged learning in others. On a magnificent mauſoleum which pope Sixtus V. erected to his memory, it is recorded to his praiſe, that men of probity and men of learning were his only relations. He was author of "Commentaries" on ſome parts of the Scriptures, and of ſeveral "Sermons." His "Conſtitutio pro Benedictinis" was publiſhed at Paris in 1519. Some of his "Letters" have been publiſhed in the "Annales" of Bzovius, and Wadingus.

Nicholas V., pope, originally known by the name of Thomas of Sarzana, was the ſon of a phyſician at Sarzana, a ſmall town on the borders of Tuſcany, and the republic of Genoa, whence he derived his ſurname. His promiſing talents and early love of learning attracted the notice of cardinal Nicholas Albergati, who took him under his protection, and ſupplied him with whatever was neceſſary for purſuing his ſtudies at the univerſity of Bologna. Here he applied to the different branches of academical learning with extraordinary diligence and ſucceſs, and acquired the character of being one of the moſt learned divines and able diſputants of his time. Being introduced to the court of Eugenius IV., he recommended himſelf to the good opinion and eſteem of that pontiff, who employed him in all the diſputes between the Latins and Greeks at the councils of Ferrara and Florence. On theſe occaſions he acquitted himſelf very ably as a ſcholar, divine, and man of prudence, and his merits were rewarded, in the year 1445, by his promotion to the biſhopric of Bologna. In 1446 he was promoted to the purple, and in the following year he was elevated to the papal throne by the unanimous voice of the cardinals met to chooſe a ſucceſſor to Eugenius IV. The coronation of the new pope took place on the 19th of March, when he aſſumed the name of Nicholas, out of gratitude to Nicholas Albergati. Immediately after his elevation to the papal dignity, he ſent notice of the event to all the Chriſtian princes, acknowledging himſelf to be quite unworthy of the high honour to which he had been raiſed, he ſaid, againſt his will, and from which he was ready to retire, if ſuch reſignation was thought neceſſary or expedient for the good of the church. It was during the pontificate of Nicholas that the ſixth jubilee was celebrated at Rome, and though the city was crowded with pilgrims during the whole year, yet, by the prudent regulations of the pope, they were furniſhed with all neceſſary ſupplies upon reaſonable terms, and all diſorders and quarrels were prevented. It was, however, at this feſtival that an accident happened which gave him great concern. As the crowd one day was paſſing over the bridge of St. Angelo, it broke down, by which more than two hundred perſons were either drowned or trampled to death. In the year 1453, Nicholas received intelligence of the capture of Conſtantinople by Mahomet II. Some hiſtorians mention this fact as the greateſt affliction that befel the pope, but Gibbon, ſpeaking on the ſubject, ſays, "Some ſtates were too weak, and others too remote: by ſome the danger was conſidered as imaginary, by others as inevitable: the weſtern princes were involved in their endleſs and domeſtic quarrels; and the Roman pontiff was exaſperated by the falſehood or obſtinacy of the Greeks. Inſtead of employing in their favour the arms and treaſures of Italy, Nicholas V. had foretold their approaching ruin, and his honour ſeemed engaged in the accompliſhment of his prophecy. Perhaps he was ſoftened by the laſt extremity of their diſtreſs, but his compaſſion was tardy: his efforts were faint and unavailing; and Conſtantinople had fallen before the ſquadrons of Genoa and Venice could ſail from their harbours." From this time he ſpent the remainder of his pontificate in endeavours to allay the civil wars and commotions which took place in Italy, to reconcile the Chriſtian princes who were then at war with one another, and to unite them in one league againſt the enemies of the Chriſtian church. In his efforts he was completely unſucceſsful, and the diſappointment is ſaid to have haſtened his death, which happened in 1455, after he had completed the eighth year of his pontificate. "The fame of Nicholas V.," ſays the author juſt quoted, "has not been adequate to his merits. From a plebeian origin, he raiſed himſelf by his virtue and learning: the character of the man prevailed over the intereſt of the pope; and he ſharpened thoſe weapons which were ſoon pointed againſt the Roman church. He had been the friend of the moſt eminent ſcholars of the age: he became their patron; and ſuch was the humility of his manners, that the change was ſcarcely diſcernible either to them or to himſelf. If he preſſed the acceptance of a liberal gift, it was not as the meaſure of deſert, but as the proof of benevolence: and when modeſt merit declined his bounty, "accept it," he would ſay, with a conſciouſneſs of his own worth, "you will not always have a Nicholas among you." The influence of the holy ſee pervaded Chriſtendom; and he exerted that influence in the ſearch, not of benefices, but of books. From the ruins of the Byzantine libraries; from the darkeſt monaſteries of Germany and Britain, he collected the duſty manuſcripts of the writers of antiquity; and wherever the original could not be removed, a faithful copy was tranſcribed, and tranſmitted for uſe. The Vatican, the old repoſitory for bulls and legends, for ſuperſtition and forgery, was daily repleniſhed with more precious furniture; and ſuch was the induſtry of Nicholas, that in a reign of eight years he formed a library of 5000 volumes. To his munificence the Latin world was indebted for the verſions of Xenophon, Diodorus, Polybius, Thucydides, Herodotus, and Appian; of Strabo's Geography; of the Iliad; of the moſt valuable works of Plato and Ariſtotle; of Ptolemy and Theophraſtus, and of the fathers of the Greek church. The authorities of the foregoing articles of the popes Nicholas are Gibbon; Bower's Hiſt. of the Popes; and Moreri.

Nicholas, Eymericus, a famous Spaniſh inquiſitor, was born at Girone, in Catalonia, about the year 1320. He embraced the monaſtic life in the order of St. Dominic, and, after diſtinguiſhing himſelf as a preaching friar, was made inquiſitor-general of the kingdom of Arragon in the year 1356, by pope Innocent VI. In the year 1371 he came to Avignon, and was created his chaplain and judge of hereſies by pope Gregory XI. He died at Girone in 1393, having held the poſt of inquiſitor-general during nearly forty-four years, and when he was about eighty years of age. He was author of an extraordinary work, entitled "Directorium Inquiſitorum," divided into three parts. The *firſt* part treats concerning articles of faith: the

the *ſecond* reſpecting the puniſhment of heretics: of thoſe who are ſubject to the juriſdiction of the Inquiſition, and of ſuch crimes as are beyond its cognizance: the *third* part deſcribes the manner of carrying on the proceſſes before the tribunals of the holy office. It was firſt printed in the year 1503, at Barcelona, and afterwards at Rome in 1578, with the corrections and commentaries of Francis de Penna, ſince which time it has gone through ſeveral editions. Limborch made much uſe of it in writing his "Hiſtory of the Inquiſition," and it juſtifies that author in the darkeſt ſhades which he has given of that horrid tribunal, which, fortunately for mankind, is now for ever aboliſhed from the face of the earth.

NICHOLAS, in *Geography*, a county of Kentucky, containing 2863 inhabitants.

NICHOLAS, *Cape St.*, the N.W. extremity of the iſland of St. Domingo, in the Weſt Indies, W. of the town of its name, more commonly called "The Mole."

NICHOLAS, *Port St.*, lies on the coaſt of Peru, ſix leagues S.S.E. of Port Cavallo.

NICHOLAS *Iſland*, a ſmall iſland on the N. coaſt of the iſland of Cuba. N. lat. 23° 15′. W. long. 79° 40′.

NICHOLAS *Point*, a cape on the N. coaſt of the iſland of Java. S. lat. 5° 51′. E. long. 105° 54′.

NICHOLASVILLE, the county town of Nicholas county, in Kentucky; 12 miles S.E. of Lexington. It has a court-houſe, and a few dwelling houſes.

NICHOLS, FRANK, in *Biography*, a phyſician and anatomiſt of eminence, was born in London in the year 1699, where his father was a barriſter. After receiving the rudiments of his education at a private ſchool in the country, he was ſent to Weſtminſter, and thence to Oxford, where he was admitted a commoner of Exeter college in 1714. He applied himſelf to the uſual academical exerciſes with great aſſiduity, and chooſing medicine for his profeſſion, commenced a courſe of diſſections, which he purſued with much diligence and perſeverance, ſo as to render himſelf perfectly maſter of this branch of his art. Hence he was choſen reader of anatomy in the univerſity, where he uſed his utmoſt endeavours to introduce a zeal for this neglected ſtudy, and obtained a high and well merited reputation. His reſidence at Oxford, however, was only temporary; for at the cloſe of his courſe he returned to London, where he had determined to ſettle, after having made a ſhort trial of practice in Cornwall, and a ſubſequent viſit to the principal ſchools of France and Italy. On his return to England, he reſumed his anatomical and phyſiological lectures in London, and they were frequented, not only by ſtudents from both the univerſities, but by many ſurgeons, apothecaries, and others. His reputation rapidly extended, and in the year 1728 he was elected a fellow of the Royal Society, to which he communicated ſeveral papers, which were publiſhed in the Philoſophical Tranſactions, eſpecially ſome obſervations on the nature of aneuriſms, in which he controverted the opinion of Dr. Freind; and a deſcription of a ſingular diſeaſe, in which the pulmonary vein was coughed up. In the year 1729, he received the degree of M.D. at Oxford, and became a fellow of the College of Phyſicians in 1732. In 1734 he was appointed to read the Gulſtonian lectures at the college, and choſe the ſtructure of the heart and the circulation of the blood for his ſubjects. At the requeſt of the preſident, Dr. Nichols again read the Gulſtonian lectures in 1736, chooſing for his topics the urinary organs, and the nature and treatment of calculous diſeaſes; and in 1739, he delivered the anniverſary Harveian oration. In 1743, he married one of the daughters of the celebrated Dr. Mead.

Dr. Nichols was appointed lecturer on ſurgery to the College in 1748, and began his courſe with a learned and elegant diſſertation on the "Anima Medica," which was publiſhed as a ſeparate work in 1750. While he was proceeding with his courſe, however, he received what he conſidered an inſult from the College, who choſe a junior fellow as an elect, on the death of Dr. Coningham, in preference to him, without any apparent reaſon; and he indignantly reſigned his lectureſhip, never afterwards attending the meetings of the fellows, except when matters of the utmoſt importance were in agitation. In 1751 he took ſome revenge in an anonymous pamphlet, entitled "The Petition of the unborn Babes to the Cenſors of the Royal College of Phyſicians in London," in which Dr. Neſbitt, Dr. Maule, Dr. Barrowby principally, and ſir William Browne, ſir Edward Hulſe, and the Scots, were the objects of his ſatire.

On the death of ſir Hans Sloane, in 1753, Dr. Nichols was appointed his ſucceſſor as one of the king's phyſicians; an office which he held till the death of his majeſty in 1760. An offer of a penſion was made to him, if he would have aſked for it, but he rejected it with diſdain. In 1772 he publiſhed a ſecond edition of his treatiſe "De Animâ Medicâ," to which was ſubjoined a diſſertation "De Motu Cordis et Sanguinis in Homine nato et non nato," inſcribed to his learned friend and coadjutor the late Dr. Lawrence.

Weary at length with his profeſſion, and with a reſidence in London, and alſo wiſhing to ſuperintend the education of his ſon at Oxford, he removed to that city, where he had ſpent ſome of the moſt agreeable years of his youth. But when the ſtudy of the law recalled his ſon to London, the doctor took a houſe at Epſom, where he paſſed the remainder of his life in a literary retirement, varying his recreations by an attention to the recent botanical reſearches of Linnæus, and by ſome agricultural inquiries. His conſtitution had never been robuſt; he was conſtantly ſubject to ſevere catarrhal affections, and an aſthmatic cough, which, returning with great violence in January 1778, deprived the world of this valuable man, in the eightieth year of his age. Gent. Mag. for 1778. Hutchinſon, Biograph. Med.

NICHOMACHUS, one of the ſeven Greek writers on muſic that have been preſerved, and collected and publiſhed by Meibomius, who ſuppoſes him to have flouriſhed in the time of Auguſtus. He is the only Greek theoriſt of the Pythagorean ſect whoſe writings are come down to us. He was cloſely followed by Boethius, as may be ſeen in his fifth chapter De Muſica. The treatiſe of Nichomachus is called a Manual, and divided into two books. In the firſt he treats of the elements of harmony (by which the ancients meant melody, or muſical intervals fit for ſong or melody); of the two kinds of human voice, that of ſpeech, and that of ſong; of the muſic of the ſpheres, or harmonical proportions in the diſtances, magnitude, and motion of the heavenly bodies; of the expreſſion of ſounds by the ratio of numbers; of the ſeven ſtrings of the ancient lyre, to which Pythagoras added an eighth, or the octave; how the ratio of arithmetical ſounds was invented; of the diapaſon, or octave, in the diatonic genus; of the diviſion of the ſcale by Timæus Philolaus; of the biſdiapaſon, or double octave in the diatonic genus; and of the progreſſion and diviſion of ſounds in the three genera. The ſecond book contains a ſketch of the hiſtory of muſical inventions, of the lyre by Mercury, of Orpheus, Linus, and Terpander, &c. names and ratios of muſical ſounds in the three genera.

NICHOUAN, in *Geography*, a town of Perſia, in the province of Irak; 20 miles E.N.E. of Conſar.

NICIAS, in *Biography*, an Athenian of conſiderable

note, was the ſon of Niceratus, and inherited very large property, of which a great part conſiſted in the ſilver mines at Laurium. By the influence of his wealth he attained to conſequence in the ſtate, even during the life of Pericles; and after the death of that great man, he became one of the heads of the Athenian government. In the Peloponneſian war he had the command againſt the Lacedæmonians at Sphacteria; and being upbraided by Cleon for want of ſucceſs, he propoſed to that demagogue to take his place. He conſented, and though he was wholly ignorant of military affairs, he made up in zeal and energy what he was deficient in with regard to experience, and completely effected the purpoſe which he had propoſed. In 423 B.C. Nicias commanded in an expedition for the reduction of the iſland Cythera, in which he was ſucceſsful, but though he gained much reputation by the tranſactions in which he engaged, yet he was perpetually endeavouring to reſtore peace, which, after the death of Cleon and Braſidas in battle, he performed, and a treaty, for a term of fifty years, between the Athenians and Lacedæmonians, with a league offenſive and defenſive, was ſigned B.C. 421. Alcibiades was now riſing into public eſtimation, and ſeemingly bent upon embroiling the affairs of Greece, in order to give himſelf ſcope for action. General tranquillity had not been reſtored by the peace of Nicias; a renewal of the Peloponneſian war followed, and the people of Athens determined to ſend a powerful force into Sicily, in order to aſſiſt the Egeſtines in their war with the Syracuſans. Nicias, notwithſtanding his oppoſition to this raſh meaſure, was appointed one of the generals, in conjunction with Alcibiades and Larnachus; and the expedition ſet ſail in the year 415 B.C. The Athenian troops landed in Sicily, and poſſeſſed themſelves of ſeveral towns, and Alcibiades being recalled, Nicias and Larnachus took a ſtrong poſt in the neighbourhood of Syracuſe. The ſiege of that city commenced in the next campaign, and Nicias, after ſome ſucceſsful actions, drew a line of circumvallation quite round it. The proſpect of ſucceſs, which, for a moment, ſeemed to open upon him, was clouded by the arrival of freſh ſupplies, and large reinforcements from Corinth. Larnachus being ſlain, two new generals, Eurymedon and Demoſthenes, were appointed, and the former was ſent from Athens with a ſupply of money, and an aſſurance to Nicias of a ſpeedy ſuccour. (See SYRACUSE.) Nicias conſtantly recommended cautious meaſures, and when Demoſthenes, who arrived with a large reinforcement, propoſed an immediate aſſault upon the city, he argued ſtrongly againſt ſuch a hazard. He was, however, out-voted in the council of war, and the attempt was made, which was defeated, to the great loſs of the Athenians. Demoſthenes was ſo much diſheartened by the reſult, that he adviſed inſtantly raiſing the ſiege, and returning to Athens. But Nicias declared, that he would rather die before the place than abandon an enterpriſe which might ſtill ſucceed, and expoſe himſelf to an ignominious condemnation from his countrymen. The aſpect of affairs ſoon became ſtill more gloomy; the Syracuſans received powerful ſuccours, and, what was much more alarming, a peſtilential diſeaſe broke out in the Athenian camp, which daily thinned their numbers. Nicias now thought ſeriouſly of retreating, and every thing was prepared for embarkation. As the Syracuſans had no ſuſpicions of this deſign, it might have been eaſily effected, when, juſt at the moment, an eclipſe of the moon took place. The ſuperſtition of Nicias was alarmed, and he refuſed to go on board the veſſel till he had conſulted the ſoothſayers. Theſe, willing to appear wiſe, directed that the departure ſhould be delayed thrice nine days, and thus the only opportunity of eſcape was loſt. The enemy attacked the Athenians by ſea and land; deſtroyed a number of their ſhips, and the reſidue were cloſely blocked up there; and nothing was left them but to make the beſt retreat they were able to ſome friendly Sicilian ſtate. "By falſe intelligence," ſays the hiſtorian, "Nicias was prevented from commencing his march when it might have been ſafe; and when want of proviſions at length compelled him to leave his camp, the paſſes were already blocked up. There could not be a ſcene of deeper diſtreſs than at the moment when the army commenced its march, abandoning, not only all its baggage, but the ſick and wounded, who clung round their comrades, and appealed to the gods and men againſt the cruelty of leaving them to a mercileſs foe. Nicias himſelf was the moſt melancholy figure in the group; worn down by diſeaſe and anxiety, pale and ſqualid, he ſeemed to centre in himſelf the afflictions of the whole. His mind, however, was entire, he bore up againſt deſpondency, and he exerted every effort to inſpire courage in his men, and to make them preſerve that order which alone could enſure to them ſafety. As they proceeded, they were continually haraſſed by the cavalry and light troops of the enemy, and expoſed to the want of every neceſſary. Many were cut off, and at length Demoſthenes with the whole rear-guard was forced to ſurrender. Nicias with the van arrived exhauſted at the river Aſinarus, and while they were croſſing it, and quenching their extreme thirſt, the Syracuſan cavalry riding among them made great ſlaughter, without meeting with the ſlighteſt reſiſtance." The greater part was killed, Nicias and a ſmall body ſurrendered, upon condition that the ſlaughter ſhould ceaſe. The Syracuſans, after a day of triumph, aſſembled to determine the fate of their captives, and they reſolved to put the generals, at leaſt, to death. Nicias and Demoſthenes, being informed of the determination, prevented it by a voluntary termination of their lives. This terrible diſaſter happened in the year 413 B.C. Nicias appears to have been a man of virtue, and a ſincere lover of his country; he was religious to the borders of ſuperſtition, and perpetually conſulted diviners on his own affairs, and thoſe of the ſtate. His manners were mild, and his principles were humane and pacific. Univer. Hiſt.

NICKAJACK, in *Geography*, an Indian town on the S.E. ſide of Tenneſſee river, at the point of a large bend, about 36 miles N.E. of the Creeks' croſſing places.

NICKEL, in *Chemiſtry*, a ſimple ſubſtance, and a metal of a white colour. When obtained perfectly pure it is malleable. Its luſtre is agreeable, and at ſome period it may become of importance in the arts, and in domeſtic economy.

Aſſay and Analyſis of Nickel.—This metal is generally obtained from a mineral of a reddiſh-brown colour, frequently ſpotted with green, found plentifully in different parts of Germany. This ore was formerly thought to be copper ore, from its green ſpots, but in conſequence of its affording no copper, it obtained the name of *kupfer nickel*, which means falſe copper. This mineral chiefly conſiſts of nickel and ſulphur, but contains more or leſs of arſenic, cobalt, and iron. The firſt experiments to aſcertain the nature of this mineral were by Cronſtedt in 1751, who was of opinion that he had obtained a peculiar metal from it, to which he gave the name of nickel. What he procured, however, was not pure nickel, in conſequence of which the authority of this chemiſt was doubted by Sage and Monnet. This point was at laſt finally ſettled by Bergman, who proved it to be a new metal. The experiments were publiſhed in 1775. The purification of this metal has been ſince carried to a greater extent by different chemiſts. The following is the moſt approved proceſs for obtaining the oxyd of this metal in a ſtate of purity, from which the metal is afterwards eaſily obtained.

After

After the ore above-mentioned has been roaſted with charcoal, which may probably expel ſome of the arſenic, it muſt be reduced to a fine powder, and treated with nitric acid. The remaining ſulphur will be ſeparated, or, with the arſenic, converted into ſulphuric and arſenic acids. If to a ſolution nitrat of lead be added, theſe acids will be precipitated by the lead in the ſtate of ſulphat and arſeniat of lead. If too much nitrat of lead be added, the lead may be precipitated by adding ſmall portions of ſulphuric or rather ſulphat of ſoda, till no more precipitates take place. The ſolution now contains nickel, iron, and perhaps cobalt and copper. The copper may be ſeparated by a clean bar of iron. The ſolution muſt now be treated with carbonat of potaſh, by which the three oxyds will be precipitated together. Theſe being waſhed, the nickel and cobalt may be diſſolved in pure ammonia, while the oxyd of iron will be left behind. This ammoniacal ſolution is next heated, till the ammonia is driven off, which is known by its ceaſing to tinge turmeric paper brown. If to theſe oxyds pure potaſh be added, the oxyd of cobalt will be diſſolved, while that of nickel will be left in a ſtate of purity. The oxyd of nickel is now to be made into a paſte with oil or fat, and introduced into a crucible, with ſome black flux. The crucible ſhould be lined with charcoal, and provided with a cloſe cover; the whole muſt be heated ſtrongly in a ſmith's forge for more than an hour. On cooling a button of pure nickel will be found.

This metal, as has been remarked, is of an agreeable white colour, poſſeſſing conſiderable hardneſs and luſtre. Its ſpecific gravity is about 8.3, which increaſes with hammering. It is ſaid to be capable of being hammered into ſheets not thinner than $\frac{1}{100}$dth of an inch. It is now generally believed to be magnetic, like iron. It does not fuſe at a temperature leſs than 160° of Wedgewood. It poſſeſſes the valuable property of not being changed by expoſure to the air, nor by immerſion in water, at the common temperature. When, however, it is expoſed to a tolerable heat, it becomes tarniſhed, and ultimately covered with oxyd. A much ſtronger heat ſets this oxygen free, as is the caſe with the noble metals.

The oxyds of nickel at preſent known are two, namely, the grey and the black. Chemiſts are at preſent divided in opinion whether the green oxyd be the firſt or ſecond oxyd. Dalton ſeems to be uncertain as to this point, the atom of oxygen being 7. And ſince the analyſis of Richter gives 78 of metal to 22 of oxygen, we ſhall have, conſidering the grey oxyd the firſt oxyd, $\frac{x}{7} = \frac{78}{22}$, and $x = \frac{78 \times 7}{22}$, $= 24.81$, the weight of the atom of nickel. If it be conſidered as the ſecond oxyd, then $\frac{x}{14} = \frac{78}{22}$, and $x = 49.62$, the weight of the atom of nickel. Theſe numbers are ſo near 25 and 50, that Dalton has given with doubt 25 or 50 for the atom of nickel. Sir Humphrey Davy thinks the grey oxyd the ſecond oxyd, from the number he gives for nickel agreeing alſo with the ſulphuret. We have, therefore, good ground for ſtating the weight of an atom of nickel at 50. From theſe data the firſt oxyd will conſiſt of 50 to 7, or in the 100, there is 87.7 nickel, and 12.3 oxygen. The ſecond, 50 to 14, or 100 will give 78.1 nickel, and 21.9 oxygen. The third, or black oxyd, will be 50 nickel to 21 oxygen, or in 100, there will be 70 of nickel, and 30 of oxygen.

The ſecond oxyd is obtained by diſſolving nickel in nitric acid, and precipitating the oxyd by means of potaſh. This precipitate is not the pure oxyd, but an hydrated oxyd, containing, according to ſir Humphrey Davy, $\frac{1}{4}$th its weight of water. When this hydrat is heated to ignition, the water is ſeparated, leaving the grey oxyd. When the oxymuriatic acid gas is paſſed through water mixed with the latter oxyd, it becomes converted into the black oxyd.

Nickel combines with ſulphur. We are indebted to Mr. E. Davy for the proportions of its combination with ſulphur, which he ſtates at 34 ſulphur to 66 nickel. This ſulphuret muſt be conſidered as 2 atoms of ſulphur, 2 × 13 to 1, of nickel, 50, for $\frac{50 + 26}{26} = \frac{100}{34.2}$, or 34.2 oxygen to 65.8 nickel. This very ſtrongly confirms the truth of the number 50 for the weight of the atom of this metal. From the ſame authority there appears to be another ſulphuret, formed by heating the grey oxyd with ſulphur, conſiſting of 56.5 nickel, and 43.5 oxygen. This will be 3 × 13 to 50, which gives 43.8 ſulphur, and 56.2 nickel. Nothing can be more ſatisfactory than this almoſt exact agreement between theory and practice. The firſt ſulphuret will be 13 to 50, or in 100, 20.6 ſulphur, and 79.4 nickel. According to the authority of Thenard, phoſphorus combines with nickel in the proportions of 17 phoſphorus to 83 of nickel. Theory would give the firſt phoſphuret 50 to 9, or *per cent.* 15.3 phoſphorus, and 84.7 nickel. The ſecond ſulphuret will be 50 to 2 × 9, or *per cent.* 73.5 nickel, and 26.5 phoſphorus. The combination of nickel with hydrogen, nitrogen, carbon, and the baſe of the boracic acid, is not known. It forms alloys with ſome of the metals, but theſe compounds have been little examined. Since nickel is a malleable metal, and difficult of fuſion, ſome fuſible alloy with it might be of importance. Its alloy with gold was tried by Mr. Hatchett in the proportions of 11 gold to 1 of nickel, which was brittle, and of the colour of braſs. Sir H. Davy ſpeaks highly of its alloy with iron: its colour approaches ſilver as the nickel prevails, while the malleability of the iron is not impaired. It is alſo leſs liable to ruſt than iron. The ſame author obſerves that iron in meteoric ſtones is alloyed with nickel from 1.5 to 17 *per cent.* of the latter.

Salts of Nickel, or the Combination of its Oxyds with Acids.—The few facts of which we are in poſſeſſion of combinations of this ſubſtance with acids, are not ſtrictly to be relied upon, from the circumſtance of the experiments being made upon impure nickel.

Sulphat of Nickel.—Sulphuric acid has little action upon nickel, but it diſſolves its oxyd, forming a ſalt, the ſolution of which is of a beautiful green colour. By evaporation it affords priſmatic cryſtals, which afterwards effloreſce and become opaque. The compoſition of this ſalt has not been aſcertained, but it may be inferred with ſome hope of truth, from the near coincidence of the other compounds of nickel with theory. The oxyd which unites with the acid is doubtleſs the grey; hence 34 + 50 + 14 will conſtitute the ſalt, or 34 acid to 64 oxyd. This will give *per cent.* 34.7 acid, and 65.3 of baſe.

Nitrat of Nickel.—Nitric acid oxydates and diſſolves nickel. The ſolution is of a green colour, and affords rhomboidal cryſtals. This ſalt is firſt deliqueſcent, and afterwards falls to powder, by loſing its acid, the atom of nitric acid being 19; and ſince the ſoluble nitrats moſtly contain two atoms of acid, it will be conſtituted by 2 × 19 acid to 64 of oxyd.

Muriat of Nickel.—The muriatic acid acts feebly upon nickel. With the aid of nitric acid, however, it becomes oxydated, and the muriatic acid diſſolves it, forming a green ſolution, which at firſt cryſtalliſes in the form of rhomboidal priſms. Theſe are ſoon acted upon by the air, and ulti-

mately loſe the acid, like the nitrat, the atom of muriatic acid being 22. This ſalt will conſiſt of 22 acid, and 64 of baſe.

Phoſphat of Nickel.—The phoſphoric acid takes up a very ſmall quantity of the oxyd of nickel, and hence is perhaps almoſt an inſoluble ſalt. Hence the beſt way of forming it will be by adding phoſphat of ſoda to nitrat of nickel. It will be formed by 23 of acid, and 64 baſe.

Fluat of Nickel.—This ſalt is ſoluble, and affords green cryſtals. It will conſiſt of 15 acid, and 64 baſe.

Borat of Nickel.—This ſalt is very little known. It may be formed by mixing borat of ſoda with nitrat of nickel.

Carbonat of Nickel.—This ſalt is mentioned by Bergman, who formed it by adding an alkaline carbonat to the nitrat of nickel. He found it to conſiſt of 56.4 acid and water, and 43.6 of baſe.

Acetat of Nickel.—Oxyd of nickel diſſolves in acetic acid, forming a ſoluble ſalt, which cryſtalliſes in a rhomboidal form, and of a green colour.

Oxalat of Nickel.—The oxalic acid ſlightly attacks nickel, with which it forms a green powder, from the ſalt being inſoluble. It ſhould be formed by adding oxalat of ſoda to a nitrat of nickel. The ſalt falls down in the form of green powder.

Tartrat of Nickel has not been examined.

Arſeniat of Nickel.—This is a ſoluble ſalt, but little known.

Molybdat of Nickel.—This ſalt is in the form of white powder, and probably inſoluble.

Sulphat of Nickel and Potaſh.—This is a triple ſalt, diſcovered by Prouſt. It is formed by adding potaſh to the ſulphat of nickel. By evaporation it eaſily cryſtalliſes in the form of priſms of a beautiful green colour. It has a ſweetiſh taſte.

Sulphat of Nickel and Ammonia.—Uſing ammonia as the potaſh is uſed in the laſt ſalt, forms a triple ſalt of a green colour, affording flat priſmatic cryſtals.

Sulphat of Nickel and Iron.—This ſalt is formed by adding nitrat of nickel to ſulphat of iron, or by diſſolving the two oxyds in ſulphuric acid. It affords green cryſtals, which are efflorеſcent.

A triple ſalt is alſo formed by adding an exceſs of ammonia to nitrat of nickel, conſiſting of nitric acid united with oxyd of nickel and ammonia. It affords green coloured cryſtals. This ſalt has the peculiar property of being decompoſed by the alkalies, at leaſt the oxyd is not precipitated. This property is of ſome importance for ſeparating nickel from other metals. The metal is, however, precipitated by the hydro-ſulphurets. For the principles on which the numbers repreſenting the relative weights of the atoms of bodies are calculated, ſee PROPORTION *of Chemical Compounds*.

NICKELHAJEN, in *Geography*, a town of Pruſſia, in the province of Oberland; 9 miles S.E. of Salfeldt.

NICKELSDORF, a town of Pruſſia, in the palatinate of Culm; 12 miles N. of Straſburg.

NICKELSTADT, a town of Sileſia, in the principality of Liegnitz; 5 miles S.S.E. of Liegnitz.

NICKER TREE, in *Botany*. See GUILANDINA.

NICKIOBING, in *Geography*, a town of North Jutland, ſituated on the E. coaſt of the iſland of Mors, with a good harbour in the Lymford gulf; 38 miles W.N.W. of Wiborg. N. lat 56° 54'. E. long. 8° 52'.

NICLOWITA, a town of Moravia, in the circle of Znaym; 10 miles N. of Znaym.

NICOBARS, or NANCAVERIS, a group of three iſlands in the Eaſtern ſea, ſituated between 8° and 9° N. lat. to the northernmoſt point of the iſland of Sumatra. The poſition of three of theſe iſlands forms one of the ſafeſt harbours in India, where ſhips of all ſizes may ride with the greateſt ſecurity, ſheltered from all winds, about half a mile from ſhore; with the additional advantage of two entrances, that may ſerve for getting in and out, both with a N.E. and S.W. monſoon, having a clear deep channel on each ſide. The largeſt of theſe iſlands, called Nancaveri or Nancoury, is about five or ſix leagues in circumference, and better inhabited than either of the other two. The ſecond is called Sowry or Chowry, and the other Tricút, all cloſely ſituated, and about 10 leagues to the N.E. of them is another called Catchoul. Almoſt the whole of theſe iſlands is uncultivated; though there are many large valleys that might be rendered very fruitful, with little trouble, the ſoil being naturally fertile, where the cocoa-nut and all other tropical fruits come ſpontaneouſly to the higheſt perfection, together with yams and ſweet potatoes, for obtaining which it is only neceſſary to ſcratch the earth ſuperficially, and the ſeeds ſo planted come forth in a few days. Tricút, which is the flatteſt of theſe iſlands, is divided among the inhabitants of the other two, where they have their plantations of cocoa-nut and areca trees; theſe laſt being very abundant all over the iſlands. The ſurrounding ſea abounds with exquiſite fiſh, ſhell-fiſh, as cockles and turtles; and a moſt ſplendid diſplay of beautiful ſhells of the rareſt ſort is to be met with on the ſhore. The birds' neſts, ſo much eſteemed in China, are to be found among the rocks; ambergris is found here, and the inhabitants have acquired the art of adulterating it; but the method of diſcovering whether it be adulterated with any heterogeneous ſubſtance, ſuch as wax or reſin, is to place a ſmall bit of it upon the point of a hot knife; and if it evaporates, without leaving any calx, and diffuſes a ſtrong fragrant ſmell, it is certainly genuine.

The inhabitants of theſe iſlands are of a copper colour, with ſmall oblique eyes, with ſmall flat noſes, large mouths, thick lips, and black teeth; well proportioned in their bodies, rather ſhort than tall, with large ears, in the lobes of which are large holes: they have black ſtrong hair, which they cut round; the men have little or no beard; the hinder part of their head is much flatter than ours; they never cut their nails, but they ſhave their eyebrows. A long narrow cloth, made of the bark of a tree, round their waiſt and between their thighs, with one extremity hanging behind, which has led ſome ignorant perſons to report that they had tails, and to miſlead even Linnæus, is their only dreſs. The women reſemble the men in colour and dreſs, but are of ſmaller ſtature. Both ſexes are very fond of dreſs, whenever they can obtain it. They live in huts made of cocoa-nut leaves ſupported on bamboos, about five or ſix feet high from the ground; they enter theſe by a ladder, and the floor is made partly of planks and partly of ſplit bamboos. Six or eight people generally occupy one hut, and ſkulls of wild boars form the moſt valuable articles of furniture. The occupation of the men conſiſts in building and repairing their huts, and alſo in fiſhing and trading to the neighbouring iſlands. The women are employed in preparing the victuals and cultivating the ground; they alſo paddle in the canoes, when the men go out. They unite in matrimony through choice; but if the man is diſſatisfied with his wife, from any cauſe whatſoever, he may diſcharge her, and then each may unite with another perſon. Adultery is accounted highly ignominious; and in ſome caſes puniſhable not only with a diſgraceful diſmiſſion, but even with death: although by the intervention of a ſmall token given publicly, and conſiſting of nothing more than a leaf of tobacco. The reciprocal lending of their wives of the ſame caſt is very common. A woman that has three children is reckoned very fruitful; few bear more than four. Few perſons in

theſe

theſe iſlands, particularly among the males, live to be more than 40 or 48 years. Their indolency is not equalled by any other people of the eaſt. Of thoſe who can read and write they have the higheſt opinion; the Europeans, poſſeſſing theſe qualifications, can perform acts more than human; and they conceive, that the power of divination, of controuling the winds and ſtorms, and of directing the appearance of the planets, is at our command. The dead are buried cloſe by their huts, in their beſt dreſs and with plenty of food, and with much previous lamentation on the part of ſurvivors. The different changes of the moon are productive of great feſtivity among the Nicobarians. In chronological computations, they reckon only by moons, of which they number 14, ſeven to each monſoon. At the fair ſeaſon, or beginning of the N.E. monſoon, they ſail in large canoes to the "Car Nicobars," called by them "Champaloon." The object of this voyage is trade; and for cloth, ſilver coin, iron, tobacco, and ſome other articles, which they obtain from Europeans, together with fowls, hogs, cocoa and areca nuts, the produce of their own iſland, they receive in exchange canoes, ſpears, ambergris, birds' neſts, tortoiſe ſhells, &c. Ten or twelve huts form a village. The number of inhabitants on any one of theſe iſlands does not exceed 7 or 800. Every village has its "head-man," or captain, who is generally the oldeſt. The only quadrupeds on theſe iſlands are hogs and dogs. Among the feathered tribe pigeons are abundant from June to September, on account of a berry which is then ripe, and of which they are very fond; pheaſants and turtle doves are alſo then found; but the conſtant inhabitants of the woods are a ſpecies of the green parrot, or parroquet, with a black tail and collar. The limate might, with little trouble in cultivation and clearing the woods, be rendered very ſalubrious. The whole of their muſic conſiſts of few notes: their dance is dull and inanimate; the baſis of their language is the Malay, but they have no expreſſion for any number beyond 40. They have trees in their woods of great height and ſize, and of a compact texture, which might ſerve for naval purpoſes; but the cocoa and areca nut trees are thoſe which they moſt value. The former ſerve for their own nouriſhment and that of their hogs, and is alſo an object of trade. The ſhips that are bound to Pegu from either of the coaſts of India touch at the Nicobar iſlands, and purchaſe a cargo of cocoa-nuts at the rate of four for a tobacco leaf, and 100 for a yard of blue cloth, and a bottle of cocoa-nut oil for four leaves of tobacco. The tropical fruits grown in theſe iſlands are exquiſitely flavoured, and particularly the pine-apple: the wild cinnamon and ſaſſafras grow here. The tree called by the natives "Larum," and by the Portugueſe "Mellori," is very abundant, and produces an excellent bread-fruit, different from the kind found in the interior parts of Africa, and alſo from that of Otaheite. This tree is a ſpecies of the *Pandanus* of botaniſts. Aſiatic Reſ. vol. iii.

NICOCOR, a town of Africa, in the kingdom of Cayor, near the ſea; 40 miles N.W. of Amboul.

NICOL, in *Natural Hiſtory*, a word uſed by the miners in Germany to expreſs a greeniſh cruſt, covering ſeveral of the ſpecies of marcaſites and cobalt; it emits fumes that ſmell of garlic in the calcination, and is very injurious to the workmen, cauſing contractions of their limbs, and other diſorders. It is ſometimes found in maſſes alone, but that more rarely.

NICOLAI CATHOLICON. See CATHOLICON.

NICOLAITANS, or NICOLAITES, in *Eccleſiaſtical Hiſtory*, one of the moſt ancient ſects in the Chriſtian church; thus denominated from Nicolas, a perſon ordained a deacon of the church of Jeruſalem, together with St. Stephen.

The diſtinguiſhing tenet of the Nicolaitans, as repreſented by eccleſiaſtical hiſtorians, is, that all married women ſhould be common; to take away all occaſion of jealouſy.

Other authors tax Nicolas with other impurities; but Clemens Alexandrinus imputes them all to his diſciples, who, he ſays, abuſed their maſter's words.

In the charge urged againſt the Nicolaitans (Rev. ii. 6, 14, 15.) they are not reproached with erroneous opinions concerning the Deity, but with the licentiouſneſs of their practice, and the contempt of that ſolemn law, which the apoſtles had enacted, (Acts, xv. 29.) againſt fornication, and the uſe of meats offered to idols. It is, however, certain, that the writers of the ſecond and the following centuries, Irenæus, Tertullian, Clemens, and others, affirm, that the Nicolaitans adopted the ſentiments of the Gnoſtics, concerning the two principles of all things, the æons, and the origin of this terreſtrial globe. The authority of theſe writers, ſays Moſheim, would be entirely ſatisfactory in this matter, were there not ſome reaſon to imagine, that they confounded, in their narrations, two ſects very different from each other, *viz.* that of the Nicolaitans, mentioned in the Revelations; and another, founded by a perſon named Nicolaus, in the ſecond century, upon the principles of the Gnoſtics.

Cocceius, Hoffman, Vitringa, and Maius, take the name Nicolaitan to be coined, to ſignify a man addicted to pleaſure and debauchery; adding, that it has nothing to do with Nicolas, one of the ſeven deacons. This Nicolas was condemned by Hippolytus and Epiphanius; whilſt Ignatius, Clement, Euſebius, and Theodoret, though they condemned the hereſy of the Nicolaitans, ſay that Nicolas was not ſuch an one. Hippolytus, in his book againſt hereſies, includes that of the Nicolaitans.

NICOLAS, *Argonauts of St.* See ARGONAUTS.

NICOLAS, in *Geography*, a ſmall iſland near the N. coaſt of Cuba. N. lat. 23° 15′. W. long. 79° 40′.

NICOLAU, or NIKOLOWICE, a town of Sileſia, in the principality of Ratibor; 27 miles E. of Ratibor.

NICOLAUS, DAMASCENUS, in *Biography*, a philoſopher and hiſtorian, was in great eſteem in the age of Auguſtus, by whom, as well as by king Herod, he was admitted to intimate friendſhip. He was born at Damaſcus, of the Peripatetic ſect, and was very extenſively learned. Many of his writings are referred to by Suidas and others, of which only ſome fragments are come down to our times. A Hiſtory of Aſſyria, of his compoſition, is quoted, which is ſaid to have been part of an Univerſal Hiſtory, in many books, referred to by Joſephus, Suidas, and Athenæus. Some paſſages of this are cited by Joſephus, who impeaches the author's veracity with reſpect to the account of Herod, written during the life of that prince. Strabo quotes from him certain matters relative to India. Henry de Valois publiſhed at Paris, in 1634, in Greek and Latin, the collections from different works of this author made by Conſtantine Porphyrogenitus, and brought from the iſle of Cyprus by Peireſc. Moreri.

NICOLAYKEN, or ST. NICHOLAS, in *Geography*, a town of Pruſſia, in the province of Natangen; 68 miles S.S.E. of Königſberg. N. lat. 53° 38′. E. long. 21° 43′.

NICOLE, FRANCIS, in *Biography*, a very celebrated French mathematician, who flouriſhed in the eighteenth century, was born at Paris in the year 1683. He early diſcovered a ſtrong attachment to mathematical ſtudies, and being bleſſed with an able inſtructor, he made a moſt ſucceſsful progreſs, and became intimately converſant with the higher branches of geometry. He was firſt brought into notice by detecting the fallacy of a pretended quadrature of the circle.

circle. The author of this quadrature was ſo confident in the merit of his ſuppoſed diſcovery, that he depoſited 3000 livres in the hands of a public notary at Lyons, to be paid to any perſon who, in the judgment of the Academy of Sciences, ſhould demonſtrate his ſolution to be erroneous. Nicole undertook the taſk, and ſo effectually expoſed the author's errors, that the Academy awarded him the prize, without the ſmalleſt heſitation. The premium thus obtained he preſented to the Hôtel-Dieu of Lyons. In the year 1707, the Academy nominated him mechanician; in 1716, adjunct; in 1718, aſſociate; and in 1724, penſioner. He retained his penſion till his death in 1758, when he was about ſeventy-five years of age. Though a profound geometrician, he mixed with the beſt company, and was himſelf a lively and amiable companion. His works are numerous, and inſerted in the different volumes of the "Memoirs of the Academy of Sciences." They are all mathematical, and chiefly in the higher departments of learning: a liſt of them is given in the General Biography.

NICOLETE, in *Geography*, a town of Canada, on the S.E. bank of lake St. Pierre, at the mouth of the river Nicolete, which runs into this lake, N. lat. 46° 12′. W. long. 72° 30′.

NICOLINO GRIMALDI, *il Cavaliere*, in *Biography*, commonly known by the name of Nicolini. This great ſinger, and ſtill greater actor, arrived in England in the year 1708, which forms an era in the annals of our Lyric theatre; as he was the firſt vocal performer of the higheſt claſs from Italy that trod our ſtage, and gave us a taſte at once of fine ſinging and fine acting. He was a native of Naples; his voice was at firſt a *ſoprano*, but afterwards deſcended into a full and rich *contralto*. The firſt operas in which we have met with his name in Italy were "Tullo Oſtilio" and "Xerſe," two dramas compoſed by John Bononcini for Rome, in 1694, in which he performed with the celebrated Piſtocchi, the founder of the Bologna ſchool of ſinging. So that Quadrio has ranked him very properly among the great opera ſingers who began to appear between 1690 and 1700. In 1697 and 1698 we find him the principal ſinger in the Neapolitan operas; and in 1699 and 1700 again at Rome. From this period till his arrival in England, whither he was drawn, as Cibber informs us, chap. xi. p. 315, by the report of our paſſion for foreign operas, "without any particular invitation or engagement," he ſung at Venice, Milan, and other cities of Italy where the muſical drama was eſtabliſhed. Before his abilities as a ſinger are conſidered, let us remind the reader of ſir Richard Steele's eloge upon him, in the Tatler, N° 115, as an actor; where, after calling the opera (it was "Pyrrhus and Demetrius") "a noble entertainment," he adds, "for my own part I was fully ſatisfied with the ſight of an actor, who, by the grace and propriety of his action and geſture, does honour to the human figure. Every one will imagine I mean ſignior Nicolini, who ſets off the character he bears in an opera by his action, as much as he does the words of it by his voice. Every limb and every finger contributes to the part he acts, inſomuch that a deaf man may go along with him in the ſenſe of it. There is ſcarce a beautiful poſture in an old ſtatue which he does not plant himſelf in, as the different circumſtances of the ſtory give occaſion for it. He performs the moſt ordinary action in a manner ſuitable to the greatneſs of his character, and ſhews the prince even in the giving of a letter, or diſpatching of a meſſenger. Our beſt actors," continues he, "are ſomewhat at a loſs to ſupport themſelves with proper geſture, as they move from any conſiderable diſtance to the front of the ſtage; but I have ſeen the perſon, of whom I am now ſpeaking enter alone, at the remoteſt part of it, and advance from it with ſuch greatneſs of air and mien, as ſeemed to fill the ſtage, and at the ſame time commanded the attention of the audience with the majeſty of his appearance."

The opera prices were raiſed on the arrival of this performer, the firſt truly great ſinger who had ever ſung in our theatre, to 15*s*. for the boxes on the ſtage, half a guinea the pit and other boxes, and firſt gallery five ſhillings. Nicolini was a phenomenon that occupied the attention at this time of the whole nation; not only ſir Richard Steele has celebrated the majeſty of his appearance on the ſtage in the Tatler; but Mr. Addiſon, not in very good humour with operas ſo ſoon after the failure of his "Roſamond," celebrates the abilities of Nicolini as an actor in the Spectator, N° 13, after ſeveral humorous papers on the combat with the lion in the opera of "Hydaſpes," with very high and ſerious panegyric. "It gives me a juſt indignation," ſays he, "to ſee a perſon whoſe action gives new majeſty to kings, reſolution to heroes, and ſoftneſs to lovers, thus ſinking from the greatneſs of his behaviour, and degraded into the character of the London 'prentice. I have often wiſhed, that our tragedians would copy after this great maſter in action. Could they make the ſame uſe of their arms and legs, and inform their faces with as ſignificant looks and paſſions, how glorious would an Engliſh tragedy appear with that action, which is capable of giving a dignity to the forced thoughts, cold conceits, and unnatural expreſſions of an Italian opera." In 1712, when Nicolini appeared in the opera of "Antiochus" for the laſt time before his departure for Italy, as was imagined for ever, Mr. Addiſon, in the Spectator for June 14th, N° 405, ſays, "I am ſorry to find, by the opera bills for this day, that we are likely to loſe the greateſt performer in dramatic muſic that is now living, or that perhaps ever appeared upon a ſtage. I need not acquaint my readers that I am ſpeaking of ſignior Nicolini. The town is highly obliged to that excellent artiſt, for having ſhewn us the Italian muſic in its perfection, as well as for that generous approbation he lately gave to an opera of our own country, in which the compoſer endeavoured to do juſtice to the beauty of the words, by following that noble example, which has been ſet him by the greateſt foreign maſters in that art." This is all alluſive to the opera of "Calypſo," with the fifth performance of which the ſeaſon was cloſed, June 25th. Nicolini, however, returned to England, and in the year 1715 we find him performing in Handel's opera of "Rinaldo," and receiving his accuſtomed applauſe. And, according to the ideas which tradition gives us of the abilities of this performer, his part in "Rinaldo" muſt have drawn out all his powers both as a ſinger and actor. He continued here till the year 1717, when he returned to Italy for the laſt time; but continued in favour there as an actor, after his vocal powers were faded, and a new ſtyle of ſinging was eſtabliſhed; for in 1723 we ſtill find him at Rome with the Teſi, in Leo's "Timocrate."

NICOLO DEL ABATE, born at Modena in 1512, was the diſciple of Antonio Begarelli, a Modeneſe ſculptor, whoſe models Corregio is ſaid to have often made uſe of in his works. Little is known of his progreſs at Modena, except that in partnerſhip with his fellow ſcholar Alberto Fontana, he painted the pannels of the butcher's hall in that place; and at the age of thirty-five, for the church of the Benedictines, the celebrated picture of the Martyrdom of St. Peter and St. Paul, now in the gallery at Dreſden, with ſome freſco paintings drawn from Arioſto and Virgil, in the palace of Scandiano. Of his works at Bologna, tradition has left a very diſtinguiſhed account, though little or nothing exiſts of them now but the large ſymbolic picture in the

Via di St. Mamolo, which Malvaſia calls a hieroglyphic; a nativity of Chriſt, under the portico of the Leoni palace: and four converſation pieces and concertos, of exquiſite taſte and urbanity, in the frieze of an upper apartment in the Academical Inſtitute, which have been engraved.

Notwithſtanding the innate vigour, the genial facility, and independent ſtyle of Nicolo Abate, he owes the perpetuity of his name, in a great meaſure, to his technic coalition with Franceſco Primaticcio, and to the facility with which he executed the comprehenſive and luxuriant plans of that claſſic machiniſt: even his own name was ſunk in the title of that patron rather than partner of his labours, and he is called Nicolo del Abate, becauſe Primaticcio was abbot of St. Martin, near Troyes. He went to France at his call in 1552, and his was the principal hand which executed in freſcos of unparallelled vigour and glow the extenſive ſides and cielings of the galleries and apartments at Fontainbleau, from the deſigns of Primaticcio. The ſubjects were epic and mythologic: in the great gallery, the adventures of Ulyſſes, in 58 compartments, below; and the gods of Homer, in 15 of various dimenſions, above.

This magnificent work, to the eternal diſgrace of the barbarian of an architect who gave, and the Goth of a miniſter who liſtened to the advice, was dilapidated and levelled with the ground in Dec. 1738, to make room for a new fabric; and nothing remains but a few pictures of the hiſtory of Alexander, in the apartment of madame d'Eſtampes, which was left ſtanding. The adventures of Ulyſſes have been etched by Theodore van Fulden; and ſome of the lunettes and larger compoſitions of the gallery have been engraved by G. Mantuano, Anthony Garnier, and Stephen de Laulne. Fuſeli's Pilkington.

Nicolo, Germ., in *Muſic*, a wind inſtrument, blown with a reed, and uſed as a tenor to the baſſoon, of which the hautbois is the treble. Walther.

NICOLOSIO, John-Baptist, in *Biography*, a Sicilian geographer of ſome eminence, who died at Rome in the year 1670. He was well grounded in thoſe departments of knowledge upon which the true principles of geography reſt, and by his ſuperior talents recommended himſelf to the notice of pope Alexander VII. His principal works are "Hercules Siculus, ſive Studium Geographicum," in two volumes; "Guida allo Studio Geographico;" "La Theorica del Globo Terreſtre;" "Orbis Deſcriptio," in ten large maps; "A Deſcription of the Dominions of the Church;" "A Deſcription of the Kingdom of Naples;" "Maps and Charts, with Notes illuſtrative of the Hiſtory of Alexander, by Quintus Curtius," and other works.

NICOLSBURG, in *Geography*, a town of Moravia, in the circle of Brunn; 22 miles S. of Brunn. N. lat 48° 52'. E. long. 16° 33'.

NICOLSON, William, in *Biography*, an Engliſh prelate, diſtinguiſhed for his knowledge of the hiſtory and antiquities of his country, was born about 1655, at Orton, in Cumberland, in which county his father was pariſh rector. He ſtudied at Queen's college, Oxford, and ſoon after quitting the univerſity, was ſent by ſir Joſeph Williamſon, ſecretary of ſtate, to travel on the continent. From his obſervations in this tour, he was enabled to draw up a copious deſcription of Poland, Denmark, and Germany, which was printed in Pitt's Atlas, in 1680-1. On his return from his travels, he took his degree of M.A., became fellow of his college, and was made chaplain to the biſhop of Carliſle, who gave him a prebend, and an archdeaconry, with a vicarage in his dioceſe. In 1696 he publiſhed the firſt part of his "Engliſh Hiſtorical Library," a work to which we have often referred, and which was intended to give a brief view and character of moſt of our national hiſtorians, whoſe writings are extant either in print or MS. It was followed by a ſecond part in 1697, and a third in 1699; and all the parts were publiſhed together, in a more enlarged and correct ſtate, in 1714. Previouſly to this laſt date, he publiſhed "A Scottiſh Hiſtorical Library," of the ſame kind; and in that year he was promoted to the biſhopric of Carliſle. His "Engliſh Library" drew down upon him an attack from Atterbury, in his work on the "Rights, Powers, and Privileges of an Engliſh Convocation." Dr. Nicolſon replied to it in a letter to Dr. White Kennet. In 1717 he was engaged in a diſpute reſpecting ſomething he was reported to have ſaid in relation to the celebrated ſermon of Dr. Hoadley, then biſhop of Bangor, which occaſioned the Bangorian controverſy; and in the courſe of the diſcuſſion, biſhop Nicolſon and Dr. White Kennet publicly and poſitively contradicted one another, as to an occurrence between them. This circumſtance is thought to have occaſioned the biſhop's removal to Ireland, being in 1718 tranſlated to the ſee of Londonderry. His enquiries in that country gave riſe to his "Iriſh Hiſtorical Library," printed at Dublin in 1724. He ſhewed his attention to the intereſts of his ſee, by erecting a building in the palace-garden for the preſervation of the records and other manuſcripts relating to it. In January 1726-7, he was tranſlated to the archbiſhopric of Caſhell; but before he could take poſſeſſion of it, he died at Londonderry, in the February following. He was unqueſtionably a man of great learning, to whom the world is much indebted, not only for his antiquarian reſearches, but for his knowledge in the ſciences in general. A liſt of his publications, independently of his "Libraries" already noticed, is given in the Biog. Britannica.

NICOMEDES, an ancient geometrician, celebrated for having been the inventor of the curve named the conchoid, which has been made to ſerve equally for the reſolution of the two problems relating to the duplication of the cube, and the triſection of an angle. It was much uſed by the ancients, in the conſtruction of ſolid problems. Sir Iſaac Newton approved it for triſecting angles, or finding two mean proportionals, and for conſtructing ſome other ſolid problems, as may be ſeen in his "Arithmetica Univerſalis." It is not certain at what period Nicomedes flouriſhed, but it was probably at no great diſtance from the time of Eratoſthenes, as he holds him up to ridicule on account of the mechaniſm of his *Meſolabe*, (which ſee,) and alſo from the circumſtance that Geminus, who lived in the ſecond century B.C. wrote on conchoids, of which Nicomedes was then allowed to be the inventor. See Conchoid.

Nicomedes, or Mesomedes, a famous muſician, who flouriſhed about the year 145 of the Chriſtian era, under the reign of Antoninus. He was the firſt who drew up a body of rules for performing on the lyre. The emperor, however, retrenched his ſalary as a muſician of the court, telling him that it would be ſhameful, and even cruel, if thoſe whoſe labours were of no uſe to the ſtate ſhould partake of his benefits. Other ſovereigns, in other times, have regarded the art of muſic as very uſeful to humanity. Laborde.

NICOMEDIA, in *Ancient Geography*, a town of Aſia Minor, in Bithynia, on the Aſtacene gulf. It had once borne the appellation of Olbia, a pretended nymph who had laid its foundation. Nicomedes, king of Bithynia, afterwards enlarged and embelliſhed it, and gave it his own name. Pauſanias ſays that it was one of the moſt conſiderable towns of Bithynia. Hannibal made it a place of refuge, when he could find no other aſylum from the fury of the Romans.

NICO-

NICOMIA, in *Natural Hiſtory*. See CHERT.

NICON, in *Biography*, a diſtinguiſhed Ruſſian prelate, was born in 1613, of obſcure parents, in a village belonging to the government of Niſhnei Novgorod. He received at the baptiſmal font the name of Nikita, which afterwards, when he became a monk, he changed to Nicon, the appellation by which he is more generally known. He was educated in the convent of St. Macarius, where his ſtudies were directed almoſt entirely to the holy ſcriptures, and influenced by the exhortations of his preceptors, he imbibed at a very early period the ſtrongeſt attachment to a monaſtic life, but his father ſet his face againſt it, and he entered into the marriage ſtate, and thus precluded from admiſſion into the convent, he was ordained a ſecular prieſt. With his wife he ſpent ten years, firſt as a pariſh-prieſt in a country village, and afterwards at Moſcow in the ſame capacity; but having loſt three children, whom he tenderly loved, he became diſguſted with the world, and having perſuaded his wife to take the veil, he entered into the monaſtic order. He choſe for his retreat a ſmall iſland in the White ſea, inhabited only by a few perſons, who formed a kind of eccleſiaſtical eſtabliſhment, as remarkable for the auſterity of the rules as for the ſolitude of the ſituation. There were twelve monks, each occupying a ſeparate cell, about a mile and a half diſtant from one another, and from the church, which ſtood in the centre of the iſland. Theſe lonely anchorites aſſembled every Saturday evening in the church, where they aſſiſted in the performance of divine ſervice during the whole night, and the next day till noon, and then retired to their reſpective habitations. After a ſhort reſidence in this iſland, he accompanied the chief of the eccleſiaſtical eſtabliſhment to Moſcow, to raiſe a collection for the purpoſe of building a new church, but he had ſcarcely returned from this expedition, when, at the inſtigation of the principal, whom he had offended during his journey, he was driven by the other monks from the iſland. He embarked, during very tempeſtuous weather, in an open boat, with only one perſon, and was driven upon an iſland near the mouth of the river Onega. From this iſland he repaired to a monaſtery on the continent, and was admitted into the ſociety; but inſtead of inhabiting an apartment in the convent, he conſtructed a ſeparate cell on an adjacent iſland, where he lived on fiſh which he caught with his own hands, and never viſited the monaſtery but during the time of divine ſervice. On the death of the ſuperior he was unanimouſly elected to fill the vacant dignity. In this capacity he continued three years, at the end of which, being induced, by family affairs, to viſit Moſcow, he was preſented to the czar, who, captivated by his talents and learning, detained him at Moſcow, under his immediate protection. He ſoon obtained church preferment, was made abbot, archbiſhop, and at length patriarch of Ruſſia, promotions which he deſerved by his extraordinary virtues, rare talents, and ſound learning. While archbiſhop of Novgorod, he had an opportunity of diſplaying a memorable inſtance of firmneſs and diſcretion. During a popular tumult, the imperial governor took refuge in the archiepiſcopal palace againſt the fury of the inſurgents, who burſting open the gates, inſiſted, with threats of ſpeedy vengeance, that the governor ſhould be inſtantly delivered up to them. Nicon, inſtead of complying with their demand, advanced boldly into the midſt of them, and exhorted them to peace. They ſeized the worthy prelate, treated him with every indignity, and left him for dead. Obtaining ſpeedy medical aid, he recovered, and did not ceaſe his efforts till he had carried his point, and ſuch was the prudence which he manifeſted, that he actually ſoftened the hearts of thoſe who but a ſhort time before had exulted in his ſuppoſed deſtruction: and many of the deluded multitude flocked around him, intreating him not only to forgive them their ill conduct, but to intercede for them with their ſovereign. Being armed with full powers delegated by the emperor, he finally quelled the rebellion. To him alſo was committed the trial of the rebels, and the abſolute diſpoſal of life and death; an office which he executed with ſo much judgment and lenity, that he only puniſhed with death the leader of the ſedition, ten others ſuffered the puniſhment of the knoot, and were afterwards baniſhed, and a few were condemned to a ſhort term of impriſonment. The conduct of Nicon on this occaſion was admired even by his enemies: he gained the reſpect of the inhabitants by the unwearied aſſiduity with which he performed the functions of his archiepiſcopal office, and conciliated their affection by acts of unbounded charity. He built and endowed almshouſes for widows, old men, and orphans, was the great patron of the indigent; the zealous protector of the lower claſs of men againſt the oppreſſions of the great, and during a dreadful famine, appropriated the revenues of his ſee to the general relief of the poor. Nicon was no leſs conſpicuous in the vigilant diſcharge of his patriarchal office, to which he was appointed in 1652, being then in the thirty-ninth year of his age. He eſtabliſhed ſchools for the inſtruction of prieſts in the Greek and Latin languages, and enriched the patriarchal library with rare eccleſiaſtical and claſſical manuſcripts, brought from mount Athos. By the diligent reviſal of the holy ſcriptures, he perceived that many errors had crept into the printed copies of the Bible and Liturgy, and prevailed upon the czar to ſummon a general council of the Greek church at Moſcow, in which it was determined that the moſt ancient Sclavonian verſion of the bible was exact, and that the numerous errors which had crept into the later copies ſhould be corrected. He ſuperintended the printing of a new edition of this Sclavonian bible, which was become exceedingly rare. He removed from the churches the pictures of deceaſed perſons, to whom many of the Ruſſians offered the moſt blind adoration: he aboliſhed certain ceremonies, which had been carried to a ſuperſtitious exceſs; and, ſays Mr. Coxe, "in a word, his labours tended more to the reformation of the church, than the united efforts of all his predeceſſors in the patriarchal chair." Nicon was no leſs diſtinguiſhed for his talents in a civil capacity, and being conſulted by the czar on all occaſions, he ſoon became the ſoul of his councils, and gained a complete aſcendancy in the cabinet. The influence which, from the ſuperiority of his genius, he thus obtained in the czar's councils, induced Voltaire, in his erroneous account of this patriarch, to aſſert that "he wiſhed to raiſe his own chair above the throne, and that he not only uſurped the right of ſitting cloſe to the czar in the ſenate, but pretended that neither peace nor war could be made without his conſent." "This idle aſſertion," ſays Mr. Coxe, "has been adopted by the compiler of the article Ruſſia in the Univerſal Hiſtory," but nothing can be more void of foundation.

After having thus attained the higheſt ſummit of human grandeur to which a ſubject can arrive, he fell a victim to popular diſcontents, and to the cabals of a court. His fall was more ſudden than his riſe, and is traced from the following cauſes: the people became his enemies on account of his reformation of the ceremonies in the church: the prieſts and clergy, becauſe he looked for more purity in their moral conduct, and more learning than they choſe to be at the pains of acquiring; the courtiers were jealous of his pre-eminence, which was the conſequence of his ſuperior talents. All theſe parties united in one combination againſt him; and Nicon haſtened his fall by his ſupercilious demeanour, which occaſionally bordered upon arrogance; by truſting

ſolely

ſolely for his ſupport to the rectitude of his conduct, and the favour of his ſovereign, and by neglecting to guard againſt what he conſidered the petty intrigues of a court. At firſt he was excluded from the preſence of his ſovereign, and diſdaining to hold the higheſt office in the kingdom when he had loſt the confidence of his maſter, he voluntarily abdicated his patriarchal dignity. This was on the 21ſt of July, 1658, after he had held the high office only ſix years: he quitted that exalted ſtation with the ſame greatneſs of ſoul with which he had aſcended it. He was permitted to retain the title of patriarch, while the functions of his office were performed by the archbiſhop of Novgorod. He choſe for the place of reſidence the convent of Jeruſalem, built and endowed by himſelf, which is ſituated about the diſtance of thirty miles from the city of Moſcow. Upon his arrival at the convent, he immediately re-aſſumed his former recluſe way of life, and practiſed the moſt rigid mortifications. The hermitage which he inhabited is thus deſcribed by an author who viſited the ſpot in the beginning of the laſt century: "a winding ſtair-caſe, ſo narrow, that one man could hardly paſs, leads to a little chapel, of about a fathom ſquare, in which the patriarch uſed to perform his ſolitary worſhip. The room in which he lived was not much larger; in it hung a broad iron plate, with a croſs of braſs, fixed to a heavy chain, weighing above twenty pounds, all which the ſaid patriarch wore about his neck for twenty years together. His bed was a ſquare ſtone two ells in length, and ſcarcely one in breadth, over which was ſpread nothing but a covering of ruſhes. Below, in the houſe, was a ſmall chimney, in which the patriarch uſed to dreſs his own victuals." Nicon did not ſpend his whole time in the performance of uſeleſs auſterities, he employed himſelf in compiling a regular ſeries of Ruſſian annaliſts from Neſtor, the earlieſt hiſtorian of that country, to the reign of Alexey Michaelovitch. After comparing and collating numerous manuſcripts, he digeſted the whole collection in chronological order, into a work, which is ſometimes called, from its author, "The Chronicle of Nicon," and ſometimes, from the place where it was begun and depoſited, "The Chronicle of the Convent of Jeruſalem." This compilation is juſtly eſteemed as a work of great authority. The innocent manner in which the author paſſed his time could not protect him from the perſecution of his enemies. Complaints were urged againſt him, and new crimes were invented to render him ſtill more obnoxious, till at length he was depoſed, and baniſhed to a diſtant convent. The principal cauſe aſſigned for this depoſition was, that Nicon, having by his voluntary abdication meanly deſerted his flock, was unworthy to fill the patriarchal chair; and this allegation is a ſufficient proof that the other crimes were maliciouſly imputed to him, circulated merely to prejudice the czar, and to influence the judges againſt him. In conformity to his ſentence, Nicon was degraded to the condition of a common monk, and impriſoned in the convent of Therapont, in the government of Bielozero. His confinement, for ſome time, was extremely rigorous, becauſe, conſcious of his own integrity, he perſiſted in a denial of all guilt, and refuſed to compromiſe the matter by accepting a pardon for crimes which he had never committed. Upon the death of Alexey, in 1676, Feodor, probably at the inſtigation of his prime miniſter, prince Galitzin, the friend and patron of genius, permitted Nicon to remove to the convent of St. Cyril, in the ſame government, where he enjoyed the moſt perfect liberty. Nicon ſurvived his depoſition fifteen years. In 1681, he obtained permiſſion to return to the convent of Jeruſalem, that he might end his days in that favourite ſpot, but the venerable old man expired upon the road on his journey, in the ſixty-ſixth year of his age. His remains were tranſported to that convent, and buried with all the ceremonies which are uſual at the interment of patriarchs. See Coxe's Travels, vol. ii.

NICONIA, in *Ancient Geography*, a town ſituated on the Euxine ſea, at the mouth of the Iſter.—Alſo, a town placed by Strabo on the northern bank of the Tyras, or Dnieſter, about 140 ſtadia from its mouth. It was probably the ſame with the preceding town.

NICOP, in *Geography*, a town of European Turkey, in Bulgaria; 45 miles E.S.E. of Nicopoli.

NICOPOLI, a town of European Turkey, in Bulgaria, ſituated on the Danube, ſaid to have been built by Trajan, after a victory over the Dacæ. It is the ſee of a biſhop, ſuffragan of Sophia, and the reſidence of a ſangiac; 164 miles N.W. of Adrianople. N. lat. 43° 51′. E. long. 24° 8′.

NICOPOLI, or *Glanich*, a town of Turkiſh Armenia, built by Pompey; 15 miles S. of Erzerum.—Alſo, a town of European Turkey, in Romania, on the Meſto; 90 miles E.N.E. of Saloniki.

NICOPOLIS, or NICOPOLI, in *Ancient Geography*, a town of Greece, in Epirus; founded by Auguſtus as a monument of the victory obtained at Actium over Antony. Pliny repreſents it as a free town: Tacitus gives it the title of a Roman colony. Strabo informs us that Auguſtus, having collected into this place the inhabitants of the deſerted towns in its vicinity, gave it the name of Nicopolis; and by way of diſtinguiſhing it from ſeveral other towns of the ſame name, called it "Achaiæ Nicopolis," or "Actia Nicopolis."

NICOPOLIS, or *Nicopolis ad Hæmum*, a town of Thrace, at the foot of mount Hæmus, towards the ſource of the river Iatrus; placed by Ptolemy between Praſidium and Oſtaphos.

NICOPOLIS, a town of Lower Mœſia, at the mouth of the river Iatrus, on the Danube. In order to diſtinguiſh it from Nicopolis upon the Hæmus, built alſo upon the Iatrus, it was called "Nicopolis ad Danubium," or "Nicopolis ad Iſtrum." Ammianus Marcellinus ſays, that it was founded by Trajan, after his victory over the Dacians. See NICOPOLI.

NICOPOLIS, or *Nicopolis ad Neſſum*, a town of Thrace, founded by Trajan, ſome leagues from the mouth, and to the left of the river Neſſus. Ptolemy places it between Pantallia and Topiris.

NICOPOLIS, a town of Egypt, in the environs of Alexandria. Joſephus places it at twenty ſtadia from Alexandria, in Judæa. According to Dion Caſſius, Auguſtus was its founder, who gave it the ſame name, and conferred upon it the privilege of the ſame games with the town of Nicopolis in Epirus.—Alſo, a town of Aſia, in Cilicia, ſituated in the mountains, on the river Pinarus, N.E. of its mouth.—Alſo, a town of Armenia Minor, built by Pompey according to Strabo. Ptolemy places it in the interior of the country, at a diſtance from the Euphrates, and in the vicinity of the mountains. By way of diſtinction from other towns, it was called "Nicopolis Pompeii."—Alſo, a town of Bithynia, on or near the Boſphorus.—Alſo, a town of Aſia Minor, in Cilicia Propria, between Ceſtabula and Epiphania, according to Ptolemy. Strabo places it in the number of towns which were ſituated on the coaſt of the gulf of Iſſus.—Alſo, a town of Aſia, in Phrygia Salutaris.—Alſo, a town of Paleſtine, previouſly called Emmaus. It was burnt, after the death of Herod the Great, by Quintilius Varus, for having taken part in the revolt of the Jews. This town was abandoned by its inhabitants, and reduced to the condition of a village, 60 ſtadia from Jeruſalem. It was granted to 800 veteran ſoldiers by the emperor Veſpaſian, after the ruin of Jeruſalem, A.D. 71. The

town was called Nicopolis, in commemoration of the victory of the Romans over the Jews. Under the reigns of Trajan and Antoninus Pius, this town was celebrated, and ſtruck ſeveral medals. The name of Emmaus is given to this town by Ptolemy, in his Geography, and it was called Nicopolis by the Romans. It was ruined after the reign of Antonine, but re-eſtabliſhed under Elagabalus and Alexander Severus: and the name of this latter emperor was added to its own.

NICOSIA, in *Geography*, a town of Sicily, in the valley of Demona; 32 miles N.W. of Catania.—Alſo, a town and capital of the iſland of Cyprus, ſituated in the middle of a vaſt plain, and in the centre of the iſland. It is now the reſidence of the governor, as it formerly was of the kings of Cyprus. The palaces of the ſovereigns, remarkable for the beauty of their architecture, are abandoned by the Turks to deſtruction. The ſuperb church of "Santa Sofia," in which the Chriſtian kings were crowned, has been converted into a moſque; and the habitation of theſe ſovereigns, partly demoliſhed, and partly re-edified in the eaſtern taſte, is the reſidence of the Moſlem, or governor. The ſituation of the town is agreeable; ſtreams are here abundant; and it is ſurrounded by fine gardens. The adjacent ſoil is excellent, and cultivated by the induſtry and activity of freemen, would reſume the aſpect of proſperity. This town was in a remote period a place of conſiderable extent; and ſome ruins indicate its former importance. It contained, in its more ancient ſtate, within a circumference of nine miles, temples, palaces, and ſeveral beautiful monuments, and, at a later period, many monaſteries, 300 churches, Greek and Latin, and a number of public edifices. In the year 1570, when Selim II., who then ruled the Ottoman empire, projected the conqueſt of Cyprus, it was taken, after a protracted ſiege, by an aſſault of Muſtapha, the Turkiſh general; and of 50,000 people, who had retired within the walls for ſhelter, 20,000 were maſſacred, and the reſt put in irons. Beſides the church of St. Sophia, already mentioned, it had another church, *viz.* that of St. Nicholas, which is now a bezeſten, or a kind of hall, in which all ſorts of proviſions are ſold; it is a place where the principal Turkiſh, Greek, and Armenian merchants aſſemble to tranſact commercial buſineſs. The bazar, or market-place, is extenſive, much frequented, well ſupplied with proviſions, and kept in a neat and clean ſtate. N. lat. 35° 12′. E. long. 33° 2′.

NICOTERA, a town of Naples, in Calabria Ultra, the ſee of a biſhop, ſuffragan of Reggio, near the coaſt of the Mediterranean; 32 miles N.N.E. of Reggio. N. lat. 38° 33′. E. long. 16° 16′.

NICOTIANA, in *Botany*, received its name in honour of John Nicot, of Niſmes, ambaſſador from the French court to that of Portugal, who during his reſidence at Liſbon, in 1560, received ſome of the ſeed from a Dutchman, who had it from Florida, and part of this he ſent to France. There the plant ſoon became famous, as well as in other parts of Europe, by the name of Tabac, or Tobacco.—Linn. Gen. 99. Schreb. 133. Willd. Sp. Pl. v. 1. 1014. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 1. 390. Brown. Prod. Nov. Holl. v. 1. 447. Juſſ. 125. Lamarck Illuſtr. t. 113. Tourn. t. 41. Gærtn. t. 55.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Luridæ*, Linn. *Solaneæ*, Juſſ. Brown.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, tubular, ovate, cut half way down into five unequal ſegments, permanent. *Cor.* of one petal, funnel-ſhaped; tube longer than the calyx; limb more or leſs ſpreading, with five plaits, and five lobes. *Stam.* Filaments five, awl-ſhaped, aſcending, nearly as long as the corolla, often unequal; anthers oblong. *Piſt.* Germen ſuperior, ovate; ſtyle thread-ſhaped, as long as the corolla; ſtigma capitate, notched. *Peric.* Capſule nearly ovate, marked with a narrow furrow at each ſide, of two cells and two valves, burſting at the top into four parts. *Receptacles* half-ovate, dotted, affixed to the partition. *Seeds* numerous, kidney-ſhaped, rugged.

Eſſ. Ch. Corolla funnel-ſhaped; limb five-cleft, plaited. Stamens inclining. Capſule of two cells, and two valves, opening into four parts at the top. Calyx tubular, five-cleft.

1. N. *Tabacum*. Virginian Tobacco. Linn. Sp. Pl. 258. Willd. n. 1. Ait. n. 1. Woodv. Med. Bot. t. 60. Stokes's Mat. Med. v. 1. 390. (Hyoſcyamus peruvianus; Ger. em. 357. Βλεννοχοις; Renealm. Spec. 38. t. 37.)—Leaves lanceolate-ovate, ſeſſile, decurrent. Segments of the corolla acute. Native of America, from whence it was brought to Europe by ſir Francis Drake, in the middle of the 16th century, and is now a hardy annual in our gardens, flowering in July and Auguſt. The *herb* riſes to the height of ſix feet, and is of a rank coarſe habit, downy, viſcid and fœtid. *Leaves* alternate, claſping the ſtem, and decurrent, one or two feet long, flaccid, acute, entire; various in breadth. *Stem* round, branched, panicled, bearing abundance of long tubular, roſe-coloured *flowers*. With us this plant is chiefly cultivated in the kitchen-garden, for private uſe, ſerving to fumigate the hot-houſes, and drive away inſects, in which it is all-powerful. Revenue laws forbid the raiſing of Tobacco for ſale in England. For its more important qualities and uſes, as well as its commercial hiſtory, ſee TOBACCO.

2. N. *fruticoſa*. Shrubby Tobacco. Linn. Sp. Pl. 258. Regn. Bot. tab.—Leaves lanceolate, tapering at the baſe, claſping the ſtem. Segments of the corolla acute. Stem ſhrubby.—This is ſaid to be a native of China. It has been cultivated in the Engliſh greenhouſes for more than a century. We have ſeen it in the open air, in a garden near Naples, with a *ſtem* three or four inches in diameter, forming a ſmall tree. Its woody perennial habit, and narrow *leaves*, which taper down into a ſort of *footſtalk*, that claſps the branch at its baſe, are the chief marks of diſtinction between this and the former, with which its *flowers* very nearly agree. We think Mill. Ic. t. 185. f. 1, may repreſent this ſpecies.

3. N. *undulata*. New Holland Tobacco. Ait. n. 3. Brown. Prodr. v. 1. 447. Venten Malmaiſ. t. 10. Sims in Curt. Mag. t. 673.—Radical leaves obovate, obtuſe, ſomewhat wavy; ſtem-leaves ſharp-pointed. Corolla ſalver-ſhaped, very obtuſe.—Native of New South Wales, as well as of the ſouthern part of New Holland. *Brown*. It came to Kew in 1800, and is perennial in the greenhouſe, flowering all ſummer long. The ſettlers at Port Jackſon are ſaid to uſe this herb as Tobacco. It is downy, viſcid and fœtid. *Leaves* and whole herb much ſmaller than in the Virginian Tobacco. *Flowers* racemoſe, drooping, large, white, with a green tube; fragrant at night like the *Mirabilis longiflora*. Their *limb* is nearly at a right angle with the tube, its ſegments rounded and obtuſe, ſometimes cloven. *Calyx* acutely ribbed and furrowed.

4. N. *plumbaginifolia*. Leadwort-leaved Tobacco. Viviani Hort. Dinegr. 26. t. 1.—Radical leaves ovate, contracted at the baſe; ſtem-leaves lanceolate, claſping the ſtem; all undulated. Corolla ſalver-ſhaped, acute.—The native country of this ſpecies is unknown. It has been cultivated in ſome Italian gardens, and we obtained flowering ſpecimens, in May 1804, from the ſtove of the late lady Amelia Hume. The *ſtem* is much branched from the very bottom. *Leaves* broader than in the laſt, with which ſpecies the *flowers* moſt agree in colour, ſize, and arrangement,

but differ eſſentially in the acuteneſs of their ſegments. The *calyx* alſo is wider.

5. N. *axillaris*. Axillary Tobacco. Poiret in Lamarck Dict. v. 4. 480.—Leaves oppoſite, ovate, flat, nearly ſeſſile. Stalks axillary, ſolitary, ſingle-flowered. Corolla obtuſe. Segments of the calyx deep, ſpatulate.—Gathered by Commerſon at Monte Video, and communicated by Thouin to the younger Linnæus. Of the lower *leaves* we know nothing; the upper are as above deſcribed, rather above an inch long, and near an inch wide, downy, and apparently viſcid, like the reſt of the herbage. Lower *flower-ſtalks* longer than the leaves, upper ſhorter. Segments of the *calyx* nearly equal, very deep and obtuſe. *Corolla* white or yellowiſh, ſtreaked and bordered with purple; its tube thrice the length of the calyx; limb obliquely twiſted and folded in the bud, funnel-ſhaped when expanded, with ſlight blunt ſegments. *Fruit* unknown. It is evident that ſome uncertainty muſt attend the genus of this plant, till the whole of the fructification is known, but we have concurred with Commerſon and Poiret in making it a *Nicotiana*.

6. N. *triſtis*. Dull-purple Tobacco.—Leaves lanceolate, wavy, claſping the ſtem. Corolla ſalver-ſhaped, its tube not twice the length of the calyx, and ſcarcely longer than the obtuſe limb.—Gathered by Commerſon at Monte Video. The whole *herb* is viſcid and downy. *Stem* ſomewhat branched, from one to two feet, or more, in height. Radical *leaves* roundiſh-ovate, or obovate; thoſe on the ſtem lanceolate, dilated and claſping the ſtem at their baſe; all wavy or ſomewhat criſped at the margin. *Flowers* racemoſe, the lower ones accompanied by gradually diminiſhed leaves. *Flower-ſtalks* ſeldom ſo long as the *calyx*, which is cut half way down into five unequal, linear, obtuſe, erect ſegments. *Corolla* of a dull purple, ſalver-ſhaped; tube an inch long, being not twice the length of the calyx, cylindrical; limb rather ſhorter than the tube, its ſegments roundiſh, obtuſe, horizontal, plaited. One of the *ſtamens* ſhorter than the reſt.

7. N. *ruſtica*. Common Green Tobacco. Linn. Sp. Pl. 259. Willd. n. 3. Ait. n. 4. (Hyoſcyamus niger; Matth. Valgr. v. 2. 412. H. luteus; Ger. em. 356.)—Leaves ſtalked, ovate, entire. Tube of the corolla bell-ſhaped, not twice the length of the calyx; ſegments of the limb rounded, ſpreading, one-fourth as long as the tube.—Native of America, from whence it was brought about the ſame time as the *N. Tabacum*, which it reſembles in qualities. This is a hardy annual in our gardens, flowering from Midſummer to Michaelmas. The *ſtem* is three or four feet high, leafy with panicled *branches*. *Leaves* from three to ſix inches long, of a broad ovate, or ſomewhat heart-ſhaped, obtuſe figure, on *ſtalks* one or two inches in length. *Flowers* numerous, ſcarcely an inch long, of a dull yellowiſh-green, bell-ſhaped. Segments of the *calyx* ſemi-ovate. *Capſule* roundiſh, a little depreſſed. Every part is downy, clammy, and fœtid, as in the reſt of the genus. Gerarde ſays of this plant that "taken in ſmoke, it worketh the ſame kind of drunkenneſſe that the right Tobacco doth."

8. N. *paniculata*. Panicled Tobacco. Linn. Sp. Pl. 259. Stockh. Tranſ. for 1753. 40. t. 1. Willd. n. 4. Ait. n. 5 (N. minor, folio cordiformi, tubo floris prælongo; Feuill. Peruv. v. 1. 717. t. 10.)—Leaves ſtalked, heart-ſhaped, entire. Panicles much branched. Tube of the corolla club-ſhaped, five times as long as the calyx; limb very ſhort, ſpreading, with ſhallow rounded lobes.—Native of Peru. Linnæus received the ſeeds from Bernard de Juſſieu, and having raiſed the plant, publiſhed it in the Stockholm Tranſactions. This differs from the laſt in its much more lax and compound *panicles*, and eſpecially in the length and ſlender club-ſhaped figure, of the *corolla*, though its colour is nearly the ſame. Feuillée, who diſcovered this plant in the valley of Lima, ſays not a word of its being applied to any particular uſe.

9. N. *urens*. Prickly Tobacco. Linn. Sp. Pl. 259. Willd. n. 5. (N. arboreſcens ſpinoſiſſima, flore exalbido; Plum. Cat. 3 Ic. 204. t. 211.)—Leaves ſtalked, heart-ſhaped, crenate. Spikes recurved, many-flowered. Stem hiſpid. Tube of the corolla bell-ſhaped; limb revolute.—Gathered in South America, or the Weſt Indies, by Plumier. No other botaniſt appears to have ſeen it. Our only guides therefore are his figure and ſhort definition. This ſeems to be a very large plant. The *leaves* are above a foot long, heart-ſhaped; their margin wavy and crenate. *Stem* and *ſtalks* denſely clothed with pungent briſtles. Branches of the *panicle* alternate, very long, recurved, ſpiked rather than racemoſe, the copious *flowers* being nearly, or quite, ſeſſile. Segments of the *calyx* deep, lanceolate, acute. *Corolla* above an inch long; its tube wide and bell-ſhaped; ſegments of the limb revolute, acute.

10. N. *glutinoſa*. Clammy, or Spaniſh, Tobacco. Linn. Sp. Pl. 259. Willd. n. 6. Ait. n. 6. Andr. Repoſ. t. 484. (Andra nya Tobaken; Linn. Stockh. Tranſ. for 1753. 41. t. 2.)—Leaves ſtalked, heart-ſhaped, acute, entire. Flowers racemoſe, drooping, ſomewhat ringent. Calyx as long as the tube.—Native of Peru. A hardy annual with us, flowering in the latter part of ſummer, but not valuable for its beauty. The broad, heart-ſhaped, acute, wavy *leaves* are unlike thoſe of any other ſpecies cultivated here; and the curved, ſomewhat ringent *corolla*, ſcarcely longer than the linear-lanceolate ſegments of the *calyx*, is characteriſtic. Its colours are nearly thoſe of the firſt and ſecond ſpecies, but leſs vivid. Burmann, the editor of Plumier, points out the affinity of this and the laſt, but they cannot be confounded. The ſtalked *leaves* agree in that particular with Gerarde's *Sana ſancta Indorum*, p. 357. f. 2, the cut of which, printed likewiſe in other old books, has hitherto been confounded with *N. Tabacum*, with which indeed the *flowers* accord, and not at all with the ſpecies before us. We conceive this cut relates to ſome ſpecies not hitherto aſcertained by recent botaniſts; for though *N. Tabacum* varies in the length and breadth of its *leaves*, their taper baſe, and the want of *footſtalks*, is abundantly unlike the figure to which we allude.

11. N. *puſilla*. Primroſe-leaved Tobacco. Linn. Sp. Pl. 258. Willd. n. 7. (N. foliis ovato-lanceolatis, obtuſis, rugoſis, calycibus breviſſimis; Mill. Ic. v. 2. 124. t. 185. f. 2.)—Radical leaves elliptic-oblong, rugoſe; ſtem-leaves ovate, ſmall. Flowers racemoſe. Tube of the corolla club-ſhaped, five times as long as the calyx; limb acute.—Native of Vera Cruz, from whence Houſtoun ſent the ſeeds to Miller. It is biennial, flowering in the ſtove in Auguſt. *Stem* a ſpan high, with racemoſe *branches*, of ſlender yellowiſh-green *flowers*, whoſe *corolla* is not an inch long. The *leaves* are chiefly radical, reſembling thoſe of the primroſe, but darker.

Tabacum minimum, Ger. em. 358, appears to be another ſpecies, hitherto unſettled, with a branched leafy *ſtem*, a ſpan high; *leaves* ovate, on footſtalks, oppoſite; and ſtalked, acute, greeniſh-yellow *flowers*. Having ſeen no ſpecimen, we leave it for future enquiry.

N. minima of Molina, Poir. in Lam. Dict. v. 4. 481, is alſo probably another ſpecies unknown to us. S.

NICOTIANA, in *Gardening*, contains plants of the herbaceous annual kind, of which the ſpecies cultivated are the ſhrubby tobacco (N. fruticoſa); the Virginian tobacco (N. tabacum); and the common or Engliſh tobacco (N. ruſtica.)

In the firſt there is a variety which riſes about five feet high; the ſtalk does not branch ſo much as that of the real plant; the leaves are large and oval, about fifteen inches long, and two broad in the middle, but diminiſh gradually in ſize to the top of the ſtalk, and, with their baſe, half embrace it; the flowers grow in cloſer bunches than thoſe of the original, and are white: they are ſucceeded by ſhort, oval, obtuſe ſeed-veſſels. It flowers about the ſame time with the ſort from which it comes, and grows naturally in the woods of the iſland of Tobago.

Of the ſecond ſpecies there are ſeveral varieties; as the great broad-leaved, in which the leaves are more than a foot and a half long, and a foot broad, their ſurfaces very rough and glutinous, and their baſes half embrace the ſtalk. In a rich moiſt ſoil the ſtalks are more than ten feet high, and the upper part divides into ſmaller branches, which are terminated by looſe bunches of flowers ſtanding erect; they have pretty long tubes, and are of a pale purpliſh colour. It flowers in July and Auguſt, and is the ſort commonly brought to market in pots, being ſometimes called Oronoko tobacco.

And there is another variety, in which the ſtalks ſeldom riſe more than five or ſix feet high, and divide into more branches. The leaves are about ten inches long, and three and a half broad, ſmooth, acute, ſeſſile; the flowers are rather larger, and of a brighter purple colour. It flowers at the ſame time; and is called by ſome ſweet-ſcented tobacco.

The narrow-leaved variety riſes with an upright branching ſtalk, four or five feet high. The lower leaves are a foot long, and three or four inches broad: thoſe on the ſtalks are much narrower, leſſening to the top, and end in very acute points, fitting cloſe to the ſtalks; they are very glutinous. The flowers grow in looſe bunches at the top of the ſtalks; they have long tubes, and are of a bright purple or red colour. They appear at the ſame time with the former. Theſe varieties are alſo all natives of America.

The third ſpecies has alſo a variety which riſes with a ſtrong ſtalk near four feet high; the leaves are ſhaped like thoſe of the preceding, but are greatly furrowed on their ſurface, and near twice the ſize, of a darker green, and on longer footſtalks. The flowers are of the ſame ſhape, but larger.

Method of Culture.—The two firſt ſorts may be increaſed by ſowing the ſeeds annually in the ſpring, as March, on a hot-bed, the laſt in the natural ground. The ſeeds ſhould be covered about a quarter of an inch deep; and when the plants are come up, they ſhould be allowed freſh air daily, and occaſional watering, managing them as tender annuals. When the plants are from three to ſix inches high, as in May or the following month, they ſhould be planted out in moiſt weather, in the open ground; ſuch as are deſigned for ornament ſingly, and thoſe intended for uſe, in rows, any where, three feet aſunder; giving a good watering as ſoon as planted, repeating it occaſionally till the plants have got freſh root.

The ſecond ſpecies may alſo be raiſed by ſowing the ſeeds in a warm border in April, for ſetting out in the ſame manner, or by ſowing in patches in the flower-borders, &c. to remain, thinning the plants afterwards to one in each patch.

In the third ſort the ſeeds may be ſown in any bed or border in the ſpring, raking them in lightly. When the plants are three inches high, they ſhould be planted out where they are to remain; or they may be ſown in patches to remain, thinning the plants out afterwards, as above. But in America, where regular plantations are made, the method is this:

The beds being prepared, and well turned up with the hoe, the ſeed, on account of its ſmallneſs, is mixed with aſhes, and ſown upon them, a little before the rainy ſeaſon. The beds are raked, or trampled with the feet, to make the ſeed take the ſooner. The plants appear in two or three weeks. As ſoon as they have acquired four leaves, the ſtrongeſt are drawn up carefully, and planted in the field by a line, at the diſtance of about three feet from each plant. If no rain fall, they ſhould be watered two or three times. Every morning and evening the plants muſt be looked over, in order to deſtroy a worm which ſometimes invades the bud. When they are about four or five inches high, they are to be cleaned from weeds, and moulded up. As ſoon as they have eight or nine leaves, and are ready to put forth a ſtalk, the top is nipped off, in order to make the leaves longer and thicker. After this, the buds which ſprout at the joints of the leaves are all plucked, and not a day is ſuffered to paſs without examining the leaves, to deſtroy a large caterpillar which is ſometimes very deſtructive to them. When they are fit for cutting, which is known by the brittleneſs of the leaves, they are cut with a knife cloſe to the ground; and, after lying ſome time, are carried to the drying ſhed or houſe, where the plants are hung up by pairs, upon lines, leaving a ſpace between that they may not touch one another. In this ſtate they may remain to ſweat and dry. When perfectly dry, the leaves are ſtripped from the ſtalks, and made into ſmall bundles tied with one of the leaves. Theſe bundles are laid in heaps, and covered with blankets. Care is taken not to overheat them, for which reaſon the heaps are laid open to the air, from time to time, and ſpread abroad. This operation is repeated till no more heat is perceived in the heaps, and the tobacco is then ſtowed in caſks for exportation. But in China, where the uſe of tobacco both in ſnuff and for ſmoaking is very general, buildings are not thought neceſſary, according to ſir George Staunton, as they are in the Weſt Indies, for curing it; there being little apprehenſion of rain to injure the leaves when picked. They are hung on cords to dry without any ſhelter, upon the ſpot in which they grow.

It is probable that this plant might be grown with advantage in this climate, if it were not prohibited by the duty.

Theſe ſorts, when cultivated for the purpoſe of ornament, produce a fine effect by their leaves and flowers in the autumn, and alſo afford much variety.

NICOYA, or St. Lucar, in *Geography*, a town of Mexico, in the province of Coſta Rica, on a a river which runs into the Pacific ocean. From hence the inhabitants ſend to Panama ſalt, honey, maize, wheat, fowls, and the purple juice of a ſhell-fiſh found in the bay of Salinas, about 30 miles E. of the town. The Spaniards have alſo a pearl fiſhery; 80 miles W. of Carthage. N. lat. 10° 36′. W. long. 85° 50′.

NICSAR, or Niksar, a town of Aſiatic Turkey, in Caramania, the ſee of an archbiſhop; ſituated in a valley, and at the extremity of a plain watered by the Kalki Irmak, which diſcharges itſelf into the Amaſia, and is thus conveyed into the Black ſea. The approaches to Nikſar are ſaid to exceed, if poſſible, in beauty and rich vegetation thoſe to Karakiſſar. It is a long town, crowned by a ruined fort of conſiderable extent: the walls and towers appear to be works of the Saracenic age, and at a diſtance exhibit a picturеſque object; though they would now afford but an impotent defence. A ſtream from the hills ruſhes through the valley, and turns the wheels of many mills for cutting the pines into planks. The houſes are no longer terraced; their roofs are moſtly of wood, ſhelving, and covered with tiles.

The

The ancient "Neocæſarea" may be eaſily recogniſed under the name of Nikſar; and it is intereſting as the city and biſhopric of St. Gregory Thaumaturgus, who found there but 17 Chriſtians, and left but 17 Pagans. He built a church in this city, under Philip, who commenced his reign in the year 241; and this, according to Tillemont, was the firſt of which hiſtory gives us any certain account. This town is placed by Morier, in his "Journey through Perſia, &c." at 30 miles from Tocat. N. lat. 39° 25'. E. long. 85° 50'.

NICTAU, a river of Nova Scotia, which runs into the ſea at Annapolis. On its banks are quantities of bog and mountain ore, where a bloomery is erected.

NICTITATING MEMBRANE, in *Anatomy*, a thin membrane, which covers the eyes of ſeveral creatures, and ſhelters them from duſt, or too much light; yet is ſo thin, that they can ſee indifferently well through it.

This nictitating membrane is chiefly found in the bird and fiſh kind.

This membrane, in the eagle's eye, is remarkably cloſe and firm, inſomuch as to be accounted as a ſecond eye-lid; and hence that remarkable firmneſs of the eagle's ſight in viewing the ſun. See *Anatomy of* BIRDS.

NICUESA, *Gulf of*, in *Geography*, lies on the eaſt coaſt of the country of Honduras, on the Spaniſh main, having Cape Gracias-a-Dios for its north limit, and Cape Blanco on the ſouth; and due weſt from Catherine or Providence. N. lat. 13° 42'.

NIDA, a town of Pruſſia, in the province of Natangen; 12 miles W.S.W. of Lick.

NIDDA, a town of the principality of Upper Heſſe; 38 miles E.N.E. of Mentz. N. lat. 50° 26'. E. long. 9° 2'.

NIDDUI, in the *Jewiſh Cuſtoms*, is uſed to ſignify ſeparated or excommunicated. This, according to ſome, was to be underſtood of the leſſer ſort of excommunication in uſe among the Hebrews. He that had incurred it was to withdraw himſelf from his relations, at leaſt to the diſtance of four cubits: it commonly continued a month. If it was not taken off in that time, it might be prolonged for ſixty, or even ninety days: but if, within this term, the excommunicated perſon did not give ſatisfaction, he fell into the *cherem*, which was a ſecond ſort of excommunication; and thence into the third ſort, called *ſhammatha*, or *ſhematta*, the moſt terrible of all. But Selden has proved that there were only two kinds of excommunication, *viz.* the greater and leſs; and that theſe three terms were uſed indifferently.

NIDDYCORDA, in *Geography*, a town of Hindooſtan, in Madura; 30 miles N.E. of Coilpetta.

NIDEN, a town of Pruſſia, in the province of Samland, on the Friſch Nerung; 25 miles S. of Memel.

NIDENSTEIN, a town of the principality of Heſſe; 7 miles S. of Caſſel.

NIDERNDORFF, a town of Auſtria; 12 miles N.N.W. of Gram.

NIDERWOLTZ, a town of the duchy of Stiria; 8 miles N.E. of Muckrau.

NIDGET, in *Agriculture*, a term applied to a ſort of harrow formed in a triangular manner, which is employed in the culture of hops, and which may be employed with advantage in cleaning other ſorts of ſowed crops. See HOP.

NIDJIBABAD, or NIDJIBGUR, in *Geography*, a town of Hindooſtan, in Oude; built by Najab-ud-Dowlah, as a convenient mart between Hindooſtan and Cachemire; 80 miles N.N.E. of Delhi. N. lat. 29° 35'. E. long. 78° 41'.

NIDUM, in *Ancient Geography*, a town of Britain, marked in Antonine's Itinerary, between Bomium and Iſcalegua Auguſta or Caerleon. Nidum is fixed by Camden, Gale, and Baxter, at Neath, in Glamorganſhire; but the real courſe of the road from Maridunum to Iſcalegua Auguſta is confeſſedly very uncertain.

NIDUS, NEST, a repoſitory, wherein certain animals, particularly fowls, inſects, and reptiles, lodge their eggs, for incubation; and wherein, when hatched, they nurſe their young, till they become able to ſhift for themſelves.

The word is Latin, and is ſuppoſed to be derived from *nidor, a rank* or *ill ſmell:* in regard the neſts of animals uſually ſtink.

Dr. Derham ſays, he has often wondered how waſps, hornets, and other inſects, that gather dry materials, (as the duſt of wood ſcraped for that purpoſe,) ſhould find a proper glutinous matter to cement and glue their combs, and line their cells: but he adds, that, in all probability, it is in their own bodies; as in the tinea veſtivora, the cadworm, &c.

Goedart obſerves of his erucas, that fed on leaves, that they made their cells of leaves glued together with their own ſpittle.

NIDUS *Avis*, in *Botany*, Bird's Neſt. See NEOTTIA, and EPIPACTIS, n. 9.

NIEBLA, in *Geography*, a town of Spain, in the province of Seville, ſituated on the river Tinta, containing three pariſhes and a convent, with about 3000 inhabitants. It is ſuppoſed to have been founded on the ſcite of an ancient town called "Cuniſtorges." It was formerly the capital of a ſmall Mooriſh kingdom, and taken by the Chriſtians in the 13th century; 11 miles N.E. of Moguer. N. lat. 37° 19'. W. long. 6° 46'.

NIEBOLOW, a town of Poland, in Galicia; 32 miles S.W. of Halitſch.

NIECE, a term relative to uncle and aunt, ſignifying a brother's or ſiſter's daughter; which, in the civil law, is the third degree of conſanguinity; and, in the common law, the ſecond.

NIECHOROSSCZA, in *Geography*, a town of Poland, in the palatinate of Kiev; 56 miles W.S.W. of Kiev.

NIECHOROZ, a town of Poland, in the palatinate of Kiev; 56 miles W.S.W. of Kiev.

NIEDERBRONN, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diſtrict of Wiſſembourg; 12 miles S.W. of Wiſſembourg. The place contains 1438, and the canton 13,811 inhabitants, on a territory of 185 kiliometres, in 20 communes.

NIEDEROLM, a town of France, in the department of Mont Tonnerre, and chief place of a canton, in the diſtrict of Mayence. The place contains 591, and the canton 9413 inhabitants, in 18 communes.

NIEDZWIEDTOZE, a town of Lithuania, in the palatinate of Novogrodek; 26 miles W.S.W. of Sluck.

NIEHUS, or NEUHAUSZ, a town of Germany, in the duchy of Saxe-Lauenburg; 8 miles W. of Thommdamm.

NIEKE CORONDE, in the language of the Ceyloneſe, the name of a ſpecies of cinnamon. The tree which produces it reſembles the nieke, another tree very common there. This is a very bad kind of cinnamon, and has very little taſte or ſmell. It is very ſeldom ſold as cinnamon, but is much in eſteem among the natives for its medicinal virtues. They obtain a water, and an oil from it, by roaſting, which they

they anoint themſelves with, to preſerve them from noxious fumes, and infections of any kind; and uſe the expreſſed juice of the leaves to cool the head, and ſtrengthen the brain, rubbing it on externally. Phil. Tranſ. N° 409.

NIEL, in *Geography*, a ſmall iſland near the weſt coaſt of Scotland. N. lat. 55° 58′. W. long. 5° 32′.

NIELECOHOLO, a town of Chineſe Tartary. N. lat. 42° 1′. E. long. 124° 17′.

NIEMANOWICZE, a town of Lithuania, in the palatinate of Troki; 48 miles N. of Grodno.

NIEMECK, a town of Saxony; 18 miles N. of Wittemberg. N. lat. 52° 4′. E. long. 12° 40′.

NIEMECZ, or NIMIEC, a ſtrong town of European Turkey, in Moldavia, ſituated on a mountain, at the foot of which runs a river of the ſame name, which diſcharges itſelf in the Moldava; 76 miles W.N.W. of Jaſſi. N. lat. 47° 23′. E. long. 25° 58′.

NIEMECZYN, a town of Lithuania, in the palatinate of Wilna; 12 miles N.E. of Wilna.

NIEMEN, a river that takes its riſe a few miles ſouth of Minſk, in Lithuania, and paſſing by Grodno, joins the Wilna at Kowno; and ſoon afterwards entering Pruſſia, changes its name to Memel.

NIEMERSAT, a town of Pruſſia, in Samland, near the Baltic; 8 miles N. of Memel.

NIEMI, a town of Sweden, in Weſt Bothnia; 44 miles N. of Tornea.

NIEMUROW, a town of Poland, in the palatinate of Belcz; 36 miles S.W. of Belcz.

NIENBERG, a town of the duchy of Berg; 6 miles S.S.E. of Wipperfurt.

NIENBORG, a town of Weſtphalia, in the biſhopric of Munſter, on the Dinckel; 21 miles N.W. of Munſter. N. lat. 52° 9′. E. long. 6° 51′.

NIENBURG, a town of Germany, in the county of Hoya, on the Weſer; 12 miles S.S.E. of Hoya. N. lat. 52° 38′. E. long. 9° 21′.—Alſo, a town of Germany, called *Munch Nienburg*, in the duchy of Anhalt Cothen, ſituated on the Saale, and containing the prince's palace and a church; 8 miles N.W. of Cothen. N. lat. 51° 53′. E. long. 11° 50′.

NIENDORP, a town of the duchy of Holſtein; 5 miles E.S.E. of Gluckſtad.

NIENHOFF, a town of Holſtein; 11 miles N.N.W. of Arenſbock.

NIENHUS, or NIEUHAUS, a town of Germany, in the county of Bentheim, ſeated on the Dinckel, near its confluence with the Vechte; 17 miles S.E. of Covorden. N. lat. 52° 33′. E. long. 6° 50′.

NIENKIRCHEN, the name of three towns in the duchy of Holſtein.

NIENRADE, or DRECHROIDE, a town of Weſtphalia, in the county of Mark; 20 miles S. of Dortmund. N. lat. 51° 12′. E. long. 7° 50′.

NIENT COMPRISE, in *Law*, an exception taken to a petition, as unjuſt; becauſe the thing deſired is not in that act or deed whereon the petition is grounded.

Thus a perſon deſiring of the court to be put in poſſeſſion of a houſe, formerly adjudged to him among other lands; the adverſe party pleads, that the petition is not to be granted, by reaſon though the petitioner had a judgment for certain lands and houſes, yet this houſe is nient compriſe, not compriſed therein.

NIENT *Culpable*. See NON *eſt culpabilis*.

NIEOU-TCHUANG, in *Geography*, a town of Chineſe Tartary; 300 miles E.N.E. of Peking. N. lat. 41°. E. long. 122° 18′.

NIEPA, a town on the north coaſt of the iſland of Cuba; 55 miles N. of St. Yago.

NIEPER. See DNIEPER.

NIEPOLOMICE, a town of Poland, in the palatinate of Cracow; 10 miles E. of Cracow.

NIER, a ſmall river of Ireland, which flows from the Waterford mountains to the river Suire.

NIEREDOWA, a town of Lithuania, in the palatinate of Troki; 10 miles N. of Birza.

NIESAWAY, or NIESOVIA, a town of Perſia, in the province of Schirvan, with a harbour, on the eaſt coaſt of the Caſpian ſea; 45 miles S.S.E. of Derbend.

NIESOLONE, a town of Poland, in Volhynia; 34 miles N.W. of Zytomiers.

NIESTER. See DNIESTER.

NIESUCHWIESCHOWZA, a town of Poland, in Volhynia; 33 miles N.W. of Lucko.

NIESWICZ, a town of Lithuania, in the palatinate of Novogrodek; 24 miles N.W. of Sluck.

NIESYCE, a town of Lithuania, in the palatinate of Minſk; 44 miles N.E. of Minſk.

NIETRO, a river of Naples, which runs into the gulf of Tarento, N. lat. 39° 12′. E. long. 17° 24′.

NIEVA, an iſland ſouth-weſt of Miſtake bay, in Hudſon's ſtraits.

NIEUIL, a town of France, in the department of the Upper Vienne, and chief place of a canton, in the diſtrict of Limoges; 7 miles N.W. of Limoges. The place contains 671, and the canton 5126 inhabitants, on a territory of 137½ kiliometres, in 6 communes.

NIEUKERK, a town of Guelderland, near the Zuyder See; 8 miles S.S.W. of Harderwyck.

NIEUPORT, a ſea-port town of France, in the department of the Lys, and chief place of a canton, in the diſtrict of Furnes; which name it aſſumed when Philip, comte of Flanders, built a harbour in 1168. It lies near the ſea-ſhore, on a branch of the river Yperlee, which, by its junction with the river Colme, forms a canal that runs into the ſea. The harbour at low-water is dry. The place is chiefly defended by its ſluices, by which the adjacent country may be inundated. After the peace of Utrecht in 1713, the French ceded this town to the Engliſh, who, in 1715, ſurrendered it to his Imperial and Catholic majeſty Charles VI. But being taken again by the French in 1745, it was reſtored at the peace of Aix-la-Chapelle. Before the French revolution, here was a convent of Engliſh Chartreux, founded at Shene in 1415 by Henry V.; and in the reign of queen Elizabeth, removed firſt to Malines, and at laſt eſtabliſhed at Nieuport in the year 1626. It is inhabited chiefly by fiſhermen, and its chief trade conſiſts in nets and cordage for veſſels. In 1794 it was taken by the French; 9 miles S.W. of Oſtend. The place contains 2983, and the canton 7533 inhabitants, on a territory of 207½ kiliometres, in 19 communes. N. lat. 51° 7′. E. long. 2° 33′.—Alſo, a town of Holland, on the Leck; 15 miles E. of Rotterdam.

NIEUWE DIEP, a harbour on the north coaſt of Holland, taken poſſeſſion of by the Engliſh fleet in 1799; and near it is a magazine, called "Nieuwe Werk," taken by the Engliſh at the ſame time; 6 miles E. of Helder.

NIEUWELD and *The Ghoup*, are continuations of the Roggeveld mountain, in the diſtrict of Stellenboſch and Drakenſtein, which adjoin the Cape diſtrict, in the ſouthern part of Africa. Theſe diviſions join others of the ſame

name

name in the diſtrict of Graaf Reynet. They have lately been deſerted, on account of the number of Bosjeſman Hottentots who dwell cloſe behind them.

NIEUWENTYT, Bernard, in *Biography*, a celebrated Dutch philoſopher and mathematician, was born at Weſtgraafdyk, in North Holland, in the year 1654. His father was a miniſter, and he wiſhed to educate the ſon for the ſame profeſſion; but finding him diſinclined to ſuch a deſtination, he ſuffered him to follow his own inclination. He ſtudied philoſophy according to the ſyſtem of Des Cartes, then engaged in mathematical purſuits, and became intimately acquainted with the abſtruſe ſciences. He next ſtudied medicine, and then went through a courſe of reading on juriſprudence. In the ſtudy of all theſe ſciences he ſucceeded ſo well, as deſervedly to acquire the character of a good philoſopher, a deep mathematician, and an able and juſt magiſtrate. From his writings it alſo appears, that he did not permit his various ſtudies and ſubjects of inquiry to divert his thoughts from a due attention to the great and fundamental principles of natural and revealed religion. He was naturally of a grave and ſerious diſpoſition, but at the ſame time a very affable and agreeable companion. His manners were ſo engaging, that they conciliated the eſteem of all his acquaintance: hence he acquired great credit and influence in the council of the town of Puremerende, where he reſided; and alſo in the ſtates of that province, who reſpected him the more becauſe he never engaged in any cabals or factions, but recommended himſelf only by an open, manly, and upright behaviour. He died in the year 1718, at the age of 63. He was author of many works on different ſubjects, among which are the following: "Conſiderationes circa Analyſeos ad Quantitates infinitè parvas applicatæ Principia, &c." in which he propoſed ſome difficulties on the ſubject of the analyſis of infiniteſimals; "Analyſis Infinitorum, ſeu Curvilinearum proprietates, ex Polygonorum deductæ, &c.;" "The proper Uſe of the Contemplation of the Univerſe, for the Conviction of Atheiſts and Unbelievers." This was publiſhed in 4to., in the year 1715; of which a French tranſlation was publiſhed at Paris in 1725, entitled "L'Exiſtence de Dieu dèmontrèe par les Merveilles de la Nature;" and one in Engliſh, in 3 vols. 8vo., under the title of "The religious Philoſopher, or the right Uſe of contemplating the Works of the Creator." This went through ſeveral editions, and was highly eſteemed. A work of a ſimilar kind, adapted to the preſent improved ſtate of ſcience, has been ſome years in hand by the author of the "Scientific Dialogues." Nieuwentyt, only a few weeks before his death, finiſhed an excellent refutation of Spinoza, which was publiſhed in Dutch at Amſterdam, in 1720. Moreri.

NIEZABAD, Niasabad, or *Nieſovaia Priſtan*, in *Geography*, a town of Perſia, in the province of Schirvan, with a harbour on the Caſpian ſea; 40 miles S. of Derbend. This was formerly the moſt frequented by the Ruſſians, and chiefly viſited by the merchants of Shamakee, who ſupplied the province of Schirvan with European commodities. Near the harbour are ſeveral wretched villages. N. lat. 41° 18′.

NIF, a town of Aſiatic Turkey, in Natolia; 16 miles E. of Smyrna.

NIFAN, or Niban, a town of Arabia, in the province of Oman; 80 miles S.W. of Haſſek.

NIFFO, a town of Africa, on the Grain coaſt.

NIFO, Agostino, in *Biography*, a celebrated philoſopher and man of letters, was born either at Jopoli, in Calabria, or Seſſa, in Terra di Lavoro. Having received a good education, he quitted his father's houſe, which had been made uncomfortable to him by a mother-in-law, and went to Naples, where he undertook the inſtruction of youth. He accompanied ſome of his ſcholars to Padua, where, in 1492, he was choſen profeſſor extraordinary of philoſophy. He was afterwards advanced to the profeſſorſhip in ordinary, and to the firſt chair. During his abode at Padua he embraced the doctrine of the unity of the ſpiritual ſubſtance, and that there is only one ſoul and intellect that animates all nature. This he maintained in a treatiſe "De Intellectu et Dæmonibus," which brought on him a formidable attack from the abettors of eſtabliſhed opinions, under which he would, probably, have ſunk, had not Barazzi, biſhop of Padua, kindly interpoſed, and perſuaded him to retract certain offenſive paſſages in his work. Leaving Padua he reſided ſome time at Seſſa, where he married, and had ſeveral children, and from this, his favourite reſidence, he is frequently denominated *Sueſſanus*. His reputation was now ſpread throughout Italy, and he was ſucceſſively invited to various ſchools of learning. By the prince of Salerno he was engaged to teach philoſophy for ſome time in that city. About the year 1510 he held a chair in the univerſity of Naples. In 1513 he was invited to Rome by Leo X., who honoured him with the title of count palatine, and, at the ſame time, conferred upon him the privilege of uſing the name and arms of the Medici; he was, at one time, a profeſſor at Rome, in the college of Sapienza, and, at another, he occupied a chair at Bologna. In 1519 he removed to Piſa, where he was offered a ſalary of ſeven hundred gold florins. The prince of Salerno drew him again to that city in 1525, in which, or at Seſſa, he probably paſſed the remainder of his days. The time of his death is uncertain, ſome writers fix it in 1537, but others adduce a dedication of his to Paul III. in 1545, as a proof that he was living at that period. It is, however, generally admitted that he died in 1538. Niſo was a man of mean and forbidding aſpect, but he was a very pleaſant companion; he lived chiefly among the great, and ſeems (which happens to but few literary characters,) to have been in eaſy circumſtances, and he had a very valuable library. He wrote a great number of works relative to the peripatetic philoſophy, aſtronomy, and medicine; rhetoric, ethics, politics, &c. Commentaries and tranſlations of the works of Ariſtotle and Averrhöes compoſe the greater part of them. It is ſaid that he refuted the impoſtures of aſtrologers, and was the firſt to deliver Europe from the terrors of a deluge which had been predicted for the year 1524. Roſcoe's Life of Leo X. See alſo Bayle's Dict.

NIGANISH, in *Geography*, a town or valley on the E. coaſt of the iſland of cape Breton. N. lat. 46° 40′. W. long. 60° 15′.

NIGATA, a ſea-port of Japan, on the N. coaſt of the iſland of Niphon. N. lat. 37° 30′. E. long. 139° 10′.

NIGDEH, or Nikde, a town of Aſiatic Turkey, in Caramania, ſurrounded with walls, and defended by a caſtle; 44 miles S.E. of Akſerai. N. lat. 38° 7′. E. long. 35° 10′.

NIGELLA, in *Botany*, from *niger*, black, in alluſion to the colour of the ſeeds; it being unqueſtionably the μελανθιον of Dioſcorides, ſo called with the ſame meaning. Linn. Gen. 276. Schreb. 370. Willd. Sp. Pl. v. 2. 1248. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 3. 326. Sm. Prod. Fl. Græc. Sibth. v. 1. 373. Juſſ. 233. Tourn. t. 134. Lamarck Illuſtr. t. 488. Gærtn. t. 118. Claſs and order, *Polyandria Pentagynia*. Nat. Ord. *Multiſiliquæ*, Linn. *Ranunculaceæ*, Juſſ.

Gen.

Gen. Ch. *Cal.* none. (The floral leaves in ſome ſpecies are in danger of being miſtaken for one.) *Cor.* Petals five, ovate, flat, obtuſe, ſpreading, contracted at the baſe. Nectaries from five to ten, ſhort, ſtalked, ranged in a circle, each two-lipped; the outer or inferior lip larger, cloven, ſomewhat convex, marked with two dots; the inner ſhorter, narrower, ovate with a linear termination. *Stam.* Filaments numerous, awl-ſhaped, ſhorter than the petals; anthers compreſſed, obtuſe, erect. *Piſt.* Germens ſeveral, five or ten, ſuperior, oblong, combined, compreſſed, erect; ſtyles terminal, awl-ſhaped, angular, very long but revolute, permanent; ſtigmas longitudinal, lateral. *Peric.* Capſules as many as there were germens, oblong, compreſſed, pointed, connected by their inner margins, opening at the upper part of the inner margin. *Seeds* numerous, angular, rough.

Eſſ. Ch. Calyx none. Petals five. Nectaries from five to ten, three-cleft, two-lipped, within the petals. Capſules five, connected.

Obſ. Willdenow, by an error of the preſs, has *capſulæ convexæ*, for *connexæ*. This union of the capſules is, in ſeveral ſpecies, ſo complete, as to form apparently one ſimple globoſe ſeed-veſſel, of five cells. See Dr. Sims's excellent remarks in Curt. Mag. v. 31, under t. 1264.

Section 1. *Styles five.*

1. N. *damaſcena.* Common Fennel-flower. Love in a miſt. Devil in a buſh. Linn. Sp. Pl. 753. Curt. Mag. t. 22. (Melanthium damaſcenum; Ger. em. 1084. M. ſylveſtre; Matth. Valgr. v. 2. 152. With a double flower, Nigella flore albo multiplici; Ger. em. 1085.)—Flowers ſurrounded with a leafy involucrum. Fruit globoſe, ſmooth.—Native of corn-fields in the ſouth of Europe, and for 250 years paſt a common hardy annual in our gardens, eſpecially the double kind, varying with white or pale-blue petals. The *root* is ſmall, whitiſh. *Stem* erect, one or two feet high, branched and buſhy, ſmooth like every other part. *Leaves* alternate, doubly or triply pinnatifid, as finely cut as thoſe of Fennel, but flat; the ſegments ſpreading, linear and acute, thoſe at the bottom much crowded. *Flowers* terminal, ſolitary, encompaſſed and overtopped by a circle of leaves, much like the reſt. *Nectaries* five, alternate with the petals; their claw purple; limb green, bent upward at a right angle, with a ſpreading, purple, flat, bluntly two-lobed, hairy under lip, deſtitute of any horns or appendages. The *petals* in the double variety are multiplied, but numerous *ſtamens* remain to perform their office. The united inflated *capſules* form a ſmooth, almoſt membranous, globe, crowned with the wavy ſpreading *ſtyles*. The *ſeeds* when bruiſed have a luſcious fragrance. Gardeners keep a dwarf variety, more condenſed in its habit, with ſmall white petals.

2. N. *ariſtata.* Athenian Fennel-flower. Sm. Prod. Fl. Græc. Sibth. v. 1. 373. Fl. Græc. t. 510, unpubliſhed.—Flowers ſurrounded with a leafy involucrum. Nectaries and anthers awned. Capſules turbinate, rough.—Gathered by Dr. I. Sibthorp near Athens. This is more branched than the preceding, but the *leaves*, *flowers* and *involucrum* are ſmaller. The *petals* are heart-ſhaped, with long claws, and pointed. Under lip of the *nectaries* a beautiful object when ſomewhat magnified, being almoſt triangular, pale yellow, with a broad tranſverſe blue ſtripe bordered with purple, and having two aſcending horns in front, annulated with red; the whole clothed with long hairs. The *capſules* are oblong, triply keeled, rough with granulations, and combined merely at their inner edges, ſpreading at the top, not globoſe nor inflated, but agreeing with moſt of the following ſpecies, not at all with the preceding.

3. N. *ſativa.* Small Fennel-flower, or Gith. Linn. Sp. Pl. 753. Fl. Græc. t. 511, unpubliſhed. Zorn Ic. t. 119. (N. cretica; Bauh. Prod. 75. Melanthium ſativum; Matth. Valgr. v. 2. 151. Camer. Epit. 551. Melanthium n. 1.; Ger. em. 1084.)—Involucrum none. Fruit ſomewhat globoſe, rough. Nectaries hairy, with blunt points. Petals ovate. Leaves rather hairy.—Native of the Levant; common in Greece and the Archipelago. Dr Sibthorp determines this ſpecies to be the real μελανθιον of Dioſcorides, and records, in his manuſcripts, that the modern Greeks ſtill retain the cuſtom, mentioned by this ancient writer, of ſprinkling its ſeeds upon their bread. In England it is ſeldom cultivated but for curioſity, being leſs handſome than ſome other kinds. The *ſtem* is leſs branched, and *leaves* broader, than in either of the preceding. *Petals*, and ten *nectaries*, pale blue or nearly white, the lower lip of the latter hairy, ending in two blunt or knobbed points, and marked with a tranſverſe violet ſtripe. *Capſules* combined, nearly as in *N. damaſcena*, but rough. The *anthers* are beaked, as in the laſt.

4. N. *arvenſis.* Field Fennel-flower.—Linn. Sp. Pl. 753. Fl. Græc. t. 512, unpubliſhed. (Melanthium ſylveſtre; Ger. em. 1084. M. ſylveſtre alterum; Matth. Valgr. v. 2. 153, but not Camer. Epit. 553, which ſeems deſigned for the laſt.)—Involucrum none. Capſules turbinate, rough. Nectaries ſmooth, with blunt points. Petals heart-ſhaped.—Native of fields in Germany, France, Italy, and the iſle of Cyprus. The *ſtem* is branched copiouſly, from the very bottom. *Leaves* once or twice three-cleft, uſually rather rounder in their whole outline than any of the foregoing. *Flowers* moſt like the laſt, but ſmaller, with heart-ſhaped *petals*, and ſmooth yelloviſh *nectaries*, though the latter are marked with a ſimilar purple ſtripe, and end in knobbed points. The *fruit* moſt reſembles that of the ſecond ſpecies. The *ſeed* is ſaid to be fragrant in this, as well as in *N. ſativa*. It is ſeldom preſerved in gardens, though known here before the end of the 17th century.

Section 2. *Styles uſually ten.*

5. N. *hiſpanica.* Spaniſh Fennel-flower. Linn. Sp. Pl. 753. Curt. Mag. t. 1265. Desfont. Atlant. v. 1. t. 112. (N. hiſpanica, flore amplo; Ger. em. 1085. Moriſ. ſect. 12. t. 18. f. 9.)—Styles ten, ſpreading, the length of the petals. Segments of the nectary obtuſe.—This ſplendid ſpecies is a native of Spain and Barbary, as well as of the ſouth of France. It has for near 200 years been cultivated, as a hardy annual, in our gardens. The whole plant is larger in all its parts than any we have already deſcribed; the *ſtem* buſhy, and ſegments of the *leaves* linear-lanceolate. *Flowers* large, of a rich purpliſh blue, varying to a pale red, with dark or reddiſh *ſtamens* and *ſtyles*. The number of the latter is, we believe, conſtantly ten. The *petals* are ovate, an inch long, veiny, pale and greeniſh underneath. Lower lip of the *nectaries* hairy, variegated with crimſon, in two divaricated, blunt, or ſomewhat knobbed, lobes.

6. N. *orientalis.* Yellow Fennel-flower. Linn. Sp. Pl. 753. Curt. Mag. t. 1264. (N. piſtillis denis, corollâ longioribus; Mill. Ic. 125. t. 187. f. 1. N. chalepenſis lutea, corniculis longioribus; Moriſ. ſect. 12. t. 18. f. 10.)—Styles uſually ten, nearly erect, twice the length of the petals. Segments of the nectary acute. Seeds compreſſed, bordered.—Native of Syria. The ſeeds were ſent from Aleppo, at the end of the 17th century. This is a hardy annual, but being leſs ſtriking in appearance than the laſt, is not ſo commonly cultivated. In the gardens of Italy we have often obſerved it, ſometimes with only five ſtyles. The *ſtem* is much branched. *Leaves* narrow. *Petals* ſpatulate, acute, about half an inch long, yellow marked with green

and

and red. *Nectaries* five or more, yellow, with tranſverſe crimſon ſtripes, hairy; the ſegments of their lip acute. *Capſules* oblong, compreſſed, combined at their inner edges, about half way up. *Seeds* flattiſh, ſurrounded with a membranous border.

NIGELLA, in *Gardening*, compriſes plants of the hardy herbaceous flowering annual kind, of which the ſpecies cultivated are; the common fennel-flower (N. damaſcena); the ſmall fennel-flower (N. ſativa); the field fennel-flower (N. arvenſis); the Spaniſh fennel-flower (N. hiſpanica); and the yellow fennel-flower (N. orientalis).

The firſt ſpecies from the fine cut leaves about the flower, has the names of *Fennel-flower*, *Devil-in-a-buſh*, and *Love-in-a-miſt*; but the firſt is become obſolete.

And there is a variety of it with ſingle white flowers, and another with double flowers, which is frequently cultivated in gardens with other annuals for ornament.

Of the third there is a variety with white flowers, and another with double flowers.

And the fourth has likewiſe a variety with double flowers.

Method of Culture—Theſe plants are all increaſed by ſowing the ſeeds on light earth where the plants are to remain, as they ſeldom ſucceed well when tranſplanted, in patches at proper diſtances; and when the plants are come up, they ſhould be thinned, leaving only three or four in each patch, keeping them afterwards clear from weeds. The beſt ſeaſon for ſowing is March; but if ſome be ſown in Auguſt, ſoon after they become ripe, on a dry ſoil, and in a warm ſituation, they will abide the winter, and flower ſtrong the ſucceeding year. By ſowing the ſeeds at different times, they may be continued in beauty moſt part of the ſummer ſeaſon. As they are all annual plants they require to be raiſed every year.

But the varieties with double flowers are chiefly introduced into flower gardens.

They afford ornament and variety among other annuals in the clumps and borders of gardens and pleaſure grounds.

NIGELN, in *Geography*, a town of Pruſſia, in the province of Samland, on the Curiſch Nerung; 15 miles S. of Memel.

NIGEMOW, a town of Poland, in Galicia; 14 miles E.S.E. of Halicz.

NIGER, C. PESCENNIUS, in *Biography*, a diſtinguiſhed competitor for the Roman empire, deſcended from an equeſtrian family, ſettled at Aquinum, was brought up to the military ſervice, and paſſed through different degrees of rank, in ſuch a manner as to procure the notice and eſteem of the emperor Marcus Aurelius. Under Commodus he ſignalized himſelf in a war with the barbarians in the vicinity of the Danube, and from his conduct when ſerving againſt ſome revolters in Gaul, he was recommended to the emperor, by Septimius Severus, as a man neceſſary to the ſtate. He was afterwards raiſed to the conſulate at the particular requeſt of the troops ſerving under him, and he was in poſſeſſion of the important government of Syria, at the time of the death of Commodus, A.D. 192. The moſt ample teſtimony is given by hiſtorians to his excellence as a military commander. He puniſhed theft with the utmoſt rigour. To every thing like luxury and effeminacy in his troops he was a declared foe. He rendered every privation and ſuffering tolerable to his ſoldiers by protecting them againſt the exactions and injuſtice of their officers, and alſo by the example which he himſelf gave of ſubmiſſion to all rules of diſcipline which he had laid down. Nothing could be more abſtemious and hardy than his manner of living in the field, and he could boldly appeal to his aſſembled army whether he was ever diſtinguiſhed from thoſe who ſerved in the ranks, except by the mere circumſtance of command. He was not merely a ſoldier, but had thought maturely on ſubjects of civil adminiſtration, concerning which he would offer advice to the emperors under whom he ſerved. Such was the character of Niger, and ſo highly was he eſteemed by the ſenate and people, reſpected by the troops, and beloved by the province which he had governed with mildneſs and equity, that he ventured to declare himſelf a candidate for the empire, in the year 193, when the office of chief magiſtrate had been purchaſed by Didius Julianus. The army readily concurred in the deſign, and in conjunction with the citizens of Antioch, near which capital he then lay, ſaluted him emperor with loud acclamations. All the eaſtern provinces recognized his elevation, and the ſurrounding ſatraps ſent their congratulations. He received offers of aſſiſtance from the kings and governors in alliance with the empire; but he declined all foreign aid, in the confidence that he ſhould meet with ſufficient ſupport from the ſubjects of Rome. This confidence proved his ruin. A formidable competitor declared himſelf; this was Septimius Severus, who was at the head of the legions in Illyria, and who poſſeſſed all the vigour and policy requiſite for a conteſt. Severus attacked the army of Niger under the command of Æmilianus, and entirely defeated it; after this, the conqueror attacked the emperor himſelf, and in an obſtinate conflict, drove Niger from the field, who, with a few of his friends, fled for ſafety beyond mount Taurus. He had, previouſly to this, fortified with great care the paſſes of this ridge between Cappadocia and Cilicia, and leaving them under a ſtrong guard, he went to Antioch to levy new forces. A violent ſtorm, attended with torrents of rain, overthrew the barriers raiſed on Taurus, and the enemy penetrated into Cilicia. Niger again faced them near the Iſſus, on the very ſpot in which Alexander gained a celebrated victory over Darius. He was again defeated with the loſs of 20,000 men, and fled from the field to Antioch, which he found full of conſternation. Without ſtopping, he continued his flight, intending to take refuge among the Parthians, but being overtaken by the enemy's cavalry, he was killed before he could reach the Euphrates. This happened in the beginning of the year 195. The ſanguinary victor took vengeance upon his wife and children, whom he cauſed to be maſſacred, together with all that bore the name of the unfortunate emperor. Univer. Hiſt.

NIGER, in *Geography*, a river of Africa, deſcribed by the Moors under the name of "Nel, or Neel, el Abeed," or the river of ſlaves, and "Neel Kibbeer," and called by the Negroes "Joliba," or the Great Waters, known in the country by the name of "Guin," or "Jin," which takes its riſe at a ſmall village denominated Sankari, in the high lands of Jallonkoodoo, about ſix days' journey S.W. from Bammakoo. From this moſt elevated point in the weſtern quarter of Africa, between the fifth and ninth degrees of W. longitude, the Niger and Gambia turn, in oppoſite directions, to the eaſt and weſt. Few geographical facts have been more queſtioned in modern times than the courſe of the great inland river of Africa, generally underſtood by the name of Niger; ſome deſcribing it to run to the *weſt*, and others to the *eaſt*. The authority of Mr. Park, the African traveller, whoſe fate has been much regretted, founded on ocular demonſtration, ſets this queſtion for ever at reſt, by determining the courſe of the river to be from *weſt* to *eaſt*, an opinion which had been anticipated by the information of another traveller, Mr. Houghton. Herodotus, more than twenty-two centuries ago, deſcribes, from the information of the Africans, a great river of Africa, far removed to the ſouth of the Great Deſert, and abounding with crocodiles. From him we learn, that it flowed from weſt to

eaſt, dividing Africa, in like manner as Europe is divided by the Danube. This ancient author farther aſſerts, that the people from the borders of the Mediterranean, who made the diſcovery, were carried to a great city on the banks of this river; and that the people of this quarter were *black*, that is, much blacker than their viſitors. Although Herodotus erroneouſly ſuppoſed this river to be the remote branch of the Egyptian Nile, and reaſons on this circumſtance accordingly; this argument ſerves to expreſs, in a more forcible manner, the ſuppoſed direction of its courſe. Pliny alſo believed that the Nile came from the weſt; but he is far from identifying it with the Niger, which he deſcribes as a diſtinct river, and he ſeems to afford us a probable concluſion reſpecting its courſe, for he ſpeaks of the "Bembotus" river as running into the Weſtern ocean, meaning to expreſs by it either the Gambia or Senegal river, and not the Niger. Ptolemy is poſitive in deſcribing the Niger as a ſeparate ſtream from the Senegal and Gambia; and his Niger is made to extend from weſt to eaſt, over half the breadth of Africa, between the Atlantic ocean, and the courſe of the Nile. It is not certain who ſtarted the oppoſite opinion reſpecting the courſe of this river. Edriſi, however, in the 12th century, not only conducted the "Nile of the Negroes," or Niger, *weſtward*, and into the Atlantic, but alſo derived it from the Egyptian Nile, in direct contradiction to the opinion of Herodotus. Abulfeda followed Edriſi in the ſame erroneous opinion reſpecting the Niger; which he calls a *twin* river with that of Egypt, and alſo the Nile of Ghana. The ſentiments of the moderns ſeem to have been chiefly adopted in deference to the authority of Edriſi. Accordingly, the early Portugueſe diſcoverers adopted the ſame idea, and having deduced their knowledge of the African geography from Arabian authors, afterwards ſet the faſhion in what related to this branch of geography. So that in deſpite of Ptolemy, and of the ancients in general, the great inland river of Africa was deſcribed to run to the weſt, and to form the head of the Senegal river: nay more, it was at laſt ſuppoſed to be the parent ſtock of all the great *weſtern* rivers of Africa. The ancient and true opinion with regard to the Niger has been revived, and in ſome meaſure eſtabliſhed by the reſearches conducted under the African aſſociation: in conſequence of theſe, and the ſubſequent reports of major Houghton and of Mr. Magra, the general poſition of the ſources of the Joliba, or Niger, have been referred to the country of Manding or its vicinity. Bammakoo has been placed near the higheſt navigable point of its courſe; Sego and Jenné have been repreſented as ſituated near its banks, and its waters as ſeparated into two channels, in the quarter of Tombuctoo. Mr. Park's obſervations have eſtabliſhed theſe poſitions, and the concluſion deduced from them. The Niger, from the place of its firſt riſe, appears to run near 100 miles in a northerly courſe, before it turns finally to the eaſtward, and its courſe is ſuch as to intercept all the ſtreams that deſcend from the Kong mountains on the ſouth. At the loweſt point to which Mr. Park traced this river, and which (although about 420 Britiſh miles in direct diſtance from its ſource) could only be reckoned the early part of its courſe, it was a very conſiderable body of water; the largeſt, he ſays, which he had ſeen (in Africa), and it abounded with crocodiles. The rainy ſeaſon was but juſt begun; and the river might have been forded at Sego, where its bed expands to a vaſt breadth. Still, however, ſays major Rennell, we muſt not eſtimate the bulk of the Niger, that Niger which was in contemplation of Pliny and the Romans, by the meaſure of its bulk at Sego and Silla. If we ſuppoſe it to be the ſame river which paſſes by Kaſſina, and we know of no other, which place is 700 miles, or more, to the eaſtward of Silla, it would doubtleſs receive by the way great additional ſupplies of water, and be at leaſt a much deeper river than where Mr. Park ſaw it. To Pliny it was well known, that the Niger ſwelled periodically, like the Nile, and at the ſame ſeaſon; and this fact is alſo proved by Mr. Houghton's report and by Mr. Park's obſervations. Pliny alſo ſays, that its productions were the ſame with thoſe of the Nile.

The Niger deſcends from the high level of Manding into Bambarra, on the eaſtward, with a rapid and furious courſe, at Bammakoo, about 150 miles below its ſource; after which it glides ſmoothly along, and affords an uninterrupted navigation to Houſſa, and probably by Kaſſina to Wangara; by the two firſt of which places, a very large and navigable ſtream does certainly paſs, under the ſame name as is applied by the Arabs and Moors to the Joliba, that is, Neel Abeed, or river of ſlaves; a name that marks the idea of the people of the country through which it flows, in the minds of that people.

The courſe of the Niger, or Joliba, is eſtabliſhed, by ocular demonſtration, as far as Silla; and may alſo be admitted as far as Houſſa, about 400 miles farther to the eaſt, on the foundation of the information collected by Mr. Park, with which the reports of Mr. Magra and major Houghton agree. Thus, the firſt 700 geographical miles of its courſe are from *weſt* to *eaſt*, or rather from W.S.W. to E.N.E. It appears from various authorities, that the waters of the Niger are continued from Manding to Wangara: as far as Silla its courſe is to the eaſtward, and, without doubt, continues in the ſame direction to Houſſa, 400 miles farther to the eaſtward, if we may depend upon Mr. Park's information. Other teſtimonies are alſo decidedly in favour of an eaſterly courſe of the Niger from Houſſa to Wangara. The only remaining queſtion pertains to its termination. Many circumſtances concur to prove that the Joliba or Niger terminates in lakes in the eaſtern quarter of Africa; and thoſe lakes ſeem to be ſituated in *Wangara* and *Ghana*; which ſee reſpectively. That it does not form the *upper part* of the Egyptian Nile, may be inferred from two circumſtances; firſt, the great difference of level that muſt neceſſarily exiſt between the Niger and the Nile, admitting that the Niger reached the country of Abyſſinia. For by that time it would have ran at leaſt 2300 geographical miles, in a direct line; and near 2000 after it had deſcended to the level of the Sahara, or Great Deſert. And the Nile, at the point where the White river, (which alone can be taken for the Niger, if the above ſuppoſition be admitted,) falls in, has more than a thouſand ſuch miles to run before it reaches the ſea; and has, moreover, two or more cataracts to deſcend in its way: not to add here, that Abyſſinia is a very elevated tract. The ſecond circumſtance is, that the Niger, throughout the tract of Nigritia, in common with all the rivers of that region, ſwells with the periodical rains, and is at its higheſt pitch, when the Nile is under the like circumſtances in Egypt. Now, conſidering how long a time it would require for the waters of Nigritia to reach Egypt, the effect ought ſurely to be, that inſtead of what happens at preſent, the Nile ought to be kept up to nearly its higheſt pitch, a very long time after the Niger. But without farther enlarging, it is certain, that if the eaſtern waters do not run into the Nile, (of which there does not appear a ſhadow of probability,) they muſt either be evaporated in lakes, or loſt in ſands. The lake of Kauga offers itſelf in a poſition very convenient for the purpoſe, and a river taken by Edriſi for the Niger, is actually ſaid to paſs near it. Moreover, Agathemerus and Ptolemy concur in deſcribing the rivers of interior Africa as terminating as well as beginning

ginning within the continent. Among the eaſtern waters, the "Gir" of Ptolemy ſeems to be recognized in the river of Bornou, and its adjuncts; and the Niger in that of Tombuctoo and Wangara. The Panagra of the ſame geographer anſwers to Wangara; and his Libya Palus, which forms the termination of the Niger eaſtward, ſeems to be meant either for the largeſt of the lakes, or for the lakes of that country, of which there are ſeveral, collectively. Rennell's Proceedings of the African Aſſociation, paſſim. See GUIN and JOLIBA.

NIGHT, that part of the natural day, during which the ſun is underneath the horizon: or, night is that ſpace of time wherein the ſun is out of our hemiſphere.

Under the equator, the nights are always equal to the days. Under the poles, the night continues half a year.

The ancient Gauls and Germans divided their time not by days, but nights; as appears from Tacitus and Cæſar; and the people of Iceland and the Arabs do the ſame at this day. See DAY, HOUR, &c.

The ſame is alſo obſerved of our Saxon anceſtors.

Thus in the council of Cloveſhoe, anno 824, we read, "Ibi finita et proſcripta contentione coram epiſcopo poſt 30 noctes, illum juramentum ad Weſtminſter deductum eſt." —Whence our cuſtom of ſaying, *ſevenight*, *fortnight*, &c.

NIGHT, *Signals by*. See SIGNALS.

NIGHT-*awn-hynd*, *Third*. See THIRD.

NIGHT-*mare*. See INCUBUS.

We ſhall here obſerve that the term "night-mare" is derived from *Mara*, which in the Runic theology of the ancient Scandinavians, was a ſpirit or ſpectre of the night, that ſeized men in their ſleep, and ſuddenly deprived them of ſpeech and motion. See Keyſler, Antiquit. Sel. Septentrional, cited by Warton, in his Hiſt. of Eng. Poetry, vol. i. diſſ. 1.

NIGHT-HAWK, in *Ornithology*. See CAPRIMULGUS *Europæus*.

NIGHTINGALE, *Luſcinia* or *Philomela*, the browniſh-grey motacilla, with the annules of the knees grey. See MOTACILLA *Luſcinia*.

The nightingale derives its name from *night*, and the Saxon word *galan*, *to ſing*.

Mr. Hunter found, by diſſection, that the muſcles of the larynx are ſtronger in the nightingale than in any other bird of the ſame ſize.

This bird, the moſt famed of the feathered tribe, for the variety, length, and ſweetneſs of its notes, viſits England in April or May, and leaves us in Auguſt; and during its continuance with us, its range is confined to a part of this iſland: it is not found in Scotland, Ireland, or North Wales, nor in any of the northern countries, except Yorkſhire; and it does not migrate ſo far to the weſt as Devonſhire and Cornwall. Nightingales form their neſts of oak leaves, a few bents, and reeds. The eggs are of a deep brown. They begin their ſong in the evening, and continue it the whole night. Pennant.

NIGHTINGALE, *American*, of Edwards. See MOTACILLA *Calidris*.

NIGHTINGALE, *Mock*, or *Black-cap*. See MOTACILLA *Atricapilla*.

NIGHTINGALE, *Virginian*, the common, but improper name of a bird of the groſs-beaked kind, called by authors the *coccothrauſtes indica criſtata*: it is brought to us from Virginia, and is much valued in England for its beauty and delicate manner of ſinging; it is very fond of almonds and the like fruits. See LOXIA *Cardinalis*.

NIGHTINGALE *Iſland*, in *Geography*, a ſmall iſland in the Eaſt Indian ſea, near the S. coaſt of Madura. S. lat. 7° 15′. E. long. 114°.—Alſo, a ſmall iſland in the South Atlantic ocean, of an irregular form, with a hollow in the centre, about ſeven or eight miles in circumference. At its ſouthern extremity are ſome rocky iſlets, and on the N.E. coaſt is anchorage. S. lat. 37° 29′. W. long. 11° 48′.

NIGHTSHADE, in *Botany*. See SOLANUM.

NIGHTSHADE, *Garden*, *Solanum nigrum*, in the *Materia Medica*, is common about rubbiſh, dunghills, and in neglected gardens, producing its flowers during all the ſummer months. Its ſmell is faint and diſagreeable; but, being ſimply herbaceous, it manifeſts no peculiar flavour to the taſte. It appears to poſſeſs the deleterious qualities of the other nightſhades, in a very conſiderable degree; its odour being, as it is ſaid, ſo powerfully narcotic as to cauſe ſleep. The berries are equally poiſonous with the leaves. Three children, upon eating them, were ſuddenly ſeized with cardialgia and delirium, accompanied with ſpaſms, and remarkable diſtortions of the limbs; and to poultry they proved fatal in a ſhort time. The plant, or rather the leaves, which were boiled and eaten by a mother and four children, produced ſwellings of the face and limbs, followed by inflammation and gangrene; but the huſband, who likewiſe ate of this vegetable at the ſame time, found no conſequent diſorder. Its deleterious effects appear ſtill more certain from the experiments of Meſſrs. Gataker and Bromfield; the latter aſſerting that in doſes of one grain it had a mortal effect upon one of his patients. However, Dioſcorides and Theophraſtus mention it as an eſculent plant, and Guerin, cited by Woodville, relates, that he drank an infuſion of fifteen grains of the Solanum nigrum without ſuffering, in conſequence of it, any complaint: and that an epileptic patient took from half a dram to two drams of the expreſſed juice of the plant, without perceiving any narcotic ſymptoms; nor with ſome ſoldiers, to whom a ſtill larger doſe was given, together with two drams of the juice of the berries, was any other effect produced, than that of an increaſed quantity of urine. As this ſpecies of nightſhade is ſuppoſed to be the Ετερυχνος κηπαιος of Dioſcorides, its external uſe was reſorted to in ancient times as a diſcutient and anodyne in various affections of the ſkin, tumefactions of the glands, ulcers, and diſorders of the eyes; nor does the utility of this practice want the confirmation of later experience. With the Arabians it is a common application to burns and ulcers; and Ray alſo expreſſes a high opinion of its effects in indurations of the breaſt. The writings of the ancients afford little evidence of its internal uſe; though, according to Cæſalpinus, it appears not to have been wholly neglected. The attention of the faculty was directed to this plant in the year 1757, by Mr. Gataker, ſurgeon to the Weſtminſter hoſpital, by a publication recommending its internal uſe in old ſores, ſcrofulous and cancerous ulcers, cutaneous eruptions, and even in dropſies; all of which were much relieved, or completely cured, by the ſolanum. From his experiments it appears, that one grain of the dried leaves of the plant, infuſed in an ounce of water, ſometimes produced a conſiderable effect; that in the doſe of two or three grains it ſeldom failed to evacuate the firſt paſſages, or to increaſe very ſenſibly either the diſcharge by the ſkin, or that by the kidnies, and it not unfrequently occaſioned headache, giddineſs, dimneſs, and drowſineſs. Mr. Bromfield, who ſoon afterwards publiſhed a pamphlet on the ſame ſubject, declares, that the caſes in which he tried the ſolanum were much aggravated by it, and he therefore contends that the uſe of it is prejudicial and dangerous. Judging from the diſuſe of the ſolanum, ſince the termination of this controverſy, the opinion of Mr. Bromfield ſeems to be tacitly con-

firmed. Afterwards, *viz.* in 1764, Mr. Gataker aſcribed the efficacy of nightſhade, not to any ſpecific power, but to the evacuation produced by it. Lewis. Murray. Woodville.

NIGHTSHADE, *American*, in *Botany*, &c. See PHYTOLACCA.

NIGHTSHADE, *Baſtard*. See RIVINA.

NIGHTSHADE, *Deadly*. See ATROPA.

NIGHTSHADE, *Deadly*, in the *Materia Medica*. (See ATROPA.) Sauvages (Noſol.) ſuppoſes that the belladonna was the plant which produced ſuch ſtrange and dreadful effects upon the Roman ſoldiers, during their retreat, under the command of Antony, from the Parthians: they are ſaid by Plutarch to have ſuffered great diſtreſs for want of proviſions, and were urged to eat unknown plants; among others, they met with an herb that was mortal; he that had eaten of it loſt his memory and his ſenſes, and employed himſelf wholly in turning about all the ſtones he could find, and, after vomiting up bile, fell down dead. Shakſpeare in his Macbeth makes Banquo ſay,

> "Or have we eaten of the inſane root
> That takes the reaſon priſoner."

There is a remarkable inſtance of the direful effects of this plant recorded in Buchanan's Hiſtory of Scotland; wherein he gives an account of the deſtruction of the army of Sweno, when he invaded Scotland, by mixing a quantity of the juice of theſe berries with the drink which the Scots, by their truce, were to ſupply them with: this ſo intoxicated the Danes, that the Scots fell upon them, in their ſleep, and killed the greateſt part of them; ſo that there were ſcarcely men enough left to carry off their king. See on this article, Phil. Tranſ. vol. lx. part i. p. 62.

NIGHTSHADE, *Enchanter's*, in *Botany*. See CIRCÆA.

NIGHTSHADE, *Malabar*. See BASELLA.

NIGHTSHADE, *Three-leaved*, or Herb Puris of Canada. See TRILLIUM.

NIGHTSHADE, *Woody*, called *Bitter-ſweet*. See SOLANUM *Dulcamara*.

NIGHTSHADE, *Woody*, *Dulcamara*, in the *Materia Medica*, is a plant which grows plentifully by the ſide of hedges and in moiſt ditches, climbing upon the buſhes, with winding, woody, but brittle ſtalks. It is perennial, and flowers in June and July. The roots and ſtalks of this ſpecies, which, on firſt chewing them, yield a conſiderable bitterneſs, that is ſoon followed by an almoſt honey-like ſweetneſs, have been commended in different diſorders, as high reſolvents and deobſtruents.

Experience, ſays Dr. Lewis, has ſhewn that they are by no means equally deleterious with deadly nightſhade; that they act more regularly and uniformly; and that, without producing nervous complaints, they produce more conſiderable evacuations, eſpecially by ſtool: but, he adds, that their virtues, in particular caſes, have not yet been ſufficiently aſcertained. The younger branches, or extreme twigs, either freſh or dried, in which latter caſe their powers are ſomewhat diminiſhed, are the parts employed; and their ſenſible qualities are ſaid to be the ſtrongeſt in Autumn, when the leaves are fallen; and, therefore, they ſhould be gathered at this ſeaſon rather than in ſpring. Boiling water extracts their whole active matter; but their virtues are deſtroyed by much motion. Scheele found that they contain citric acid. Dulcamara is very generally admitted to be a medicine of very conſiderable efficacy. Murray ſays, that it promotes all the ſecretions; Haller obſerves, that it partakes of the milder powers of the nightſhade, joined to a reſolvent and ſaponaceous quality; and the opinion of Bergius ſeems to coincide with that of Murray. This author confines its uſes to rheumatiſmus, retentio menſium et lochiorum. It appears alſo, by the experiments of Razoux, and others, to have been uſed with advantage in ſome obſtinate cutaneous affections. Dr. Cullen ſays, that he has employed a decoction of the ſlender twigs in the cure of rheumatiſm, ſometimes with advantage, but at other times without any effect: he adds, that the dulcamara, in all his trials, has hardly ever been obſerved to be in any meaſure diuretic. Of the various diſeaſes in which it has been recommended, the chief inſtances enumerated by Haller and Murray are, phthiſis, lues venerea, peripneumonia notha, ſcorbutus, icterus, aſthma, &c. on the authority of Boerhaave, Sauvages, Sager, and others. Mr. Thomſon, in his "London Diſpenſatory," ſays, that it has been found uſeful in humoral aſthma, dropſy, chronic rheumatiſm, and in lepra vulgaris and alphos, pſora, and ptyriaſis. Willan ſays, that it is not applicable for the cure of lepra nigricans, and Mr. Thomſon aſſerts, that it is not of the leaſt uſe in acute rheumatiſm, nor, as he conceives, in fluor albus and ſuppreſſion of the menſes, in which caſes it has been ſtrongly recommended. This plant is generally given in decoction or infuſion, and ſometimes in the ſubſtance pulverized; and to prevent its exciting nauſea, it is ordered to be diluted with milk, and to begin with ſmall doſes, as large doſes have been found to produce very dangerous ſymptoms, ſuch as vomiting, convulſions, and delirium, violent palpitation, and a palſy of the tongue. Razoux gives the following preſcription; ℞ Stipitum dulcam. rec. drac. ſſ. in aquæ font unc. 16 coquatur ad unc. 8. This was taken in the doſe of three or four drams, diluted with an equal quantity of milk every four hours. Linnæus directs two drams or half an ounce of the dried ſtipites to be infuſed half an hour in boiling water, and then to be boiled ten minutes; and of this decoction he gave two tea-cups full morning and evening. In the London Pharmacopeia the decoction is directed to be prepared by boiling down one ounce of the ſtalks ſliced in one and a half pint of water to a pint and ſtraining. The doſe is from f℥iv. to f℥j, combined with any aromatic tincture, given thrice a day. The extract of belladonna is prepared by bruiſing a pound of the freſh leaves in a ſtone-mortar, ſprinkling over them a little water; then expreſſing the juice, and, without any ſeparation of the ſediment, evaporating it to a proper conſiſtence. The inſpiſſated juice of the Edinburgh Pharmacopeia is prepared by bruiſing the freſh leaves, incloſing them in a hempen bag, and preſſing them ſtrongly, until they yield their juice, which is to be evaporated in flat veſſels, heated with boiling water ſaturated with muriate of ſoda (common ſalt), and immediately reducing to the conſiſtence of thick honey: and when the maſs is cold putting it into glazed earthen veſſels, and moiſtening with alcohol. The medicinal properties of this extract are the ſame as thoſe of the plant, but weaker. The doſe is from gr. j. gradually increaſed to grs. v., given in the form of pills. The doſe of the powder may be from grs. x. to ℥i, taken in a cupful of milk. The berries have not yet been applied to medical uſe. They ripen in September and October; they are very juicy, bitter, and poiſonous. As they are very common in the hedges, and may be eaſily miſtaken by children for red currants, which they ſomewhat reſemble, their deleterious effects are the more worthy of notice. Lewis. Mat. Med. Woodv. Med. Bot.

NIGHTWALKERS, in a *legal* ſenſe, are ſuch perſons as ſleep by day and walk by night, being oftentimes pilferers or diſturbers of the peace.

5 Ed. III. cap. 14. Conſtables are authoriſed by the common

mon law to arreſt nightwalkers, and ſuſpicious perſons, &c. Watchmen may alſo arreſt nightwalkers, and hold them until morning: and, it is ſaid, that a private perſon may arreſt any ſuſpicious nightwalker, and detain him till he give a good account of himſelf. (2 Hal. P.C. 98.) One may be bound to the good behaviour for being a nightwalker; and common nightwalkers and haunters of bawdy-houſes are to be indicted before juſtices of peace, &c. But it is held not lawful for conſtable, &c. to take up any woman, as a nightwalker, on bare ſuſpicion only of being of ill fame, unleſs ſhe be guilty of a breach of the peace, or ſome other unlawful act.

NIGHTWALKERS, in a *phyſical* ſenſe. See NOCTAMBULATIO.

NIGIDIUS FIGULUS, PUBLIUS, in *Biography*, one of the moſt learned men of ancient Rome, the contemporary and friend of Cicero, was a profeſſed advocate for the doctrines advanced and defined by Pythagoras. He is repreſented by Cicero as an accurate and penetrating enquirer into nature, and as one to whom is to be aſcribed the revival of that philoſophy which had formerly flouriſhed for ſeveral ages in the Pythagorean ſchools, both in Italy and Sicily. He was alſo a conſiderable proficient in mathematical and aſtronomical learning, but like his maſter applied the knowledge of nature to the purpoſes of impoſture. He held frequent diſputations with Cicero and his friends on philoſophical ſubjects. His attachment to ſcience did not prevent him from engaging in civil affairs, and aſpiring to poſts of honour and authority in the ſtate. Cicero was indebted to him for conſiderable aſſiſtance in unravelling and defeating Cataline's conſpiracy, and he alſo received important ſervices from him in the time of his adverſity. Nigidius, in the civil war between Pompey and Cæſar, attached himſelf to the party of the former, and upon Cæſar's acceſſion to the ſupreme power, he was baniſhed from Rome, and died in a ſtate of exile. He wrote ſeveral books on various ſubjects, of which fragments only have come to our hands, which may be ſeen in the "Variæ Lectiones" of Janus Rutgers: and in the "Comment. de Hiſt." by Anthony Ricoboni. After the time of Nigidius the Pythagorean doctrine was much neglected, few perſons being able to decypher, with accuracy, the obſcure dogmas of this myſterious ſect. Enfield's Hiſt. of Phil. vol. ii. Univer. Hiſt.

NIGLARIEN, in *Greek Muſic*, the name of a languid and effeminate nome or chant, with which Ariſtophanes reproaches its author, Philoxenes.

NIGONO, in *Geography*, a town of Italy, in the department of the Panaro; 22 miles S.W. of Modena.

NIGRINA, in *Botany*, a name alluding to the univerſal blackneſs aſſumed by the plants in drying, has been applied by Thunberg to two very different things, the MELASMA of Bergius, and the CHLORANTHUS of Swartz; ſee thoſe articles.

NIGRITIA, in *Geography*. See NEGROLAND.

NIGRITIES OSSIUM, among the ancients. See CARIES.

NIGUMBO, in *Geography*. See NEGOMBO.

NIHIL, NIHILUM, *Nothing*, among the ſchool philoſophers, is what has no real eſſe, and which is only conceived negatively, and denominated by a negative.

NIHIL *Capiat per Billam*, or *per breve*, in *Law*, is a form uſed when judgment is given againſt the plaintiff, ſo as to bar his action, or overthrow his writ or bill.

NIHIL, or *Nil debet*, is the uſual plea in an action of debt; but it is no plea in an action of covenant, or breach aſſigned for non-payment of rent, &c.

NIHIL *Dicit* is a failing of a defendant to put in an anſwer to the plaintiff's plea by the day aſſigned; on which omiſſion judgment is given againſt him of courſe, *quod nihil dicit*, becauſe he alleges nothing to the contrary.

NIHIL, or *Nihili album*, in *Botany*. See POMPHOLYX.

NIHILS, or NICHILS, in *Law*, iſſues which the ſheriff, that is appoſed in the exchequer, ſays are nothing worth, and illeviable; from the inſufficiency of the parties that ſhould pay them.

NIHILS, *Clerk of the, nihilorum clericus*. See CLERK and EXCHEQUER.

NIJAR, in *Geography*, a town of Spain, in the province of Granada; 12 miles N.E. of Almeria.

NIKA, a town of Perſia, in Mazanderan; 15 miles S.E. of Fehrabad.

NIKALINZIN, a town of Poland, in Galicia; 44 miles S. of Halicz.

NIKERA, a river of Guiana, which runs into the Atlantic, N. lat. 6°. W. long. 57° 20'.

NIKIA, a town of European Turkey, in Macedonia; 26 miles S.E. of Akrida.

NIKIOPING, or NYKOPING, *i. e. New Mart*, a ſea-port of Sweden, and capital of Sudermanland, ſituated at the mouth of a river, near the Baltic. The town is well built, and is one of the moſt ancient cities in Sweden, having formerly been the reſidence of the kings and princes of Sudermanland. Its air is ſo mild and ſalubrious, that the court and its attendants have removed hither from Stockholm in a time of contagion. The number of its inhabitants exceeds 12,000; and the city is nearly biſected by a large river, over which a ſtone bridge was erected in 1728. This town, which has ſuffered much by fire, the ravages of the Ruſſians, and the decays of time, has two handſome churches, a commodious harbour, ſeveral manufactories of cloth and Morocco leather, a braſs hammer-mill, and carries on a conſiderable trade by ſea. Its chief magiſtrates are two burgo-maſters. The governor of Sudermanland reſides in this city. The Swediſh language is ſuppoſed to be ſpoken in its greateſt purity at Nikioping and its vicinity. Without this town is a royal encloſure, and the adjacent country is very fertile; 50 miles S.W. of Stockholm. N. lat. 58° 45'. E. long. 16° 53'.

NIKITSK, a town of Ruſſia, in the government of Moſcow; 20 miles S.E. of Moſcow.

NIKLE', a town of Egypt, on the left branch of the Nile; 10 miles S. of Faoué.

NIKMID, or NICKMID. See ISMID.

NIKOLAEVSKOI, a town of Ruſſia, in the government of Vologda; 36 miles S.E. of Totma.—Alſo, a town of Ruſſia, in the government of Tobolſk, on the Undebs; 60 miles E.S.E. of Tomſk.—Alſo, a town of Ruſſia, in the laſt-named government; 72 miles S.E. of Eniſeiſk.

NIKOLAI, or NIKOLOW, a town of Sileſia, in the lordſhip of Pleſz; 12 miles N. of Pleſz. N. lat. 50° 8'. E. long. 18° 50'.

NIKOLAJEV, a town of Ruſſia, in the government of Ekaterinoſlav, on the Ingul, near the Bog. This town was founded in 1791, and has ſince increaſed ſo rapidly, that the admiralty has been removed hither from Cherſon; 63 miles N.W. of Cherſon. N. lat. 46° 54'. E. long. 31° 55'.

NIKOLSK, a town of Ruſſia, in the government of Vologda, and province of Uſting, on the Jug; ſix miles S. of Uſting. N. lat. 59° 55'. E. long. 45° 34'.

NIKOLSKOI, a town of Ruſſia, in the government of Archangel; 52 miles W.S.W. of Archangel.—Alſo, a town of Ruſſia, in the government of Archangel, on the Onega; 72 miles S.E. of Oneg.—Alſo, a town of Ruſſia, in the government

government of Archangel; 52 miles S. of Mezen.—Alſo, a town of Ruſſia, in the government of Vologda; 24 miles S.S.E. of Vologda.—Alſo, a town of Ruſſia, in the government of Upha, on the Ural; 80 miles E.S.E. of Orenburg.—Alſo, a town of Ruſſia, in the government of Tobolſk; 40 miles N. of Tomſk.

NIKSAR. See NICSAR.

NIL, in *Botany*, a name given by the Arabians to two very different ſeeds, which are often, by this means, miſtaken in their writings one for another. Avicenna tells us, firſt, that nil is the ſeed of a creeping plant, of the bindweed kind, and that this plant had blue flowers, like the campanules, or bell-flowers; but, in another place, he tells us, that nil is the name of a plant uſed in dyeing, which ſeems to be the ſame with our *iſatis*, or woad.

It is probable, that the convolvulus, or bindweed, called nil, obtained this name only from its flower being of the ſame colour with the fine blue pigment obtained from the other nil, or woad.

NIL *habuit in tenementis*, in *Law*, a plea to be brought in an action of debt only, brought by a leſſor againſt a leſſee, for years, or at will, without deed.

NILAB, in *Geography*, a name given to the river Indus, or Sinde, in Thibet.

NILACUNDI, in *Natural Hiſtory*, a name given to a ſtone of the gem kind, which is half a ſapphire and half a ruby.

The word *nilaa* is the Indian name for the ſapphire, derived from the word *nil*, the name of indigo, and given to this gem becauſe of its fine blue colour, which approaches to the tinge of the pigment. The latter part of the word is not eaſily accounted for, without making a little variation in the ſpelling, but with that, is very clear and eaſy. *Jacut*, or *jacuti*, and, as ſome ſpeak it, *jacunti*, is the name given by the Indians to the ruby, and it is only ſuppoſing the word to be properly *niljacunti*, and it expreſſes, in their own language, exactly what we underſtand by it, a ſtone part ſapphire and part ruby.

NILAHUMATU, in *Botany*, a name given by ſeveral authors to the ſmooth-fruited ſtramonium of Malabar.

NILAS, in *Geography*, a town of Mexico, in the province of Culiacan; 50 miles N.E. of Culiacan.

NIL-CUND, a town of Thibet; 75 miles N. of Catmandu. N. lat. 29° 18′. E. long. 84° 57′.

NILE, a famous river of Africa, which riſes in the Gebel-el-Kumr, or mountains of the moon, in a diſtrict called *Donga*, (which ſee,) N. lat. 8°. It is firſt known by the name of BAHR *el-Abiad*, (which ſee,) or the White river, and about N. lat. 16° is joined by the BAHR-*el-Azrek*, (which ſee,) or the Blue river; the former tinged, and the latter clear, as is the caſe with reſpect to the Maranon and the Miſſouri; and which after ſeveral windings and turnings, and being united with various other ſtreams, enters Egypt at Aſſouan or Syene. In its courſe it waſhes the walls of many cities and towns, and having divided Egypt into two parts, it diſcharges itſelf by ſeven mouths into the Mediterranean, N. lat. 31° 25′. The comparative courſe of the Nile may be eſtimated at about 2000 Britiſh miles, thus rivalling the longeſt Aſiatic rivers, and being only exceeded by the Ob, Kian-ku, and Hoan ho, and alſo by the Maranon, and probably by the Miſſouri. This river forms ſome conſiderable cataracts, the chief of which is that of Granadil in Nubia, N lat. 22°, before it gains the level of Egypt, after paſſing ſome rapids to the S. of Syene. Alvarez has long ago obſerved, that the riſe of the Nile in Egypt is occaſioned by the violent rains, which, during the ſummer, deluge the ſouthern regions; and he might alſo have added the melting of the ſnow on the African alps, which give ſource to the real Nile, or Bahr-el-Abiad; for as the Atlas is covered with perpetual ſnow, which alſo crowns the Andes under the equator, it is probable, that the central ridge of Africa preſents the ſame features, and that an ancient geographer might have been frozen to death in his torrid zone. Beſides, Abyſſinia, through which the Abyſſinian Nile, or Bahr-el-Azrek paſſes, is one of the moſt mountainous and precipitous countries in the world. The fertility of Egypt, which is for the greateſt part a narrow vale, through which the Nile paſſes, has been generally aſcribed to the inundations of this river; but this is applicable in a ſtrict ſenſe only to parts of the Delta; whereas, in other diſtricts there are canals, and the adjacent lands are generally watered by machines. Mr. Gray's deſcription of Egypt, as immerſed under the influx of the Nile, though exquiſitely poetical, is far from being juſt. In Upper Egypt the river is confined by high banks, which prevent any inundation into the adjacent country. This is alſo the caſe in Lower Egypt, except at the extremities of the Delta, where the Nile is never more than a few feet below the ſurface of the ground, and where of courſe inundation takes place. But the country, as we may imagine, is without habitations. The fertility of Egypt, ſays Mr. Browne, the intelligent and obſerving traveller now cited, ariſes from human art. The lands near the river are watered by machines; and if they extend to any width, canals have been cut. The ſoil in general is ſo rich as to require no manure. It is a pure black mould free from ſtones, and of a very tenacious unctuous nature. When left uncultivated, fiſſures have been obſerved, ariſing from extreme heat, of ſuch depth that a ſpear of ſix feet could not reach the bottom. Rain in Egypt is a very uncommon phenomenon; the heat alſo is extreme, particularly from March to November; and as a ſupply of water was ſo deſirable, we need not wonder that the uſual period of the Nile's inundation ſhould be expected with ſo much anxiety, and that inſtruments ſhould be conſtructed for meaſuring its increaſe. (See NILOMETER.) Until the ſummer ſolſtice, this increaſe is not much perceived, but it continues advancing till near the end of Auguſt, and often even in September. The greateſt breadth of this majeſtic river may be computed at 2000 feet, or about one-third of a mile. Its motion is even ſlower than that of the Thames, and does not exceed three miles an hour. The water is always muddy; in April and May, when it is cleareſt, it has ſtill a cloudy hue; when it overflows, the colour is a dirty red. It is purified before it is drank; and for this purpoſe bitter almonds pulverized are mixed in a jar of water, and turned about for ſome minutes: it is then left to ſettle, and in five or ſix hours the heterogeneous particles ſubſide to the bottom of the veſſel, and the water becomes limpid and excellent. The Nile abounds with a variety of fiſh; ſuch as the bûlti or labrus niloticus, kelb-el-bahr, farbân, charmût, a round fiſh about eight inches long, and ſaid to be poiſonous, taban-el-bahr, or eel, *i. e.* muræna anguilla, and nefâſh, apparently a ſpecies of ſalmon, and found of a very large ſize. The oxyrynchus is alſo famous in the antiquities of Egypt, and according to D'Anville is the fiſh now called keſhee. The beſt is the bûlti, ſomewhat like the white trout, but ſometimes attaining to the weight of fifty pounds. Except good and large eels, none of the fiſh have a ſtrict ſimilitude of the European. Among ſeveral kinds of water-fowl which frequent the Nile, we may mention the large fowl, here called the Turkey gooſe, or Anas nilotica, the fleſh of which is palatable and ſalubrious food. From Cairo to Aſſouan,

Aſſouan, about 360 miles, the banks, except where they are rocky, preſent no natural plant; they ſomewhat reſemble the ſteps of ſtairs, and are ſown with all ſorts of eſculent vegetables, chiefly that uſeful plant the "bamea," which grows to little more than three feet in height, with leaves like thoſe of the currant-buſh, and produces oblong aculeated pods, which yield a pleaſant flavour to the repaſt. Other ſtriking and ancient features of this diſtinguiſhed ſtream, are the rafts of "belaſſes," or large white jars, uſed for carrying water; little rafts of gourds, in which a ſingle perſon conducts himſelf with great philoſophical dignity acroſs the ſtream; and the divers who, concealing their heads in pumpkins, approach the water-fowl unperceived, and ſeize them by the legs. The hippopotamus Mr. Browne never ſaw or heard of in Egypt; in Nubia they are ſaid to abound. The crocodiles are reduced in number, and are confined to the diſtrict above Aſſiût, where they are dangerous to bathers. It is not eaſy, we are told, to conceive a more pleaſurable mode of travelling than that by the Nile when it overflows. The great body of water, perfectly calm and unruffled, the banks on each ſide covered with the rich product of the huſbandman's labour, form a ſcene in every ſenſe alluring. The paſſengers are protected by a ſimple awning of branches from the immediate action of the ſun, and the great heat of the tropical latitude is aſſuaged by a gentle breeze, which generally continues during four or five meridian hours. The mariners chant reſponſive to the motion of their oars; and the veſſel offers an apt emblem of ſmiling fortune in her moſt proſperous career. The narrow vale through which the Nile purſues its courſe in Egypt, is bounded on either ſide with barren rocks and mountains. The towns and cultivation are chiefly on the eaſtern bank; behind which are vaſt ranges of mountains extending to the Arabian gulf, abounding with marble and porphyry, but almoſt deſtitute of water, and inhabited only by Bedouins. Acroſs theſe mountains is a ſolitary road to Coſſeir on the Red ſea. On the weſt the hills lead to a vaſt ſandy deſert, in which are the two Oaſes, a name applied to iſlands ſituated in ſand.

The ſources of the Nile, and the cauſes of its inundation and fertilizing powers, have been ſubjects of ſpeculation and of hiſtorical detail from almoſt the remoteſt period of antiquity. Our limits forbid our entering on a detail of the different conjectures of ancient writers; eſpecially as we have obtained more ſatisfactory information with regard to theſe particulars from modern travellers. Thoſe who wiſh to acquaint themſelves with the opinions of the ancients, may conſult Herodotus, Diodorus Siculus, Strabo, and Pliny. (See DELTA, EGYPT, and NILOMETER.) The Nile during the three months of its inundation ſupplies Egypt, without the aid of rain, with a ſufficient quantity of water for the reſt of the year; and as it thus facilitates, or rather in a conſiderable degree ſuperſedes labour, it has been ſtyled the ſource of plenty and happineſs, and even of life itſelf. If Albuberque, the Portugueſe, had been able to execute his project of turning its courſe from Ethiopia into the Red ſea, this country, which is now ſo rich, would have become a ſavage deſert, ſurrounded by ſolitudes. We need not wonder, therefore, that the Egyptians ſhould always have profeſſed, and that they ſhould ſtill retain a kind of religious veneration for the Nile. They have called it holy, bleſſed, and ſacred: and on the appearance of the new waters, that is, on the opening of the canals, mothers are ſeen plunging their children into the ſtream, from a belief that theſe waters have a purifying and divine virtue, ſuch as the ancients are ſaid to have attributed to every river.

The Nile was reckoned in the number of the great gods of the Egyptians. To this beautiful river they gave the name of Oceanus, Ypeus, and Nilus; and it was alſo denominated Siris, which, by abbreviation, is the ſame name with Oſiris, becauſe in reality it repreſented that god. Of all the feſtivals they celebrated in honour of this river, that of opening the canals, at the time of its inundation, was the moſt ſolemn and magnificent. At this feſtival the ancient kings of Egypt aſſiſted in perſon, accompanied by their miniſters, by all the grandees of the kingdom, and by an innumerable multitude of people. They anticipated their obligations to this river for the benefits which its inundation was to produce, by throwing into it, in the form of ſacrifice, barley, corn, ſugar, and other fruits. It is ſaid that on this joyful occaſion, they made a ſacrifice of a young virgin, whom they drowned in this river. A cuſtom ſtill ſubſiſting at this day, ſays Savary, ſeems to prove that the Egyptians formerly ſacrificed a young virgin to the god of the Nile; for they now make a ſtatue of earth in the ſhape of a girl, to which they give the name of "the betrothed bride," upon the dyke of the "Khalig of the Prince of the Faithful," which they throw into the river previouſly to the opening of the canal. At the feſtival, when this cuſtom is obſerved, the pacha deſcends from the caſtle, accompanied by his whole court, and repairs in pomp to Foſtat, where the canal commences that traverſes Grand Cairo. (See CAIRO.) He places himſelf under a magnificent pavilion, prepared at the head of the dyke. The beys, preceded by their muſic, and followed by their mamelukes, compoſe his retinue: the chiefs of their religion appear mounted on horſes richly capariſoned. All the inhabitants on horſeback, on foot and in boats, are anxious to aſſiſt at this ceremony. The land and the water are covered by upwards of 300,000 men. The boats are in general agreeably painted, well carved, and ornamented with canopies and flags of different colours. Thoſe of the women are diſtinguiſhed by their elegance, their richneſs, the gilded columns that ſupport the canopy, and above all, by the blinds let down over the windows. Every body remains ſilent until the moment when the pacha gives the ſignal. In an inſtant the air is filled with ſhouts of joy, the trumpets ſound a flouriſh, and the timbrels and other inſtruments reſound from every ſide. When the dam is deſtroyed, and the waters flow towards Grand Cairo, the viceroy throws into the canal pieces of gold and ſilver, which are picked up by ſkilful divers. During the amuſements of this day the inhabitants ſeem to be in a ſtate of intoxication. Mutual compliments and congratulations paſs, and on every ſide are heard ſongs of thankſgiving. A crowd of dancing girls run along the banks of the Khalig, and enliven the ſpectators by their laſcivous dances. The ſucceeding nights, after the canal has filled the great ſquares of the capital, afford more agreeable ſpectacles. In the evening each family is collected in boats, ornamented with carpets and rich cuſhions; the ſtreets, the moſques, and the minarets are illuminated. The largeſt ſquare in the city, nearly half a league in circumference, forms an immenſe baſon, ſurrounded by the palaces of the beys, lighted with lamps of various colours. Several thouſand boats with maſts, from which lamps are ſuſpended, produce a moving illumination, the aſpects of which are continually varying. The coolneſs of the night, the ſerenity of the ſky, and various other circumſtances, concur to render the ſcene intereſting and delightful. The Egyptians, according to Maximus Tyrius, worſhipped the Nile on account of its uſefulneſs.

NILEMBI NEUR, a town of the iſland of Ceylon, in the dominions of Candy, about ſix or ſeven miles S. of Candy; whither

whither the king occaſionally retreats, and where he has a palace and ſtore-houſes.

NILIACUM MEL, a name by which the ancients expreſſed the very fineſt honey.

NILOMETER, or NILOSCOPE, an inſtrument uſed among the ancients to meaſure the height of the water of the river Nile, in its overflowings.

Ths word comes from Νειλος, *Nile* (and that from νεα ιλυς, *new mud*, or, as ſome others will have it, from νεω, *I flow*, and ιλυς, *mud*), and μετρον, *meaſure*. The Greeks more ordinarily call it Νειλοσκοπιον. It is called by the Arabians *Mekias*, denoting meaſure.

The nilometer is ſaid by ſeveral Arabian writers to have been firſt ſet up, for this purpoſe, by Joſeph, during his regency in Egypt: the meaſure of it was ſixteen cubits, this being the height of the increaſe of the Nile, which was neceſſary to the fruitfulneſs of Egypt.

From the meaſure of this column, Dr. Cumberland deduces an argument, in order to prove that the Jewiſh and Egyptian cubit were of the ſame length. Scripture Weights and Meaſures, p. 18.

In the time of Herodotus 16, or at leaſt 15 cubits were neceſſary to overflow the *Delta* (which ſee): the ſame number of cubits was the ſtandard meaſure in the time of the Romans. Before the time of Petronius, as we learn from Strabo, plenty was not known in the Delta unleſs the Nile roſe to 14 cubits. A book in Arabic ſtill exiſts, entitled "Nil ſi alnel al Nil," which contains a table of all the riſings of the Nile from the firſt year of the Hegira (A. D. 622), down to the year 875 (A. D. 1470); and this work aſcertains that in the lateſt times, as often as the Nile has 14 cubits depth in its channel, there is a harveſt ſufficient for the year; that, if it reaches 16, there is ſufficient for two years; but when it falls ſhort of 14, or exceeds 18, famine enſues, and this account correſponds exactly with that of Herodotus. The contents of this Arabic book may be known by thoſe who conſult the word *Nile* in the Bibliotheque Orientale of D'Herbelot, or the extracts from Kalkafendas, in Dr. Shaw's Travels. M. Volney obſerves, that the meaſure of theſe cubits is not uncertain. Fréret, D'Anville, and M. Bailli, have proved, that the Egyptian cubit, being invariably 24 digits, is equal to $20\frac{1}{2}$ French inches, and the preſent cubit, called "Draa Maſri," is preciſely divided into 24 digits, and contains $20\frac{1}{2}$ French inches. But the columns by which the riſe of the Nile is meaſured have undergone an alteration. Until the time of Omar, the meaſuring column, called the nilometer, had been divided into cubits of 24 digits each; but in order to remedy certain irregularities, which had been found very diſadvantageous to commerce, he ordered this nilometer to be deſtroyed, and ſubſtituting another in its place, which he erected in the iſland of Raouda, he commanded that the 12 lower cubits ſhould conſiſt of 28 digits inſtead of 24, while the upper remained the ſame as before: hence, when the riſe of the Nile appeared by the column to be 12 cubits, it was really 14; for theſe 12 cubits being each of them four digits too long, there was an exceſs of 48 digits, or two cubits. Conſequently, when 14 cubits, the meaſure of a ſufficient harveſt, were proclaimed, the inundation was really at the height for plenty, and the multitude, always deceived by words, never ſuſpected the impoſition. But this alteration could not eſcape the Arabian hiſtorians, who tell us, that the columns of the Saide, or Upper Egypt, continued to be divided by 24 digits; that the height of 18 cubits (according to the old reckoning) was always injurious; and that 19 was very rare, and almoſt a prodigy. Nothing, therefore, is leſs certain than the progreſſive changes here alleged; and which are rendered improbable by a known fact, which is, that in the long period of 18 centuries the riſe of the Nile never varied. Whence then is the preſent difference? How can it ſo ſoon have altered from 15 to 22 cubits, ſince the year 1473? This is owing, as Volney apprehends, not to phyſical changes, but to other circumſtances. It is not the Nile, but the column and meaſures which have varied. Of this fact Pocock and Niebuhr have given ſufficient evidence. If we advert to the account of Herodotus, he ſays that according to the report of the Egyptian prieſts the Nile inundated the Delta, in the time of Mœris, if it only roſe to eight cubits. In order to ſolve this difficulty, it ſhould be conſidered, that ſubſequent to this prince, an alteration took place in the meaſure of the country, and one cubit was made into two. It will be proper likewiſe to obſerve, that the degrees of inundation are not the ſame through all Egypt, on the contrary, a gradual diminution takes place as the river approaches the ſea. At Aſſouan or Syene the overflow is more conſiderable by one-ſixth than at Grand Cairo; and when the depth of water, at this latter city, is 27 feet, it is ſcarcely four at Roſetta and Damietta. The reaſon of this is, that beſides the quantity of water abſorbed by the grounds, as it flows, the river, confined in one ſingle bed, and within a narrow valley, riſes higher in the upper country; whereas, when it has paſſed Cairo, being no longer obſtructed by the mountains, and ſeparating into a great number of branches, it neceſſarily loſes in depth what it acquires in ſurface. Volney's Travels, vol. i.

Herodotus mentions a column erected in a point of the iſland of Delta, to ſerve as a Nilometer: and there is ſtill one of the ſame kind in a moſque of the ſame place.

The Nilometer at the point of the iſle of Raouda is thus deſcribed by Savary. It is a lofty pillar of marble in the middle of a baſin, the bottom of which is on a level with the bed of the Nile. It is graduated through its whole length, and divided into cubits and inches. A Corinthian capital, on which reſts a beam, that ſupports a gallery, crowns this column. When the inundation commences, the waters enter the baſon by a conduit; the public cryers then examine the pillar every morning, and publiſh the daily increaſe of the river in all the ſtreets of Cairo. When it reaches 16 cubits, the dyke, which cloſes the canal of the "Prince of the Faithful," is cut with great ceremony; and the Nile flows acroſs the town, amidſt the acclamations of the people, who make the cryers a ſmall acknowledgment. As Egypt owes no tribute to the grand ſeignior when the waters do not riſe to 16 cubits, they often conceal the truth, and do not publiſh their attainment of a certain point, even when they have paſſed it. See NILE.

Before the Arabian conqueſt of Egypt, the Nilometer was placed in the town of "Halouan," five leagues to the ſouthward of Foſtat, oppoſite to the ancient Memphis, which, at the time of this conqueſt, was the reſidence of the governors of Egypt. In the year 92 of the Hegira, this mekias was overturned, and the caliph ordered another to be erected in the iſland between Foſtat and Gizé. One hundred and forty years after, this Nilometer fell, and the emperor Elmetouakkel built another in the ſame place, which was called the "New Mekias." This Nilometer is now exiſting.

As all the riches of Egypt ariſe from the inundations of the Nile, the Egyptians uſed to ſupplicate them at the hands of their Serapis; and committed the moſt execrable crimes, as actions forſooth of religion, to obtain the favour. This occaſioned

occaſioned Conſtantine expreſsly to prohibit theſe ſacrifices, &c. and to order the Nilometer to be removed into the church; whereas, till that time, it had been in the temple of Serapis. Julian the Apoſtate had it replaced in the temple, where it continued till the time of the great Theodoſius. See, on the ſubject of Nilometers, the Acta Eruditorum Lipſ. anno. 1686, p. 147.

NILUFAR, in *Botany*, a name given by the ancient writers to the common water-lily. They diſtinguiſhed this plant by that name, from the Indian nymphæa, whoſe root was of a cold and ſoporific virtue, like that of the mandrake. This they call always *nenufar*.

NILUS, in *Ancient Geography*, an interior country of Arabia, which furniſhed myrrh and incenſe, according to Strabo, l. xvi.

NIMBO-ETCHAUK, in *Geography*, a town of Bengal; 36 miles N.W. of Ramgur.

NIMBURG, or NIEMBURG, a town of Bohemia, in the circle of Boleſlaw, near the Elbe; 26 miles E.N.E. of Prague. N. lat. 50° 8′. E. long 15° 6′.

NIMBUS, among the Romans, a ſcarf embroidered with gold, which women wore on their foreheads.

NIMBUS was likewiſe uſed for the money thrown among the people on any public occaſion.

NIMBUS, in *Antiquity*, a circle obſerved on certain medals, around the heads of ſome emperors; anſwering to the areolæ, or circles of light, drawn around the images of ſaints. See MEDAL.

The nimbus is ſeen on the medals of Maurice, Phocas, and others even of the upper empire.

NIMEGUEN, or NIMMEGEN, in *Geography*, a very ancient, rich, ſtrong, and populous city of Holland, on the S. ſide of the Wahab, ſaid to have taken its name from Magus, king of the Gauls. It is the capital of the Lower Guelderland, and was anciently the capital of the whole duchy: it is alſo the chief town of Betuwa, or Batavia, the country of the Batavi. It has thirteen gates, and is defended by an ancient fortreſs, called Vlack-Hof, ſuppoſed to have been built about the time of Julius Cæſar; and ſeveral other fortifications. It was anciently a free city; and after Charlemagne had rebuilt the caſtle in the year 775, he made this the ſecond imperial city of Lower Germany; Aix-la-Chapelle being the firſt, and Thionville the third. It was ſeparated from the empire by William III., king of the Romans, and united to the comté of Holland in 1248, but ſold by him in 1270, together with its territory, to Otho III., comte of Gueldres, whoſe ſucceſſors remained maſters of it till the ſtates of Holland revolted againſt Spain. It was taken by the French in 1672, and after two years' poſſeſſion, abandoned. The churches of Nimeguen are in general handſome ſtructures; and the town-houſe is remarkable for its beauty and magnificence. The town was taken by the French in 1794; 50 miles S.E. of Amſterdam. N. lat. 51° 53′. E. long. 5° 47′.

NIMES, or NEMS, a town of Bohemia, in the circle of Boleſlaw; 38 miles N. of Prague.

NIMES. See NISMES.

NIMETACUM, in *Ancient Geography*, a town in the Itinerary of Antonine, on the route from Caſtellum to Colonia Agrippina, between Minariacum and Camaracum; 18 miles from the former, and 14 from the latter.

NIMETULAHITES, a kind of religious among the Turks, ſo called from *Nimetulahi*, their inſtitutor.

When a Turk would be admitted into the order, he is to ſhut himſelf up cloſe in a chamber forty days, reſtricted to four ounces of food *per* day. The term expired, the Nimetulahites take him by the hand, and lead him a Mooriſh dance, accompanied with an infinity of ridiculous geſticulations, till the violence of the exerciſe, with his former regimen, throws him down on the ground. This fall is conſtrued an extacy, during which he is ſuppoſed to have a viſion.

The Nimetulahites meet every Monday in the night-time, and ſing hymns to God, &c.

NIMGOUTA, in *Geography*, a town of Chineſe Tartary, in the government of Kirin. N. lat. 44° 23′. E. long. 129° 21′.

NIMIQUIPAR, a town of New Mexico, in the province of Hiaqui; 156 miles E. of Riochico.

NIMPHÆUM, in *Ancient Geography*, *Kerche*, a town of the Tauric Cherſoneſus, having, according to Strabo, a good port. It was ſituated N.W. of Acra, nearly E. of Zephyrium, and S.S.W. of the Boſphorus or Panticapæum.

NIMPTSCH, in *Geography*, a town of Sileſia, in the principality of Brieg, near the Lohe, with a caſtle on an eminence. The Roman Catholics and the Lutherans have each a church; 25 miles S.E. of Brieg. N. lat. 50° 37′. E. long. 16 45′.

NINAF, a town of Egypt, on the left bank of the Nile; 14 miles N. of Cairo.

NINDIA, a town of Bengal; 18 miles N. of Burdwan.

NINE FEET HARBOUR, a bay on the W. coaſt of Florida. N. lat. 27°. W. long. 82° 50′.

NINE ISLANDS, a cluſter of ſmall iſlands in the Pacific ocean, ſo called by Capt. Carteret. S. lat. 4° 40′. E. long. 154° 30′.

NINE-MILE-HOUSE, a village of the county of Tipperary, Ireland, well known to thoſe who travel the great ſouthern road, as the ſtage between Kilkenny and Clonmell. It is 71 miles S.W. from Dublin, and 11 miles N.E. from Clonmell.

NINE-PIN-COLLAR, that ſort of horſe-collar which is made ſomewhat in the form of the ninepin. See COLLAR.

NINETY-SIX, in *Geography*. See CAMBRIDGE.

NINGHAN, a town of Bengal; 18 miles N. of Burdwan.

NINGO, or ALLAMPI, a diſtrict or kingdom of Africa, on the Gold Coaſt, with a town of the ſame name; 43 miles W.S.W. from the river Volta. N. lat. 5° 18′. W. long. 0° 36′.

NING-PO, a city of the firſt claſs, in the province of Tche-kiang, called by the Europeans Liampo, and having an excellent port, on the eaſtern coaſt of China, oppoſite to Japan. This city is ſituated at the confluence of two rivers, called Kin and Yao, which form a channel, reaching to the ſea, and ſufficient for the navigation of veſſels of 300 tons. Theſe rivers water a plain, almoſt environed by mountains, and forming a kind of oval baſin, whoſe diameter from E. to W. acroſs the city may be about 20 miles, and that from N. to S. being much longer. This place, which reſembles a garden, both by its level ſurface and cultivation, is full of trees and houſes, and divided by a great number of canals. Eighteen or twenty leagues from this place is an iſland, called Tcheou-chan, where the Engliſh firſt landed on their arrival in China. The ſilks manufactured at Ningpo are much eſteemed in foreign countries, eſpecially in Japan, where the Chineſe exchange them for copper, gold, and ſilver. This city has four others under its juriſdiction, beſides a great number of fortreſſes. N. lat. 29° 54′. E. long. 120° 14′.

NINGUM, or MINCUM, in *Ancient Geography*, a town of Italy, upon the route from Aquilea to Salona, between

Tergeſte and Pucentium; 28 miles from the firſt and 18 from the ſecond. Anton. Itin.

NING-YUEN, a town of Chineſe Tartary, ſituated on a river of the ſame name, near the gulf of Leáo-tong; 20 miles E.N.E. of Pekin.

NINIANS, St., a conſiderable town, and extenſive pariſh, ſituated on the ſouth bank of the river Forth, in the county of Stirling, Scotland. The ancient name of the pariſh was Eggles; nor is it exactly known at what time, or from whom it obtained its preſent appellation. The town is two miles from Stirling, and is noted for its manufacture of tartan, alſo for its tanneries; and though it contains a population of 4000 perſons, is ſtill under the juriſdiction of the county magiſtrates only. Like moſt of the other pariſhes bordering on the Forth, that of St. Ninians is naturally divided into three regions, differing materially from each other in point of ſoil, fertility, and climate. Theſe are the carſe-lands, which approximate neareſt to the river, the middle or dry-lands, and the muir-lands. In the two firſt-mentioned diſtricts the country exhibits an appearance of high cultivation, and derives much pictureſque effect from the windings of the Forth, and the variety of plantations and ſeats with which they abound. To the hiſtorian and the antiquary St. Ninians is a fruitful theme. Having been in very remote times ſituated near the confines of no leſs than four kingdoms, it was, beyond doubt, frequently the ſcene of contention between them, and was ſometimes in the poſſeſſion of one and ſometimes of another, according to the deciſion of fortune. In ſucceeding ages, it became the theatre of ſome of the moſt glorious events in the annals of Scottiſh hiſtory. The celebrated battle of Bannockburn was fought within this pariſh on the 24th of June, 1314, and is ſtill commemorated in the names of many ſpots, as well as by ſeveral monuments erected by the victorious army. The poſition occupied by the troops of Bruce is diſtinctly marked by numerous veſtiges of military art. On Brocks-brae is an immenſe ſtone, called the Bore-ſtone, ſaid to have ſupported the ſtandard of the Scottiſh monarch; and on Plain-muir, immediately behind the houſe which lately belonged to Bain Whyt, eſq., is a ſmall circular fortification, pointed out as the ſcite of king Edward's tent. The battle of Sauchie-Burn, ſo fatal to the cauſe of James III., was likewiſe decided in this pariſh, not more than a mile from the field of Bannockburn. The houſe called Beaton's-mills, where the wounded monarch ſought refuge after the engagement, and was put to death, is ſtill ſtanding, and may be ranked among the warning monuments of that ambition which ſo frequently endangered, and in the end brought about the total ruin of the royal family of Stuart.

The pariſh of St. Ninians extends, at a medium computation, about ten miles in length, and ſix in breadth; and abounds with ſtrata of lime-ſtone and coal, though theſe minerals are only wrought in a few particular ſpots. According to the parliamentary returns of 1811, it contains 1371 houſes, and 7636 inhabitants, being an increaſe, ſince 1801, of 11 houſes and 786 perſons. Sinclair's Statiſtical Account of Scotland, vol. xviii. Beauties of Scotland, vol. iii.

NINIVEH, in *Ancient Geography*. See Ninus.

NIN-O, in *Chronology*, is the name of the era moſt commonly uſed among the Japaneſe. It commences with the reign of Sin-ma, the founder of their monarchy, 660 years before the Chriſtian era.

Nino, in *Geography*, a town of Curdiſtan; 50 miles W. of Erbil.

NINOVE, a town of France, in the department of the Scheldt, and chief place of a canton, in the diſtrict of Audenaerde, ſituated on the Dender, and having one handſome pariſh-church, rebuilt in 1718; 18 miles S.E. of Ghent. The place contains 3021, and the canton 16,773 inhabitants, on a territory of 212½ kiliometres, in 15 communes.

NINSEA, a ſmall iſland near the N. coaſt of Sardinia. N. lat. 48° 17′. E. long 9° 29′.

NINSI, in *Botany*, the ſpecific name of a ſpecies of *Sium*, Linn. Sp. Pl. 361, called by the Japaneſe *Nisji*, or *Nindſin*, much celebrated by Kæmpfer, in his Amœn. Exot 818, for the virtues of its root; which reſembles that of *Ginſeng* in form, and, as it ſeems, in reputed reſtorative qualities. Kæmpfer ſays it is, next to Tea, the moſt famous plant of the Eaſt. See Sium.

NINTH, in *Muſic*. The ninth, being one of the principal diſcords, muſt be regularly prepared and reſolved; but though it is only the octave of the ſecond, and itſelf a ſecond to the octave, yet it requires a very different treatment. The ſecond is prepared and reſolved in the baſe; but the ninth muſt be prepared and reſolved in the treble, and can very ſeldom have admiſſion in fewer than three parts. The ninth is major or minor, according to the key in which it is uſed. The major ninth is prepared in a third, a fifth, and ſometimes a ſixth, but never in the eighth. It is reſolved in a third, a ſixth, or an eighth, from every one of the concords in which it is prepared. In four parts it is accompanied by the $\frac{5}{3}$, and differs only from the common chord by being taken inſtead of the eighth by ſuſpenſion. The minor ninth is prepared in the third only, and reſolved in the eighth if the baſe is continued; and reſolved in the third, if the baſe falls a third. In four parts the ſixth, and ſometimes the fifth accompany it. Other diſcords may be joined with the ninth, as $\frac{9}{4}$ or $\frac{9}{7}$, and then both the diſcords muſt be prepared and reſolved together. In four parts the $\frac{9}{4}$ muſt be accompanied by the fifth, and the $\frac{9}{7}$ by the third; but in five parts both by the third and fifth.

NINTIPOLONG, in *Zoology*, the Ceyloneſe name of a ſpecies of ſerpent, called alſo *ſerpens hypnoticus*. It is a very poiſonous ſpecies, and its bite brings a ſleep upon the perſon, which terminates in death. It is of a deep blackiſh-brown, variegated with ſmall ſpecks of white.

NINUS, in *Biography*, the reputed founder of the Aſſyrian monarchy, is repreſented as the ſon of Belus, and the commencement of his reign is ſuppoſed to have been about the year B.C. 2059. Little can be inferred from the facts recorded of this perſon: it is even doubted whether there ever was ſuch a monarch, and other people confound him with the Egyptian Seſoſtris. He is ſaid to have been of a very martial and ambitious diſpoſition, and to have trained up a vaſt number of his ſubjects to the uſe of arms, and having made an alliance with Ariæus, king of the Arabians, he marched into the diſtrict of Babylonia, the capital of that name not having yet been founded, and eaſily ſubdued it. He then invaded Armenia, the king of which, on making his ſubmiſſion, he left upon the throne as his vaſſal. He next overthrew and put to death the king of Media, and placing a confidential governor over that country, he proceeded to the conqueſt of the reſt of Aſia, all of which, except Bactria and India, he reduced under his dominion. Returning to Aſſyria, he founded the mighty city of Nineveh. He again took the field for the purpoſe of conquering Bactria, which had before reſiſted his arms, and the troops which he muſtered on this occaſion are ſtated at nearly two millions. He defeated the king of the country in the field, but made little progreſs in the ſiege of his ſtrong capital. At this juncture, the huſband of the celebrated Semiramis, who was a principal officer in the army of Ninus, impatient

of

of the abſence of his ſpouſe, ſent for her to the camp before Bactria. This lady, diſtinguiſhed for her courage, perceiving that the ſiege was feebly conducted, took a body of men with her; and climbing the rock upon which the citadel was ſeated, entered it, and thus gave the Aſſyrians the opportunity of becoming maſters of the town. Ninus, firſt admiring her valour, was afterwards captivated with her beauty, and was not eaſy till he made her the partner of his throne, and he had by her a ſon mamed Ninyas. He brought back immenſe ſpoils from Bactria, and died after a reign of fifty years, leaving Semiramis regent of his vaſt dominions. Such is the hiſtory, or, perhaps, more properly ſpeaking, the legend of Ninus; it has been admitted by various writers of antiquity, but certainly no great dependence can be placed upon it. Univer. Hiſt. Holberg's Univer. Hiſt.

Ninus, or *Niniveh*, in *Ancient Geography*, a town of Aſia, the capital of Aſſyria, placed by Ptolemy, Ammianus, and Strabo, in the province of Adiabene, and ſo called from the name of its founder, Ninus, according to the teſtimony of profane hiſtorians. The Scripture aſcribes its origin to Aſhur, the ſon of Shem, or, as ſome have interpreted the paſſage, (Gen. x. 11.) to Nimrod, the ſon of Cuſh, and grandſon of Ham. To this purpoſe Bochart gives the following tranſlation of the original Hebrew: "From this place he (*i. e.* Nimrod) went out to go into Aſſyria, where he built Nineveh, Rehoboth, Calah, and Reſen;" *i. e.* when Nimrod had eſtabliſhed the beginning of his empire at Babylon, and in the land of Shinar, he advanced towards Aſſyria, where he built powerful cities, alſo many fortreſſes, to keep the people in ſubjection. On this ſubject, ſee Ashur and Assyria. Whoever was the founder of Nineveh, it appears to have been one of the moſt ancient, large, powerful, and famous cities of the world; and to have been ſituated on or near the Tigris, to the weſt, as ſome ſay, and according to others, to the eaſt of this river. In the time of the prophet Jonah (ch. iv. 11.), it was reckoned to contain more than 120,000 perſons, who could not diſtinguiſh their right hand from their left, or of young children who had not attained the age of reaſon; whence it has been inferred, that the number of inhabitants at that time amounted to 600,000 perſons. Strabo allows it to have been much larger than Babylon. Diodorus Siculus ſays, (Bibl. lib. ii.) that it was 480 ſtadia in circumference, or forty-ſeven miles, and that it was ſurrounded with lofty walls and towers; the former being 100 feet high, and ſo broad, that three chariots might drive upon them abreaſt; and the latter, of which there were 1500, were each 200 feet high. Nineveh was taken by Arbaces and Beleſis, in the year B. C. 747, under the reign of king Sardanapalus, in the time of Ahaz, king of Judah, or about the time when Rome was founded. It was taken a ſecond time by Aſtyages and Nabopolaſſar, from Chinaladan, king of Aſſyria, B. C. 626; and no more recovered its former ſplendour. It was entirely ruined in the time of Lucianus Samoſatenſis, who lived under the emperor Adrian. Under the Perſians, however, it was rebuilt, but was deſtroyed by the Saracens about the ſeventh century. Modern travellers inform us, that the ruins of ancient Nineveh may ſtill be ſeen on the eaſtern bank of the Tigris, and on the oppoſite ſide the city of Moſul, which many do not diſtinguiſh from Nineveh. See Mosul.

NINZIN, in the *Materia Medica*, a name uſed by ſome authors for the famous Chineſe root, commonly called *ginſeng*. See Ninsi.

NIO, in *Geography*, an iſland of the Grecian Archipelago, anciently known under the name of *Ios*, becauſe it was peopled by Ionians, is lofty, mountainous, and interſected by ſome vallies and ſome plains that are not very extenſive, and is little more than 40 miles in circuit. The baſe is every where ſchiſtoſe or granitical, and its mountains are for the greater part calcareous. Its population includes 3700 perſons of the Greek church. This iſland pays to the captain-pacha nearly 9000 piaſtres, collected by a Greek waiwode, who is appointed by the Porte, and who maintains order and adminiſters juſtice, conjointly with ſix primates, whom the inhabitants elect every year in a general aſſembly. This iſland would have almoſt eſcaped notice, if Homer, paſſing from Samos to Athens, had not anchored in its harbour, and died there a few days after. The inhabitants paid the reſpect to his memory of erecting a monument, no veſtige of which now remains. Moſt of the medals of Nio bear a palm-tree on the reverſe, though this tree is no longer cultivated in the iſland, as the climate is not ſufficiently warm for the purpoſe. The inhabitants are chiefly cultivators, few of them being mariners or merchants; and as they are active and laborious, water the grounds intended to ſupply herbage and fruits, and well manure the ſoil, they render it, though naturally far from being fertile, in a conſiderable degree productive. The women employ themſelves in ſpinning the cotton which they gather, and in knitting ſtockings and caps for ſale. This iſland furniſhes wine, not only to all its inhabitants, but alſo to thoſe veſſels which anchor in the harbour. When the ſeaſon is good, they gather about 50,000 okes of oil, of indifferent quality. The wheat, barley, and legumes are generally ſufficient for the conſumption of nine or ten months. Cotton, to the amount of from eight to ten thouſand okes, and alſo ſtockings and caps, are annually exported for Ancona and Venice; and ſome cotton cloths are manufactured and conſumed in the iſland. A ſmall quantity of wax and honey is exported. The iſland breeds 400 ſmall ſized oxen, 6000 goats, and 300 ſheep. Cheeſe is an article of exportation, but of little importance. The harbour is on the S.S.W. ſide of the iſland; and the town, ſeated on an eminence, is half a league from it; it is tolerably well built, and ſeems to occupy the ſcite of the ancient city. Sonnini ſays, that the inhabitants are hoſpitable and affable; whereas Tournefort, in his time, has deſcribed the Niots as thieves and robbers. The feſtival of St. Gregory, celebrated by the Greeks in this iſland, as well as in ſome others of the Archipelago, is conſecrated to cock-roaches, which are here, particularly in ſummer, very diſguſting and troubleſome inſects. They alſo note the feſtival of St. John the Baptiſt; and they abſtain from undertaking any buſineſs of importance on the ſame day of the week throughout the whole year, becauſe ſuperſtition leads them to imagine, that its iſſue would be unproſperous. N. lat. 36° 46′. E. long. 5° 24′. Olivier. Sonnini.

NION, or Nyon, a town of Switzerland, in the Pays de Vaud, delightfully ſituated upon the edge of the lake of Geneva. It was formerly called "Colonia Equeſtris Noiodunum;" and in proof of its antiquity, Roman inſcriptions and other ancient remains have been frequently diſcovered in the outſkirts of the town. In this part the lake forms a beautiful curve, happily alluded to by Lucan, where he mentions the army of Julius Cæſar ſtriking their tents, which were poſted on the borders:

"Deſeruere *cavo* tentoria fixa Lemano."

i. e. "They ſtrike their tents, and quit the *hollow bend* of Leman's lake."

The modern manufacture of this town is a beautiful porcelain; 10 miles N. of Geneva. N. lat. 46° 24′. E. long. 6° 6′.

NIONS. See Nyons.

NIORT, a town of France, and capital of the department of the Two Sevres, ſeated on the river Sevre Niortoiſe. It is divided into two parts, each of which comprehends 7514 inhabitants, the canton of one including 12,502, and that of the other 11,714 inhabitants, on a territory of 215 kiliometres, in 13 communes. N. lat. 46° 19′. W. long. 0° 23′.

NIOTA, in *Botany*, a barbarous name adopted by Lamarck and Poiret, from the Hortus Malabaricus. Lamarck Illuſtr. t. 299. Poiret in Lam. Dict. v. 4. 490. (Karin-Njoti; Rheede Hort. Malab. v. 6. 31.)—Claſs and order, *Octandria Monogynia*. Nat. Ord. *Guttiferæ*, ſect. 3. Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in four ſhallow rounded ſegments, permanent. *Cor.* Petals four, equal, oblong, ſpreading, broad at the baſe. *Stam.* Filaments eight, inſerted into the receptacle, awl-ſhaped, equal, rather ſhorter than the corolla; anthers incumbent, arrow-ſhaped. *Piſt.* Germen ſuperior, four-lobed, probably four-celled; ſtyle central, awl-ſhaped, the length of the ſtamens; ſtigma ſimple. *Peric.* Capſule ſolitary, ovate, with a ſhort oblique point, thick and woody, of one cell, apparently not burſting. *Seed* ſolitary, oval, filling the cavity.

Eſſ. Ch. Calyx in four rounded ſegments. Petals four, ſpreading, much longer than the calyx. Germen four-lobed. Stigma ſimple. Capſule ſolitary, ovate, woody, of one cell, filled by the ſolitary ſeed.

1. N. *pendula*. (N. tetrapetala and pentapetala; Poir. as above. Karin-Njoti; Rheede, v. 6 t. 18.)—Gathered by Commerſon in Madagaſcar. Rheede ſays his plant grows in ſandy ground on the coaſt of Malabar, as well as in Ceylon. He deſcribes it as a lofty *tree*, as thick as a man's body, the *wood* white and bitter. So we find it in Commerſon's ſpecimen. The *leaves* in that ſpecimen are alternate, on *ſtalks* nearly an inch long, elliptic-oblong, or ſomewhat obovate, obtuſe, with a very ſlight blunt point, entire, coriaceous, ſmooth, and ſhining, four inches long, and above one broad, furniſhed with one rib, and a multiplicity of finely reticulated veins. *Stipulas* none. *Flower-ſtalks* ſolitary, lateral, but ſcarcely axillary, uſually as long or longer than the leaves, in one inſtance ſhorter, furniſhed with a minute ſcale or *bractea* at the baſe, pendulous, each bearing an *umbel* of ſeveral *flowers*. Partial *ſtalks* above an inch long, angular, ſmooth. *Flowers* about as large as thoſe of an Orange, to which genus the younger Linnæus ſuſpected this plant might belong. The *petals* are elliptic-oblong, obtuſe, folding laterally over each other in the bud, finely downy externally. Rheede ſays they are on one ſide of a yellowiſh-white, on the other (we preſume the inner) nearly blood-coloured. *Stamens* orange, with red *anthers*. He deſcribes the *flowers* as without ſmell, the *leaves* and *ſeed* intenſely bitter. Lamarck's figure is diminiſhed, except the *fruit*, which agrees with Rheede's, and is as big as a moderate walnut. We have no doubt that both theſe authors deſcribe the very ſame ſpecies, though in the *Hortus Malabaricus*, five *petals* are repreſented, with only as many *ſtamens*. It is well known that this work cannot be implicitly truſted in the latter particular, and the deſcription ſays the *petals* are three or four, ſometimes five. The materials on which M. Poiret has founded two diſtinct ſpecies, ſeem to us therefore inſufficient.

A ſpecimen agreeing with that of Commerſon was ſent by Koenig to ſir Joſeph Banks, for the *Samandara* of Hermann, Muſ. Zeyl. 5, and Linn. Fl. Zeyl. 202, a tree which the latter could not refer to any particular genus. He cites as a ſynonym the *Nagam*, Hort. Mal. v. 6. 37. t. 21, which is certainly the HERITIERA, ſee that article, to which all authors have referred the *Samandara*. It ſeems therefore that Koenig has, in this inſtance, been miſtaken. The other ſynonyms of Linnæus, as mentioning the preſence of ſeveral capſules to each flower, indicate the *Heritiera* and not the *Niota*.

We retain with reluctance this barbarous, though not uncouth, name. The genus ſhould be inſerted near to *Allophyllus* in the Linnæan ſyſtem.

NIP, in *Rural Economy*, a provincial term applied to a near ſplit-farthing houſewife.

NIPA, in *Botany*, the Malay name of this plant, being unexceptionable as to ſound, is retained by Thunberg for the genus. Thunb. Act. Holm. 1782. v. 3. 231. Nov. Gen. 90. Schreb. 777. Willd. Sp. Pl. v. 4. 597. Juſſ. 38. Lamarck Illuſtr. t. 897. (Nypa; Rumph. Amboin. v. 1. 69. t. 16.)—Claſs and order, *Monoecia Monadelphia*. Nat. Ord. *Palmæ*, Juſſ.

Gen. Ch. Male flowers lateral, below the female, on the ſame plant. *Cal.* Perianth proper none. Sheaths oblong, concave, pointed, coriaceous; the outer larger; cloſing gradually upon the inner. *Cor.* Petals ſix, linear, equal, ſpreading or reflexed. *Stam.* Filament one, thread-ſhaped, erect, the length of the petals; anthers twelve, terminating the filament, combined, oblong. Female flowers terminal. *Cal.* as in the male. *Cor.* none. *Piſt.* Germen angular, (frequently five-ſided), obliquely truncated, ſmooth; ſtyle none; ſtigma a lateral furrow. *Peric.* Drupas numerous, collected into an angular head about eight inches in diameter; angles acute or obtuſe; attenuated below, blunted above, ſmooth.

Eſſ. Ch. Male, Calyx none. Petals ſix. Filament ſimple. Anthers twelve, combined. Female, Calyx none. Corolla none. Style none. Stigma a lateral furrow. Drupa angular, with a ſingle ſeed.

1. N. *fruticans*. Thunb. Rumph. v. 1. t. 16.—Native of Java, and other of the Eaſt Indian iſlands. *Stem* in the young plant none, but riſing to ſome feet in height, when the palm is grown to maturity. *Leaves* pinnate; leaflets oppoſite, ſtriated, marginated, pointed, ſmooth. *Male* and *Female flowers* on the ſame plant, but diſtinct, on different ſtalks; males ſeveral, lateral, inferior, in ſpikes, placed on dichotomous ſtalks; females terminal, ſeſſile, forming a little globular head.

Thunberg informs us that the Indians uſe the leaves of this palm for covering houſes and making mats. The fruit alſo is eſculent both in a crude ſtate and when preſerved.

NIPAL, in *Geography*. See NEPAUL.

NIPASKEE, a lake of North America. N. lat. 62° 10′ W. long. 101°.

NIPEGON, a large river of North America, which, flowing from the north, diſcharges itſelf into lake Superior. It leads to a tribe of the Chippewas, who inhabit near a lake of the ſame name, ſituated about half-way between lake Superior and Albany river. Near it is a ſmall river, which, juſt before it enters the lake, has a perpendicular fall from the top of a mountain of 600 feet.

NIPES, a town on the north-weſt coaſt of Hiſpaniola; 25 miles W. of Petite Goave.

NIPHATIS, in *Ancient Geography*, a mountain of Aſia, in Armenia, which, according to Ptolemy, was a part of mount Taurus, ſouth of mount Abos, and towards the ſource of the Tigris, which traverſed it by a ſubterranean paſſage of about 25 miles.

NIPHON, NIPON, or *Niſon*, in *Geography*, the principal iſland of Japan, which is applied by the inhabitants to the whole of it. It lies north-eaſt of the iſlands of Kiuſiu, termed alſo Saikokf or the weſtern country, and Sikokf.

Its

Its length from S.W. to N.E. is not leſs than 750 Britiſh miles; but it is ſo narrow in proportion, that the medial breadth cannot be aſſumed above 80, though in two projecting parts it may double that number. The five principal cities in this iſland are Meaco or Miaco, Jedo, Oſacca, Sarunga, and Saccai. N. lat. 33° 45′ to 40°. E. long. 130° to 140°. See JAPAN.

NIPISIGHIT BAY, a name given to the ſouthern projection of Chaleur bay; and a river of this name falls into it from the ſouth-weſt, by a broad bay-like mouth.

NIPISSING LAKE, a lake of Upper Canada, north-eaſt of lake Huron, and connected with it by French river.

NIPISSINS, Indians inhabiting near the head-waters of Ottawas river. The number of warriors is 300.

NIPPERS, in the *Manege*, are four teeth in the forepart of a horſe's mouth, two in the upper, and two in the lower jaw. A horſe puts them forth between the ſecond and third year.

NIPPERS is alſo an inſtrument in uſe among ſmiths and farriers, being a kind of pincers, wherewith, in ſhoeing a horſe, they cut the nails before they rivet them. It is alſo uſed in taking off a ſhoe.

NIPPERS, in a ſhip, are pieces of flat braided cordage, uſed to faſten the cable to the voyal, in a ſhip of war, when the former is drawn into the ſhip, by mechanical powers applied to the latter. Theſe nippers are uſually ſix or eight feet in length, according to the ſize of the cable; and five or ſix of them are commonly faſtened about the cable and voyal at once, in order to be heaved in by the capſtern. Thoſe which are fartheſt aft are always taken off, as the cable approaches the main hatchway; and others are at the ſame time faſtened on, in the fore part of the ſhip, to ſupply their place. The perſons, employed to bind the nippers about the cable and voyal, are called *nipper-men*: they are aſſiſted, at this office, by the boys of the ſhip, who always ſupply them with nippers, and receive the ends of thoſe which are faſtened, to walk aft with them, and take them off at the proper place, in order to return them to the nipper-men. Falconer.

NIPPLE, PAPILLA, in *Anatomy*, a prominence ariſing from the middle of the breaſt or mamma. See BREAST.

The nipples of women, in their firſt lying in, are frequently ſo ſmall, and ſunk into their breaſts, that the infant cannot get at them to ſuck its nouriſhment. The readieſt method, in this caſe, is to apply an infant ſomewhat older, and which can draw ſtronger; or, if this does not ſucceed, to let a woman, who has been practiſed in the art, attempt to ſuck.

When theſe do not ſucceed, it is common to have recourſe to a glaſs pipe, and the poorer people in ſome places uſually make a tobacco-pipe ſerve the turn. Others apply a ſmall cucurbite, made of ivory, in the form of a hat, which they ſuck ſtrongly in their mouth. The common ſucking-glaſs is alſo, when properly applied, of very ſignal ſervice. To do this, the ſmall hole at the ſide is to be ſtopped with wax, and the glaſs heated with warm water; or, by holding it before the fire, ſo as to rarefy, and in part expel the air: it is then to be applied to the nipple, which, in this caſe, will not only be pulled out, but will diſcharge a large quantity of milk, ſo as to take down the inflammation and tumour in the breaſt. When the ſucking power of the glaſs is grown weak, the hole at the ſide is to be opened, and the milk poured out: the glaſs is then to be heated again, and the hole being ſtopped again, is to be a ſecond time applied, and ſo on, till the intention is fully anſwered.

NIPPLE-*Wort*, in *Botany*. See LAPSANA.

The common nipple-wort, which is a weed, growing by the ſide of foot-paths and hedges, was formerly eſteemed excellent for curing ulcerated nipples, whence it obtained its name. It is ſaid to be drying, detergent, and digeſtive. The leaves and ſtalks may be boiled and eaten. James.

NIQUI, in *Ichthyology*, the name of a fiſh of the cucullus kind, approaching to the figure of that ſpecies commonly called *draco* and *araneus marinus*, and in Engliſh the *weaver*. It is common about the American ſhores, and is eatable when the liver and gall are taken out, otherwiſe it is ſaid to be poiſonous. See TRACHINUS *Draco*.

NIR, in the *Materia Medica*, a name given by the Arabian phyſicians to the pigment, or colour made from the *iſatis*, or woad.

NIRANEE, in *Geography*, a town of Hindooſtan, in Allahabad; 16 miles W.N.W. of Currah.

NIRIS, a town of Perſia, in the province of Farſiſtan; 75 miles E. of Schiras.

NIRNOVA, a river of Moldavia, which runs into the Pruth.

NIRVA, a town of Japan, in the iſland of Niphon; 80 miles E.N.E. of Meaco.

NIRUA, a town of South America, in the province of Caraccas; 30 miles N.W. of Segovia Nueva.

NISAMPARA, a town of Hindooſtan, in Bahar; 23 miles S.S.W. of Patna.

NISAN, in *Chronology*, a month of the Hebrews, anſwering to our March, and which ſometimes takes from February, or April, according to the courſe of the moon. It was made the firſt month of the ſacred year, at the coming out of Egypt. *This month ſhall be unto you the beginning of months, it ſhall be the firſt month of the year to you.* (Exod. xii. 2) It was the ſeventh month of the civil year. Moſes calls it *Abib*. The name Niſan is only ſince the time of Ezra, and the return from the captivity of Babylon.

NISAO, in *Geography*, a river which riſes in the centre of the iſland of St. Domingo, and falls into the ſea on the ſouth ſide, 7 miles W. of Nigua river.

NISARI, anciently *Niſyros*, an iſland of the Mediterranean, facing cape Crio, from which it is diſtant only three leagues. It ſeems to have been ſeparated from the iſland of Stancho; and of its origin the ancient poets have given the following allegorical account. Neptune, it is ſaid, being in purſuit of a giant, detached a piece of the iſland of Cos, in order to overwhelm him; and this piece, under which the giant was cruſhed, became the iſland of Niſari, on which a temple to Neptune was erected, in order to commemorate its formation. Under this allegory we may diſcover that the effort of Neptune to conquer the reſiſtance of the giant, means no more than the violence of an irruption of the waters, which, burſting through every obſtacle, worked for themſelves a paſſage acroſs the lands of Cos or of Stancho. Niſari is an iſland of ſmall extent, elevated, and ſtony: it preſents warm waters, and other veſtiges of volcanoes; grind-ſtones are very common, and it produces ſeveral ſorts of commodities in abundance; but it wants a harbour where veſſels can caſt anchor in ſafety. Niſari is diſtant 20 miles from Rhodes. N. lat. 36° 35′. E. long. 27°.

NISDORF, a town of Bohemia, in the circle of Leitmeritz; 10 miles N. of Kamnitz.

NISEMASSE, a cluſter of ſmall iſlands in the Eaſt Indian ſea. N. lat. 8° 15′. E. long. 128° 42′.

NISH, one of the ſmaller weſtern iſlands of Scotland. N. lat. 56° 14′. W. long. 5° 48′.

NISHAMPOUR, a town of Bengal, and chief place of the circar of Pooſtola. N. lat. 25° 5′. E. long. 88° 38′.

NISI, a town of European Turkey, in the Morea. N. lat. 37° 10′. E. long. 22°.

NISIBIN,

NISIBIN, anciently *Niſibis*, a fortreſs of Aſiatic Turkey, in the government of Moſul; 70 miles N.W. of Moſul. N. lat. 37°. E. long. 40° 30′.

NISIBIS, in *Ancient Geography*, a large and populous city of Meſopotamia, about two days' journey from the Tigris, in the midſt of a pleaſant and fertile plain, at the foot of mount Maſius, and on the river Mygdonia. A treble incloſure of brick walls are defended by a deep ditch. In the year of Rome 684, it was ſubject to Tigranes, king of Armenia, from whom it was taken by Lucullus. It was afterwards taken by Trajan, and, after a revolt, retaken by his troops. Since the time of Lucullus, it had been deſervedly eſteemed the bulwark of the eaſt. It ſuſtained three memorable ſieges againſt the power of Sapor, king of Perſia; and the diſappointed monarch, after urging his attacks above 60, 80, and 100 days, was thrice repulſed with loſs and ignominy. But in the year 363 of the Chriſtian era, after the death of Julian, and under the irreſolute emperor Jovian, it ſurrendered to Sapor by treaty. It is now reduced to 150 houſes. The marſhy lands in its vicinity produce rice; and the fertile meadows, as far as Moſul and the Tigris, are covered with the ruins of towns and villages.

NISIDA, in *Geography*, a ſmall iſland, evidently formed by volcanic exploſion, in the ſouth-eaſt corner of the gulf of Puzzuolo, near the main land, fertile, and well cultivated. On the ſouth coaſt is a ſmall harbour, called "Porto Pavone;" and on a neighbouring rock ſtands a Lazaretto, where ſhips bound for Naples are obliged to perform quarantine. This iſland abounds in rabbits and large black ſnakes: its chief produce is oil; 5 miles W.S.W. of Naples.

NISI PRIUS, in *Law*, a judicial writ which lieth in caſes where the jury being impanelled, and returned before the juſtices of the bench, one of the parties requeſts to have ſuch writ, for the eaſe of the county, whereby to will the ſheriff to cauſe the inqueſt to come before the juſtices in the ſame county, at their coming thither.

It is called a writ of *niſi prius*: and its effect is, that the ſheriff is hereby commanded to bring to Weſtminſter the men impanelled, at a certain day, before the juſtices, *niſi prius juſticiarii domini regis ad aſſiſas capiendas venerint*; that is, unleſs the juſtices go, before that day, into ſuch county to take aſſiſes. This they are ſure to do, in the vacations preceding each Eaſter and Michaelmas terms, and there diſpoſe of the cauſe; which ſaves much expence and trouble to the parties, the jury, and the witneſſes. See JURY.

NISI PRIUS and *Aſſiſe, Courts of*, are compoſed of two or more commiſſioners, who are twice in every year ſent by the king's ſpecial commiſſion, all round the kingdom, (except only London and Middleſex, where courts of *niſi prius* are holden in and after every term, before the chief or other judge of the ſeveral ſuperior courts, and except the four northern counties, where the aſſiſes are holden only once a year,) to try, by a jury of the reſpective counties, the truth of ſuch matters of fact as are then under diſpute in the courts of Weſtminſter-hall.

NISI PRIUS, *Juſtices of*. See ASSISES and JUSTICES.

The preſent juſtices of aſſiſe and *niſi prius* are more immediately derived from the ſtatute Weſtm. 2. 13 Edw. I. c. 30, which directs them to be aſſigned out of the king's ſworn juſtices, aſſociating to themſelves one or two diſcreet knights of each county. By ſtatute 27 Edw. I. c. 4, (explained by 12 Edw. II. c. 3.) aſſiſes and inqueſts were allowed to be taken before any one juſtice of the court in which the plea was brought, aſſociating to him one knight or other approved man of the county. And laſtly, by ſtatute 14 Edw. III. c. 16, inqueſts of *niſi prius* may be taken before any juſtice of either bench, (though the plea be not depending in his own court,) or before the chief baron of the exchequer, if he be a man of the law; or otherwiſe before the juſtices of aſſiſe, ſo that one of theſe juſtices be a judge of the king's bench, or common pleas, or the king's ſerjeant ſworn. For their circuits, ſee CIRCUIT.

NISITA, in *Geography*, a town of Naples, in the province of Lavora; ſeven miles W.S.W. of Cuma.

NISMA, a town of Saxony, in the biſhopric of Naumburg; ſix miles E. of Zeitz.

NISMES, or NIMES, a town of France, and capital of the department of the Gard. It is large, and pleaſantly ſituated on the declivity of a hill, covered with vineyards and orchards, not far from a ſmall river called the "Viſtre." Before the revolution, it was the ſeat of a particular government, and contained a ſeminary, a college, an academy of ancient hiſtory and belles lettres, ſeveral hoſpitals, a citadel, and about 32,594 inhabitants, of whom a third was ſuppoſed to be Proteſtants. It is divided into three parts, and is ſaid to contain 39,300 inhabitants; and its three cantons include 14,972, 14,800, and 12,850 inhabitants, on a territory of 227½ kiliometres, in four communes. It has various manufactures, the moſt conſiderable of which are cloth and ſilk: the number of ſtockings annually made in this town has been computed at 20,000 pair. This city was a large and magnificent city, before it was taken by the Goths. Its veſtiges of Roman antiquity are grand and numerous; among which we may reckon an amphitheatre, a temple of Diana, a grand tower ſuppoſed to have been a mauſoleum, a public fountain, and a temple of the Corinthian order, of exquiſite taſte, erected by the inhabitants, in the year of Rome 754, to the memory of Caius and Lucius, the ſons of Agrippa. N. lat. 43° 50′. E. long. 4° 26′.

NISQUEUNIA, or NESTIGIUNA, a ſettlement of America, on the Mohawk river, between Albany and Schenectady. It is the principal ſeat of the ſociety called "Shakers."

NISSA, a town of European Turkey, in Servia, ſituated on a river of the ſame name, which joins the Ibar, 30 miles N.N.W. of the town. It is ſurrounded with walls and ramparts, and contains ſeveral moſques, baths and fountains: the houſes are conſtructed of clay and wood; 245 miles N.W. of Adrianople. N. lat. 43° 31′. E. long. 21° 36′.

NISSA, or NIZZA, a town of Portugal, in Alentejo; 21 miles E. of Abrantes.

NISSER, a lake of Norway, in the province of Chriſtianſand; 35 miles W. of Skeen.

NISSOLIA, in *Botany*, ſo named by Jacquin and Linnæus, in memory of William Niſſolle, M.D. of Montpellier, author of ſeveral botanical eſſays, in the Memoires de l'Acad. des Sciences, and mentioned as an excellent naturaliſt by Tournefort, who dedicated a ſuppoſed genus to him, in the Inſt. Rei Herb. 656, which is undoubtedly a *Lathyrus*, as all following botaniſts have made it. Jacq. Amer. 198. Linn. Gen. 365. Schreb. 483. Willd. Sp. Pl. v. 3. 899. Mart. Mill. Dict. v. 3. Juſſ. 364. Lamarck Illuſtr. t. 600. Gærtn. t. 145. Claſs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, bell-ſhaped, with five teeth; the upper ones moſt deeply divided. *Cor.* papilionaceous. Standard roundiſh, ſlightly emarginate, reflexed, its edges folded back. Wings oblong, obtuſe,

tuſe, erect, dilated upwards, ſpreading in the fore part. Keel cloſed, the ſhape of the wings. *Stam.* Filaments ten, united into a cylinder, which is ſplit along the upper ſide; anthers roundiſh. *Piſt.* Germen oblong, compreſſed; ſtyle awl-ſhaped, bent upwards at a right angle; ſtigma obtuſe, ſomewhat capitate. *Peric.* Legume oblong, compreſſed, of two or three joints, ſeparating tranſverſely, ſpongy within, the uppermoſt terminating in a vertical expanded wing. *Seeds* ſolitary in each joint, kidney-ſhaped, ſeldom more than one perfected in each legume.

Eſſ. Ch. Calyx with five teeth. Stamens all connected. Legume jointed, ſingle-ſeeded, ending in a dilated wing.

1. N. *arborea.* Upright Niſſolia. Linn. Sp. Pl. 992. Jacq. Amer. 199. t. 174. f. 48.—Stem arboreous, erect. Leaves ſmooth.—Found by Jacquin, in woods at Carthagena, in South America, flowering in July and Auguſt. Linnæus received a ſpecimen from Rolander, but ſcarcely any other botaniſt ſeems to have noticed this plant. It is deſcribed as a *tree* of no beauty, twelve feet high, whoſe long weak branches require ſupport. *Leaves* deciduous, a ſpan long, alternate, ſtalked, compoſed of one or two pair, with an odd one, of elliptic-oblong, pointed, entire *leaflets*, the terminal one rather the largeſt, two and a half or three inches in length; all on ſhort, partial ſtalks, thin, ſmooth, with one rib and ſeveral tranſverſe veins; ſhining above; glaucous beneath. *Stipulas* none. *Flowers* in denſe, ſhort, axillary or terminal, ſtalked cluſters, rather ſmall, pale, inodorous. Jacquin deſcribes them ſeſſile, or ſpiked, but his figure indicates their having ſlender partial ſtalks, as in the Linnæan ſpecimen. He delineates the *legume*, which we have not ſeen, above three inches long, compreſſed, with one fertile joint, a *ſeed* the ſize of a French bean, and a falcate veiny wing.

2. N. *ferruginea.* Ruſty Niſſolia. Willd. n. 2. (N. Quinata; Aubl. Guian. v. 2. 743. t. 297.)—Stem ſhrubby, climbing. Cluſters compound. Leaves clothed with ruſty down beneath.—Gathered by Aublet on the banks of the river Sinemari in Guiana, flowering and fruiting in October and November. The *ſtems* twine about the talleſt trees to their very tops. The *leaflets* are about four pair with an odd one, gradually larger upwards, veiny, clothed with ruſty down at the back. *Cluſters* compound, large, terminal, the *ſtalks* and *calyx* covered with ruſty down. *Petals* violet-coloured. *Legume* downy, the ſize of the laſt, but leſs falcate. The natives call this plant *Quinata.* The bark of the trunk exudes a red tranſparent aſtringent gum; probably like that of *Pterocarpus Draco.*

3. N. *fruticoſa.* Shrubby Niſſolia. Linn. Sp. Pl. 992. Jacq. Amer. 198. t. 179. f. 44. Hort. Vind. v. 2. 78. t. 167. Ait. Hort. Kew. ed 1. v. 3. 6.—Stem ſhrubby, climbing. Cluſters whorled, leafy. Leaves ſmooth.—Gathered by Jacquin, in woods and buſhy places at Carthagena, flowering in September. Lord Petre is ſaid to have cultivated this plant in 1766. Linnæus had it in his ſtove, climbing to a great extent, but never flowering. Jacquin obſerved the ſame at Vienna, but after 15 years it bloſſomed. The *leaves* ſomewhat reſemble the firſt ſpecies, but are not half ſo large. The *flowers* compoſe long, pendulous, whorled, partly leafy *cluſters*, at the ends of the branches, and are variegated with yellow and crimſon. *Legume* about an inch long, with a rounded, curved, veiny wing.

NISSUWA, or NAZAWA, in *Geography*, a town of Arabia, in the province of Oman; 80 miles S.W. of Maſcat.

NISUS, in *Ornithology*, a name by which many authors call the *accipiter fringillarius*, or ſparrow-hawk. See FALCO *Niſus.*

NISUS is alſo a name uſed by ſome old naturaliſts for the haliaetus, or *aquila marina*, called in Engliſh the *ſea-eagle*, or *oſprey*. See FALCO *Oſſifragus.*

NITCHOU, in *Geography*, a river which riſes in a mountain of Thibet, and runs into the Burrampooter, at Ghergong.

NITCUDY, a river of Hindooſtan, which runs into the Manzorah; 35 miles E. of Oudighir.

NITEDULA, in *Zoology*, the garden-mouſe. See MYOXUS *Nitela.*

NITH, in *Geography*, a river of Scotland, which riſes in Ayreſhire, and paſſing through Dumfrieſſhire, enters Solway Frith, about 10 miles below Dumfries. The valley through which it flows is called "Nithſdale" or "Nidſdale." This tract of ground is rich in coals, lime-ſtone, and free-ſtone; its ſoil is generally fertile, highly cultivated, and capable of farther improvement. Although it is now parcelled out among farmers, yet from ſome remains of old walls, it ſeems to have been formerly encloſed as parks for deer or cattle for the duke of Queenſbury, whoſe property it is, and whoſe caſtle of Drumlanrig ſtands near. The mouth of the river is in N. lat. 55° 2′. W. long. 3° 32′.

NITHARD, in *Biography*, an hiſtorian of the ninth century, was the ſon of Angilbert, abbot of St. Riquier, and of Bertha, daughter of Charlemagne. He was born before the year 790, and was probably educated at the court of his grandfather. It is thought that he ſerved in the armies of Charlemagne, in the poſt of duke or count of the maritime coaſt. He was much attached to Louis le Debonnaire, and likewiſe to his ſon, Charles the Bald, king of France. By this prince he was deputed in the year 840 to his brother, the emperor Lothaire, in order to accommodate the differences between them: in 842 he was one of the commiſſioners of Charles in regulating the partition territory with Louis of Germany. The want of ſucceſs in endeavouring to preſerve peace between theſe brothers diſguſted him with the court, from which he retired, and is thought to have embraced the monaſtic life in the abbey of St. Riquier, though it has been aſſerted by others that he continued to ſerve in the army, and was only buried in that monaſtery. Nithard is known in the literary world as the author of a valuable work, containing the hiſtory of the diviſions between the ſons of Louis le Debonnaire, in four books, of which the firſt three were written in 842, and the fourth is loſt. It was publiſhed in 1594 by M. Pithou in his "Annalium et Hiſtoriæ Francorum Scriptores, &c." The ſtyle of the work is obſcure and embarraſſed, but the narrative is methodical, and the author was well informed of the facts which he relates. It has ſince been tranſlated by Ducheſne and Bouquet in their Collection of French Hiſtorians. It was tranſlated into French by Couſin in his "Hiſtory of the Weſtern Empire."

NITHERED, in *Agriculture*, a provincial word uſed to ſignify periſhing with cold.

NITIDULA, in *Zoology*, a genus of inſects of the order Coleoptera, of which the generic character is as follows: antennæ clavate, the club ſolid; ſhells margined; head prominent; thorax a little flattened, margined. There are forty-three ſpecies, divided into two ſections, *viz.* thoſe that have a cylindrical lip, and thoſe that have a ſquare lip. In the former diviſion there are thirty-three ſpecies; in the latter only ten. Theſe laſt form the tribe Elophorus of Fabricius. The inſects are chiefly inhabitants of Europe; a few of them of South America, and ſome are com-

mon

mon to our own country. Thoſe of ſection B are, for the moſt part, aquatic inſects, found in ſtagnant waters, or under duck-weed. The reſt are to be traced on plants and flowers.

A. *Lip cylindrical.*

Species.

* BIPUSTULATA. This ſpecies is oval and black; the ſhells have a red dot. It inhabits this country, and other parts of Europe. Deſtroys carcaſes, meat, and bacon, on which it feeds.

4-PUSTULATA. This is brown and oval; the ſhells are marked with two red ſpots. It inhabits Germany, and is larger than the laſt. The ſhells are ſometimes ſpotted on the margin; the legs are rufous.

OBSCURA. Oval, black, duſky; the legs are pitchy. It inhabits Germany.

ABBREVIATA. This is oval, black, and rather duſky; the ſhells are ſmooth, obtuſe, abbreviated. It inhabits New Zealand. The body is a little downy; the legs are rufous or black.

MARGINATA. Oval; ſhells grooved, the edge and ſpots on the diſk ferruginous. It is found in Italy. The body is beneath pitchy, and the thorax black, with a broad ferruginous border.

* ÆSTIVA. Teſtaceous, ſubvillous; thorax tranſverſe, emarginate; eyes black. This is an inhabitant of various parts of Europe.

OBSOLETA. Oval, teſtaceous; ſhells ſmooth; thorax emarginate.

* FERRUGINEA. Oval, ſubvillous, ferruginous; ſhells ſtriate. This is an Engliſh inſect, and found on the lycoperdon.

IMPERIALIS. Oval, black; ſhells with connected white ſpots, forming two ſtreaks; the edge is rufous. It is found in Germany.

STRIGATA. Oval, brown; edge of the thorax and ſhells, line at the baſe, and ſtreak acroſs the tip of the latter fulvous. Found in Saxony.

10-GUTTATA. Oval, brown; edge of the thorax and five ſpots on the ſhell pale. It inhabits Germany.

VARIA. Oval; thorax and ſhells varied with black and ferruginous. It is found particularly at Keil.

SORDIDA. Oval, black; thorax and ſhells dull ferruginous. It is found in divers parts of Germany, and reſembles the laſt.

FLEXUOSA. Oval, black; edge of the thorax and flexuous ſpot on the ſhells yellow. It is found in France.

BICOLOR. Ferruginous; ſhells black, with a ferruginous band at the baſe, and dot at the tip. It inhabits Keil.

COLON. Black; ſhells varied with ferruginous; thorax emarginate. It inhabits different parts of Europe.

LIMBATA. Black; edge of the thorax and border of the ſhells ferruginous. It inhabits Saxony, and is a very ſmall inſect.

HÆMORRHOIDALIS. Black; ſhells ferruginous at the tip. It inhabits Hamburgh.

* DISCOIDES. Black; diſk of the ſhells ferruginous; thorax margined. It is found in England, and in various parts of Germany.

* RETICULARIA. Black; ſhells ſmooth; thorax margined.

6-PUSTULATA. Black; ſhells truncate; three dots on the ſhells, tail and legs rufous. Inhabits Germany on flowers, and is a ſmall inſect.

LITUA. Teſtaceous; ſhells with a black arched blotch. It inhabits Saxony, and is ſmall.

TESTACEA. Thorax teſtaceous, with a black ſpot; ſhells teſtaceous, with a black band in the middle, dotted with teſtaceous. Found in Keil.

FLORALIS. Black; ſhells teſtaceous, the future black. An inhabitant of different parts of South America.

* ÆNEA. Braſſy-green; antennæ and legs black. It inhabits England.

VIRIDESCENS. Braſſy-green; legs rufous. It inhabits Keil.

HEMIPTERA. This is ferruginous; the ſhells are abbreviated, teſtaceous, immaculate. Found in ſome of the South American iſlands.

DIMIDIATA. Black; ſhells abbreviated, brown; legs ferruginous. This is a very minute inſect, and is alſo found in the South American iſlands.

TRUNCATA. Teſtaceous; ſhells truncate, with a common black ſpot at the baſe. It is found in Germany.

* RUFIPES. Black, poliſhed; legs pale. This is an Engliſh inſect.

SETACEA. Ochraceous, immaculate; eyes black; ſhells very ſmooth

PECTORALIS. Brown; head and legs ferruginous; club of the antennæ yellow.

PILOSA., Black; ſhells villous; antennæ and legs ferruginous. It inhabits Germany.

B. *Lip ſquare.*

Species.

* AQUATICA. Brown; thorax rough, and with the ſhells braſſy-brown. This, as well as the next, is found in many parts of Europe, and in this country in ſtagnant waters

* NUBILA. Grey; thorax and ſhells grooved and rugged.

ELONGATA. Thorax punctured, braſſy; ſhells brown, with longitudinal raiſed lines. Found in the ſtagnant waters of Germany.

CRENATA. Brown; thorax rugged; ſhells grooved crenate. This alſo is found in Germany.

HUMERALIS. Brown; thorax ſmooth; ſhells crenate, ſtriate, with a humeral teſtaceous dot. It inhabits Germany, and is ſmall.

FLAVIPES. Black; thorax grooved; ſtriate ſhells and legs teſtaceous. It inhabits Sweden, in ſtagnant water.

PYGMÆA. Thorax margined, nearly ſmooth, black; ſhells ſtriate, the tip and legs ferruginous.

* MINIMA. Thorax ſmooth; ſhells ſtriate; body brown, immaculate. This is found in England, and other parts of Europe, and is, as its name denotes, very minute.

COCCINELLOIDES. Black; head, thorax, and ſhells fumate. Found in Europe.

* FUSCA. Brown-teſtaceous; ſhells punctured, ſtriate; antennæ and legs teſtaceous. It inhabits this country, and other parts of Europe.

NITIDUM FOLIUM, among *Botaniſts*. See LEAF.

NITRARIA, in *Botany*, ſo named by Schober, a Ruſſian botaniſt, who travelled under the ſanction of government into Siberia, and who firſt diſcovered this plant on the ſqualid nitro-ſaline parts of the deſert extending from the north of the Caſpian ſea to about the 50th degree of latitude. He alſo found it aſſuming rather a different appearance, in the

the ſalt plains of Siberia, between the Irtis and Ob rivers, by the ſalt lakes near the Jeniſea, and in the regions beyond the lake Baikal. Schob. in Nov. Act. Petrop. v. 7. 315. t. 10. Linn. Gen. 239. Schreb. 322. Willd. Sp. Pl. v. 2. 858. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 3. 147. Juſſ. 316. Lamarck Illuſtr. t. 403. Gærtn. t. 58. Claſs and order, *Dodecandria Monogynia*. Nat. Ord. *Ficoideæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, five-cleft, erect, very ſhort, permanent. *Cor.* Petals five, oblong, ſpreading, channelled, arched at the tip with an inflexed point. *Stam.* Filaments fifteen, awl-ſhaped, nearly erect, the length of the corolla; anthers roundiſh. *Piſt.* Germen ſuperior, ovate, terminating in a thickiſh ſtyle longer than the ſtamens; ſtigma ſimple. *Peric.* Drupa of one cell, ovate-oblong, pointed. *Seed.* Nut ſolitary, three-celled, ovate, pointed.

Obſ. Gærtner ſays, that the unripe germen is trilocular, and that the nut is ſcrobicular, of one cell and ſix-valved at the top.

Eſſ. Ch. Corolla of five petals, arched at their tips. Calyx five-cleft. Stamens fifteen. Drupa ſingle-ſeeded.

1. N. *Schoberi.* Linn. Sp. Pl. 638. Pall. Roſſ. v. 1. p. 1. 80. t. 50. f. A. Andr. Repoſ. t. 529.—Leaves entire, obtuſe.—Native of Siberia, in very rich ſalt lands by the lake Koræ̆koffkoi. It flowers at Kew through the greater part of the ſummer. *Root* woody, knobbed or tuberous. *Stems* numerous, woody, ſpreading, proſtrate, branched, from one to two feet in length, (the *branches* elegantly diſpoſed like a winged leaf,) whitiſh-grey, generally ſpinous. *Leaves* four or five together, ſucculent. *Flowers* in a terminal cyme, about ſix together, of a delicate blue and white, with orange-coloured anthers. *Fruit* blue.

The different appearance aſſumed by this ſpecies when growing near the Caſpian ſea is delineated by Pallas in his *Flora Roſſica* v. 1. t. 50. f. B. Willdenow calls it in that ſtate *N. Schoberi* β, and ſays, that it has broader leaves, red berries, a conical nut, and ſpineleſs ſtem. This variety is larger than the Siberian one in all its parts, and may probably be a diſtinct ſpecies. Pallas ſays, that the berries, though ſaltiſh, are inſipid, and yet reckoned a luxury in the Caſpian deſert Camels are ſaid to feed on the twigs. From the very ſucculent and ſaline properties of its leaves Murray conjectures, that it might be employed with advantage for the extraction of ſoda.

2. N. *tridentata.* Desfont. in Uſt. Annal. v. 16. 101. Willd. n. 2 —Leaves three-toothed at their tips.—Native of moiſt and ſandy ſpots near the ſea in the neighbourhood of Suſa in the kingdom of Tunis, and on the borders of the deſert. All we know of this is from Desfontaines, quoted above; who deſcribes it as having "ſpinous *branches*, fleſhy *leaves*, and a *nut* with only one cell inſtead of three."

NITRATS, in *Chemiſtry*, that genus of ſalts formed by the nitric acid with the different ſaline baſes. The great facility with which the nitric acid is decompoſed by the different inflammable bodies, is the cauſe of the marked character of detonation poſſeſſed by theſe compounds. The heat and light furniſhed during the detonation of the nitrats with inflammable bodies, as in the caſe of gunpowder, has been uſed as a ſucceſsful argument againſt the Lavoiſerian doctrine of combuſtion. If the oxygen be the ſource of the light and heat, and that only when it paſſes from the elaſtic to the ſolid or liquid form, it will be evident, that cold ought to be produced from the detonation of the nitrats. It is now, however, pretty generally admitted, that bodies do not give out caloric in the ratio of their condenſation, but in proportion to the change of ſpecific heat during the chemical change. It is therefore highly probable, that no great quantity of heat is given out during the combination of nitrogen with oxygen to form nitric acid. It muſt alſo be admitted, that the inflammable bodies themſelves give out a quantity of caloric during the detonation with nitre. A ſimilar concluſion muſt be drawn in the action between oxymuriat of potaſh and the inflammable bodies.

The greateſt proportion of the ſoluble nitrats contain 2 atoms of acid to 1 of baſe, ſo that inſtead of conſidering the acid as 19, the weight of 1 atom, hydrogen being 1, it will be generally found 38. Thoſe ſalts, which have been called ſub-nitrats, are generally nitrats, in which the acid is 19. We ſhall now give an account of ſome of the nitrats that have been omitted in their proper places, and refer to others under their reſpective baſes. Of theſe the moſt important is the *nitrat* of POTASH; which ſee.

NITRAT *of Alumine*. This ſalt is prepared by diſſolving alumine in nitric acid, and evaporating the ſolution till the ſalt cryſtalliſes. In this ſalt there is always an exceſs of acid, and it is therefore ſometimes reckoned a ſuper-nitrat. It cryſtalliſes with great difficulty in thin ſoft plates, which have but little brilliancy. It has an acid and alſo an aſtringent taſte. Its ſpecific gravity, according to Haſſenfratz, is 1.645. It is very ſoluble in water, and when the fluid is evaporated, it is converted into a glutinous maſs of the conſiſtence of honey. It often aſſumes on cooling the form of a jelly. When expoſed to the air, it very ſoon attracts moiſture and deliqueſces. When heated, the acid is diſengaged with great facility, and the earth remains behind.

NITRAT *of Ammonia*. This ſalt was formerly diſtinguiſhed by the names of *nitrum ſemivolatile*, and *nitrum flammans*. Berthollet examined it in the courſe of his experiments on the component parts of nitric acid, and ſir Humphrey Davy, in his reſearches, has added conſiderably to our knowledge of its compoſition and decompoſition. It may be prepared by diſſolving carbonat of ammonia in diluted nitric acid, and evaporating the ſolution till the ſalt cryſtalliſes. The appearance of this ſalt varies much according to the temperature at which its ſolution is evaporated. In a heat of from 70° to 100°, and by ſlow cooling, it is obtained in ſix-ſided priſms, terminated by long ſix-ſided pyramids. When the ſolution is evaporated at the temperature, of boiling water, or 212°, the cryſtals are channelled and have a fibrous texture, or they are formed of long elaſtic threads. When dried in a heat of about 300°, it aſſumes the form of a white and very compact maſs. Theſe differences are unqueſtionably owing to different proportions of water of cryſtallization, which the ſalt contains. Nitrat of ammonia has a very acrid, bitter, and diſagreeable taſte. Its ſpecific gravity is, according to Haſſenfratz, in the Annales de Chimie, 1.579. At the temperature of 60° it is ſoluble in two parts of water, and it diſſolves in half its weight of boiling water. When expoſed to the air, nitrat of ammonia ſoon attracts moiſture and deliqueſces. When it is heated in the ſtate of cryſtals, it becomes fluid at a temperature below 300°, and at from 360° to 400° it boils without decompoſition; but when heated to 450°, or higher, it is gradually decompoſed without loſing its water of cryſtallization. When this ſalt is decompoſed in a temperature not exceeding 500°, it is wholly converted into nitrous oxyd and water. From the experiments of ſir H. Davy theſe products are in about the proportion of four parts of gas to three of water. When expoſed to a heat of 600°, and higher, it explodes, and is totally

totally decompoſed, being converted into nitrous gas, nitrous acid, water and azotic gas. Hence its name among the older chemiſts, *nitrum flammans*. Its conſtituent parts, according to ſir H. Davy, are

Acid -	69.5	72.5	74.5
Baſe - -	18.4	19.3	19.8
Water -	12.1	8.2	5.7
	100	100	100

In the firſt of theſe analyſes the ſalt was priſmatic; in the ſecond it was fibrous; and in the third it was compact. The chief uſe of this ſalt is for yielding NITROUS *Oxyd*; which ſee.

NITRAT *of Barytes* is uſually prepared by diſſolving native carbonat of barytes in nitric acid, or by decompoſing ſulphuret of barytes by means of nitric acid, and evaporating the filtered ſolution till the nitrat cryſtalliſes. Its cryſtals are regular octahedrons, and they often adhere to each other in the form of ſtars. Sometimes it is obtained in ſmall brilliant plates. Its ſpecific gravity is 29.2 nearly. It is very eaſily reduced to powder. Its taſte is hot, acrid, and auſtere. It is ſoluble in 12 parts of water at the temperature of 60°, and in about three or four parts of boiling water. As the ſolution cools, the ſalt may be obtained in cryſtals. It is ſcarcely at all altered by expoſure to the air. When thrown on burning coals it decrepitates, undergoes a kind of fuſion, and then becomes dry. When ſtrongly heated in a crucible, the whole acid is gradually driven off, and the barytes remains pure. It detonates leſs violently with combuſtibles than moſt of the nitrats. The conſtituents are given by Fourcroy and Vauquelin, in the Annales de Chimie, as follows:

Acid - - -	38
Baſe - - -	50
Water - - -	12
	100

NITRAT *of Glucine*. See GLYCINE.

NITRAT *of Lime*. See LIME.

NITRAT *of Magneſia*. See MAGNESIA.

NITRAT *of Magneſia* and *Ammonia* was firſt deſcribed by Fourcroy in 1790, and is prepared by mixing together the ſolutions of nitrat of ammonia and nitrat of magneſia, or by decompoſing either of theſe ſalts in part by the baſe of the other. When the two ſalts are mixed together, the nitrat of ammonia and magneſia gradually precipitates in cryſtals. Theſe cryſtals are in the form of fine priſms; they have a bitter acrid ammoniacal taſte; are ſoluble in about 11 parts of water at the heat of 60°, and in leſs as the temperature is higher. When expoſed to the air, they gradually attract moiſture, but more ſlowly than either of their component parts. The phenomena, which this compound exhibits when heated, are ſimilar to thoſe which its component parts exhibit in like circumſtances. According to Fourcroy it is compoſed of

78 parts of nitrat of magneſia,
22 ——— ammonia.

NITRAT *of Silver*, in the *Materia Medica*. See SILVER.

NITRAT *of Soda*. See SODA.

NITRAT *of Strontian*. See STRONTIAN.

NITRAT *of Yttria*. See YTTRIA.

NITRAT *of Zirconia*. See ZIRCONIA.

NITRAT *of Ammonia*, in *Agriculture*, a neutral ſaline ſubſtance formed by the combination of the nitric acid and ammonia, or volatile alkali. This ſubſtance cannot be obtained in ſufficient proportions for the purpoſes of agriculture, but is uſeful in the analyſis of ſoils.

NITRAT *of Iron*, a ſalt formed by the union of nitric acid with iron, but is a ſalt rarely preſented by nature: its properties or effects, as they may apply to agriculture, are not, lord Dundonald ſays, worthy of much obſervation.

NITRAT *of Lime*, is an earthy ſalt which conſiſts of the nitric acid and lime. It is found in the mother-earth of nitre manufactories, on old walls, and mixed with true native nitre in the kingdom of Naples. The pureſt is obtained by the artificial and direct combination of its conſtituent parts. And it is a ſaline ſubſtance, that is alſo found in the rubbiſh of old buildings, and in thoſe materials from which ſaltpetre is extracted: *viz.* animal and vegetable matters, which, with a due proportion of calcareous earth, have undergone the putrefactive proceſs, together with a ſubſequent, ſufficiently long, expoſure to atmoſpheric air. According to Dr. Home, it is likewiſe contained in what is commonly called hard-water, which, by his experiments, was found to promote the growth of plants in a much higher degree than ſoft-water. It is very ſoluble and deliqueſcent; it is decompoſed by fixed alkalies, and forms therewith nitrat of potaſh or ſaltpetre, and nitrat of ſoda, or cubic nitre.

NITRAT *of Magneſia*, is an earthy ſalt, compoſed of the nitric acid and pure magneſia. It is found native in the mother-earth of nitre manufactories, and on walls. It has been obtained artificially by direct and indirect combination.

Lord Dundonald remarks that no agricultural experiments have yet been made with this compound; it is a very deliqueſcent and ſoluble ſalt; and there is reaſon to expect, that it will produce effects in promoting vegetation, ſimilar to thoſe which may reſult from the application of the nitrat of lime.

It is decompoſed by alkalies and lime, and forms therewith nitrat of potaſh, nitrat of ſoda, and nitrat of lime.

NITRAT *of Potaſh*, a neutral ſalt, formed by the combination of nitric acid and potaſh, or the fixed vegetable alkali. It is found in the fiſſures of the lime-ſtone hills, near Molfetta, in the kingdom of Naples, in various waters, and even in rain: likewiſe in the freſh juices of many plants, ſuch as the heliotrope, pellitory, tobacco, and others. It is produced ſpontaneouſly wherever its alkaline baſis is expoſed to a free current of air, and to the exhalations of putreſcent vegetable and animal matter; as on damp walls, rubbiſh, the ordure of ſtables, dunghills, &c. In Spain, the Eaſt Indies, and near Lima, it is generated upon commons and uncultivated ground; and it is even aſſerted that in the ſouthern regions of Spain, ſaltpetre is found in the duſt of the high roads. Lord Dundonald, in his treatiſe on the Connection of Agriculture with Chemiſtry, ſtates "that it is conſtituted by the putrefaction and complete decompoſition of animal and vegetable ſubſtances, when mixed with calcareous matter and wood aſhes." It is found to promote vegetation, but is too expenſive to be uſed as a manure for land.

NITRAT *of Soda*, a very ſoluble ſubſtance, formed from the combination of the nitric acid and the minerial alkali, or ſoda, which, on account of the figure of its cryſtals, has obtained the name of *cubic*, or more properly, of rhomboidal nitre. Bergmann diſtinguiſhes it by the name of nitrated ſoda, and modern chemiſts by that of nitrat of ſoda. It has not hitherto been found in a native ſtate, but is always produced, either directly or indirectly, by the artificial combination of its conſtituent parts. "Lord Dundonald

nald ſuppoſes it capable of promoting vegetation in an equal degree with the nitrat of potaſh."

NITRE, in *Chemiſtry*, the *Materia Medica*, &c. See *Nitrat of Potaſh*, under POTASH.

NITRE, in *Agriculture*, a term formerly applied to a ſalt extracted in Perſia and the Eaſt Indies, from certain earths that lie on the ſides of hills; and artifically produced, in ſome parts of Europe, from animal and vegetable matters rotted together (with the addition of lime and aſhes), and expoſed for a length of time to the air, without the acceſs of which nitre is never generated.

It was formerly ſuppoſed to have much influence in the buſineſs of vegetation. See NITRAT *of Potaſh*.

NITRE, *Alkaliſed*, is the fixed alkali remaining after the nitrous acid has been deſtroyed by its detonation with any inflammable matter. This alkali is generally called *fixed nitre*.

NITRE, *Ammoniacal*, is a neutral ſalt reſulting from the combination of the nitrous acid, to the point of ſaturation, with volatile alkali. The acid, in the moſt concentrated ſtate in which it is commonly met with, ſaturates about five-ſixths its weight of vegetable fixed alkali.

NITRE, *Antimoniated*. See ANTIMONY.

NITRE, *Calcareous*, is a neutral ſalt, compounded of the nitrous acid combined to ſaturation with a calcareous earth; and generally called *nitre with an earthy baſis*. This ſalt is very deliqueſcent, but incapable of a true cryſtallization. It has a poignant, acrid, and bitter taſte. See NITRUM *Calcareum*.

NITRE, *Clyſſus of*. See CLYSSUS.

NITRE, *Cryſtals of*. See CRYSTAL.

NITRE, *Cubic*, or *Quadrangular*, is a neutral ſalt, formed by the nitrous acid when ſaturated with mineral alkali. This cryſtalliſes not into a priſmatic but a cubical figure, and ſometimes into parallelepipedons, with rhomboidal faces. It is inferior to ordinary nitre, and never uſed.

NITRE, *Decoction of*, is prepared by boiling half an ounce of nitre, and two ounces of fine ſugar, with a ſcruple of cochineal as a colouring material, in $2\frac{1}{2}$ pints of water, till half a pint is waſted, and after ſtanding to ſettle, the clear purpliſh-red liquor is poured off for uſe.

NITRE, *Diaphoretic, of Antimony*. See ANTIMONY.

NITRE, *Fixed by Arſenic*, is the alkali of nitre, the acid of which has been expelled in an open fire by means of arſenic, of which ſome portion is retained by the alkali. This may be employed as a flux, as it greatly aſſiſts vitrification.

NITRE, *Fixed by Coals*. See FIXED *Nitre*.

NITRE, *Fixed by Metals*, is the alkali of nitre ſeparated from its acid, and mixed with the earth of the calcined metals.

NITRE, *Fixed by Tartar*, is the alkali of nitre and that of tartar mixed together by means of detonation. This is called the *white flux*.

NITRE, *Glauber's Spirit of*. See SPIRIT, and NITRIC *Acid*.

NITRES, *Metallic*, a general denomination that comprehends all neutral ſalts compoſed of the nitrous acid united with a metallic ſubſtance; the ſeveral kinds of which may be thus diſtinguiſhed, *viz. nitre of ſilver*, called *lunar cryſtals*, *nitre of lead*, *nitre of mercury*, &c. The acid acts in general powerfully upon all metallic ſubſtances, but with remarkable differences, depending on the peculiar natures of the metals. It diſſolves zinc, iron, copper, biſmuth, lead, mercury, and ſilver, the moſt readily of all the acids; tin it diſſolves imperfectly; regulus of antimony it only corrodes; gold and platina cannot be diſſolved by nitrous acid alone, without the concurrence of marine acid.

NITRE, *Nitred*. See NITRUM *Nitratum*.

NITRE, *Purified*. See NITRUM *Purificatum*.

NITRE, *Spirit of*. See SPIRIT.

NITRE, *Troches of*, are made by grinding one part of the purified ſalt with three parts of fine ſugar, and making up the mixture with mucilage of gum tragacanth.

NITRE, *Vegetating*. See NITRUM *Vegetans*.

NITRE, *Vitriolated*. See NITRUM *Vitriolatum*.

NITRIC ACID, in *Chemiſtry*, ſo called by the French chemiſts in 1787, is a compound of great value in the hands of the analytical chemiſt. Although this acid may be formed ſynthetically, in very ſmall quantity, by paſſing electric ſparks, in quick ſucceſſion, through a mixture of oxygen and nitrogen gaſes, it is, for all uſeful purpoſes, obtained from nitre (nitrat of potaſh). It appears firſt to have been procured from this ſubſtance by Raymond Lully in the 13th century, by diſtilling it from a mixture of nitre and clay. This method is ſtill practiſed in ſome manufactories, but it is more generally procured by decompoſing the nitre by means of ſulphuric acid, a proceſs firſt diſcovered by Glauber.

Into a glaſs retort put two parts of nitre and one of ſulphuric acid, of the ſpecific gravity of 1.85. A capacious quelled receiver is now to be luted to the retort: the heat of a lamp or a ſand-bath muſt then be gently applied. The nitric acid ſoon begins to be evolved, which condenſes in the neck of the retort, and runs into the receiver, of a pale yellow colour. As the heat is increaſed, yellow fumes ariſe, and the vapour becomes more difficultly condenſed. In this ſtage of the proceſs ſome of the acid is decompoſed into nitrous gas and oxygen gas. Theſe elaſtic fluids render the quelled receiver, or a tube of ſafety, highly neceſſary. The laſt portion of acid is not brought off till the heat has been raiſed almoſt to redneſs.

The liquid obtained by this proceſs was called by the old chemiſts ſpirit of nitre, and aquafortis. It is of a deep yellow or orange colour, and conſiſts, if the materials employed be pure, of nitric acid mixed with nitrous gas, to which it owes its yellow colour; as when this gas is expelled by heat the acid becomes colourleſs as water.

In the large way, and for the purpoſes of the arts, this acid is made in extremely thick caſt iron or earthen retorts, to which an earthen head is adapted, and connected with a range of proper condenſers. The ſtrength of the acid is varied by putting more or leſs water in the receivers. The nitric acid, thus made, generally contains ſulphuric acid, and muriatic acid from the impurity of the nitrat employed. If the former, a ſolution of nitrat of barytes will occaſion a white precipitate: if the latter, nitrat of ſilver will render it milky. The ſulphuric acid may be ſeparated by a ſecond diſtillation from very pure nitre, equal in weight to an eighth of that originally employed; or by precipitating with nitrat of barytes, decanting the clear liquid, and diſtilling it. The muriatic acid may be ſeparated by proceeding in the ſame way with nitrat of ſilver, or with litharge, decanting the clear liquor, and re-diſtilling it, leaving an eighth or tenth part in the retort. The acid for the laſt proceſs ſhould be condenſed as much as poſſible, and the re-diſtillation conducted very ſlowly; and if it be ſtopped when half is come over, beautiful cryſtals of muriat of lead will be obtained on cooling the remainder, if litharge be uſed. Other methods are mentioned for the obtaining aquafortis or nitric acid. The following, which differs but little from that of Glauber, is given by ſir Humphrey Davy in his Elements of Chemical Philoſophy. "It is," he ſays, "procured, for the purpoſe of chemiſtry, by the diſtillation of nitre and oil of vitriol:

about two parts of nitre ſhould be uſed to one part of oil of vitriol, and the retort heated in a ſand-bath connected with a receiver kept cool by moiſtened cloths. This acid, thus obtained, is uſually coloured, but becomes pale by expoſure to air. If the nitre be dry, its ſpecific gravity is from 1.52 to 1.55. This ſubſtance acts with great violence on all metals anciently known, excepting gold and platina, and it cauſes volatile oils to inflame. When it is paſſed through a porcelain tube heated to redneſs, oxygen is given off, and nitrous acid gas; and the ſame effect is produced upon the reſidual acid, as if it had been mixed with water; ſo that it is proved to be compoſed of nitrous acid gas, oxygen of water: and *four* in volume of nitrous gas, and two of oxygen gas condenſed in water, I find abſorb one in volume of oxygen to become nitric acid." He further adds, that from his own experiments, compared with thoſe of Kirwan, Wenzel, and Berthollet, he thinks that the ſtrongeſt acids contain from 14 to 15 *per cent.* of water, and, according to the principles of the French nomenclature, they ought to be called nitro-nitric acids. Aquafortis, or hydro-nitric acid, when its ſpecific gravity is below 1 4, ſtrengthens by being boiled: when ſtronger than 1.45, it becomes weaker by boiling.

The nitre of commerce frequently contains ſome muriatic ſalts, which being decompoſed by the ſulphuric, in common with the nitre, the muriatic acid comes over mixed with the nitric. If an exceſs of ſulphuric acid be employed, and the heat be very great, the latter, more or leſs, is frequently diſtilled over, ſo that nitric acid is often contaminated with ſulphuric and muriatic acids. The preſence of the muriatic acid may be beſt avoided by carefully cryſtalliz.ng the nitre to be employed. If at laſt it ſhould ſtill contain a little muriatic acid, it may be ſeparated by nitrat of ſilver. The ſulphuric acid may be ſeparated by re-diſtilling from a litharge, or barytes ſufficient to ſaturate all the ſulphuric acid. After the nitrous gas has been expelled by heat, the acid may be deemed pure. In this ſtate it is perfectly colourleſs, and of a ſtrong acid taſte, which, when diluted with water, is not unpleaſant. It ſhould be kept in a bottle coated on the outſide with black varniſh, or in a dark place. When it is expoſed to the light, oxygen gas is diſengaged, and the nitrous gas which is liberated tinges it of a yellow colour.

When expoſed to the air it appears to exhale white fumes. This is occaſioned by the great attraction of the acid for the moiſture of the atmoſphere.

To all animal ſubſtances it gives a beautiful yellow tinge.

The ſtrongeſt acid yet produced is not of greater ſpecific gravity than 1.62. Mr. Dalton informs us, that when its ſpecific gravity is 1.42, it boils at 248° of Fahrenheit. If it be ſtronger, the acid is diſtilled off; and if weaker, the water, till it comes to the above maximum. It corrodes animal and vegetable ſubſtances very ſpeedily, and the latter in the greateſt degree. The yellow colour it gives to them, excepting ſubſtances containing albumen, is not produced but when the acid is very ſtrong, and aſſiſted by heat. If it be added to the eſſential oils, they ſpeedily inflame, leaving behind a ſpongy coal. When it is poured upon powdered charcoal, very dry, it takes fire. The ſame effects take place with ſulphur and phoſphorus, at a certain temperature.

It is decompoſed by all the metals, excepting gold, platina, and titanium: hence it is an important agent in chemiſtry for oxydating moſt of theſe ſubſtances. Many of the metals, ſuch as zinc, iron, tin, &c. take the whole of the oxygen from it, while nitrogen alone is diſengaged. Others of the metals, ſuch as ſilver, mercury, copper, &c. deprive it of only one atom of oxygen, the nitrous gas being ſet free, producing red fumes with the preſence of oxygen. When it is poured on zinc, tin, or biſmuth, in a ſtate of fuſion, inflammation takes place. The ſame effect takes place in the cold when the metals are in fine powder.

Nitric acid, as has been deſcribed, is not to be regarded as the real acid, but a compound of real acid and water. The determination of real acid, in a given quantity of the liquid, has much engaged the attention of chemiſts. We are indebted to Kirwan, Davy, Berthollet, and Dalton, for reſearches on this ſubject. The experiments of the firſt and laſt of theſe chemiſts appear to come neareſt the truth.

Mr. Kirwan deprived ſome carbonat of ſoda of its water of cryſtallization: 367 grains of a ſolution of this ſalt contained 50.05 grains. This was ſaturated with 147 grains of nitric acid, of the ſpecific gravity of 1.2754, equal, as he had aſcertained, to 67.179 grains, of the ſpecific gravity 1.5543, which he made his ſtandard. The carbonic acid evolved by adding nitric acid was 14 grains. To this ſolution he added 939 grains of water, which reduced it to the ſpecific gravity 1.0401, at the temperature of 58°.5, the whole ſolution weighing 1439 grains. He next prepared a ſolution of nitrat of ſoda, of the ſpecific gravity of 1.0401, and found that the ſalt, in 1439 grains of this ſolution, was $\frac{1}{16.901}$ of the whole; therefore $\frac{1439}{16.901} = 85.142$ grains of nitrat of ſoda. Now, the 50.05 — 14 = 36.05 gr. is the weight of the alkali. The acid, therefore, will be 85.142 — 36.05 = 49.092 grains; but the acid of 1.5543 weighed 67.179 grains; conſequently 67.179 — 49 092 = 18.087 will be the water contained in 67.179 of acid, of 1.5543 ſpecific gravity, which is equal to 26.9 *per cent.* Hence 100 parts of nitric acid of 1.5543, conſiſts of 73.1 of real acid, and 26.9 of water.

Dalton has made a number of ſimilar experiments, which ſtrongly confirm the concluſions of Kirwan, the greateſt difference between them being no more than 1.4 *per cent.* in the quantity of real acid. The following is a table given by Dalton. The column of real acid is taken from Kirwan, with trifling corrections: in which he has alſo given a column for the quantity of real acid by meaſure, and another ſhewing the number of atoms of acid and water.

Atoms.	Acid *per cent.* by Meaſure.	Acid *per cent.* by Weight.	Specific Gravity.	Boiling Point.
Acid. Water.				
1 + 0	17.5	100	1.75	30°
2 + 1	13.4	82.7	1.62	100
1 + 1	11.2	72.5	1.54	175
	10.2	68.5	1.50	210

The

The firſt column of this table ſhews the number of atoms of acid and water, in which it appears, that when the compound is 1 atom of acid to 1 of water, the liquid acid contains 72.5 of real acid, and 27.5 of water by weight, and the ſame by meaſure will be 112 acid: this laſt is governed by the ſpecific gravity, which is 1.54. The boiling point of this ſtrength being at 175°, it will be ſeen that the maximum of the boiling point is at 248°; when the liquid acid conſiſts of 1 atom of real acid to 2 of water, the ſpecific gravity being 1.42, and the real acid 54.4 *per cent.* The acid, free from water, if its exiſtence in the liquid form be poſſible, Mr. Dalton ſuppoſes would be as volatile as æther. It appears that the acid of 1.42 is the beſt ſtrength to remain permanent, ſince, according to the experiments of this ingenious chemiſt, the acid and water are ſo nearly balanced in their affinities as to evaporate together. The acid or the water will therefore be apt to evaporate, as the real acid or water may be in exceſs above this point, which may be denominated the point of mutual ſaturation.

The acid of this ſtrength has very curious properties, on which Dalton makes ſome ingenious obſervations. Prouſt has ſtated, that an acid of the ſtrength of 1.48 gives no more efferveſcence with tin than it does with ſand. When metals, which produce ammonia, are acted upon by nitric acid; theſe, I ſuppoſe, are ſuch as decompoſe both the water and acid, taking all the oxygen from both. The metal, under this circumſtance, combines with 3 atoms of oxygen, while the nitrogen and the hydrogen form ammonia. If the acid conſiſted of 1 of real acid to 2 of water, an atom of water would be ſet free, which would dilute the remaining acid, and thus facilitate the proceſs. If, however, the acid and water were as 2 to 3, then an atom of nitric acid, and an atom of water, would be afforded to the atom of ammonia, forming an atom of nitrat of ammonia. The remaining acid and water would juſt be reduced to 1 of acid to 2 of water. At this point, and below it, efferveſcence would take place; but in the inſtance with 2 of acid to 3 of water, all the products will be diſpoſed of in forming nitrat of ammonia, and reducing the acid to the ſtrength of 1 of acid to 2 of water, during which change no efferveſcence will take place. This view of the ſubject is very ingenious, and fully explains the phenomena attendant on the oxydation of thoſe metals which cauſe the formation of ammonia.

The acid of 1 of acid to 3 of water, has no ſtriking properties. That which conſiſts of 1 to 4, Mr. Dalton is of opinion, is that which freezes at — 2° of Fahrenheit. Mr. Dalton, and previous to him, ſir Humphrey Davy, have attempted to procure nitric acid in the gaſeous form, by combining nitric oxyd (nitrous gas) with oxygen, but their reſults have not been attended with ſucceſs. This appears to ariſe from the uncertainty in the combination of nitric oxyd gas with oxygen gas, eſpecially when water is not preſent. It appears, from the experiments of Mr. Dalton, that nitric oxyd will combine with oxygen in any proportions between 1.3 and 3.6 of the oxyd to 1 of oxygen. This apparent anomaly to the doctrine of definite proportion is very ingeniouſly explained by the above-mentioned chemiſt. When the nitric oxyd is to oxygen as 3.6 to 1, the oxygen combines with one-half of the nitric oxyd, forming nitric acid, which combines afterwards with the other half to form nitrous acid, or the fuming and coloured nitric acid. When, on the other hand, 1 of oxygen combines with 1.3 of nitrous oxyd, in which the minimum of the latter exiſts, a compound is formed, which, according to the opinion of Mr. Dalton, conſiſts of 1 atom of nitrogen with 3 of oxygen, and which he has denominated the oxynitric acid. The firſt of theſe combinations is favoured by uſing a veſſel which gives a ſhort column of great diameter, and in which the change is quick. The ſecond combination, in which the oxygen is in exceſs, is facilitated by the change being ſlow, which is effected by uſing a long tube of ſmall diameter. A tube of an intermediate ſize being employed when the gaſes are 1 of oxygen to 1.8 of nitric oxyd by meaſure, the nitric acid will be formed by the union of the two gaſes. It is the opinion of this diſtinguiſhed chemiſt, that if the gaſes, even in exact proportions to form nitric acid, be mixed in a dry veſſel, that all the compounds, namely, nitrous acid, nitric acid, and oxynitric acid, may exiſt, which, when water is introduced, may ſo act upon each other, as to form nitric acid. Theſe facts, with the reaſoning reſulting from the ſame, ſeem to baffle all attempts to obtain nitric acid in a free ſtate. Mr. Dalton, after much care and attention, has given the means to determine the component parts of the nitric acid. If, as he ſeems fully to have eſtabliſhed, the atom of nitrogen be 5, and the acid be conſtituted by 1 atom of nitrogen to 2 of oxygen, the proportions will be 14 of oxygen to 5 of nitrogen, and the weight of the atom of acid will be 19. For the colouring of fuming nitric acid, ſee NITROUS *Acid*; ſee alſo NITRIC *Oxyd*, and NITROUS *Oxyd*. The combinations of nitric acid with the different ſaline baſes, are called *nitrats*.

NITRIC, and NITROUS *Acid*, in the *Materia Medica*. The *nitric* acid of the London Pharmacopeia is prepared by mixing *nitrat* of potaſh dried and ſulphuric acid, of each two pounds, in a glaſs retort; and diſtilling the nitric acid from a ſand-bath, until red vapours are produced; then add an ounce of dried nitrat of potaſh, and re-diſtil the acid in a ſimilar manner. The ſpecific gravity of this acid is to that of diſtilled water as 1.500 to 1.000. If a piece of lime-ſtone be immerſed in a fluid-ounce of it diluted with water, ſeven drams ought to be diſſolved. According to the directions of the Edinburgh Pharmacopeia, any quantity of nitrous acid is put into a retort, and having fitted a receiver, a very gentle heat is applied until the reddeſt part ſhall have paſſed over, and the acid which remains in the retort have become nitric acid. The *nitrous* acid of the Edinburgh Pharmacopeia is prepared by pouring ſixteen ounces of ſulphuric acid upon two pounds of bruiſed nitrat of potaſh in a glaſs retort, and diſtilling from a ſand-bath, with a gradually augmented heat, until the iron pot becomes obſcurely red-hot. The ſpecific gravity of this acid is to that of diſtilled water as 1.550 to 1.000. The Dublin Pharmacopeia orders ſix pounds of nitrat of kali to be mixed with four pounds by weight of ſulphuric acid, and then diſtilled until the reſidue becomes dry. The ſpecific gravity of this acid is to that of diſtilled water as 1.500 to 1.000.

In performing theſe operations, it is adviſable to uſe Woulfe's apparatus, or a range of two or three globular receivers, the laſt of which ſhould contain a ſmall portion of water. In order to prevent the nitrous oxyd from combining with the condenſed acid in the receiver, deepening its colour, and giving it that form which conſtitutes nitrous acid, the London College orders a large portion of ſulphuric acid to be employed, which ſerves to contribute a ſufficient portion of water for preſerving the conſtitution of the nitric acid; for, although a large proportion of this acid be obtained by following the directions of the London formula, yet it is actually weaker than that which is obtained either by the Edinburgh or the Dublin proceſſes. The Edinburgh College orders the acid to be kept in this form; and as a medical agent it anſwers the ſame purpoſes as the colourleſs acid; for, when both are diluted with water, they have the

the ſame appearance, and are brought to the ſame ſtate, the addition of the water expelling completely the nitrous oxyd, which is looſely united with the nitric acid to form the nitrous. The quantity of acid obtained is about half the weight of the nitrat employed: and the reſidue is a white, ſpongy, ſaline cake of ſulphat of potaſh, with an exceſs of ſulphuric acid, which may be diſſolved out of the retort by hot water. By the London proceſs, the nitric acid is at firſt obtained tolerably free from nitrous oxyd; but in general the re-diſtillation will be found neceſſary. In the expulſion of the nitric oxyd, to change the nitrous into nitric acid, according to the directions of the Edinburgh College, a portion of the acid is carried over with the gas, as nitrous acid vapour: this ſhould not be waſted, but be condenſed by a ſmall portion of water being put into the receiver, and thus form a diluted acid. Mr. Murray (Mat. Med.) juſtly obſerves, that the heat of a water-bath is beſt adapted for this operation, being ſufficient for the purpoſe, and not too high to produce the decompoſition of the acid. A completely colourleſs acid, however, is not obtained, unleſs the acid be re-diſtilled from a ſmall portion of black oxyd of manganeſe; but this is not neceſſary for medical purpoſes. The contaminations of nitric acid by muriatic or ſulphuric acid do not affect its medicinal virtues.

Nitrous acid, as the term is underſtood in the Edinburgh Pharmacopeia, is a yellow or orange-coloured fluid, emitting, when expoſed to the air, deep orange-coloured extremely ſuffocating fumes. With regard to its chemical affinities and other qualities, it agrees in every reſpect with nitric acid. It conſiſts of nitric oxyd looſely combined with nitric acid and water.

Nitric acid is a colourleſs, or very pale yellow, limpid fluid, emitting, when expoſed to the air, white ſuffocating vapours, and poſſeſſing ſtrong acid properties. It is highly corroſive, and tinges the ſkin yellow, which remains till the epidermis is peeled off. It unites with water in every proportion, and while mixing heat is evolved. See the articles Nitric and Nitrous *Acid*, ſupra.

Strong fluid nitric acid is uſed only for pharmaceutical purpoſes; except when extricated in the form of vapour, it is employed for deſtroying contagion. It is leſs powerful than the oxymuriatic acid, but is more generally uſeful, as it can be extricated in the chambers of the ſick without proving deleterious to animal life. For this purpoſe, f℥ij of ſulphuric acid may be poured over ℥iv of coarſely powdered nitre in a china cup, and placed in a pipkin of hot ſand. This quantity is ſufficient for fumigating a room that is ten feet ſquare; and where a larger portion is required, it is more adviſable to multiply the number of pipkins than to put a larger quantity of the materials into one veſſel. The officinal preparations of nitric acid are the following, *viz.* Acidum nitricum dilutum, L.E.D.; Oxydum antimonii, L.; Argenti nitras, L. D.; Liquor ferri alkalini, L.; Ung. hydrargyri nitratis, L. E. D.; Hydrargyri nitricum oxydum, L.; Spiritus ætheris nitrici, L. E. D.; Unguentum acidi nitroſi, E. D.

The diluted nitric acid, L., is prepared by mixing a fluid-ounce of nitric acid with nine fluid-ounces of diſtilled water. For that of E. take equal weights of nitrous acid and mix them, avoiding the noxious vapours. For that of D. take of nitrous acid and diſtilled water of each one pound. The ſpecific gravity of this mixture is to that of diſtilled water as 1280 to 1000. When the diluted acid is prepared according to the directions of the London College, f℥i contains about grs. x of nitric acid, of 1,500 ſpecific gravity, while the ſame meaſure of the ſame acid, prepared after the Edinburgh and Dublin, and the former London formulæ, contains grs. xxxv of the ſame acid; a difference, which, as it may lead to errors in practice, is to be regretted.

Nitric acid is tonic and antiſeptic. When largely diluted with water, it forms an agreeable and uſeful beverage in fevers, particularly of the typhoid type. In larger doſes, leſs diluted, it has been adminiſtered with effect in chronic hepatitis, even when dropſy has ſupervened; and it has alſo been ſerviceable in reſtraining violent ſickneſs, in dyſpepſia, aſthma, and the greater number of cachexiæ. From obſervations of Mr. Scott, publiſhed at Bombay in 1796, this acid excited attention as a remedy for ſyphilis; but after the moſt ample trials, by almoſt every practitioner of eminence in the country, its antiſyphilitic powers have not been found to correſpond to the accounts of thoſe tranſmitted from India. Although it gives a temporary check to the progreſs of the diſeaſe, it does not permanently remove the ſymptoms; and, as Mr. Pearſon juſtly obſerves, it would by no means be warrantable to ſubſtitute the nitrous (or nitric) acid in the place of mercury, for the cure of venereal complaints. It has been found, however, of conſiderable ſervice when given at the ſame time with mercury, in old obſtinate ulcerations of the legs, although no venereal taint could be ſuſpected; and it is employed with benefit as a local ſtimulant in the form of lotion, in the proportion of f℥ij of the acid to ℔j of water, to fœtid ulcers, attended with a thin ichorous diſcharge, and in caries of the bones. In India it is ſometimes uſed in the form of a bath, and in this ſtate produces the ſame effects as when it is taken internally. The doſe of the diluted acid is from m x to m xxx in f℥iij of water, given three or four times a day. Its officinal preparations are, Aceti hydrargyri, E. D.; Submurias hydrargyri præcipitatus, E. D.; Submurias hydrargyri ammoniatus, D.; Oxydum hydrargyri cinereum, E. D.; Oxydum hydrargyri rubrum, E. D. See Mercury. Thomſon's Lond. Diſpenſatory, 1811.

Nitric *Oxyd*, in *Chemiſtry*. This ſubſtance, like the nitric acid, is a compound of nitrogen with oxygen: the former being formed of 1 atom of nitrogen to 2 of oxygen, the latter 1 to 1.

Several of the metals, as ſilver, mercury, and copper, when added to the nitric acid, deprive it of 1 atom of oxygen only. The remainder, which is 1 to 1, eſcapes in the form of gas. This gas has been formerly called nitrous gas; but, according to the preſent ſtate of chemical nomenclature, it is called nitric oxyd.

To procure nitric oxyd, introduce ſmall bits of copper into a gas bottle, or a ſmall retort, upon which pour nitric acid of the ſpecific gravity 1.2. Let the proceſs go on a little, the mouth of the retort being under water, or mercury, before the gas is collected. This ſerves to diſplace the air of the retort. The gas, which is now obtained, will be colourleſs as common air. In this proceſs, an atom of copper decompoſes two atoms of nitric acid, taking an atom from each to form the ſecond oxyd of copper. This oxyd then combines with two other atoms of acid, to form nitrat of copper. The two atoms of nitric oxyd, reſulting from the decompoſed acid, would be abſorbed by the remaining acid, if a ſufficient quantity were preſent; by which it would acquire, firſt, a yellow colour; a deep orange, as it increaſes; next, a green; and ultimately, a blueiſh tint. For the better obſervance of theſe ſhades of colour, ſilver ſhould be employed inſtead of copper; ſince the ſolutions of copper in any acid are of green colour. When, however, the exceſs of acid is not great in producing nitric oxyd, a great proportion of this gas is evolved. For common purpoſes,

poſes, it may be collected over water, which abſorbs only about $\frac{1}{20}$th of its bulk: on ſome occaſions, however, it is neceſſary to collect it over mercury.

Nitric oxyd may be ſeparated from other gaſes, by means of ſolutions of iron with the black oxyd. The liquid, by agitation, ſoon abſorbs all the nitric oxyd, without affecting any other gas that might exiſt with it. This furniſhes an eaſy method of aſcertaining the purity of nitric oxyd. The abſorbed gas may be ſeparated unchanged by heat.

When the nitric oxyd is mixed with oxygen, or is brought in contact with the atmoſphere, red fumes immediately appear, which are of greater denſity than common air. This is called nitrous acid gas.

The ſpecific gravity of nitric oxyd is to common air, according to Kirwan, as 1 to 1.19; but Davy, who is nearer the truth, makes it 1.102. If hydrogen be equal to 1, and 100 cubic inches weigh 2.5 grains, then the nitric oxyd will be 13, and 100 cubic inches of it will weigh 32.5 grains.

When a lighted taper, or ſulphur in a ſtate of inflammation, are immerſed in this gas, the flame becomes extinguiſhed; but phoſphorus and charcoal, when once kindled, burn in it, and conſequently deprive it of its oxygen.

Several of the metals, ſuch as arſenic and zinc, when heated in this gas, deprive it of its oxygen; the reſidual gas being nitrogen.

Other bodies take away only part of its oxygen: of theſe are the alkaline ſulphurets, the muriatic ſolution of tin, and ſeveral of the ſulphats. For theſe facts we are indebted to ſir Humphrey Davy. The reſulting gas is the nitrous oxyd, which is compoſed, according to Dalton, of one atom of oxygen to two of nitrogen. In this proceſs, an atom of nitric oxyd gas gives up an atom of oxygen, which combines with the decompoſing body; while the deſerted atom of nitrogen combines with an atom of nitrous gas, forming nitrous oxyd. This moſt clearly ſhews why the atom of nitrous oxyd ſhould be heavier than an atom of nitric oxyd. The latter atom is conſtituted by 1 to $1 = 5 + 7 = 12$; the former of 1 of oxygen to 2 of nitrogen, or $7 + 2 \times 5 = 17$. Sir Humphrey Davy, notwithſtanding this corroborating fact, conſiders nitrous oxyd as 1 of oxygen to 1 of nitrogen; by doing which, the nitric acid is made to conſiſt of 1 of nitrogen to 5 of oxygen; a thing very improbable between two bodies having ſo little affinity for each other.

When nitric oxyd is acted upon by electricity, an atom of oxygen is liberated from one atom of the gas, and given to another, till the whole is divided into nitric acid and nitrogen. In other words, one-half of the gas gives its oxygen to the other half. By this change, if the original volume be 1, the reſulting volume will be $\frac{1}{2} \times \frac{13}{12.125} = \frac{13}{24\frac{1}{4}}$, a little more than half.

When nitric oxyd is mixed with hydrogen, it does not explode by the electric ſpark. It is, however, ſaid to detonate, when paſſed through a red-hot porcelain tube; the reſult being water and nitrogen. The relative volume of theſe gaſes, to produce this reſult, will be 13 of hydrogen and 12 of nitrogen.

We are indebted to Dr. Henry for the fact of nitric oxyd being decompoſed by ammonia. For this purpoſe, the two gaſes are to be put into the ſtrong tube, called Volta's eudiometer, and the electric ſpark paſſed through them. When the nitric oxyd is in exceſs, the reſult is nitrogen, water, and a little nitric acid; when the ammonia predominates, then nitrogen, water, and hydrogen are produced.

From the great facility with which the nitric oxyd combines with oxygen, it has been employed to aſcertain the quantity of oxygen mixed with other gaſes. There is, however, ſome uncertainty in this method, in conſequence of ſeveral compounds being formed by oxygen and nitric oxyd. Dalton recommends an exceſs of the latter to be uſed, in order to prevent the ambiguity above mentioned, and afterwards to take up the exceſs with a ſolution of the green ſulphat of iron.

When nitric oxyd is mixed with oxymuriatic acid gas, a ſudden decreaſe of volume takes place, from the muriatic acid and nitric acid being formed, both of which become liquid. This effect, however, does not take place, if the gaſes be perfectly dry, and the veſſels free from moiſture.

Since an atom of nitric oxyd conſiſts of 1 of nitrogen to 1 of oxygen, the weight of its atom will be $5 + 7 = 12$; the nitric acid, being 1 of nitrogen to 2 of oxygen, will be $5 + 2 \times 7 = 17$: hence the proportions of oxygen and nitric oxyd to form nitric acid will be 7 to 12. In mixing this with other gaſes, where mutual action takes place, the proportion by weight will be as the weights of their atoms. Their proportions by volume will be obtained, by multiplying the ratio of their weights by the united ratio of their ſpecific gravities: the latter ratio will be eaſily expreſſed, by making the ſpecific gravity of hydrogen gas unity. If, for inſtance, nitric oxyd be mixed with hydrogen, to be paſſed through a red-hot porcelain tube, the proportion by weight will be 12 of the oxyd to 1 of hydrogen, the relative weights of their atoms, and $\frac{12}{1} \times \frac{1}{13} = \frac{12}{13}$, or 12 of nitric oxyd by meaſure to 13 of hydrogen. Ammonia and nitric oxyd will be $\frac{6}{12} \times \frac{13}{7.5} = \frac{13}{15}$, or 13 by volume of ammonia to 15 of nitric acid.

NITRO-AERIAL Spirit, a term invented by Mayow, and ſince uſed by many others, to expreſs a very active principle in the air, cauſing great changes in the bodies abſorbing it, and expoſed to it. This acid ſpirit is, according to Mayow, compoſed of terrene matter, which is flexible and humid, and of etherial particles, which are rigid and dry, active and igneous, and proceeding from the air. Theſe igneous particles are common to nitre and to air, and are therefore called *nitro-aerial;* and the ſpirit of nitre derives, according to this ſyſtem, from theſe particles its active and corroſive quality, which makes it a ſort of potential fire; and on this the form of nitre chiefly, if not wholly, depends.

NITROGEN, in *Chemiſtry*, a ſimple oxydable body, by ſome chemiſts called azot, from its property of deſtroying life. This name appears improper, ſince ſeveral other gaſes have the ſame effect upon animals.

Before the diſcovery of Cavendiſh, our knowledge of this gas was little more than negative. It was then believed to be the baſe of the nitric acid, but the certainty was not eſtabliſhed till the gas was combined with oxygen, by paſſing a number of electric ſparks through the two gaſes. This is the only poſitive knowledge we yet poſſeſs of this ſubſtance. Its ſpecific gravity is $12\frac{1}{8}$, hydrogen being 1. The weight of its atom is 5, hydrogen being 1. See Azot.

NITRO-MURIATIC Acid. This acid is formed by mixing the nitric and muriatic acids together, or by diſſolving

ing muriat of ammonia in nitric acid. In the latter proceſs part of the nitric acid decompoſes the ſalt, while the other part acts upon the diſengaged muriatic acid, to form the nitro-muriatic acid. This acid was known to the ancients, who called it *aqua regia*, from its property of diſſolving gold. It is now pretty generally admitted to be oxymuriatic acid, formed by the oxygen of the nitric acid with the muriatic acid. Hence we may infer, that the proportions of theſe acids ſhould be as the weight of the atoms of real acid, which is 22 of muriatic acid to 19 of the nitric: the latter gives an atom of oxygen to the former, forming oxymuriatic acid, which will be 29, while 12 of nitric oxyd will be partly evolved, but is more generally retained by the liquid, to which it gives an orange colour.

This is by far the moſt convenient menſtruum for gold and platina, and is uſed in the arts for that purpoſe. See OXYMURIATIC *Acid*.

NITROUS ACID. This name has been commonly given to the nitric acid when rendered fuming by the preſence of nitric oxyd Since, however, nitric acid may contain almoſt any proportion of nitric oxyd, we cannot with propriety admit this mixture as nitrous acid. Dalton is of opinion that nitric acid and nitric oxyd may unite in ſuch proportions as to form a compound, to which he has given the name of nitrous acid. In order to obtain pure nitrous acid, this chemiſt recommends water to be firſt impregnated with oxygen gas, and then with nitric oxyd. By this means 2 atoms of nitric oxyd unite with 1 of oxygen, forming nitrous acid. Since, as we have obſerved under NITRIC *Oxyd*, that nitric acid is 1 of nitric oxyd to 1 of oxygen, nitrous acid muſt, therefore, conſiſt of 1 atom of nitric acid, united to 1 of nitric oxyd, and its atom will be, therefore, $12 + 19 = 31$.

Mr. Dalton ſuppoſes that the common fuming acid is generally a compound of nitrous acid and nitric acid. He obtained an acid by ſaturating nitric acid of 1.3 with nitric oxyd gas, which boiled at 160°, while the ſame acid, without the gas, boiled at 236°. Hence he concludes that the nitrous acid is formed in the firſt inſtance, and gives the increaſed volatility to the nitric acid.

The exiſtence of an acid, containing leſs oxygen than the nitric acid, has been inferred from the fact of expoſing nitrat of potaſh to a certain degree of heat, by which a portion of oxygen gas is driven off. The ſalt, however, is ſtill neutral, a proof that the remaining acid was ſtill capable of ſaturating the alkali. Hence it has been ſuppoſed, that nitric acid has parted with ſo much of its oxygen as to leave nitrous acid, and that the ſalt is converted from a nitrat into a nitrite. In this experiment an atom of oxygen is diſengaged from an atom of nitric acid, leaving an atom of nitrous oxyd, which combining with another atom of nitric acid, forms an atom of nitrous acid, ſo that the reſult is half as many atoms of the latter, as there were of the nitric acid. The ſalt originally conſiſted of 1 atom of potaſh combined with 2 atoms of nitric acid, while the reſulting ſalt conſiſts of 1 atom of nitrous acid, combined with 1 of alkali.

NITROUS *Gas*. See EUDIOMETRY and GAS.

NITROUS *Oxyd*. In referring to NITRIC *Oxyd*, it will be found that it is compoſed of 1 atom of nitrogen and 1 of oxygen. This is a compound of the ſame elements, but with leſs oxygen. In the ſequel it will appear that nitrous oxyd is formed of 2 atoms of nitrogen with 1 of oxygen, being, therefore, a heavier atom than nitric oxyd as 17 to 12. The following is the proceſs for procuring this gas in a ſtate of purity. Into a glaſs retort put as much cryſtallized nitrat of ammonia as will half fill it when fuſed: place the retort over a lamp, capable of giving a degree of heat equal to 400°, and let the neck of the retort be connected with a pneumatic trough. After the ſalt has fuſed, and the water of cryſtallization driven off, the heat requires to be raiſed to between 3 and 400° of Fahrenheit. Numerous bubbles will ſoon appear on the ſurface of the fluid, much more brilliant than thoſe previouſly obſerved from the boiling of the liquid. It is under this appearance that the ſalt is decompoſed, and the nitrous oxyd evolved. This decompoſition will go on till the retort is quite empty, the whole of the nitrat of ammonia being converted into water and the gas in queſtion. It will be proper to obſerve, that the retort muſt be removed the inſtant the laſt portion of ſalt is decompoſed, to prevent the water of the veſſel coming into it by the preſſure of the atmoſphere. If the gas be received over water, a quantity of gas, equal to the volume of the water, will be abſorbed. Hence, for any nice experiments, it ſhould be received over mercury. Nitrous oxyd has all the mechanical properties of common air, with reſpect to tranſparency, colour, and elaſticity. Its ſpecific gravity is 20, hydrogen being 1, and the weight of 100 cubic inches is equal to 50 grains. Its conſtitution will be eaſily ſeen from its formation, in the proceſs above deſcribed. Nitrat of ammonia is conſtituted by an atom of nitric acid, an atom of ammonia, and 1 of water. When the ſalt is decompoſed, the 2 atoms of nitrogen, 1 from the acid, and the other from the ammonia, jointly combine with 1 atom of oxygen from the acid, forming nitrous oxyd, while the other atom of the oxygen from the acid combines with the hydrogen of the ammonia, forming water. This agrees with the fact, ſince nitrat of ammonia produces nothing but water and nitrous oxyd. Nitrat of ammonia, according to ſir Humphrey Davy's numbers, conſiſts of 1 proportion of acid and 5 proportions of oxygen for the acid, and 1 of nitrogen to 6 of hydrogen for the ammonia. The 2 proportions of nitrogen retain, each, a proportion of oxygen, forming 2 of nitrous oxyd, while the other 3 of oxygen combine with 6 proportions of hydrogen, forming 3 of water. This equally explains the fact, but does not poſſeſs the ſimplicity of Dalton's numbers for the weight of atoms. It is not leſs irreconcilable, that 1 of nitrogen ſhould combine with 6 of hydrogen, than 1 of nitrogen combining with 5 of oxygen to form nitric acid.

Although the nitrous oxyd contains leſs oxygen than nitric oxyd, yet the former ſupports combuſtion with moſt bodies; while the latter, as has been obſerved under that article, is ſcarcely ſuſceptible of this property. If ſulphur be firſt kindled, and then introduced into nitrous oxyd, it burns with a brilliant roſe-coloured flame, producing ſulphuric acid and nitrogen gas.

Phoſphorus, ſimilarly treated, burns with great violence.

Carbon expoſed in this gas, and fired by a lens in the ſun's heat, burns with great brilliancy, producing carbonic acid and nitrogen gas. According to Prieſtley it is capable of detonation with hydrogen, by the electric ſpark producing water and nitrogen. When the hydrogen is not ſufficient, nitric acid is ſaid to be formed. This latter fact appears very improbable.

It is alſo decompoſed by ſulphuretted, phoſphuretted, and carburetted hydrogen gaſes, by applying the mixtures to a ſtrong heat.

Iron wire burns in this gas equally well with oxygen, but with leſs duration, producing the black oxyd of iron. It is decompoſed by zinc, the nitrogen being left, while the zinc is

oxydated. It is ſaid to combine with potaſh and ſoda, forming peculiar compounds.

Dr. Prieſtley, who diſcovered this gas in 1776, declares it unreſpirable, and the Dutch chemiſts, who afterwards examined it, coincide with him in this opinion. We are indebted to ſir Humphrey Davy for many additional facts relative to it, among which he found that, to a certain extent, it is reſpirable, under which it produces effects on the ſyſtem not much unlike intoxication: theſe effects are, however, very different on different ſubjects, and according to the time it is breathed. Some become highly exhilarated, exhibiting unuſual motions and geſtures, with incoherent language, and at the ſame time unconſcious of all around them. On returning conſciouſneſs, they deſcribe ſome extravagant ſcene, which they relate as a dream, but in which the impreſſions have been more vivid. Others are very differently affected, appearing almoſt in a ſtate of inſenſibility. The countenance appears as in a ſtate of paralyſis, and of a livid and purple colour. They will ſit motionleſs for ſome time, and when they recover have no lively dream to repeat. Almoſt all who breathe it effectually, become unconſcious in a few minutes, and breathe the gas involuntarily for ſome time afterwards. During the rage for gaſeous medicine, it was held up as promiſing great advantage in certain diſeaſes. This idea has been ſome time abandoned, with little hope of its revival.

NITRUM is uſed by the poet Martial to expreſs that ſort of foulneſs in cryſtal, which Pliny, and others of the ancient Roman authors, diſtinguiſhed by the name of *ſal*.

NITRUM *Calcareum*, in *Natural Hiſtory*, a name given by Dr. Liſter to a peculiar ſpecies of neutral ſalt, which he firſt publicly deſcribed in his book on the medicinal waters of England. He very improperly calls it nitre; becauſe it has none of the properties or qualities of nitre, but only a ſort of general reſemblance in its external form. He obſerves that this ſalt, though very little known, was abundantly the moſt copious of all the ſorts afforded by the mineral waters in general; and ſays its cryſtals were long and ſlender, and conſiſted of four ſides, and were terminated by a point compoſed of two triangular planes. He adds, that this ſalt doubtleſs had its origin from a mixture of the acid of ſulphur and a calcareous earth of an alkaline nature.

This ſalt is found in almoſt all the mineral waters of Germany, and is very juſtly obſerved by Hoffmann to be of the nature of Glauber's ſalt: that it is not nitre is evident from this, that it is not inflammable, nor will yield aquafortis by diſtillation. It ſeems, indeed, true Glauber's ſalt, compoſed of the acid of vitriol, or ſulphur, for this is in both the ſame, and of that alkaline earth which is the baſis of ſea-ſalt: this is its origin, in the veſſels of the chemiſt, as well as in the bowels of the earth, and probably the figure of the cryſtals of that obſerved by Dr. Liſter, was the ſame in the point, as well as in the body, both being quadrilateral columns terminated by pyramids compoſed of a number of triangular planes. Hoffmann, Opera, tom. v. p. 139.

The medicinal waters in the neighbourhood of Paris contain it alſo in a very conſiderable quantity, though leſs than this. It is the opinion of Hoffmann, that when any water before impregnated with a vitriolic acid, in its current under ground, paſſes over this calcareous earth, it as readily joins a part of it with it, as the vitriolic acid does with the ſea-ſalt, for its baſis, in making the common Glauber's ſalt, and thence produces a bitter purging ſalt, of the ſame nature with that; and, indeed, if the acid of ſulphur be mixed with any alkaline ſubſtance, a bitter neutral ſalt is produced, ſomewhat analogous to this, and to the Glauber's ſalt.

NITRUM *Nitratum*, in *Chemiſtry*, the name of a preparation of nitre, made by adding a ſufficient quantity of ſpirit of nitre to a lixivium of pure nitre, and afterwards evaporating it to a pellicle, and ſetting it by to ſhoot. The cryſtals formed by this liquor are perfectly nitrous in their figure, but they will be of an acid taſte.

This preparation of nitre is a good medicine in burning fevers.

NITRUM *Purificatum*, *purified nitre*, is thus prepared: take nitre, or common ſaltpetre, one pound; pure water three quarts and a pint, ſet them on the fire together, and diſſolve the ſalt perfectly by boiling: then ſtrain the hot lixivium through a double flannel, and ſet it over the fire again in an earthen veſſel. Evaporate it gently, till on taking out a little of the liquor in a ſpoon as it cools, there are ſeen threads as it were ſhooting in it; in this ſtate the ſalt is ready to concrete. Set it in a cool place, putting clean ſticks acroſs the veſſel, and the ſalt will form itſelf into extremely pure and beautiful cryſtals on the ſide of the veſſel, but principally on the ſticks. Theſe dried in a colander are fit for uſe. See *Nitrat of* POTASH.

This is the beſt of all the preparations of nitre, for medicinal uſe, in its native form. It diſſolves immediately on entering the body, where it wonderfully cools, and thins the blood, giving it a fine florid colour. In all inflammatory diſeaſes attended with condenſations of the blood, this ſalt proves excellently cooling and attenuating. It is given from four or five grains, to ten, twelve, or fifteen at a doſe. Some give more at a time, but it is more adviſable to have the doſes ſmaller, and oftener repeated. It is alſo good in the ſmall-pox, and ſuppreſſions of urine. It is alſo ſaid to be given by many in hæmorrhages with ſucceſs. If there be any caſe in which caution is required, it is in a conſumption where the lungs are ulcerated. Of this purified nitre, a ſafe and powerful alterant is readily and eaſily prepared in the following manner: take an ounce of the nitre, and two ſcruples of cochineal, in fine powder; boil theſe in five or ſix ounces of water; filter the liquor, and afterwards evaporate it to a dryneſs, ſtirring it continually as it thickens, and a fine purple powder will be then produced, fit to be given in the form of bolus, pills, powder, &c.

NITRUM *Vegetans*, a name given by the chemiſts to a preparation of nitre, which very readily ſhoots out into beautiful cryſtallizations. If, in making Glauber's ſpirit of nitre, there are uſed four parts of nitre, and one of oil of vitriol, and the ſpirit be entirely driven off, the white ſalt remaining dry in the retort, on being expoſed to the open air, will ſoon be covered with a thick and long down, as if it grew; but if this ſalt be diſſolved in water, and then ſtrained, and evaporated to a dryneſs, in a cylindrical glaſs, and kept expoſed to the open air, its upper ſurface will often appear covered with beautiful branching little plants, all which will diſſolve away upon the application of heat, and leave the ſurface even; but upon expoſing the veſſel again to the open air, in a quiet place, they will grow again as before, thus ſeveral times exhibiting the reſuſcitation of plants, as it were from their own aſhes.

Some chemiſts have formed ſeveral fables upon ſome ſuch baſis as this; and very probably the whole ſecret of their operations was no more than a concealed fraud of this kind, this having nothing to do with vegetation.

NITRUM *Vitriolatum*, a preparation of nitre made as follows: diſſolve the maſs left in the retort after diſtillation of a ſpirit of nitre, in about eight times its weight of water;

filtrate the ſolution, and when perfectly clear, evaporate the liquor to ſuch a ſtandard, that the ſalt will no longer be ſuſtained in it; then ſet it in a cool place, and collect the ſalt as it ſhoots, laying it in an earthen colander to dry. This is of much the ſame virtues with tartar vitriolated, and is frequently ſold under its name.

NITTA, in *Geography*, a town of Japan, in the iſland of Niphon; 50 miles N.N.W. of Jedo.

NITTANY, a mountain of Pennſylvania, between the Juniatte and the W. branch of Suſquehannah river.

NITTENAU, a town of Bavaria, on the Regen; 15 miles N.N E. of Ratiſbon.

NITTLES, in *Sea Language*. See KNITTLES.

NIVALIS, in *Ornithology*. See EMBERIZA *Nivalis*.

NIVARIA, in *Ancient Geography*, a town of Spain, on the route from Emerita to Cæſarea Auguſta, according to the Itinerary of Antonine, between Septimonca and Cauca; 32 miles from the former, and at the ſame diſtance from the latter.

NIVELLE, DE LA CHAUSSÈE PETER CLAUDE, in *Biography*, a dramatic writer, was born at Paris in 1692, of an ancient and reſpectable family. He was educated chiefly at the Jeſuits' college, and ſtudied rhetoric and philoſophy at Pleſſis. His uncle was high in office, and could have introduced the young man into ſituations that would have led to wealth, reſpectability, and honour, but he had no deſire of the great things of this world, and choſe rather to indulge his taſte for literature. His firſt publication was "Epitre de Clio à M. de Berey," in which he attacked his friend La Motte's ſyſtem of proſe-poetry. This poem was highly applauded; and being urged by his friends to turn his thoughts to dramatic compoſitions, he produced a comedy, entitled "La Fauſſe Antipathie." This piece was ſufficiently ſucceſsful to encourage him to proceed, and his next comedy, "Le Prejugè à la Mode," was received with an applauſe that ſurpaſſed his moſt ſanguine expectations. This was followed by "L'Ecole des Amis," and by the tragedy of "Maximinian." His reputation gained him an admiſſion into the French Academy, but at the ſame time it excited againſt him the envy and jealouſy of his contemporaries. He therefore choſe to bring out his next comedy of "Melanide," as the work of an unknown author. By this artifice he eluded oppoſition, and obtained a ſucceſs equal to the merits of his performance, which is reckoned his maſter-piece. His biographer ſays, that the "Ecole des Méres" is by ſome preferred to it, and that his "Governante" is the favourite with others. Of all theſe works, the peculiar characteriſtics are, according to D'Alembert, that they form a ſchool of morals: that they breathe an ardent ſpirit of virtue, and inſpire the love of it. Piron, jealous of the ſucceſs of the "Melanide," ridiculed the moral ſtrains of its author, and jeeringly aſked a friend who was going to the performance, if "he was intending to hear father La Chauſſèe preach." This jeſt was not forgotten; and Nivelle, though a man of amiable diſpoſitions, oppoſed the election of Piron when he was a candidate for a ſeat in the Academy. He tried his powers in other departments of the drama, and compoſed a kind of romantic paſtoral, entitled "Amour pour Amour," and ſeveral other farces and pieces of low humour. His celebrity is, however, chiefly founded upon his grave comedies, for in the ſingle tragedy which he attempted, he failed. He died in 1754, at the age of 62. His theatrical works were publiſhed at Paris in five volumes, 12mo. 1763.

NIVELLE, GABRIEL NICHOLAS, was born at Paris about the year 1687. Feeling an early inclination to retirement and ſtudy, he entered the ſeminary of St. Magloire, belonging

to the congregation of the Oratory, where he continued till that community was diſperſed in 1723. After this he was nominated prior commendatory of St. Gerèon, in the dioceſe of Nantes. In the year 1730, he was impriſoned for four months in the Baſtile, on account of his oppoſition to the bull Unigenitus. He died in 1761, at the age of 74. He is principally known by a work entitled "An Account of the Proceedings in the Faculty of Theology at Paris, on the Subject of the Conſtitution Unigenitus," in ſeven volumes 12mo., and ſome other pieces connected with the ſame ſubject.

NIVELLES, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Dyle, formerly capital of Wallon Brabant, to which belonged the privilege of coining money; 15 miles S. of Bruſſels. It is divided into two parts, one containing 3230 inhabitants, and its canton 9324, on a territory of 145 kiliometres, in 10 communes, and the other, comprehending 3307 inhabitants, and its canton 11,005, on a territory of 100 kiliometres, in 11 communes.

NIVERNOIS, LOUIS-JULES MANCINI, *Duke of*, in *Biography*, was born at Paris in 1716. He was brought up to the military ſervice, and after he had ſerved in the army ſome time, he was nominated ambaſſador to Rome, and then to Berlin, where he made himſelf very acceptable to the great Frederic. In 1763 he was entruſted with the important negociation of the definitive treaty of peace at London. In every concern of this kind, in which he was engaged, he maintained the character of a prudent and enlightened miniſter, who united amenity of manners with the dignity of his ſtation. After his return to Paris he devoted himſelf entirely to letters, and by ſome publications he obtained an admiſſion into the French Academy, and that of inſcriptions. This worthy and excellent man lived to be a ſufferer from the revolution, and was committed to priſon during the tyranny of Robeſpierre, but fortunately eſcaped the guillotine, and when that blood-thirſty wretch paid the forfeit of his crimes, Nivernois was releaſed. He died in 1798, at the age of eighty-two. His works were publiſhed collectively in eight volumes not long before his death.

NIVERNOIS, in *Geography*, a province of France before the revolution, the capital of which was Nevers. This province, which lies between 46° 45′ and 47° 35′ N. lat., and between 2° 55′ and 4° E. long, is of an oval form, tolerably fertile, and yielding grain, wine, fruits, and paſture. It contains pit-coal, iron mines, and mineral ſprings. Three of its rivers are navigable, *viz.* the Loire, the Allier, and the Yonne. It is now the department of the *Nyevre*, which ſee.

NIVERNOIS *Bay*, a large bay at the eaſtern extremity of lake Ontario.

NIVERS, in *Biography*, muſic-maſter and organiſt of St. Sulpice at Paris, publiſhed, in 1667, a treatiſe on compoſition, and many other works on chanting, plain-chant, le chant Gregorien, &c. And when the ſyllable *ſi* was firſt propoſed for the 7th of the key of C natural, he wrote a book on the gammut of *ſi*, and an elementary tract, called "Muſique des Enfans," together with twelve books for the organ. Laborde.

NIVILLE, in *Geography*, a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Beauvais. The place contains 131, and the canton 9854 inhabitants, on a territory of 202½ kiliometres, in 22 communes.

NIUKCHEVSKOI, a town of Ruſſia, in the province of Uſtiug, on the Sula; 24 miles S. of Uſt Siloiſk.

NIURUNDA, a town of Sweden, in the province of Medelpadia;

Medelpadia; 10 miles S. of Sundſwall.—Alſo, a river of Sweden, which riſes in the province of Harjeadalen, bearing the name of "Liunga," till it arrives at Hufro, in the province of Medelpadia: here it changes its name, and after croſſing the province, runs into the gulf of Bothnia, five miles S. of Sundſwall.

NIWA, a town of Sweden, in Weſt Bothnia, ſituated on the Tornea; 16 miles N. of Tornea.

NIXONTON, a poſt-town of America, in North Carolina, and capital of Paſquotank county, containing a court-houſe, gaol, and a few dwelling-houſes; 28 miles N.E. of Edenton.

NIZA, a town of Portugal, in the province of Alentejo; 15 miles N.N.W. of Portalegre.

NIZAMBADDA, a town of Hindooſtan, in the circar of Cicacole; 10 miles N.E. of Cicacole.

NIZAMPATAM, a town of Hindooſtan, in the circar of Guntoor, at one of the mouths of the river Kiſtnah, on the coaſt of the bay of Bengal; 34 miles S.W. of Maſulipatam. N. lat. 15° 55′. E. long. 80° 48′.

NIZAMPET, a town of Hindooſtan, in the circar of Aurungabad; 15 miles W. of Aurungabad.

NIZAO, a river of Hiſpaniola, which runs into the ſea, three miles E. of cape Nizao.

NIZEGORODSKOE, a province of Ruſſia, bounded on the N. by Koſtromſkoe, on the W. by Vladimir and Tambov, on the S. by Penzenſkoe, and on the E. by Kazan and Simbirſk; about 160 miles long, and 100 broad. The capital is Niznei Novogorod. N. lat. 54° 10′ to 57°. E. long. 42° to 46°.

NIZNOTOSMANSKOI, a town of Ruſſia, in the government of Archangel, on the Dwina; 48 miles E. of Schenkurſk.

NIZZA *de la Paglia*, a town of France, in the department of the Tanaro, on the river Belbo; 7 miles N.W. of Acqui. N. lat. 44° 48′. E. long. 8° 28′.

NIZZOLI, Mario, in *Biography*, an elegant ſcholar of the ſixteenth century, was born at Breſcello, in the duchy of Modena, in the year 1498. Of his education nothing is known, but when he was a young man he was invited to reſide with the count Gianfranceſco Gambara of Breſcia, a man illuſtrious for his patronage of letters. To this nobleman Nizzoli acknowledges the higheſt obligations for ſupporting him by his liberality, and favouring him in his literary ſtudies. His work, entitled "Theſaurus Ciceronianus," was undertaken at the inſtance of his patron, and printed at his houſe in 1535. Nizzoli was appointed private tutor to the marquis di Soragna, and was afterwards profeſſor of eloquence in the univerſity of Parma. Here he wrote his work "De veris Principiis et vera ratione Philoſophandi," firſt publiſhed in 1553. In 1562, he was appointed, by prince Veſpaſiano Gonzaga, director and profeſſor of the new univerſity at Sabionetta. At its opening he delivered a Latin oration, which was printed in the following year. In an inſcription to his memory at Breſcello, dated 1576, he is ſaid to have died at the age of ſeventy-eight. Nizzoli was one of the moſt elegant Latin writers of his time. His Theſaurus has been ſeveral times reprinted, with additions, under the title of "Apparatus Latinæ Locutionis." A new edition of the "De veris Principiis Philoſophandi," &c. was printed by Leibnitz, with an illuſtrative preface.

NO, or No-ammon, in *Ancient Geography*, a town of Egypt, mentioned by the ancient prophets Ezekiel and Nahum, and placed by Jerome near Alexandria.

NOACALLY, in *Geography*, a river of Bengal, which runs into the bay of Bengal, N. lat. 22° 45′. E. long. 92° 16′.

NOACHI Columba, in *Aſtronomy*. See Columba.

NOAD, in *Geography*, a town of Hindooſtan, in Madura; 18 miles W.N.W. of Coilpetta.

NOADA, a town of Bengal; 50 miles N.W. of Ramgur.

NOAGUR, a town of Bengal; 23 miles S.E. of Doeſa.

NOAH, in *Biography*, a patriarch and prophet, was the ſon of Lamech, a deſcendant of Seth, the third ſon of Adam, was born in the year 2948 B.C. In his days a general corruption of manners prevailed among the human race, but he had the fortitude to preſerve himſelf uncontaminated by the evil examples which ſurrounded him, and ſecured to himſelf the divine approbation by his piety and other exemplary virtues. He undertook the office of a public preacher of righteouſneſs, and endeavoured, by his exhortations and admonitions, to reform the morals of his contemporaries, and to reſtore true religion among them. His efforts were of no avail, and as the people ſunk deeper under the dominion of vice, they were ſentenced to deſtruction by an univerſal deluge, from the effects of which Noah and his family were ſaved, by being directed to build an ark or veſſel, which ſhould float on the waters, and thus preſerve all thoſe who were admitted into it. This tremendous ruin, recorded in the Old Teſtament, and evidently referred to in various fabulous authors, took place in the year 2349 B.C., when Noah was ſix hundred years old. (See Ark and Deluge.) After this, Noah lived till the year 1998 B.C. in the 950th year of his age. See the book of Geneſis, chap. v.—ix. for various other particulars relating to Noah and his family: ſee alſo Anc. Univer. Hiſt. and Blair's Chronology.

Noah's *Ark*. See Ark.

Noah's *Ark Shell*, in *Natural Hiſtory*, the name of a kind of ſea-ſhell, which authors were always puzzled about referring to any genus, till a late French author has referred it to a new genus he had made under the title *cordiformis*, taking in the bucardia, and triangular heart ſhells. The cabinets of the curious afford us three ſpecies of this ſhell; the common kind, a yellow and white kind with broad irregular lines, and a variegated kind. We have another ſhell of this genus, which no one ever doubted to belong to it, which yet is of an oblong figure, and ſo much reſembles the Noah's ark, as to plainly ſhew they ought both to be reckoned ſpecies of the ſame genus. This is the oblong bucardium, or ox-heart ſhell, commonly called the *baſtard* Noah's ark.

NOAILLES, Louis Anthony de, in *Biography*, was born in 1651, and being devoted in early live to the duties of the church, he obtained conſiderable preferment. In 1676 he was nominated biſhop of Cahors, from whence he was removed to Chalons, and laſtly to the ſee of Paris in 1695. He laid down capital rules for the conduct of his clergy; but his peace was diſturbed by the Jeſuits in conſequence of the approbation which he gave to Queſnel's Reflections on the New Teſtament. In 1700 he was raiſed to the dignity of cardinal, and on this occaſion Louis XIV. ſaid to him, "I have more pleaſure in procuring for you the cardinal's hat, than you have in receiving it." Notwithſtanding this, the king was afterwards prejudiced againſt him by father Tellier, the Jeſuit. Pope Clement XI. was alſo ſet againſt him, and iſſued his famous bull of *Unigenitus*, on occaſion of Queſnel's book, which Noailles had ſanctioned. The cardinal was exiled, but after the death of Louis, Tellier was baniſhed in his turn, and the cardinal recalled. He died in 1729.

NOAILLES, ADRIAN-MAURICE, *Duc de*, a celebrated French general, nephew of the preceding, who flouriſhed in the eighteenth century, early devoted himſelf to military purſuits. He ſerved with his father in Catalonia, and afterwards under Vendome, both in Spain and in Flanders. In 1703 he commanded in Rouſillon, and gained ſeveral important advantages over the enemy. In 1710 he made himſelf maſter of Gironne, one of the moſt important places in Catalonia, for which Philip V. created him a grandee of Spain, and Louis XIV. made him field-marſhal. In the ſucceeding reign he was appointed preſident of the council of finances, but when Dubois obtained the aſcendancy at court, Noailles was exiled. On the death of that miniſter he was recalled and reſtored to his place. In 1733 he commanded at the ſiege of Philipſburg, and obliged the Germans to abandon Worms. He afterwards ſerved with high reputation in Italy. He died in 1766.

NOAILLES, in *Geography*, a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Beauvais; 7 miles S.E. of Beauvais. The place contains 632, and the canton 8298 inhabitants, on a territory of 185 kiliometres, in 22 communes.

NOAKPOUR, a town of Hindooſtan, in Bahar; 25 miles W.S.W. of Arrah.

NOALE, a town of Italy, in the Treviſan; 9 miles S.S.W. of Trevigio.

NOANAGUR, a town of Bengal, in the province of Tipera; 20 miles N. of Comillah. N. lat. 23° 45′. E. long. 91 20′.

NOANAGUR, or *Cutchnagur*, a town of Hindoeſtan, and capital of a diſtrict, in the country of Guzerat, near the gulf of Cutch; 178 miles W.S.W. of Amedabad. N. lat. 22° 22′. E. long. 62° 30′.

NOANAMAS, a town of South America, in the province of Choco, chiefly inhabited by Indians; 170 miles N. of Popayan. N. lat. 5° 15′. W. long. 76° 46′.—Alſo, a river of South America, which runs into the Pacific ocean, N. lat. 4° 45′.

NOANGONG, a town of Bengal; 30 miles S. of Rajemal.

NOARA, LA, a town of Sicily, in the valley of Demona; 10 miles S.E. of Patti.

NOB, NOBE, *Noba*, or *Nomba*, in *Ancient Geography*, a ſacerdotal city of Paleſtine, at the fartheſt extremity weſtward of the tribe of Benjamin, and the place where the ark ſome time reſted, after the taking of Shiloh by the Philiſtines, ſo totally ruined by king Saul, on account of the ſmall aſſiſtance which the high prieſt Abimelech had given the fugitive David, that according to St. Jerome, it lay in ruins in his time, which were then viſible at a ſmall diſtance from Dioſpolis.

NOBA, in *Geography*, a ſmall iſland in the Eaſt Indian ſea, near the W. coaſt of Aroo. S. lat. 5° 5′. E. long. 135° 13′.

NOBBER, a ſmall poſt-town of Ireland, in the county of Meath, noted as the birth-place of O'Carolan, the Iriſh bard. It is 33½ miles N.N.W. from Dublin.

NOBILIARY, a collection, or hiſtorical account, of the noble families of a province, or nation.

Chorier has publiſhed a nobiliary of Dauphiné; and Caumartin, another of Provence. The Germans are particularly careful of their nobiliaries, to keep up the purity of their families.

NOBILISSIMUS, in *Antiquity*, a title, or quality, given to the princes of the imperial family.

F. Doucine advances, that the title nobiliſſimus was firſt given under the emperor Juſtin; others find the title *nobilis Cæſar*, or *N. C.* that is *Nobiliſſimus Cæſar*, on medals long before that time, even as early as Trajan. Spanheim and Joubert, indeed, ſet this title on medals no higher than the time of Philip the Younger; though it appears earlier in ſome inſcriptions; ſo that even Mr. Tillemont is miſtaken, where he ſays, the quality of nobiliſſimus is not to be found in hiſtory before the time of Conſtantine the Great, who firſt gave it to his two brothers; after which it was attributed to ſuch of the emperor's children as were not Cæſars. See CÆSAR.

Triſtan adds, that the Cæſars bore the title of *nobiliſſimi* in all ages; but that the *nobiliſſimate* firſt became a diſtinct independent dignity in the time of Conſtantine the Great.

NOBILITY, a quality that dignifies, or renders a thing noble; particularly, that raiſes a perſon poſſeſſed thereof above the rank of a peaſant or commoner.

In England, indeed, the term nobility is reſtrained to degrees of dignity above knighthood. Every where elſe nobility and gentility, or gentry, are the ſame. See GENTLEMAN.

Some refer the origin of nobility in Europe to the Goths: who, after they had ſeized a part of Europe, rewarded their captains with titles of honour, and called them *nobles*, *nobiles*, to diſtinguiſh them from the common people.

Nobility, in England, is only conferred by the king, and that by writ or by patent, in virtue whereof it becomes hereditary. In other countries there are other ways of acquiring it.

The nobility of England is called the *peerage of England*. Its degrees are only five; *viz.* that of a duke, a marquis, earl or count, viſcount, and baron. See under DUKE, MARQUIS, &c.

The diſtinction of rank and honours is neceſſary in every well governed ſtate, in order to reward ſuch as are eminent for their ſervices to the public, in a manner moſt agreeable to themſelves, and without burthen to the community; and at the ſame time to excite in others a ſpirit of laudable emulation. In our mixed and compounded conſtitution, a body of nobility is peculiarly neceſſary, as a barrier to withſtand the encroachments both of the crown and of the people. It creates and preſerves, ſays judge Blackſtone, that gradual ſcale of dignity which proceeds from the peaſant to the prince; riſing like a pyramid, from a broad foundation, and diminiſhing to a point as it riſes. It is this aſcending and contracting proportion that adds ſtability to any government; for when the departure is ſudden from one extreme to another, we may pronounce that ſtate to be precarious. The nobility, therefore, conſtitutes the pillars, which are reared from among the people, more immediately to ſupport the throne; and if that falls, they muſt alſo be buried under its ruins. And as titles of nobility are thus expedient in the ſtate, it is alſo expedient that their owners ſhould form an independent and ſeparate branch of the legiſlature. See PARLIAMENT.

The privileges of the Engliſh nobility are very conſiderable: they are all eſteemed as the king's hereditary counſellors, and are privileged from all arreſts, unleſs for treaſon, felony, breach of peace, condemnation in parliament, and contempt of the king. No ſupplicavit can be granted againſt them; no capias, or exigent, ſued againſt them for action of debt, or treſpaſs; and no eſſoign lies againſt them: in criminal caſes they are only to be tried by a jury of peers, who are not put to their oath; but their verdict upon their honour ſuffices. They alſo anſwer to bills in chancery upon their honour, and not upon their oath; but when they are examined

mined as witneſſes, either in civil or criminal caſes, they muſt be ſworn. In their abſence from parliament, they are allowed a proxy to vote for them: and in all places of truſt they are allowed to conſtitute deputies, by reaſon of the neceſſity the law ſuppoſes them under of atttending the king's perſon. The honour of peers is ſo highly tendered by the law, that it is much more penal to ſpread falſe reports of them and certain other great officers of the realm, than of other men: ſcandal againſt them being called by the peculiar name of "ſcandalum magnatum," and ſubjected to peculiar puniſhments by divers ancient ſtatutes. (3 Edw. I. c. 34. 2 Ric. II. ſt. 1. c. 5. 12 Ric. II. c. 11.) A peer cannot loſe his nobility but by death or attainder. It has been ſaid, indeed (Moor. 678.), that if a baron waſtes his eſtate, ſo that he is not able to ſupport the degree, the *king* may degrade him; but it is expreſsly held by later authorities (12 Rep. 107. 12 Mod. 56.) that a peer cannot be degraded but by act of parliament. See PEERS and PARLIAMENT.

Guillim obſerves, that if an appeal of murder, or felony, be ſued by a commoner againſt a peer, he ſhall be tried by commoners, not peers. See APPEAL.

No peer may go out of the kingdom without the king's leave: if any have leave, he is to return upon the king's writ, or to forfeit goods and chattels.

Anton. Matthæus obſerves, that nobility, among the Romans, was a quite different thing from what it is among us. The nobles, among the Romans, were either thoſe raiſed to the magiſtrature, or deſcended from magiſtrates: there was no ſuch thing as nobility by patent.

Bartoli ſays, that doctors, after they have held a profeſſor's chair in an univerſity for twenty years, become noble, and are entitled to all the rights of counts.

But this claim is not admitted at court, &c. though Bartoli's ſentiments be backed with thoſe of ſeveral other authors, particularly Chaſſanæus, in his Conſuetudin. Burgundiæ; Boyer ſur la Coûtume de Berry; Faber C. de Dig. Def. 9. &c. which laſt, however, reſtrains Bartoli's rule to doctors in law, and prince's phyſicians.

By an edict of the French king, in 1669, it is declared, that trade ſhall not derogate from nobility, provided the perſon do not ſell by retail.

In Bretagne, by ancient cuſtom, a nobleman loſes nothing by trading even in retail: but he re-aſſumes all his rights as ſoon as he ceaſes to traffic, his nobility having ſlept all the time. In Germany, a woman, not noble by birth, doth not become, *v. gr.* a counteſs, or baroneſs, by marrying a count, or baron: a lady of the higher degree, indeed, becomes a princeſs by marrying a prince; but this does not hold of a lady of the lower nobility.

On the coaſt of Malabar, children are only capable of being noble by the mother's ſide: it being allowed them to take as many huſbands as they pleaſe, and to quit them whenever they think good.

NOBLE, NOBILIS, a perſon who has a privilege which raiſes him above a commoner, or peaſant, either by birth, by office, or by patent from his prince.

The word comes from the Latin *nobilis;* formed from the ancient *noſcibilis, diſtinguiſhable, remarkable.*

In England, the word noble is of a narrower import than in other countries; being confined to perſons above the degree of knights; whereas, abroad, it comprehends not only knights, but what we ſimply call *gentlemen.*

The nobles of England are alſo called *pares regni,* as being *nobilitatis pares,* though *gradu impares.*

The Venetian nobleſſe is famous: it is in this that the ſovereignty of the ſtate reſides. It is divided into three claſſes. The firſt only comprehends twenty-four families.

The ſecond includes the deſcendants of all thoſe who were entered into the golden book, in 1289, and deſtined to govern the ſtate, which then began to be ariſtocratic.

The third conſiſts of ſuch as have bought the dignity of noble Venetians.

This laſt claſs is only admitted to the inferior employs; the two former, to all indifferently.

The title of noble Venetians is ſometimes alſo given to foreign kings, princes, &c.

NOBLE alſo denotes a money of account, containing ſix ſhillings and eight-pence.

The noble was anciently a real coin, under the denomination of *Roſe-noble.*

Authors obſerve, that there has not been any piece of gold and ſilver of this name coined with us ſince 9 Hen. V. They were firſt coined by Edw. III. in 1334.

The noble contained 80*d.* the ſame with the preſent money of account. Its half was called *obolus,* containing 40*d.* its fourth part the *quadrans,* or farthing in thoſe days, 20*d.*

NOBLE, EUSTACHE LE, in *Biography,* a copious and very miſcellaneous writer, was born in 1643, of a diſtinguiſhed family at Troyes. He was educated for the profeſſion of the law, and roſe by his talents to the poſt of procureur-general in the parliament of Metz. He obtained a high reputation, but was charged with having forged certain acts of court to his own emolument. Being committed to the Chatelet, he was condemned to an amende-honorable, and baniſhed for nine years; from this ſentence he appealed, and was transferred to the Conciergerie. After this, for ſome miſconduct with reſpect to Gabrielle Perreau, known by the name of La Belle Epiciere, he was again ſentenced to be baniſhed for ſeveral years. He, however, obtained permiſſion to remain in France, on the condition of ceaſing to execute any judiciary office. His misfortunes produced no amendment in his life and morals, but he continued as diſſipated as ever till his death in 1711, at the age of ſixty-eight. He was reduced to ſuch a ſtate of indigence, that he was buried at the charge of the pariſh, though his works are ſaid to have produced above 100,000 crowns to the publiſhers. Theſe have been collected in nineteen volumes 12mo. They have been divided into three claſſes. 1. The ſerious, conſiſting of hiſtorical and political pieces, and ſome indeed, notwithſtanding the looſeneſs of his character, on the ſubject of religion; of theſe, his "Entretiens Politique ſur les Affaires du Tems," a periodical publication, was highly popular on account of its pleaſantry and low wit. 2. The romantic, comprifing a number of works, half hiſtory and half romance. 3. The poetical, conſiſting of tranſlations, fables, tales, comedies, epiſtles.

NOBLEBOROUGH, in *Geography,* a townſhip of America, in Lincoln county, Maine, incorporated in 1788, and containing 804 inhabitants; 10 miles S.E. of Newcaſtle. —Alſo, a town in the Herkemer county, New York, on the head-waters of Canada creek.

NOBODY KNOWS WHAT, a name given by Capt. Cook to the northern arm of Duſky bay.

NOBREGA, MANOEL DA, in *Biography,* the head of the firſt Jeſuits that ever ſet foot in South America, a country in which that body of people have exerted themſelves more than in any other part of the world. He was a native of Portugal, ſtudied firſt at Coimbra, and afterwards at Salamanca, then returning to Coimbra, he graduated in canon law. His father and uncle held high official ſtations

ſtations at court, which ſeemed to promiſe him almoſt any degree of preferment, but failing to obtain ſome univerſity rank on which his heart was ſet, and which ought to have been awarded him, he rejected the world, as he thought the world had rejected him, and entered, in this fit of diſguſt, the newly eſtabliſhed order of Jeſuits in 1544.

When it was determined that Jeſuit miſſionaries ſhould be ſent to Braſil, Nobrega was nominated head of the miſſion, and he, with five others, ſet ſail with Thomé de Souſa, the firſt governor-general of Braſil, in February 1549. They immediately began that ſyſtem of kindneſs and conciliation towards the natives of South America, from which the Jeſuits never deviated, and on which they eſtabliſhed their empire in Paraguay. Nobrega was as able a ſtateſman as he was a miſſionary, and to him it was owing, that the French did not ſucceed in eſtabliſhing themſelves in Rio Janeiro, and dividing Braſil with the Portugueſe, or, perhaps, ejecting them from it. He was nominated vice-provincial of Brazil in 1550, and provincial in 1553, when that country was made a ſeparate province. He died in 1570, at the age of fifty-three, but worn out with the fatigues of a miſſionary life. Gen. Biog.

NOBSQUASSIT, or Nobscusset, in *Geography*, the N.E. part of Yarmouth, in Barnſtaple county, Maſſachuſetts, in which are 25 ſalt-works, that annually produce 500 buſhels of marine ſalt.

NOBUTPOUR, a town of Hindooſtan, in Benares; 21 miles E. of Benares.

NOCARIO, a town of the iſland of Corſica; 12 miles N.E. of Corte.

NOCE', a town of France, in the department of the Orne, and chief place of a canton, in the diſtrict of Mortagne; five miles E. of Beleſme. The place contains 1161, and the canton 10,667 inhabitants, on a territory of 182½ kiliometres, in 18 communes.

NOCEA, a town of European Turkey, in the Morea; 20 miles E. of Miſitra.

NOCERA, a town of Italy, in the duchy of Spoleto, the ſee of a biſhop; 16 miles N.E. of Spoleto. N. lat. 43° 7'. E. long. 12° 48'.

Nocera *delli Pagani*, a town of Naples, in Calabria Citra, the ſee of a biſhop, ſuffragan of Salerno; containing 12 pariſh churches, and ſix convents. This town, anciently called "Nuceria Alphatorna," and being a Roman colony, had the privilege of coining money. It appears a cluſter of villages, and is ſaid to contain 30,000 inhabitants; 20 miles S.E. of Naples. N. lat. 40° 44'. E. long. 14° 27'.

NOCERIANA Terra, *Earth of Nocera*, in the *Materia Medica*, a white earth, being a ſpecies of bole, uſed in medicine in Germany, Italy, and ſome other parts of the world, but not known in the Engliſh ſhops. It is found at Nocera, in Umbria, whence its name. It is now dug principally about Macerata, a city in the marquiſate of Ancona, in the pope's territories, and is in great eſteem in malignant fevers, and againſt the bites of venomous animals.

It is a denſe earth, of a greyiſh-white, very hard, and of an inſipid taſte, and does not effervеſce with acid menſtruums.

NOCKAMIXON, in *Geography*, a townſhip of America, in Buck's county, Pennſylvania, containing 846 inhabitants.

NOCKLE, in *Rural Economy*, a provincial term often applied to a mallet or beetle. It is ſometimes written *knockle*.

NOCOR, in *Geography*, a river of Morocco, which runs into the Mediterranean, N. lat. 35° 15'.

NOCTAMBULATIO, in *Medicine*. See Somnambulism.

NOCTANTER, in *Law*, is the name of a writ iſſuing out of the Chancery, and returnable in the King's Bench; given by the ſtatute of Weſt. 2. 13 Ed. I. cap. 46. by virtue of which ſtatute, where any one having right to approve waſte ground, &c. makes and erects a ditch or a hedge, and it is thrown down in the night-time, and it cannot be known by a verdict of aſſize or jury, by whom; if the neighbouring vills will not indict ſuch as are guilty, they ſhall be diſtrained to make again the hedge or ditch at their own coſts, and to anſwer damages. The word *noctanter* is ſo neceſſary in an indictment of burglary, that it hath been adjudged inſufficient without it.

NOCTIBO, in *Ornithology*, the name given by the Portugueſe to a ſmall Braſilian bird, a ſpecies of the *goat-ſucker*, or *churn-owl*, more known among naturaliſts by its Braſilian name *ibijau*.

NOCTILIO, in *Zoology*. See Vespertilio *Leporinus*.

NOCTILUCA, among *Naturaliſts*, a ſpecies of phoſphorus, ſo called becauſe it ſhines in the night, without any light being thrown on it: ſuch is the phoſphorus made of urine; by which it ſtands diſtinguiſhed from ſome other ſpecies of phoſphorus, which, before they ſhine, muſt be expoſed to the ſun-beams; ſuch is the Bononian-ſtone, &c.

Mr. Boyle, in a particular treatiſe on the ſubject, gives an account of three noctilucæ. The firſt, invented by Krafft, he calls the *conſiſtent*, or *gummous* noctiluca, as being of a texture not unlike that of a cherry-gum. This, on account of its uninterrupted action, was, by the Germans, called the *conſtant* noctiluca; among us it is now known under the denomination of the *ſolid phoſphorus*. The ſecond is liquid, invented by the ſaid Krafft; this is only a diſſolution of the former in a convenient liquor. The third kind was prepared by Mr. Boyle himſelf; and was of a different nature from both the others; for it would not ſhine of itſelf like either of them, but required the contact of the air (though not any external rays or heat) to make it produce light, which would be very durable, in a well ſtopped veſſel. Add, that it was not the body that ſhone, but an exhalation, or effluvium, mixed with the air; on which accounts the inventor gives it the denomination of the *aerial* noctiluca.

The ſame Mr. Boyle, afterwards, prepared another ſort; which from the little pellucid fragments or cryſtals therein, he denominated the *icy* noctiluca. See Phosphorus.

NOCTUA, in *Ornithology*, a ſpecies of owl. See Strix *Noctua*. For other ſpecies of *Noctua*, ſee Strix.

Noctua *Aurita*, a name by which ſome have called the ſmaller ſpecies of the horn-owl, more uſually diſtinguiſhed by the name *otus*.

Noctua *Canora*, a name given by Nieremberg to a bird of the Spaniſh Weſt Indies, called by the natives *chicuatli*, and ſometimes kept by the Spaniards in cages. See Chicuatli.

Noctua *Minor*, a name given by Mr. Ray to the *keutzlin*, or, as others call it, the *ſchaffilt*, a very beautiful bird of the owl kind, and not exceeding the ſize of the common thruſh. See Strix *Paſſerina*.

NOCTUINI Oculi, a name given by ſome to grey eyes, from their reſembling thoſe of the *noctua*, or *owl*.

NOCTUOLENT, among *Botaniſts*, a name given to ſuch plants as ſmell ſtrongeſt in the night-time. See Dog-*Roſe*.

NOCTURNAL, ſomething that relates to night, *nox*;

in contradiſtinction to diurnal. In this ſenſe we ſay, nocturnal aſſemblies; nocturnal walks; nocturnal pollutions, &c.

NOCTURNAL *Pains* are a frequent concomitant of venereal diſorders, which can only be palliated with narcotics; nothing but a mercurial courſe, or a long-continued uſe of diet-drinks, can entirely remove them.

NOCTURNAL *Arch*, in *Aſtronomy*, the arch of a circle deſcribed by the ſun, or a ſtar, in the night.

Semi-NOCTURNAL *Arch of the Sun* is that portion of a circle he paſſes over between the lower part of our meridian, and the point of the horizon in which he ariſes; or between the point of the horizon in which he ſets, and the lower part of our meridian.

NOCTURNAL, or *Nocturlabium*, is more particularly uſed for an inſtrument, chiefly uſed at ſea, to take the altitude or depreſſion of ſome of the ſtars about the pole, in order to find the latitude, and the hour of the night.

There are nocturnals of various contrivances, ſome of them projections of the ſphere; ſuch as the hemiſpheres, or planiſpheres, on the plane of the equinoctial: thoſe ordinarily uſed by the ſeamen are two; the one adapted to the polar ſtar, and the firſt of the guards of the Little Bear; the other to the pole-ſtar, and the pointers of the Great Bear.

NOCTURNAL, *Conſtruction of the*. The inſtrument conſiſts of two circular plates (*Plate* I. *Navigation*, *fig.* 10.) applied on each other. The greater, which has a handle to hold the inſtrument, is about $2\frac{1}{2}$ inches diameter, and is divided into twelve parts, agreeing to the twelve months; and each month ſubdivided into every fifth day; and ſo, as that the middle of the handle correſponds to that day of the year, wherein the ſtar here regarded has the ſame right aſcenſion with the ſun.

If the inſtrument be fitted for two ſtars, the handle is made moveable. The upper left circle is divided into twenty-four equal parts, for the twenty-four hours of the day, and each hour ſubdivided into quarters, as in the figure. Theſe twenty-four hours are noted by twenty-four teeth; to be told in the night. Thoſe at the hours twelve are diſtinguiſhed by their length. In the centre of the two circular plates, is adjuſted a long index, A, moveable upon the upper plate. And the three pieces, *viz.* the two circles and index, are joined by a rivet which is pierced through the centre, with a hole two inches in diameter for the ſtar to be obſerved through.

NOCTURNAL, *Uſe of the*. Turn the upper plate till the longeſt tooth, marked 12, be againſt the day of the month on the under plate; then, bringing the inſtrument near the eye, ſuſpend it by the handle, with the plane nearly parallel to the equinoctial; and viewing the pole-ſtar through the hole of the centre, turn the index about, till, by the edge coming from the centre, you ſee the bright ſtar or guard of the Little Bear (if the inſtrument be fitted to that ſtar); then that tooth of the upper circle, under the edge of the index, is at the hour of the night, on the edge of the hour-circle; which may be known without a light, by accounting the teeth from the longeſt, which is for the hour 12.

NOCTURNAL *Crimes*, *Prevention of*. See HOMICIDE.

NOCTURNAL *Pollution*. See POLLUTION.

NOCUM, in *Geography*, a town of Hindooſtan, in the circar of Sirhind; 20 miles N.E. of Tannaſar.

NOCUMENTI ASSISA. See ASSISA.

NODAN, in *Geography*, a town of Pruſſia, in the province of Samland, on the coaſt of the Baltic; 14 miles N. of Pillau.

NODAR, or NOUDAR, a town of Portugal, in Alentejo; 21 miles S.E. of Mourao.

NODATED HYPERBOLA, a kind of hyperbola, which, in turning round, decuſſates or croſſes itſelf.

NODDLE'S ISLAND, in *Geography*, a ſmall, pleaſant, and fertile iſland in Boſton harbour, Maſſachuſetts, about two miles E.N.E. of the town; occupied as a farm, and yielding large quantities of hay.

NODDY, in *Ornithology*. See STERNA *Fuliginoſa*.

NODE denotes, in *Surgery*, a ſwelling of the perioſteum, tendons, or bones, from a venereal cauſe. The progreſs of the diſeaſe in this form is extremely ſlow, and attended with little pain. In ſome caſes, however, the pain is conſiderable, particularly in the night time. Nodes continue a long time before matter is formed, and when ſuppuration does take place, it is of a very imperfect kind.

Sudden ſwellings of the perioſteum, without nocturnal pains, are not venereal.

The bones which are peculiarly liable to nodes, are ſuch as are ſuperficial; for inſtance, the front ſurface of the tibia, the bones of the cranium, the triangular part of the ulna below the olecranon, &c.

The treatment of nodes is conſidered in the article LUES *Venerea*.

NODERMALM, in *Geography*, an iſland of Sweden, on which ſtands a part of the city of Stockholm. On it are a palace and opera-houſe, an ancient arſenal now converted into a theatre, three churches, an obſervatory, &c.

NODES, in *Aſtronomy*, the two points wherein the orbit of a planet interſects the ecliptic.

Such are the two points C and D (*Plate* XVII. *Aſtron. fig.* 7.) of which the node C, where the planet aſcends northwards above the plane of the ecliptic, is called the *aſcending* node, the *northward* node, and the *head of the dragon*; and is thus marked, ☊.

The other node D, where the planet deſcends to the ſouth, is called the *deſcending* node, the *ſouthward* node, or the *dragon's tail*; thus marked, ☋. See DRAGON'S *head* and *tail*.

The right line D C, wherein the two circles interſect, is called *the line of the nodes*.

It appears from obſervation, that the line of the nodes of all the planets conſtantly changes its place, and ſhifts its ſituation *in antecedentia*; i. e. from eaſt to weſt, contrary to the order of the ſigns.

Thus, by a retrograde motion, the line of the moon's nodes, moving at the rate of about $19\frac{1}{3}^{\circ}$ in a year, finiſhes its circuit in eighteen years two hundred and twenty-five days; in which time, after having receded from any point of the ecliptic, it returns to the ſame. See MOON.

Sir Iſaac Newton has not only ſhewn, that this motion ariſes from the action of the ſun, but has calculated, with great ſkill, all the elements and varieties in this motion, from its cauſe.

In order to underſtand the action of the ſun in this caſe, we muſt conceive the plane of the moon's motion to paſs always through the centre of the earth and the centre of the moon, and to be a plane in which the right line joining their centres, and the right line that is the direction of the moon's motion, or the tangent of her orbit, are always found. It is certain, that if the earth and moon were always acted on equally by the ſun, they would deſcend equally towards the ſun; the plane determined always by theſe two lines, would deſcend with them, keeping always parallel to itſelf, ſo that the moon would appear to us to revolve in the ſame plane conſtantly, with reſpect to the earth. But the inequalities in the action of the ſun (ſee MOON) will bring the moon out of this plane to that ſide of the plane on which the ſun is, in the half of her orbit that is neareſt the ſun, and towards the other

other ſide, in the half of her orbit that is fartheſt from the ſun. Whence we ſhall have this general rule for judging of the effect of the ſun on the nodes: that while the moon is in the half of her orbit that is neareſt the ſun, the node towards which ſhe is moving is made to move towards the conjunction with the ſun; and while the moon is in the half of her orbit which is fartheſt from the ſun, the node towards which ſhe is moving is made to move towards the oppoſition; but when the nodes are in conjunction with the ſun, its action has no effect upon them. In the firſt caſe, the moon is brought into a direction which is on the ſame ſide as the ſun is, of that direction which ſhe would follow of herſelf; and the interſection of a plane paſſing through this direction and through the centre of the earth, will cut the ecliptic, on that ſide towards which the moon moves, in a point nearer the conjunction than if there was no action of the ſun to diſturb her motion. In the other caſe, the action of the ſun has a contrary direction, and for the ſame reaſon makes the enſuing node move towards the oppoſition. When the line of the nodes produced paſſes through the ſun, then the ſun, being in the plane of the moon's motion, has no effect to bring her to either ſide; and therefore, in that caſe, the nodes have no motion at all. By applying this reaſoning, it appears, that in every revolution of the moon, the retrograde motion of the nodes exceeds the direct motion, excepting only when the line of the nodes paſſes through the ſun, when there is no motion of the nodes at all. Sir Iſaac Newton finds from the theory of gravity, that the nodes ought to move backward about $19^\circ\ 18'\ 1''$ in the ſpace of a year, and the aſtronomical tables make this motion $19^\circ\ 21'\ 21''$, whoſe difference is not $\frac{1}{300}$ of the whole motion of the nodes in a year. By a more correct computation of this motion from its cauſe, the theory and obſervation agree within a few ſeconds. (See Moon.) The inclination of the moon's orbit to the ecliptic is alſo ſubject to many variations. When the nodes are in the quarters, while the moon moves from one quarter to the conjunction, the action of the ſun diminiſhes the inclination of the plane of her orbit; the inclination of this plane is leaſt of all when the moon is in the conjunction; it increaſes again as ſhe moves from the conjunction to the next quarter, and is there reſtored nearly to its firſt quantity. When the line of the nodes paſſes through the ſun, the inclination of the moon's orbit is not affected by the action of the ſun; becauſe, in that caſe, the plane of her orbit produced, paſſes through the ſun, and, therefore, the action of the ſun can have no effect to bring the moon out of this plane to either ſide. In this laſt caſe the inclination of the moon's orbit is greateſt; it increaſes as the nodes move towards the quarters; and it is leaſt of all when the nodes are in the quarters, and the moon either in the conjunction or oppoſition. Newton has calculated theſe irregularities from their cauſes, and finds his concluſions agree very well with the obſervations of aſtronomers. When the moon is in the node, ſhe is alſo in the ecliptic, *viz.* twice in each period; when ſhe is at her greateſt diſtance from the nodes, *viz.* in the points E, F, ſhe is ſaid to be in her greateſt north or ſouth latitude, according as ſhe is then on the north or ſouth ſide of the ecliptic.

The moon muſt be in or near one of the nodes when there is an eclipſe, either of the ſun or moon.

The place of the moon's nodes may be determined, either in the ſame way as that of the nodes of the other planetary orbits, or by the following method. In a central eclipſe of the moon, the moon's place at the middle of the eclipſe is directly oppoſite to the ſun, and the moon muſt alſo then be in the node; calculate therefore the true place of the ſun, or, which is more exact, find its place by obſervation, and the oppoſite point will be the true place of the moon, and conſequently the place of its node. (See Moon.) Before the nodes of the planetary orbits can be found, it will be neceſſary to ſhew how to reduce the places of the planets ſeen from the earth to the places ſeen from the ſun, and how to compute the heliocentric latitudes. Let E (*Plate* XVIII. *Aſtronomy*, *fig.* 1.) be the place of the earth, P the planet, S the ſun, Υ the firſt point of Aries; draw P v perpendicular to the ecliptic, and produce E S to a. Compute, at the time of obſervation, the longitude of the ſun ſeen at a, and you have the longitude of the earth at E, or the angle Υ S E; compute alſo the longitude of the planet, or the angle Υ S v; and the difference of theſe two angles is the angle E S v of "commutation." Obſerve the place of the planet in the ecliptic; and the place of the ſun being known, we have the angle v E S of elongation in reſpect to longitude; hence we know the angle S v E, which meaſures the difference of the places of the planets ſeen from the earth and the ſun; therefore the place of the planet ſeen from the earth being known, the place ſeen from the ſun will be known. Alſo, tang. P E v : rad. :: v P : E v by trig. and rad. : tan. P S v :: v S : v P : ∴ tang. P E v : tan. P S v :: v S : E v :: ſin. S E v : ſin. E S v; that is, the ſine of elongation in longitude : ſine of the difference of the longitudes of the earth and planet :: tang. of the geocentric latitude : tan. of the heliocentric latitude. When the latitude is ſmall, S v : E v is very nearly as P S : P E, which, in oppoſition, is very nearly as P S : P S − S E. The "curtate" diſtance S v of the planet from the ſun may be found by this proportion, rad. : coſ. P S v :: P S : S v. See Heliocentric Latitude.

Now to determine the place of the node, find the planet's heliocentric latitudes juſt before and after it has paſſed the node, and let a and b be the places in the orbit, m and n the places reduced to the ecliptic; then the triangles $a\,m$ N, $b\,n$ N (*fig.* 2.), which we may conſider as rectilinear, being ſimilar, we have $a\,m$: $b\,n$ :: N m : N n; therefore, $a\,m + b\,n$: $a\,m$ :: N m + N n ($m\,n$) : N m, or $a\,m + b\,n$: $m\,n$ :: $a\,m$: N m; that is, the ſum of the two latitudes : the difference of the longitudes :: either latitude : the diſtance of the node from the longitude correſponding to that latitude. Or, if we take the two latitudes from the earth, it will be very nearly as accurate when the obſervations are made in oppoſition. If the diſtance of the obſervations ſhould exceed a degree, this rule will not be ſufficiently accurate. In this caſe our computations muſt be made for ſpherical triangles in the following manner. Put $m\,n = a$, $a\,m = \beta$, $b\,n = b$, N $m = x$; then by trigon. $\frac{\text{ſin. } \overline{a - x}}{\text{tan. } b} = \text{cotan. N} = \frac{\text{ſin. } x}{\text{tan. } \beta}$, radius being unity: but ſin. $\overline{a - x}$ = ſin. $a \times$ coſ. x − ſin $x \times$ coſ. a; hence $\frac{\text{ſin. } a \times \text{coſ. } x - \text{ſin. } x \times \text{coſ. } a}{\text{tang. } b} = \frac{\text{fix. } x}{\text{tang. } \beta}$; therefore, $\frac{\text{ſin. } a \times \text{tang. } \beta}{\text{tang. } b + \text{coſ. } a \times \text{tang. } \beta} = \frac{\text{ſin. } x}{\text{coſ. } x}$ = tang. x.

The longitudes of the nodes of the planets for the beginning of 1750 are, Mercury, $1^s\ 15^\circ\ 20'\ 43''$; Venus, $2^s\ 14^\circ\ 26'\ 18''$; Mars, $1^s\ 17^\circ\ 38'\ 38''$; Jupiter, $3^s\ 7^\circ\ 55'\ 32''$; Saturn, $3^s\ 21^\circ\ 32'\ 22''$; Georgian, $2^s\ 12^\circ\ 47'$.

To determine the inclination of the orbit, we have $a\,m$ the latitude of the planet, and m V its diſtance upon the ecliptic from the node; hence, ſin. m N : tang. $a\,m$ :: rad. : tang. of the angle N. But the obſervations which are near the node muſt

muſt not be uſed to determine the inclination, as a very ſmall error in the latitude will make a conſiderable error in the angle. The inclination may alſo be found thus: find the angle P S υ (*fig.* 1.), then the place of the planet and that of its node being given, we know υ N; hence, ſin. υ N : tang. P υ :: rad. : tang. P N υ, the inclination of the orbit. See Vince's Elem. of Aſtronomy.

NODHA, in *Geography*, a town of Perſia, in the province of Mecran; 63 miles S.W. of Kidge.

NODHEA, a town of Perſia, in the province of Kerman; 75 miles N.N.E. of Sirgian.

NODINGEN, an iſland of Sweden, near the W. coaſt, in the N. ſea. N. lat. 57° 16′. E. long. 11° 50′.—Alſo, a town of Sweden, in Weſt Gothland; 12 miles N. of Gothenburg.

NODULE, Nodulus, in *Pharmacy*, a bag of medicinal ingredients put into beer, or wine, to give its tincture thereto. Nodules are ſometimes alſo parcels of odoriferous ſimples, tied up in a piece of ſilk, for the patient to be frequently ſmelling to.

NODUS, Knot. See Knot.

Nodus, in *Poetry*, &c. See Intrigue and Plot.

Nodus, or *Node*, in *Dialling*, denotes a point or hole in the gnomon of a dial, by the ſhadow or light whereof, either the hour of the day in dials without furniture, or the paralle's of the ſun's declination, and his place in the ecliptic, &c. in dials with furniture, are ſhewn.

Nodus is alſo uſed for a hole in the cieling of a room, or in the window, for the making of a dial on the floor, wall, or the like.

NOË, in *Geography*, a town of France, in the department of the Upper Garonne, on the river Garonne; 17 miles S. of Toulouſe.

NOEL, two iſlands in the Indian ſea, near the coaſt of Siam. N. lat. 10° 33′ to 10° 47′. E. long. 96° 30′ to 96° 48′.

Noels, a kind of air, ſimilar to our Chriſtmas carols, ſung by the common people at the Nativity. The airs of Noels, ſays M. Rouſſeau, ought to have a ruſtic and paſtoral character, agreeable to the ſimplicity of the words, and that of the ſhepherds ſuppoſed to have ſung them in going to render homage to the infant Jeſus in the manger.

NOERZA, in *Zoology*. See Mustela *Lutreola*.

NOESA Bason, in *Geography*, an iſland in the Eaſt Indian ſea, near the S. coaſt of Java, about 25 miles in circumference. S. lat. 6° 36′. E. long. 113°.

Noesa *Cambaz*, or *Pulo Cannibaz*, an iſland in the Eaſt Indian ſea, near the S. coaſt of Java, about 45 miles in circumference. S. lat. 7° 42′. E. long. 109° 22′.

Noesa *Comba*, a ſmall iſland in the Eaſt Indian ſea. S. lat. 5° 20′. E. long. 117°.

Noesa *Laver*, a ſmall iſland in the Eaſt Indian ſea, near the S. coaſt of Ceram. S. lat. 3° 34′. E. long. 129° 10′.

Noesa *Neſſing*, a ſmall iſland in the Eaſt Indian ſea, near the N. coaſt of Timor. S. lat. 8° 9′. E. long. 126° 30′.

Noesa *Seres*, two ſmall iſlands in the Eaſt Indian ſea. S. lat. 5° 15′. E. long. 116° 58′.

NOETIANS, in *Eccleſiaſtical Hiſtory*, diſciples of Noetus, an Epheſian, the maſter of Sabellius.

They only allowed of one perſon in the godhead; *viz.* the Father; and accordingly taught, that it was God the Father that ſuffered on the croſs. An error, ſays Epiphanius, who wrote a hundred years after Noetus, never heard of before; though it is certain there had been other patripaſſians in the church before him.

Being reprehended by his ſuperiors, Noetus made them this anſwer: "What harm have I done? I adore only one God; I own none but him. He was born, ſuffered, and is dead."

NŒUDS. The fixed points in every vibrating ſtring which divide it into aliquot parts, and which produce a different ſound from the whole ſtring, are called nœuds, or knots; for example, of two ſtrings, one of which is triple the length of the other, if the ſhorteſt is cauſed to ſound, the longeſt will likewiſe ſound, not as the whole ſtring, but in uniſon with the ſhorteſt; becauſe the longeſt ſtring then, inſtead of ſounding in its totality, divides itſelf, and only produces the ſound of one of its third parts. The immoveable points, which are the diviſions, act as ſo many bridges, and theſe are what M. Sauveur calls *nodes*, naming them at the ſame time the ſwellings or undulations of the ſeveral aliquot parts where the vibrating ſtring deviates moſt from a right line.

If, inſtead of making another and a ſhorter ſtring ſound, we divide the longeſt by ſome ſmall impediment which will check its vibration without totally ſtopping it, the ſame caſe will ſtill happen in making one of the aliquots ſound; for then both will ſound in uniſon with the ſhorteſt, and we ſhall ſee the ſame *nœuds* and the ſame *bellies* as before.

If the ſhorteſt part is not an exact aliquot of the longeſt, but a common aliquot, then there will be no reſonance, or only that of the ſmalleſt part, unleſs it is ſtruck with ſuch violence as to force the obſtacle, and make the whole ſtring ſound.

M. Sauveur contrived to exhibit theſe nœuds and bellies to the Academy, in a way very clear, by putting bits of coloured paper on the ſtring, for then at the ſound of the aliquot they always ſaw the papers at the bellies fall, and thoſe of the nœuds remain undiſturbed. See a repreſentation of theſe effects *Plate Muſic*. Père Merſenne was the firſt who diſcovered, and demonſtrated theſe natural diviſions of a ſounding ſtring by experiments. Harm. Univ.

NOEWE, in *Geography*, a town of America, in the ſtate of Tenneſſee; 21 miles S. of Knoxville.

NOFESCH, in *Natural Hiſtory*, a word of Hebrew origin, uſed as the name of a precious ſtone. There has been much diſpute among the commentators on the Old Teſtament, what ſtone it was. It ſeems derived from the root *ſuch*, which ſignifies the ruby or carbuncle, and as a derivative of that word, it muſt be ſuppoſed to expreſs a red ſtone, not one of any other colour. As the ruby is ſignified by *ſuch*, this cannot mean the ſame ſtone, and therefore probably meant the garnet, they having no other name, that we know of, for that ſtone, and it being very like the ruby.

NOGALES, in *Geography*, a town of Spain, in Eſtramadura; 20 miles S.S.E. of Badajoz.

NOGARA, a town of Italy, in the department of the Benaco; 13 miles W. of Legrano.—Alſo, a town of the county of Tyrol; nine miles N.E. of Trent.

NOGARCOT, a town of Aſia, in the country of Nepaul, in which is a celebrated pagoda; 50 miles N.E. of Cath'mandu. N. lat. 28° 11′. E. long. 86° 8′.

NOGARO, a town of France, in the department of the Gers, and chief place of a canton, in the diſtrict of Condom; 21 miles S.W. of Condom. The place contains 1559, and the canton 11,700 inhabitants, on a territory of 3274 kiliometres, in 42 communes. N. lat. 43° 45′. E. long. 0° 2′.

NOGAROLA, Lewis, in *Biography*, an Italian man of letters, was deſcended from an illuſtrious family, born at Verona towards the commencement of the 16th century. He applied with great ſucceſs to the ſtudy of the Greek language, and acquired a high reputation by the various Latin

verſions of books written in that tongue. In 1545 he was appointed one of three commiſſioners to whom was committed the care of ſupplying Verona with proviſions in a time of ſcarcity. Soon after this he was ſent to the council of Trent, where he gained much applauſe, by a diſcourſe pronounced before that aſſembly. In 1554 he was made a knight of the republic of Verona, and in the following year he was appointed preſident of the juriſdiction over the work-people in the ſilk-manufactories. He died at Verona in the year 1559. His works were numerous, of which we notice the following. A Latin tranſlation of a work attributed to St. John Damaſcenus, on the ſubject "De iis qui fidem dormierunt." In the year 1549 he publiſhed at Venice "Apoſtolicæ Inſtitutiones in parvum Libellum collectæ:" to this he annexed his diſcourſe delivered before the council of Trent. In 1552 he printed, in quarto, a Latin treatiſe relating to the periodical increaſe of the Nile, from a very rare work, printed at Milan under the title of "Timotheus, ſive de Nilo, &c." He tranſlated alſo "De Univerſa Natura" of Ocellus Lucanus, which was printed at Venice in 1559; and reprinted at Heidelberg in 1598, and at Cambridge in 1671. Nogarola alſo publiſhed a Latin "Letter to Adam Fumano, canon of Verona, on the perſons of illuſtrious Italian families who have written in Greek," which is given in the Venice edition of Ocellus' work; in the "Opuſcula Mythologica," publiſhed at Cambridge in 1671, and in the "Supplementa et Obſervationes ad Voſſium de Hiſtoricis Græcis et Latinis," by John Albert Fabricius, publiſhed at Hamburgh in 1709. Moreri.

NOGARUOLA, in *Geography*, a town of Italy, in the Veroneſe; 19 miles S.S.E. of Verona.

NOGAT, an iſland at the mouth of the Viſtula, bounded N. by the old Viſtula, E. by the Friſch Haff, S.E. by the Nogat river, and W. by the Viſtula; about 30 miles in length from N. to S., and from five to fifteen broad; well watered and fertile.

NOGATA, a town of Japan, in the iſland of Ximo; 15 miles N. of Taiſero.

NOGAYANS, called alſo *Mankats*, one of the main branches of the Tartars; which, according to the Arabic and Grecian writers, owes its origin to a Mongole chieftain, named Nogay, who, towards the cloſe of the 13th century, was ſent with a ſtrong body of troops by a khan of Kaptſchak to conquer the countries lying beyond the Euxine, and who actually ſubjected the regions from the Don to the Danube, but afterwards ſhook off the ſovereignty of the khans of Kaptſchak, and became the founder of an empire, which was ſoon deſtroyed under his ſucceſſors. After the annihilation of this ſtate, the name of its founder continued in the nation which he had governed; and it is very probable that the Nogayans ſpread themſelves from the Volga to the Ural, and thence again as far as the Irtyſh, and were not driven out of theſe regions by the Kalmuks till the era of the Ruſſian ſovereignty. They now inhabit the Steppes on the N. ſide of the Caucaſian mountains and the Euxine quite to the other ſide of the Danube, and conſiſt of ſeveral larger and ſmaller ſtems, which at times are known to change their place of abode, and even their names. The Nogayans ſubject to Ruſſia, are partly in what was formerly called the Eaſtern Nogay or the Krimean Steppe, partly in the Kuban, and partly diſperſed about the Volga, and in other regions of the empire. The "Eaſtern Nogay" forms the northern larger half of the province of Taurida, denominated by the Ruſſians the "Krimean Steppe." It is about twice as large as the peninſula of the Krim, and was formerly much larger; but in 1739, by the peace of Belgrade, more than half of it came under the Ruſſian ſceptre, which part belongs at preſent to the government of Ekaterinoſlaf. The remainder, which had likewiſe formed a part of the ſtates of the Krimean khans, fell to Ruſſia, on her taking poſſeſſion of the Krim (Crim) in 1783; and this now conſtitutes the circles Melitopol and Dneprovſk in the province of Taurida. The eaſtern Nogay has ſhared the fortune of the Krim, and has been inhabited by the ſame people. The Nogayan Tartars now form a conſiderable part of its population.

The ſecond and at preſent the only main ſeat of the Nogayans is the Kuban (Cuban). The Kubanian Nogays, called alſo the little or black Nogays, are diſtributed into various hordes or ſtems, of which the Kaſay-aut and the Naurus-aut are the moſt remarkable, compoſing together about 10,000 families. It is ſaid that the population of all the eaſtern and Kubanian Nogays amounted, a few years ago, to upwards of 500,000 families; but this is probably an exaggerated account. Beſides theſe, who are lately come under the Ruſſian ſovereignty (Kuban being taken poſſeſſion of by the Ruſſians in 1783), there are, in various parts of the empire, other remains and colonies of this nation of Nogays. Tooke's Ruſſia, vol. i.

NOGELN, a town of Pruſſia, in the province of Samland; 52 miles N. of Königſberg.

NOGENT *Haut Marne*, a town of France, in the department of the Upper Marne, and chief place of a canton, in the diſtrict of Chaumont; nine miles S.E. of Chaumont. The place contains 1949, and the canton 8638 inhabitants, on a territory of 240 kiliometres, in 20 communes.

Nogent-*le-Rotrou*, a town of France, and principal place of a diſtrict, in the department of the Eure and Loire, on the Eure; 12 miles N. of Chartres. The place contains 6780, and the canton 11,552 inhabitants, on a territory of 152½ kiliometres, in 12 communes. N. lat. 48° 20′. E. long. 0° 55′.

Nogent-*Roulebois*, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the diſtrict of Dreux. The place contains 2290, and the canton 10,733 inhabitants, on a territory of 215 kiliometres, in 22 communes.

Nogent-*ſur-Seine*, a town of France, in the department of the Aube, and principal place of a diſtrict; nine miles E S.E. of Provins. The place contains 3208, and the canton 10,152 inhabitants, on a territory of 170 kiliometres, in 17 communes. N. lat. 48 30′. E. long. 3° 35′.

NOGG, in *Rural Economy*, a provincial word often uſed to ſignify ſtrong beer.

NOGHE, in *Geography*, a town of Nubia, on the right bank of the Nile; 50 miles N.E. of Sennaar.

NOGONG, a town of Bengal, capital of the circar of Barbackpour; 50 miles N.E. of Moorſhedabad. N. lat. 24° 48′. E. long. 88° 53′.

NOHOTHA, a river of Thibet, which runs into the Sanpoo; 21 miles W.S.W. of Tankia.

NOHUKUN, a river of Mexico, which riſes in the province of Yucatan, and runs into the bay of Honduras by ſeveral mouths. N. lat. 17° 30′. W. long. 90° 16′.

NOHUTTA, a town of Bengal; 18 miles W. of Nattore. N. lat. 24° 28′. E. long. 88° 46′.—Alſo, a town of Bengal; five miles S.W. of Mahmudpour.—Alſo, a town of Hindooſtan, in Bahar; 33 miles E.S.E. of Durbungah. N. lat. 25° 59′. E. long. 86° 40′.

NOIA, a town of Naples, in the province of Otranto; five miles S.E. of Nardo.—Alſo, a town of Naples, in Baſilicata;

licata; 12 miles S.S.W. of Turſi.—Alſo, a town of Naples, in Bari; 25 miles E.S.E. of Bari.

NOIERA, a town of Naples, in Principato Citra; ſeven miles W.N.W. of Salerno.

NOILSBERG, a town of Bohemia, in the circle of Leitmeritz; 18 miles N.W. of Leitmeritz.

NOIR, John le, in *Biography*, who flouriſhed in the 17th century, was the ſon of a counſellor of Avignon, and intended for the church. Having excellent natural abilities, which he improved by a liberal education, he was ordained prieſt, and acquired a high reputation at Paris and other cities, as an eloquent and popular preacher. As a reward of his merit, he was promoted to the canonry and prebend in the cathedral church of Seez. Jealous of his fame, the Jeſuits attempted to injure his credit, and even directed againſt him the fury of a number of fanatics who appeared in Normandy. Le Noir was a zealous defender of the principles of Janſeniſm; the fanatics, juſt referred to, aſſembled where he was preaching a courſe of ſermons, and having erected an image of the Virgin at the croſſing of the ſtreets, chanted litanies before it every evening, into which were introduced the words "Virgo extirpatrix Janſeniſtarum." Under the feet of this image was the figure of a black ſerpent, by which they meant to deſignate the prebendary of Seez. They uſed other means likewiſe to deſtroy the influence of Le Noir. At length the civil power thought it right to interfere, and after committing the ring-leaders to priſon, diſperſed the reſt. After this he had a conteſt with his biſhop, who obtained againſt him a *lettre de cachet*, in the year 1663, by which M. le Noir, under the pretence of having propagated erroneous notions, was, for a time, exiled to Fougeres in Britanny. On his return he attacked the prelate when about to take poſſeſſion of the archbiſhopric of Rouen, upon the tranſlation of Harlay, archbiſhop of that ſee, to the ſee of Paris. The proceſs againſt his dioceſan was referred, by the king's council, to the eccleſiaſtical judges, before whom it lay many years. In 1682 he oppoſed the election of Harlay, archbiſhop of Paris, to the office of preſident in the aſſembly of the clergy, under the plea that he had not yet cleared himſelf from the ſuſpicion of hereſy, and was, of courſe, ineligible by the canons. In the following year M. le Noir was arreſted and committed priſoner to the Baſtile, where a proceſs was carried on againſt him, before ſpecial commiſſaries, who pronounced him guilty of publiſhing defamatory writings, and adjudged him to make the *amende honorable* before the metropolitan church of Paris, and then to be ſent to the galleys for life. The firſt part of the ſentence was executed upon him, but the puniſhment of the galleys was exchanged for impriſonment. He was confined firſt at St. Malo's; afterwards in the citadel of Breſt; and laſtly at Nantes, where he died in 1692. He was author of ſeveral works; of which may be noticed "A Collection of Requeſts, or Caſes, &c." in folio, relative to the treatment of the Janſeniſts, which work is ſaid to diſplay a paſſionate eloquence, with a profound and very uncommon knowledge of law, and will be found uſeful by the eccleſiaſtical hiſtorian: "The indiſputable advantages of the church over the Calviniſts, in the controverſy between M. Arnauld and the miniſter Claude:" "The new political Light, or the new Goſpel of cardinal Palavicini, revealed by himſelf in the hiſtory of the council of Trent," which occaſioned the ſuppreſſion of a French tranſlation of that hiſtory which was about to be publiſhed. Moreri.

Noir, *Cape*, in *Geography*, a cape on the S.W. coaſt of the iſland of Terra del Fuego, at the entrance of the ſtraits of Magellan. S. lat. 54° 30'. W. long. 73° 33'. —Alſo, a cape on the northern ſide of Chaleur bay, about ſeven leagues W.N.W. of Bonaventure.—Alſo, a cape on the S. coaſt of the iſland of Milo. N. lat. 36° 47'. E. long. 24° 22'.

Noir, Fr., *black*, a note of muſic, *note noir*, a crotchet , or half a minim; *noirs à queue*, a quaver . In the old Fr. muſic there were ſeveral kinds of black notes, black with a tail, black ſquare, black lozenge. The two laſt have remained in plain chant; but in ſecular muſic nothing but the crotchet and its diviſions remain black. The note with a black head, ſtraight, and a tail, which we call a crotchet, the French call a *noir*, and the quaver with a hook to the tail, which the French, with more propriety, call a *croche*, or hook.

NOIRA, in *Ornithology*. See Psittacus *Garrulus*.

NOIR-AURORA, in *Ornithology*. See Muscicapa *Ruticilla*.

NOIR-ETABLE, in *Geography*, a town of France, in the department of the Loire, and chief place of a canton, in the diſtrict of Montbriſon; 18 miles S.S.W. of Roanne. The place contains 1887, and the canton 6990 inhabitants, on a territory of 202½ kiliometres, in 10 communes.

NOIRMOUNT Point, a cape at the entrance of St. Aubin's bay, on the S. coaſt of the iſland of Jerſey.

NOIRMOUTIER, an iſland of France, in the department of the Vendée, and chief place of a canton, in the diſtrict of Les Sables-d'-Olonne, ſeparated from the continent of France by a ſtrait three leagues long, and from about a quarter to one league wide. The canton contains 5420 inhabitants, on a territory of 67½ kiliometres, in one commune. N. lat. 46° 58'. W. long. 2° 9'.

NOIR-SOUCI, in *Ornithology*. See Loxia *Bonnarienſis*.

NOIX, Isleau, or Nut *Iſland*, in *Geography*, a ſmall iſland near the N. extremity of lake Champlain.

NOKA, a town of Hindooſtan, in Bahar; 14 miles N.N.E. of Saſeram.

NOKISSIMA, or *Burning Iſland*, a ſmall Japaneſe iſland. N. lat. 34° 15'. E. long. 139° 20'.

NOKRE-KOH, a mountain of Grand Bucharia, ſo called from its ſilver mines; 100 miles E. of Balk.

NOKSELA, a town of Bengal; 45 miles N.E. of Nattore.

NOLA, a town of Naples, in the province of Lavora, which, as ſome ſay, owed its origin to the Greeks of Chalcis; but, according to others, it was founded by the Etruſcans, forty years before the building of Rome. The Romans took it during the Samnite war. It afterwards became a Roman colony, and Veſpaſian gave it the name of Auguſtus. Near this town Hannibal was twice defeated by the Roman arms under Marcellus. This town, which was anciently rich and flouriſhing, is ſtill a handſome town, the ſee of a biſhop, ſuffragan of Naples. The ſilk ſpun in the neighbourhood is much eſteemed; 13 miles E. of Naples. N. lat. 40° 53'. E. long. 14° 20'.

NOLACHUCKY, a river of America, in the E. part of the ſtate of Tenneſſee, which runs W.S.W. into French Broad river, about 26 miles from Holſton river.

NOLANA, in *Botany*, a Linnæan genus, named from the bell-ſhaped form of its corolla, and derived from *Nola*, a little bell. Linn. Gen. 79. Schreb. 104. Willd. Sp. Pl. v. 1. 794. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 1. 304. Juſſ. 132. Lamarck Illuſtr. t. 97. Gærtn. t. 132. —Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Aſperifoliæ* or *Luridæ*, Linn. *Borragineæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, turbinate at the baſe, five-ſided, divided into five, heart-ſhaped, acute,

permanent ſegments. *Cor.* of one petal, bell-ſhaped, plaited, ſpreading, ſomewhat five-lobed, twice as large as the calyx. *Stam.* Filaments five, awl-ſhaped, erect, equal, ſhorter than the corolla; anthers arrow-ſhaped. *Piſt.* Germens five, ſuperior, roundiſh; ſtyle between the germens, cylindrical, ſtraight, the length of the ſtamens; ſtigma capitate. *Peric.* Drupas five, depreſſed, ovate. *Seed.* Nut the ſhape of the drupa, with three or four cells. Kernels ſolitary, roundiſh, finely dotted.

Eſſ. Ch. Corolla bell-ſhaped. Style between the germens. Drupas five. Nut three or four-celled.

1. N. *proſtrata.* Trailing Nolana. Linn. Sp. Pl. 202. Linn. fil. Dec. 1. 3. t. 2. Sims in Bot. Mag. t. 731. (Teganium procumbens; Schmid. Ic. 67. t. 18.)—Native of Peru. It was cultivated in 1761, by Mr. Philip Miller, and flowers from July to September. *Root* annual, ſimple, thread-ſhaped, often three feet long, black. *Stems* a foot long, herbaceous, proſtrate, branched, roundiſh, very ſmooth, with white and purpliſh dots. *Leaves* in alternate pairs, ſtalked, ovate, rhomboidal, entire, ſomewhat fleſhy, ſmooth, flat, veined, unequal in ſize. *Flowers* ſolitary, on long, hairy ſtalks, of a pale blue colour, beautifully ſtreaked from the centre with veins of dark purple, and ſhaped much like thoſe of *Convolvulus tricolor*.

There appears to be ſome ambiguity reſpecting the natural order to which *Nolana* ſhould be referred. Linnæus was not ſatisfied with having placed it among his *Aſperifoliæ*. Juſſieu hints that it has the habit both of *Convolvuli* and *Solaneæ*, whilſt Gærtner is of opinion that it ſhould be referred to the latter order.

NOLANA, in *Gardening*, comprehends a plant of the herbaceous trailing annual kind, of which the ſpecies cultivated is the trailing nolana, (N. proſtrata.)

Method of Culture.—The plants in this ſpecies may be raiſed by ſowing the ſeeds on a hot-bed in March. When they are fit to remove, they ſhould be planted out ſingly into ſmall pots filled with light earth, plunging them into a freſh hot-bed to bring them forward. When their flowers open in the ſummer, as July, they ſhould have a large ſhare of air admitted when the weather is warm, to prevent their falling away without producing ſeeds. Under this management the plants often continue flowering till the early froſts deſtroy them, and ripe ſeeds are produced in the beginning of the autumnal ſeaſon.

They afford variety among other tender annuals.

NOLAY, in *Geography*, a town of France, in the department of the Cote-d'-Or, and chief place of a canton, in the diſtrict of Beaume; 10 miles S.W. of it. The place contains 2039, and the canton 10,871 inhabitants, on a territory of 175 kiliometres, in 19 communes.

NOLDIUS, CHRISTIAN, in *Biography*, a learned Daniſh divine, was born at Hoybia, in Scania, in the year 1626. He obtained the early part of his education at Lunden; whence he was removed, in 1644, to the univerſity of Copenhagen. Here he diſtinguiſhed himſelf by the great progreſs which he made in his ſtudies, and was enrolled among the citizens of the metropolis. In 1650 he was nominated rector of the college at Landſcroen; and in the following year took his degree of M.A. In 1654 he ſet out on his travels into foreign countries, viſited all the celebrated univerſities of Germany, and obtained introductions to many of the moſt eminent divines and other literary characters in that country, and afterwards to thoſe of Holland, England, and France. After this he returned to his native country for a ſhort time, and then ſet out for Holland a ſecond time, and purſued his ſtudies nearly three years in the univerſities of Franeker and Leyden. In 1660 he undertook the office of tutor and governor of the ſons of the lord of Gerſtorff, grand maſter of the palace to the king of Denmark, and in a few years was ordained miniſter and elected profeſſor of divinity in the univerſity of Copenhagen. To this poſt the king was pleaſed to add the honourable one of rector of that ſeminary. Noldius died in 1683, at the age of fifty-ſeven. He is known as an author, by "Concordantiæ particularum Hebræo Chaldaicum," &c. of which the beſt edition is that of Jena in 1734, 4to: "Sacrarum Hiſtoriarum et Antiquitatum Synopſis:" "Hiſtoria Idumæa, ſeu, de Vita et Geſtis Herodum Diatrive:" "Logica," and an edition of Joſephus's Hiſtory. Moreri.

NOLI, in *Geography*, a ſea-port town of the Ligurian republic, the harbour of which is defended by a fort, inhabited chiefly by fiſhermen, the ſee of a biſhop; 25 miles S.W. of Genoa. N. lat. 44° 11′. E. long. 8° 28′.

NOLI ME TANGERE, in *Botany*, &c. See IMPATIENS.

NOLI ME TANGERE, in *Surgery*. This curious name is applied to a ſpecies of herpes, which is frequently ſeen making its attack on the ſkin of the noſe. The diſeaſe conſiſts of ſmall ſuperficial ulcerations, which uſually commence on the alæ of the part, and are more or leſs concealed beneath furfuraceous ſcabs. The complaint is connected with ſpecific morbid action in the part affected, and the matter ſecreted ſeems to have the power of infecting the adjoining ſkin to which it is applied. Hence the noli me tangere often proves exceedingly obſtinate, ſpreading on one ſide, healing on another, and then breaking out again in places, where, at one time, the complaint ſeemed to have entirely ceaſed.

The writer of this article has repeatedly ſeen nearly the whole noſe gradually deſtroyed by this frequently intractable malady. He has ſeveral times ſeen the morbid proceſs ſuſpended for ſix months, or even a year, and then renew its ravages with increaſed vehemence.

Such authors as have attempted to explain the cauſes of this ſpecies of herpes, have only diſplayed their own credulity, without throwing the leaſt light upon the ſubject.

The ulcerations of noli me tangere do not generally extend to the parts far within the noſtrils; but, ſome time ago, there was, under Mr. Harvey, in St. Bartholomew's hoſpital, a curious example, in which the greateſt part of the noſe was deſtroyed, and the ulceration proceeded even through the front part of the palate into the mouth. The morbid proceſs ſometimes ſtops for a conſiderable time, and then is renewed with increaſed violence. The following caſe illuſtrates the nature of noli me tangere, and one mode of treatment to which it yielded: Jane Chatillon, forty-five years of age, was attacked, in the courſe of September, 1788, with an inflammation on the left ala of the noſe. Some time afterwards the part ulcerated, which occaſioned a troubleſome and ſometimes a painful itching: different means were unſucceſsfully employed, and the caſe remained nearly in the ſame ſituation till the month of September in the following year. At this period the ulcer ſpread very faſt; the ſeptum naſi, the muſcles, and cartilages of both ſides, were, in a ſhort ſpace of time, deſtroyed. The ulceration extended on the left ſide, on the looſe edge of the upper-lip. This was the ſtate of her caſe on her admiſſion into the hoſpital of St. Louis, in the month of October, 1789.

A poultice, moiſtened with aq. veg. was applied twice a day to the ulcer; a ſudorific ptiſan preſcribed, and a pill, compoſed of one grain of calomel, and one grain of ſulph. aurat. antimonii, ordered to be taken every day. From the fifth day, the inflammation leſſened. No other ſenſible alteration

alteration took place till the 21ſt. The ſuppuration, that, till this time, had been black and putrid, now became white and inodorous.

On the 37th, the diſcharge was trifling, and the ulcer, being well deterged, was dreſſed with pledgets, dipped in a ſolution of verdigris and corroſive ſublimate, in the proportion of ſix grains of each to a pint of water. On the 40th day, cicatrization began to take place, and was finiſhed by the 60th.

Some time before it was completely cicatrized, an iſſue was made in the arm, which was healed up, without any inconvenience to the patient, ſix months after the cure. Pariſian Chirurgical Journal, vol. i.

One of the beſt external applications to noli me tangere is the following lotion: ℞. Kali arſenicati gr. iv. Aq. menthæ ſativæ ℥iv. Spiritûs vini tenuioris ℥j. Miſce et cola. We have ſeen ſeveral caſes in St. Bartholomew's hoſpital, very lately, which were either cured or ſeemed diſpoſed to get well with this application. The ſolution of arſenic, which Mr. Home has always uſed, is made by boiling white arſenic in water for ſeveral hours, in a ſand-heat. When given internally, the doſe is from three to ten drops; when for external application, a dram is to be diluted with ℥ij of water; and this ſolution is gradually made ſtronger, as the parts become accuſtomed to it, till it is of double ſtrength. However, this mode of uſing arſenic is by no means a well regulated one; and Plunket's cauſtic, (ſee ARSENIC,) for outward employment, is not nearly ſo neat an application as the above-mentioned lotion. At St. Bartholomew's hoſpital, arſenic is adminiſtered internally in the following formula: ℞. Kali arſenicati gr. ij. Aquæ menthæ ſativæ ℥iv. Spiritûs vin. ten. ℥j. Miſce et cola. Doſis ℥ij ter quotidie. In this way, the quantity of arſenic is nicely determined. We ſhall only juſt add, with regard to this medicine, that, both as an external application and an inward remedy, in caſes of noli me tangere, it perhaps deſerves the higheſt rank. One ſcruple of the argentum nitratum, diſſolved in half an ounce of diſtilled water, makes a very good application, which, although generally inferior, in point of efficacy, to arſenical ones, in the preſent diſeaſe occaſionally does good, when nothing elſe ſeems to produce any benefit. The caſe above makes us acquainted with another lotion, which deſerves further trial. All fluid remedies muſt be applied to the part, by dipping little bits of lint in them, placing theſe on the ulcerations, and covering the whole with a pledget.

The ointments, which ſeem moſt likely to prove uſeful applications to noli me tangere, are the unguentum hydrargyri nitrati, the unguentum picis, and unguentum ſulphuris. As far as our experience extends, they are generally leſs efficacious than lotions in the preſent caſes; but, in particular inſtances, they prove ſuperiorly uſeful, and, it deſerves particular notice, that ſurgeons can often make no progreſs againſt this inveterate diſeaſe, unleſs they apply a different ſort of dreſſing every day; ſometimes a lotion; at other times an ointment. The little ulcers may occaſionally be touched with the argentum nitratum. The ſmall furfuraceous ſcabs, which are continually forming on the part affected, ſhould be ſoftened with a little of the unguentum ſpermatis ceti, and removed with as much tenderneſs as poſſible.

We have already remarked, that arſenic is a good internal medicine, and the beſt mode of exhibiting it is already explained. Another medicine, which is often uſeful in theſe caſes, is what is known by the name of Plummer's pill, or the compound calomel pill. ℞. Calomelanos, ſulphuris antimonii præcipitati, ſingulorum gr. xii. Guaiaci gummi reſinæ gr. xxiv. Saponis quod ſatis ſit. Miſce fiant pilulæ duodecim. Doſis una bis quotidie. In other inſtances, we may try the decoctum ulmi, or ſarſaparilla, with one of the following pills thrice a day. ℞. Calomelanos gr. vj. Extracti conii ℥j. Miſce fiant pilulæ duodecim. The hydrargyrus ſulphuratus has alſo been recommended as an alterative remedy in caſes of noli me tangere. Cooper's Firſt Lines of the Practice of Surgery, edit. 3. and Dictionary of Surgery, edit. 2. Deſault's Pariſian Chirurgical Journal, vol. i. &c.

NOLIN CREEK, in *Geography*, a branch of Green river, in Kentucky.

NOLINA, in *Botany*, ſo named by Michaux, in compliment to "P. C. Nolin, a Frenchman, an ardent cultivator of American plants more eſpecially, to the great benefit of botany as well as agriculture." Mich. Boreal-Amer. v. 1. 207.—Claſs and order, *Hexandria Trigynia*. Nat. Ord. *Coronariæ*, Linn. *Junci*, Juſſ.?

Gen. Ch. *Cal* none. *Corolla* of one petal, in ſix deep, ſpreading, nearly equal, oval ſegments. *Stam.* Filaments ſix, awl-ſhaped, ſhorter than the corolla; anthers oblong, ſomewhat heart-ſhaped, ſlightly notched at the top. *Piſt.* Germen ſuperior, triangular; ſtyle very ſhort; ſtigmas three, obtuſe, recurved. *Peric.* Capſule roundiſh, with three angles, membranous, of three cells, the partitions from the inflexed margins of the valves. *Seeds* ſolitary, obovate, ſmaller than the cell and attached to its baſe, ſeldom more than one perfected in each capſule.

1. N. *georgiana*.—Native of Georgia in North America. *Bulb* tunicated, perennial. *Leaves* ſeveral, radical, ſpreading in every direction, from five to nine inches long, a line broad, graſſy, thick and rigid, rough at the edges. *Stalk* clothed below with a few ſcattered awl-ſhaped leaves, two feet high or more, diſtantly and looſely branched above; its branches racemoſe; flower-ſtalks aggregate. *Flowers* minute, whitiſh.

Such is nearly the account of Michaux, who conſiders this genus as allied to *Helonias* on one hand, and to *Phalangium* of Juſſieu (*Anthericum* of Linnæus) on the other. He places it in the order *Trigynia*, but deſcribes the ſtyle as ſimple, though the ſtigmas are three. We have preſumed to term *corolla*, after Linnæus, what he calls *calyx petaloideus*.

NOLINSK, in *Geography*, a town of Ruſſia, in the government of Viatka; 40 miles S. of Viatka. N. lat. 57° 44′. E. long. 50 14′.

NOLLE, a town of France, in the department of the Po; 8 miles N. of Turin.

NOLLE *Proſequi*, is uſed in *Law*, where a plaintiff in any action will proceed no farther, and may be before or after a verdict, though it is uſually before; and it is then ſtronger againſt the plaintiff than a nonſuit, which is only a default in appearance; but this is a voluntary acknowledgment that he hath no cauſe of action.

NOLLET, JOHN ANTHONY, in *Biography*, who flouriſhed in France in the laſt century, was born at Pimprè, in the dioceſe of Noyon, in the year 1700. He was educated at the college of Clermont in the Beauvoiſin, and afterwards went to Beauvais, where he laid ſuch a foundation in claſſical learning that his parents were encouraged to ſend him to Paris, to go through a courſe of philoſophy at the univerſity. Their wiſh was, that he ſhould embrace the eccleſiaſtical profeſſion, and he readily acceded to it. From a very early age he had ſhewn a taſte for the purſuits of natural ſcience, in which he afterwards ſo highly diſtinguiſhed himſelf: for the preſent, however, he checked his ruling paſſion, as being likely to interfere with the ſtudies more appropriate to his deſtined

deſtined character, and gave himſelf up entirely to the ſtudy of ſcholaſtic theology. In 1728 he was admitted to deacon's orders, and ſoon became a licenſed preacher. He had not followed this profeſſion very long before he felt an inclination for the ſciences, which was, in a ſhort time, irreſiſtible, and he now devoted his fine talents almoſt wholly to the ſtudy of natural philoſophy. He became known and attached to M. du Fay and Reaumur, and with their aſſiſtance he made a rapid progreſs in thoſe branches of knowledge for which theſe philoſophers were diſtinguiſhed. By the former he was received as an aſſociate in his electrical reſearches, and the latter reſigned to him his laboratory. In 1734 he accompanied his friends du Fay, du Hamel, and de Juſſieu on a viſit to England, where he was admitted a foreign member of the Royal Society. Two years afterwards he made a tour into Holland, where he formed an intimate connection with s'Graveſande and Muſſchenbroek. Upon his return to Paris he reſumed a courſe of experimental philoſophy, which he commenced in 1735, and which he continued during the long ſpace of 25 years. The courſes delivered by Nollet gave riſe to the adoption of ſimilar plans in other branches of ſcience, ſuch as chemiſtry, anatomy, natural hiſtory, &c. In 1738 a public profeſſorſhip of experimental philoſophy was eſtabliſhed at Paris under the patronage of cardinal Fleury, and the abbè Nollet was the firſt perſon who received that appointment. During the following year, the Royal Academy of Sciences appointed him adjunct mechanician to that body, and in 1742 he was admitted an aſſociate. In 1739, the king of Sardinia being deſirous of eſtabliſhing a profeſſorſhip of phyſics at Turin, invited the abbè Nollet to perform a courſe of experimental philoſophy before the royal family, with which he complied. From Turin he made a tour in Italy, where he made many obſervations, and collected ſome excellent facts reſpecting the natural hiſtory of the country. In the year 1744 he was called to Verſailles to give lectures to the dauphin in natural philoſophy, at which the king and royal family were frequently preſent. In the year 1749, the abbè Nollet took a ſecond journey into Italy, whence many wonderful accounts had been circulated throughout Europe, of the communication of the medicinal virtues by electricity, which ſeemed, at that time, to be ſupported by numerous well atteſted facts. To examine into theſe electrical miracles, as they were then thought, and to be aſſured of their truth or fallacy, was a grand motive with our author in paſſing the Alps at this time, and in viſiting the philoſophers who had publiſhed accounts of thoſe experiments. But though he engaged them to repeat their experiments in his preſence, and upon himſelf, he was ſoon convinced that the pretended facts were deceptions or great exaggerations, and that no method had been diſcovered, by means of which the power of medicine could by electricity be made to inſinuate itſelf into the human body. The abbè did not confine his enquiries to theſe facts only, but extended them alſo to all the branches of natural philoſophy, the arts and agriculture. After his return to France, the king, in 1753, eſtabliſhed a profeſſorſhip of experimental philoſophy at the college of Navarre, and nominated the abbè Nollet to fill that poſt. In the year 1757 the king beſtowed upon him the *brevet* of maſter of natural philoſophy and natural hiſtory to the younger branches of the royal family of France, and in the ſame year appointed him profeſſor of natural philoſophy to the ſchools of artillery and engineers. Soon after this laſt inſtance of preferment he was received a penſionary of the Royal Academy of Sciences. This celebrated naturaliſt and experimental philoſopher died in 1770, deeply regretted by that part of the public, of all countries, who were capable of appreciating his worth, as well as by the numerous friends whoſe attachment he had ſecured by the amiableneſs of his manners and the goodneſs of his heart. Independently of a vaſt number of papers publiſhed by the abbè in the different volumes of the "Memoires" of the Academy of Sciences, from the year 1740 to 1767, he was author of "Récherches ſur les Cauſes particulières des Phenomenès electriques," 1749, 12mo; "Lettres ſur l'Electricitè," 3 tom. 12mo, 1749, 1760, 1767; "Leçons de Phyſique," 6 tom. 12mo, 1764; "Eſſai ſur l'Electricitè des Corps;" "L'Andes experiences," 3 tom. See Prieſtley's Hiſt. of Electricity, 4to. p. 100 and other parts; alſo Cavallo's Complete Treatiſe on Electricity, in three vols. Likewiſe the articles ELECTRICITY, and others relating to the ſame ſubject in vol. xii. of the New Cyclopædia. Alſo CIRCUIT, LEYDEN *Phial*, &c.

NOLLIN, DENNIS, a French biblical critic, who flouriſhed in the early part of the laſt century, was educated to the bar, and acquired reputation in the character of an advocate of the parliament of Paris. Being, however, attached to theological ſtudies, he directed his whole attention to the holy ſcriptures, and quitted his legal profeſſion. He was a moſt diligent collector of whatever might tend to elucidate the writings of the prophets, apoſtles, &c. and his library is ſaid to have contained a greater number of editions of the bible, of tranſlations, and of commentaries on the ſcriptures, than had ever before belonged to any individual. This library, at his death, which happened in 1710, he directed to be ſold for the benefit of the poor of his pariſh. He publiſhed "A Letter from N. Indes, divine of Salamanca, propoſing a Method for correcting the Greek Septuagint Verſion, with an illuſtration of ſome difficult paſſages," which excited a controverſy between the author and father de Tournemine. He was author alſo of "A Letter to M. l'Abbè B. relative to the new edition of the Septuagint by John Erneſt Grabe," inſerted in the "Supplement du Journal de Sçavans" for December 1710: "Two Diſſertations, one on the French Bibles to the year 1541, and the other illuſtrative of a literary Phenomenon:" and "A Critical Letter on an anonymous Diſſertation, and the Letters of M. Richard Simon, reſpecting the Antiquities of the Chaldeans and Egyptians," 1710. Moreri.

NOLSOE, in *Geography*, one of the ſmaller Faroer iſlands; ſix miles S. of Oſteroe. N. lat. 65° 10′. W. long. 6° 38′.

NOM DE JESUS, a town of the iſland of Zebu, one of the Philippine iſlands, the ſee of a biſhop, ſuffragan of Manilla.

NOMA, NOME, (from νεμω, *to eat away*,) in *Surgery*, a phagedenic ulcer, or a ſpecies of herpes.

NOMADES, Νομαδες, from νεμω, *I feed*, a name given, in *Antiquity*, to ſeveral nations, or people, whoſe whole occupation was to feed and tend their flocks; and who had no fixed place of abode, but were conſtantly ſhifting according to the conveniences of paſturage.

The moſt celebrated among the Nomades were thoſe of Africa, who inhabited between Africa, properly ſo called, to the eaſt, and Mauritania to the weſt. They are alſo called *Numidæ*, or *Numidians*. Salluſt ſays, they were a colony of Perſians, brought into Africa with Hercules. The Nomades of Aſia inhabited the coaſts of the Caſpian ſea.

The Nomades of Arabia, according to Pliny (l. vi. c. 28.), occupied a territory eaſt of the deſerts of Palmyra, and extended from the ſouthern coaſt as far as the Aſphaltite lake; next to them were the Attali, who were accuſtomed to make incurſions on the country of the Chaldæans, in the vicinity of the Euphrates. The Arabian Nomades, and the Attali, were

were bounded ſouthward by the Scenites, who, according to Euſtathius (in Dionyſ. p. 121.) inhabited the diſtrict between Cœleſyria and the Euphrates. Strabo (l. xvi.) places theſe people in the ſame ſituation with Pliny.

The Nomades of Scythia were the inhabitants of Little Tartary; who ſtill retain the ancient manner of living. The Scythian Nomades, according to Pliny (l. iv. c. 12.), inhabited the country on the left ſide of the Caſpian ſea; and they were ſeparated from the Georgii by the river Panticapes. Strabo ſays, that they lived in waggons inſtead of houſes.

NOMAES, or NOMAO, in *Geography*, a town of Portugal, in the province of Beira; ſix miles S.E. of St. Joao de Peſqueira.

NO-MAN'S LAND, a ſmall iſland near the American coaſt, S.W. of Martha's Vineyard, about three miles long, and two broad; belonging to Duke's county, Maſſachuſetts. N. lat. 41° 15'. W. long. 71° 5'.

NO MAN's *Land*, in *Sea Language*, is a ſpace between the after-part and belfrey, and the fore-part of a ſhip's-boat, when the ſaid boat is ſtowed upon the booms, as in a deep waiſted veſſel. Theſe booms are laid from the fore-caſtle nearly to the quarter-deck, where their after-ends are uſually ſuſtained by a frame called the gallows, which conſiſts of two ſtrong poſts, about ſix feet high, with a croſs-piece, reaching from one to the other, athwart ſhips, and ſerving to ſupport the ends of thoſe booms, maſts, and yards, which lie in reſerve to ſupply the place of others carried away, &c. The ſpace called no man's land is uſed to contain any blocks, ropes, &c. which may be neceſſary on the forecaſtle. It probably derives this name from its ſituation, as being neither on the ſtarboard nor larboard ſide of the ſhip, nor on the waiſte or forecaſtle; but being ſituated in the middle, partakes equally of all thoſe places. Falconer.

NOMANCY, compounded of *nomen*, *name*, and μαντεια, *divination*, a name given to the art of divining the fates of perſons by means of the letters that form their names. Nomany, or, as it ſhould rather be called, *nominomancy*, or *onomatomancy*, ſeems to be nothing elſe but the cabbaliſtic gematria.

NOMARCHA, in *Antiquity*, the governor or commander of a nome, or nomos.

Egypt was anciently divided into ſeveral regions, or quarters, called *nomes*, from the Greek νομος, taken in the ſenſe of a diviſion; and the officer who had the adminiſtration of each nome, or nomos, from the king, was called *nomarcha*, from νομος, and αρχη, *command*.

NOMBRE DE DIOS, in *Geography*, a port town of South America, in the province of Darien, at the bottom of a bay of the ſame name; deſtroyed ſoon after it was founded by the Indians of Darien, afterwards rebuilt, and occupied by its inhabitants until the year 1584, when Philip II. ordered them to be removed to Porto Bello, as a place better adapted to the commerce of the country; 30 miles E. of Porto Bello. N. lat. 9° 36'. W. long. 79° 35'.—Alſo, a large and populous town of Mexico, on the W. coaſt, near the Pacific ocean, in the province of Zacatecas. It became populous in conſequence of the acceſſion of inhabitants, on account of its ſilver mines; 85 miles N.W. of Zacatecas. N. lat. 24° 6'. W. long. 104° 32'.—Alſo, a river of Peru, called "Tambopalla," which runs into the Pacific ocean, S. lat. 17° 10'.

NOMBRE *de Jeſus*, a town of South America, in the province of Quito; 35 miles N.W. of St. Joſef de Huates.

NOMBRE *de Maria*, a town of South America, in the province of Quito; eight miles N.E. of St. Joſef de Huates.

NOMBRE *de Hios*, a town of Mexico, in the province of New Biſcay; 120 miles N. of Parral.

NOMBRIL POINT, in *Heraldry*, is the next below the feſs-point; or the very centre of the eſcutcheon.

Suppoſing the eſcutcheon divided into two equal parts below the feſs; the firſt of theſe diviſions is the nombril; and the lower the baſe.

NOME, or NAME, in *Algebra*, denotes any quantity with a ſign prefixed, or added to it, whereby it is connected with ſome other quantity; upon which the whole becomes a binomial, trinomial, or the like.

Thus $a + b$ is a binomial, whoſe names, or nomes, are a and b, and $a + b + c$ a trinomial, whoſe names are a, b, and c, &c.

NOME, among the ancient Egyptians, a diviſion, or province, into which the whole kingdom is divided. The origin of the nomes, according to Diodorus Siculus, was this: the inhabitants being refractory, and much inclined to inſurrections, in order to prevent theſe, the kings divided the whole country into different provinces, or nomes, and eſtabliſhed the worſhip of ſome particular animal in each of them, prohibiting, at the ſame time, ſuch animal to be eaten within the bounds where it was worſhipped. Hence, as every province was intoxicated with its own particular form, and object of worſhip, it entertained the higheſt contempt for that of its neighbours, and took a pleaſure in profaning the animal, which among them had divine honours paid it. This religious oppoſition had the deſired effect; for all mutual confidence being thereby cut off, there were no more inſurrections againſt the government. Mem. Acad. Inſcrip. vol. xiii. p. 52.

NOME, in the *Ancient Greek Muſic*. Every melody determined by inviolable rules, was called by the Greeks a *nome*, or a law. The nomes acquired their denomination, 1ſt, from certain people, as the Æolian nome, the Lydian nome; 2dly, by the kind of rhythm or meaſure, as the Orthian nome, the Dactylic nome, the Trochaic nome; 3dly, by the name of their inventors, as the Hieracian nome, the Polymneſtan nome; 4thly, from the ſubject, as Pythian nome, Comic nome; 5thly, and laſtly, from their mode; as the Hypotoide or grave nome, Netoide or acute, &c. There were likewiſe nomes of half one mode and half another: there were others that were tripartite, of which Sacadas, or Clonas, was the author; the Dorian, Phrygian, and Lydian. (See SONG, and MODE.) The nomes and dithyrambics were equally hymns ſung in honour of the gods. The nomes were for Apollo, as the dithyrambics were for Bacchus. Now the literal meaning of νομος, *nome*, being a *law* or *rule*, it ſhould ſeem as if, after the invention of muſical characters, the nomes were the firſt melodies, or tunes, that were written down, and rendered permanent and unalterable; whereas, before that period, muſic muſt have been played extempore, or by memory: and as Terpander, the inventor of a muſical notation, is likewiſe ſaid to have ſet the νομοι, or *laws* of Lycurgus, to muſic, the conjecture has both a literal and a figurative foundation. Ariſtotle, (Prob. xvii. 28.) aſks why ſuch different things as *laws* and *ſongs* had the ſame appellations? and anſwers the queſtion himſelf, by ſaying, that before the knowledge of letters, *laws* were *ſung*, in order to their being the better retained in memory. If, according to Joſephus, the word νομος is not to be found in all the writings of Homer, it muſt, conſequently, be a more modern term. The word, however, *does* occur in Homer's Hymn to Apollo, v. 20, though not in the Iliad or Odyſſey.

NOMEN. See PRÆNOMEN, NAME, and AGNOMEN.

NOMENCLATOR, or NOMENCULATOR, among the Romans,

Romans, was uſually a ſlave, who attended perſons that ſtood candidates for offices, and prompted or ſuggeſted to them the names of all the citizens they met, that they might court them, and call them by their names: which among that people was the higheſt piece of civility.

NOMENCLATOR *of the Romiſh Church*, was an officer, whoſe buſineſs it was to call the perſons whom the pope invited to dinner.

He alſo liſtened to thoſe who were admitted to audience, in the ſame manner as thoſe now retained by the cardinals, called *auditors*.

NOMENCLATORES, among the *Botanical Authors*, are thoſe who have employed their labours about ſettling and adjuſting the right names, ſynonyms, and etymologies of names, in regard to the whole vegetable world.

NOMENCLATURE, NOMENCLATURA, a catalogue of ſeveral of the more uſual words in any language, with their ſignifications; compiled in order to facilitate the uſe and retaining of ſuch words to thoſe who are to learn the tongue.

We have Latin, Greek, French, &c. nomenclatures.

NOMENCLATURE, in *Botany*, which in its origin muſt have been entirely caſual, and which, long after the ſcience had made great progreſs, received no particular cultivation, was firſt reduced to fixed principles by Linnæus. He had this ſubject ſo much at heart, that he not only devoted to it 115 aphoriſms, out of the 365 which compoſe his *Fundamenta Botanica*; and commented upon them, in common with the reſt, in his *Philoſophia*; but he publiſhed a much more ample elucidation of them, in an octavo volume, entitled *Critica Botanica*. This work, being very rare in England, has not here received the attention it deſerves. Its object was, in the firſt place, to promote uniformity and ſimplicity in the nomenclature already eſtabliſhed; and in the next to provide judicious regulations, for the contrivance and application of names for new diſcoveries. The author juſtly celebrates the uſeful labours of Caſpar Bauhin, whoſe *Pinax* is a complete, if not a perfectly correct, ſyſtem of nomenclature and ſynonyms, up to the time in which it was written. He goes on to lament thoſe diſſentions which took place under the Triumvirate, as he happily calls it, of Ray, Tournefort and Rivinus, when each of thoſe great men, the leader of a ſect and author of a ſyſtem, adopted or contrived names at pleaſure, without the ſmalleſt mutual conſent or conſideration. Victory indeed remained with Tournefort, in conſequence of his ſucceſsful labours in eſtabliſhing the genera of plants, and no laurels were ever more juſtly won. His merits in this department, gave ſome popularity even to his ſyſtem, with all its faults and inconveniences. His exertions made a ſtand, for a time, againſt the confuſion, which an inundation of new diſcoveries muſt otherwiſe have produced. Science had time to rally her forces under his banners, till they could be marſhalled with more preciſion, ſo as to be augmented from time to time, without endangering the ſafety of the republic, by producing anarchy inſtead of ſtrength.

Generic names being tolerably well fixed by Tournefort, Linnæus had little to do in that department, except to introduce a few improvements and corrections, which he thought requiſite. The great principle was eſtabliſhed, that each genus ſhould be characteriſed by the parts of fructification, and diſtinguiſhed by an appropriate and fixed name. The old names, whoſe origin or meaning was loſt in the darkneſs of antiquity, were applied with as much preciſion as they could. Nobody diſputed about what ſhould be called *Quercus* or *Roſa*, nor were the faſtidious doubts of critics permitted to embroil *Vaccinium* and *Liguſtrum*, nor to hinder the progreſs of what they could not always advance. The ancient practice of dedicating certain plants to the honour of promoters of the ſcience, was confirmed and imitated. New appellations were neceſſarily contrived for new genera, in which regard was had, as much as poſſible, to their characters, uſes, or reſemblances; and Tournefort ſeldom omitted to explain the names he invented, or thoſe he adopted. Linnæus, in following his ſteps, introduced ſome reformations, chiefly as to the rejection of compound or comparative names, or of new names of barbarous origin. It is to be regretted, that he and his pupils in general, have uſually omitted to explain the meaning of the names they gave, in which there are often very fanciful and obſcure alluſions, not without frequent inaccuracies of conſtruction; ſo that we are ſometimes loſt in conjecture, in attempting to unravel the myſtery. The reader of the preſent work will find many inſtances of this in our botanical articles. He will alſo perceive, that though Linnæus might lay down excellent rules, he not unfrequently broke through them, ſometimes perhaps from negligence, ſometimes for the ſake of peace. This great man was not unfrequently thwarted, in the department of nomenclature more eſpecially, by perſons who thought they acquired a ſort of conſequence by differing from him, and who found it eaſier to do ſo by inventing new names, than by improving upon his characters or deſcriptions, or by adding any thing to his information.

The ſpecific names of plants were not ſo ſpeedily eſtabliſhed as the generic ones. Tournefort muſt yield the palm in this reſpect to Rivinus. The latter firſt attempted that brevity and uniformity in the nomenclature of ſpecies, which Linnæus afterwards adopted. Tournefort, as well as Ray, ſpoke of the ſpecies of plants, either in the phraſes of old botaniſts, or in ſimilar ones of their own contrivance, into which the utmoſt laxity of ideas was admitted. Hearſay appellations, random compariſons, or the native country of the plants, as frequently enter into ſuch phraſes, as their diſcriminative marks; nor are the latter, when they occur, choſen with an invariable regard to what is found or permanent. The length of theſe phraſes renders them in general impoſſible to be remembered, and the want of uniformity in their plan greatly impedes their utility. Aware of all theſe defects, Linnæus contrived, what he at firſt called ſpecific names, but which are in fact ſpecific characters. His intention was, that theſe ſhould ſupplant the above phraſes; with which view he made them as conciſe as poſſible, limiting them to twelve words, at the furtheſt, and moſt frequently compriſing each of them within a much ſmaller compaſs. Theſe definitions however were found impracticable, for the uſe of even the moſt learned and aſſiduous botaniſts, as names; though their perfection is the very *acme*, and, as experience proves, the moſt difficult part of botany, as far as regards the knowledge of plants. Something was ſtill wanting to enable botaniſts to converſe with facility, as well as to regiſter their own acquirements. Haller contrived to number all the ſpecies of his Helvetic Flora in a regular ſeries, and it is wonderful with what preciſion his pupils often recollect the appropriate number of each of his plants. This method however precludes the introduction of any new diſcoveries, and is liable to abundance of objections beſides. It is commodious to number the ſpecies of each particular genus by itſelf, but no perſon would ever think of uſing ſuch numbers as names.

At length Linnæus happily adopted the plan of Rivinus, of calling every plant by a ſingle ſpecific as well as a generic name. Thus he combined the advantages of all preceding modes. His definitions were a vaſt improvement upon

upon thoſe of his predeceſſors, and his ſpecific names, aſſociated therewith, made them current coin. Rivinus deſigned his names for ſpecific diſtinctions, for which their neceſſary brevity renders them totally inadequate. If they convey additional information, reſpecting circumſtances not ſo properly admiſſible into the ſcientific character, we cannot but eſteem them ſo much the better. It ſeems a ſtrange doctrine, which ſome writers have advanced, that names are the better for ſignifying nothing. Linnæus however was ſo much afraid of theſe ſpecific names ſupplanting the ſpecific definitions, or eſſential differences, that he cautiouſly denominated them trivial names, as deſigned merely for common uſe or convenience. Hence he frequently chooſes them from ſome obvious character, which may ſtrike a common obſerver ſooner than more important marks; and he has continual recourſe to the medical or economical appellations, or uſes, of plants for his ſpecific names. By this means the arts and ſciences go hand in hand. In other inſtances he promotes a knowledge of the hiſtory of botany, and aſſociates the ancient writers with the modern, by retaining ſome celebrated ſynonym, or ſome alluſive word, for the name of a long-known ſpecies. Whether we allow Rivinus or Linnæus the merit of inventing theſe ſhort ſpecific names, there can be no doubt that their adoption has contributed, more than any other circumſtance, to the popularity, and practical facility, of the Linnæan ſyſtem. This is univerſally felt and acknowledged. Their application to Zoology has been equally beneficial, and ſome of the contrivances of the great Swediſh naturaliſt in the nomenclature of animals, particularly inſects, are amongſt the happieſt efforts of his genius. His friend and fellow-labourer in this particular department of natural hiſtory, the great Bergmann, ſeized the fortunate idea for his own uſe in chemiſtry, and contrived to expreſs in two words the eſſential characters, or chemical combinations, of the productions with which that ſcience is converſant. How wiſe and advantageous this invention has been, the moſt ſuperficial admirer, as well as the deepeſt philoſopher, is every moment conſcious.

In ſpeaking of botanical nomenclature, we ought not to omit mention of the moſt ſingular attempt of the kind, by Dr. de Wolf of Dantzic, who publiſhed, in 1776, an octavo volume, entitled *Genera Plantarum vocabulis characteriſticis definita*. His plan is, to adapt ſome particular letter to each character, ſo that the generic name of a plant ſhall be an aſſemblage of the letters that expreſs all its technical characters. The firſt ſyllable is to compriſe what regards the fruit; the following one or more the integuments of the flower. A conſonant before a vowel expreſſes ſubſtance, or figure, and ſituation; a vowel number and diviſion. Such names however are barely poſſible to be pronounced, and impoſſible to be remembered. We ſhall give one of his examples. B ſtands for a berry, æ for ſeveral ſeeds in two cells. A five-cleft ſtellated corolla is expreſſed by *l i*; a conical five-cleft calyx by *v i*. Hence is formed the word *Bælivi*, for *Solanum*. A ſtands for one piſtil; *a* for one ſtamen; *i* for five diſtinct ſtamens; ſo that *Aî* prefixed to *Bælivi*, expreſſes the order and claſs of the genus in queſtion. The names of genera nearly allied are, of courſe, the moſt ſimilar, but for that very reaſon the moſt hard to diſtinguiſh or remember. Thus Wŷfom is *Polianthes*, Wŷfor *Crinum*, Wŷfær *Pontedera*, Wŷpo *Hyacinthus*, Wŷhop *Cyanella*, &c. Wîvîi is *Dictamnus*, Wîiwi *Rhodora*, Wîvîra *Ledum*, Wîpîi *Pyrola*, Wîiîwi *Ruta* with a five-cleft flower, Wîlwîi *Swietenia*, Wîwîpi *Zygophyllum* with a five-cleft flower, Wrîwîi *Tribulus*, Wîiwi or Wôôwo, according as the flowers are five or ſix-cleft, *Cluſia*. Wâwââ is *Sempervivum*, Wâmîwi *Iſopyrum*, Wâmâwâ *Trollius*, and Wâwîwi *Dillenia*. By theſe examples it will be perceived, that the author follows the artificial ſyſtem of arrangement, and that his names defy even the accentual powers of a Porſon. We cannot however deny him the praiſe of ingenuity and application. Let all who devote thoſe qualities to the purſuit of originality, at the expence of every other conſideration, come and lay their laurels at his feet. S.

NOMENCLATURE, is a term employed to denote the language peculiar to any particular ſcience, or art.

It is to the modern nomenclature of *Chemiſtry*, ſo admirable both for its ingenuity and comprehenſiveneſs, that the rapid progreſs which has been made in this department of philoſophy, during the laſt five and twenty years, is, in a great meaſure, to be aſcribed. Nor need we be ſurpriſed at this, for, "as ideas are preſerved, and communicated by means of words, it neceſſarily follows, that we cannot improve the language of any ſcience, without at the ſame time improving the ſcience itſelf; neither can we, on the other hand, improve a ſcience, without improving the language, or nomenclature, which belongs to it. However certain the facts of any ſcience may be, and however juſt the ideas we may have formed of theſe facts, we can only communicate falſe or imperfect impreſſions of theſe ideas to others, while we want words by which they may be properly expreſſed." Such is the remark of the celebrated Lavoiſier, and in all the circumſtances attendant on the reform in the ſcience and language of chemiſtry, his reaſoning is moſt fully verified. The grand outline of the modern nomenclature was ſketched and delivered to the world by Fourcroy, Morveau, Berthollet, and himſelf. This took place in the year 1787, and the changes which have ſince been made have all been of that trifling nature, as to leave the baſis of the ſyſtem, founded by theſe philoſophers, entire and undiſturbed. Their firſt ſtep was to give to each of the ſubſtances ſuppoſed to be uncompounded, or elementary, ſimple and appropriate names. In moſt inſtances they adopted thoſe that had been long in uſe, it having been made a law by them, "ſcrupulouſly to preſerve the ancient names in all caſes wherein the ſubject, denominated and long known, preſented in its ancient denomination no one of the vices which they were deſirous of avoiding." But the diſcovery of the conſtituent parts of water, and of the atmoſphere, rendered the adoption of certain new titles neceſſary, and in conſtructing theſe, they were guided by ſome prominent peculiarity preſented by each of the elementary bodies. The two ingredients, for example, of which water is compoſed, received the appellations of *oxygen* and *hydrogen*; in conſequence of the former poſſeſſing the excluſive power of imparting *acidity* to certain of its combinations, and from the latter being the "generative principle" of *water*. The roots in thoſe caſes from which the derivation is effected, were the Greek words ὀξυς, *acidum*, and ὑδωρ, *aqua*, the verb γεινομαι, *gignor*, being added to each. In all the additions which have been ſubſequently made to the elementary catalogue, the principle thus laid down has, either in letter or ſpirit, been uniformly acknowledged. It was not in every inſtance that the characteriſtic properties of the ſubſtance were ſufficiently ſtriking to enable the diſcoverer to derive the propoſed name from theſe; but in defect of ſuch aid, either the place where the compound affording the new body was found, has ſuggeſted the term, or ſome other circumſtance equally connected with its hiſtory. All names hereafter to be offered, which are perfectly arbitrary, ſhould be rejected; for as the leading diſtinction between the nomenclature of

the old and modern ſchool conſiſts in the latter conveying with the name a knowledge of the conſtitution of the compound deſignated, while the former was totally regardleſs of ſuch aſſiſtance, even the elementary bodies ſhould not receive their titles without ſome attention to the information which may be thus communicated. That much may be accompliſhed by a regard to this circumſtance, is evident from the names attached to the newly diſcovered baſes of the earths and alkalies; for who, at all acquainted with the principles upon which modern chemical language is conſtructed, could fail to recogniſe in the terms *barium* and *ſtrontium*, the baſes of *barytes* and *ſtrontian*, and in thoſe of *potaſſium* and *ſodium*, the baſes of the two fixed alkalies? The ſame may be ſaid of all the elementary bodies, which the brilliant diſcoveries of ſir Humphrey Davy, and his followers have, within theſe few years, introduced to us; and we cannot too highly applaud this diſtinguiſhed chemiſt for the earneſt regard he has ſhewn for ſo important an object, in every inſtance when the nomenclature has been extended by him. There is no circumſtance affecting the uniformity of a ſcientific language ſo apparently trifling as to deſerve to be diſregarded; and it is for this reaſon that the terminations, even of the names of the ſimple bodies, ſhould, as well as their derivation, be regulated by ſome eſtabliſhed rule. For the metals, the termination *um* has been choſen, and as there is nothing in the ſound offenſive to the genius of our language, it may very properly be adopted; eſpecially ſince the Latin names of all the older ones have this ending, from their belonging to a particular variety of nouns, of which that final ſyllable is characteriſtic. To extend this termination, however, to others of the ſimple bodies, ſeems, in ſome degree, objectionable; and inſtead of *murium* and *fluorium*, therefore, which have been choſen to repreſent the baſes of the *muriatic* and *fluoric* acids, we would recommend ſuch words as *muriogen* and *fluogen*, which are derivatives perfectly conſiſtent with the modern ſyſtem, and equally expreſſive of the character of their objects with the terms before mentioned. By perſiſting in this method, the mere ending of the word would immediately apprize us to what claſs of bodies any newly diſcovered ſubſtance might belong, or at all events, whether or not it was metallic; and this is entirely an advantage of ſufficient importance to deſerve attention. In naming the various *compounds* of chemiſtry, the projectors of the new nomenclature have invented a ſyſtem, not liable, like the elementary ſubſtances, to the caprice of a diſcoverer, but definite and invariable in its principles; and while it is capable of admitting any number of compounds that may be added, conveys immediately to the mind a knowledge of the conſtitution of the ſubſtance which it is employed to repreſent, without that effort of memory neceſſary for the interpretation of the language of the older chemiſts. The ſimpleſt form of combination is the union of the inflammable elements with each other. When theſe elements are metals, the combinations are termed *alloys*, except in thoſe caſes where mercury is employed, and the reſulting compound then is denominated an *amalgam*. For the other combinations of this claſs, where *one* of the bodies only is a metal, or has a metallic baſe, a different form of expreſſion is provided, the termination *uret* being given to the ſubſtance with which the metallic baſe is united. The combinations of ſulphur, for inſtance, are denominated *ſulphurets*; of phoſphorus, *phoſphurets*; of carbon, *carburets*; and of hydrogen, *hydrurets*. The union of ſulphur with iron, being a *ſulphuret of iron*, and, in like manner, of the reſt. The rule in this, and all other inſtances, is, that whichever of the ingredients is called the *baſe*, the name of that remains unchanged; and it is to this circumſtance that an apparent anomaly in the caſe of hydrogen, which is occaſionally found in both conditions, is to be aſcribed. Sulphur, phoſphorus, and carbon, never preſent themſelves in any mixture with the other ſimple inflammables, ſo that they do not impart to the reſulting compound the name either of a *ſulphuret*, a *phoſphuret*, or a *carburet*. They never act as *baſes* in this claſs of combinations. But otherwiſe is the caſe with hydrogen, which, in many inſtances, aſſumes the part of baſe, and, with each of the three inflammable elements laſt mentioned, forms aëriform compounds, ſtyled, agreeably to the above law, *ſulphuret of hydrogen*, *phoſphuret of hydrogen*, and *carburet of hydrogen*; but more commonly, though leſs properly, diſtinguiſhed by the titles of *ſulphuretted*, *phoſphuretted*, and *carburetted* hydrogen. Every compound which exiſts in a permanently aëriform ſtate, at all known temperatures, is called a *gas*: the ſubſtances juſt ſpoken of, therefore, are *gaſes*; and the adjectives *gaſeous* and *gaſiform* are alſo employed as expreſſive of the ſame ſtate. The next form of combination, of which it will be neceſſary to ſpeak, is the union of the inflammable elements with oxygen. This latter body, though not combuſtible itſelf, is the only *ſupporter of combuſtion* with which we are acquainted, and occupies a place, as the ſole member of a claſs having that title. An additional element has recently been held out as poſſeſſing theſe properties; but the ſubject has occaſioned much controverſy, and the weight of evidence ſeems at preſent to preponderate againſt the innovation inſiſted upon. For farther information on this point, the reader is referred to the articles MURIATIC and OXY-MURIATIC *Acids*. The name of the compound, into which oxygen enters as an ingredient, varies according to the nature of the properties exhibited by the product. When the product is an acid, it then receives a title determined by the acidified ſubſtance; but in every other caſe, the compound is merely termed an *oxyd*. In the union of oxygen with lead, for example, the reſult not being an acid, the ſubſtance obtained is called an *oxyd of lead*; and as different *doſes*, or quantities, of oxygen may unite with the ſame element, theſe are diſtinguiſhed either by the terms *firſt oxyd*, *ſecond oxyd*, and ſo on; or by prefixing derivatives from the Greek, as *proto*xyd, *deut*oxyd, from πρῶτος, *primus*, and δεύτερος, *ſecundus*; and in the ſame manner with the reſt. The combination of oxygen with elements capable of being acidified produces acids, which alſo receive a diſtinction according to the doſe of oxygen they contain. The firſt doſe of oxygen which unites with ſulphur gives exiſtence to a compound, not poſſeſſing acid properties. This, therefore, is merely an *oxyd of ſulphur*. The ſecond doſe, however, produces an acid; and the addition of a third quantity, another acid ſtill more powerful. According to the modern nomenclature, theſe are ſtyled the *ſulphurous* and *ſulphuric* acids; the terminations *ous* and *ic* being uſed to expreſs the lower and higher ſtates of acidification. In all the preceding caſes, the inflammable element is called the *baſe*; and the words *oxydate*, *oxydation*, *oxygenate*, *oxygenation*, *oxydize*, and *oxydizement*, are employed as different powers of the word *oxyd*, according to the grammatical value which it may be wiſhed to impart to it. The next change in the nomenclature ariſes from the combinations of the acids. Theſe never unite with the inflammable elements ſimply, nor until theſe elements have been previouſly combined with oxygen. Their products are then called *ſalts*; and the inflammable ſubſtance is termed their *baſe*. If the acid in combination with the baſe be in the lower ſtate of acidification, as the ſulphur*ous*, for example, the termination *ite*, or *it*, forms the characteriſtic of the claſs, added to the firſt ſyllable of the acid. Thus,

the

the union of ſulphur*ous* acid with potaſh is a ſulph*ite* of potaſh; of nitr*ous* acid with the ſame baſe, a nitr*ite*; and of phoſphor*ous* acid, a phoſph*ite*. When the acid is at the *maximum* of acidification, the termination *at* is choſen, as ſulph*at*, nitr*at*, phoſph*at*. Since ſalts, however, may be compoſed of different proportions of the ſame acid and baſe, to point out this, a farther proviſion is required; and the atomic ſyſtem, concerning which much will be found under the various chemical articles of this work, furniſhes the moſt correct means of ſupplying the deficiency. According to the principles of this doctrine, bodies can unite only in certain definite proportions, determinable by the number of *atoms*, or *particles*, which combine to form the particular compound. In the caſe of ſalts, the uniting atoms are already *compounded*, being made up of the elementary atoms which compoſe the acid and baſe. This, however, makes no difference in the law. The ſimpleſt and moſt regular form of combination is when they unite one to one. All thoſe ſalts, therefore, which are conſtituted in this proportion, will receive the name before aſſigned, without any additional diſtinction. Thus, when an atom of lime unites with an atom of ſulphuric acid, the product is a ſulphat of lime; but if two atoms of baſe be attached to one of acid, it is then propoſed that the word *ſub* ſhould be prefixed; and if two atoms of acid to one of baſe, the word *ſuper*. This will not only immediately convey to the mind the condition of the ſalt, but, with the additional information which the atomic doctrine affords, at the ſame time appriſe us of the exact quantity of acid and baſe of which a given weight of the ſalt is compoſed. The terms *ſub* and *ſuper* have long been in uſe, to denote an exceſs or deficiency of baſe; but have never been employed with that ſyſtem, or regularity, ſo indiſpenſible to the efficiency of a ſcientific language. In many caſes, therefore, the application of them, as here recommended, it may be expected, will be at variance with former practice; and of this, the name uſually attached to the *ſalt of tartar* of the ſhops, ſuggeſts itſelf as an immediate proof. This ſubſtance has long been known under the title of *ſub-carbonat of potaſh*, either from the ſuppoſition that it contained an exceſs of baſe, or to diſtinguiſh it from a cryſtallized combination of the ſame ſort, which, from the circumſtance of its *being cryſtallized*, was conceived to be the more perfect form of the ſalt. Whichever might have been the reaſon, ſince the atom of this compound is evidently conſtituted of one atom of carbonic acid, and one of potaſh, it will, in conformity with the above rule, be denominated a *carbonat of potaſh*; the cryſtallized variety being a *ſuper-carbonat*. Other inſtances might be ſelected, but as a ſlight acquaintance with the principles of the atomic philoſophy will be ſufficient for their detection, it will be unneceſſary to extend the ſubject here. In the formation of ſalts, when an acid has taken up as much of any particular baſe as it can diſſolve, it is ſaid to be *ſaturated*; and the ſolution containing it is called a *ſaturated ſolution*. The word *neutral* is alſo uſed to expreſs the ſame ſtate; and all ſalts, the acid and baſe of which have loſt thoſe properties which diſtinguiſhed them when uncombined, are termed *neutral ſalts*. If the acid ſhould be in exceſs, and impart a ſour taſte to the product, the compound is uſually ſaid to be *acidulous*.

Reſpecting the orthography of chemical language, there is conſiderable difference of opinion. By ſome authors, the words are written according to the preciſe ſpelling introduced by the French inventors. This, however, is offenſive to the idiom of our tongue, and frequently inconſiſtent with the acknowledged rules for regulating ſuch caſes, in words ſimilarly derived. The moſt common inſtances of the practice here complained of are the addition of a final *e* to the leading names of ſalts, as *ſulphate*, *phoſphate*, &c.; and the ſubſtitution of *i* for *y*, in the words *oxygen*, *hydrogen*, *oxyd*, &c. Concerning the firſt of theſe, it may be ſufficient to ſay, that however conſonant it may be with the general conſtruction of the *French* language to add an *e* in caſes like the preceding, the ſpirit of *our own* directly forbids ſuch a form of word. The pronunciation alone is ſufficient to ſhew this; and nothing but the moſt ſervile copying of the original nomenclature could have introduced the practice amongſt us. Reſpecting the latter, the common rule, in derivations, of rendering the Greek *υ* into Engliſh by *y*, juſtifies the objection here made. Eſtabliſhed methods of this ſort ought never to be deviated from, except for very ample reaſons; and in the inſtance now under remark, caprice alone can have dictated the alteration.

NOMENTUM, *La Mentana*, in *Ancient Geography*, a town of Italy, in Latium. Pliny and Virgil have mentioned this town, which gave name to a Roman way, which paſſed by it from Rome, and joined the Salar way at Eratum. The ruins of this town occupy a conſiderable extent.

NOMENY, in *Geography*, a town of France, in the department of the Meurthe, and chief place of a canton, in the diſtrict of Nancy; 6 miles E. of Pont à Mouſſon. The place contains 1331, and the canton 15,833 inhabitants, on a territory of 285 kiliometres, in 45 communes.

NOMI, a town of Japan, in the iſland of Niphon; 16 miles S.E. of Kanazava.

NOMII, in *Ancient Geography*, a mountain of Arcadia, on which was a temple conſecrated to the god Pan, the Nomian, according to Pauſanias, l. viii. c. 38.

NOMINA VILLARUM an account of the names of all the villages, and the poſſeſſors thereof, in each county, drawn up by ſeveral ſheriffs, at the inſtance of king Edward II., and returned by them into the exchequer; where it is ſtill preſerved.

NOMINAL CHARACTERS. See CHARACTER.

NOMINALS, or NOMINALISTS, a ſect of ſchool-philoſophers, the diſciples and followers of Occam, or Ocham, an Engliſh Cordelier, in the 14th century.

The Nominaliſts were great dealers in words; whence they were vulgarly denominated *word-ſellers*.

They had the denomination Nominaliſts, becauſe, in oppoſition to the Realiſts, they maintained, that words, not things, were the object of dialectics.

This ſect had its firſt riſe towards the end of the 11th century, and pretended to follow Porphyry and Ariſtotle; but it was not till Occam's time that they bore the name. The chief of this ſect, in the 11th century, was a perſon called John, who, on account of his logical ſubtilty, was called the Sophiſt, and his principal diſciples were Robert of Paris, Roſceline of Compeigne, and Arnoul of Laon.

Porphyry, in his introduction to the Ariſtotelian logic, ſays, "Concerning genera and ſpecies, whether they have a real eſſence, or are barely conceptions of the mind, and if they ſubſiſt, whether corporeally or incorporeally, whether ſpiritually or only in the objects of ſenſe, I give no opinion, becauſe the ſubject is abſtruſe, and requires a larger diſcuſſion." This point, which Porphyry left undetermined, was reſumed in the ſchools, and the opinion of Ariſtotle, that univerſals ſubſiſt not prior to individual bodies, nor after them, but within them, and are the forms eternally united to matter, which make bodies to be ſuch as they are, univerſally prevailed, till, in the 11th century, Roſceline adopted the Stoic opinion, that univerſals have no real exiſtence either before or in individuals, but are mere names

or words by which the kinds of individuals are expreſſed; a tenet which was afterwards propagated by Abelard, and produced the ſect of the Nominaliſts. This new opinion gave great offence to the philoſophers and divines of the 11th century, perhaps chiefly becauſe Roſceline, by applying it to the doctrine of the Trinity, brought upon himſelf a ſuſpicion of hereſy. Many young perſons, however, ſtrenuouſly adhered to the ſide of the Nominaliſts; and the ſect, through the ingenuity and ability of Abelard and others, obtained many followers. Some of theſe, to avoid cenſure, changed their ground ſo far as to maintain, that univerſals conſiſt in notions and conceptions of the mind, formed by abſtraction; whence they were called *Conceptualiſts*. (See that article.) The Realiſts, too, were of different opinions, ſome leaning towards the doctrine of Plato, and others towards that of Ariſtotle. In the 12th century, the controverſy ſtill continued.

At the beginning the Nominals had the upper hand: but the Realiſts, though greatly divided among themſelves, were ſupported by men of great abilities; ſuch as Albertus Magnus, T. Aquinas, and Duns Scotus. The Nominal ſect became hereby into diſrepute; till William Occam, in the fourteenth century, again revived it, and filled France and Germany with the flame of diſputation. This ſect, enjoying the countenance and favour of Louis XI., almoſt univerſally flouriſhed in Germany. Having joined the party of the Franciſcan monks, who ſtrenuouſly oppoſed John XXIII. that pope himſelf, and his ſucceſſors after him, left no means untried to extirpate the philoſophy of the Nominaliſts, which was deemed highly prejudicial to the intereſts of the church: and hence it was, that in the year 1339, the univerſity of Paris, by a public edict, ſolemnly condemned and prohibited the philoſophy of Occam, which was that of the Nominaliſts. The conſequence was, that the Nominaliſts flouriſhed more than ever. In the fifteenth century, the controverſy was continued with more vigour and animoſity than ever; and the diſputants were not content with uſing merely the force of eloquence, but had frequently recourſe to more hoſtile and dangerous weapons; and battles were the conſequence of a philoſophical queſtion, which neither ſide underſtood. In moſt places, however, the Realiſts maintained a manifeſt ſuperiority over the Nominaliſts. While the famous Gerſon, and the moſt eminent of his diſciples were living, the Nominaliſts were in high eſteem and credit in the univerſity of Paris. But upon the death of theſe patrons, the face of things was much changed to their diſadvantage. In the year 1474, Lewis XI. by the inſtigation of his confeſſor, the biſhop of Avranches, iſſued out a ſevere edict againſt the doctrines of the Nominaliſts, and ordered all their writings to be ſeized and ſecured, that they might not be read by the people, requiring the academic youth to renounce their doctrines: upon this, the leaders of the ſect fled into Germany and England, whence, at the beginning of the Reformation, they met with a ſtrong reinforcement, in Luther, Melancthon, and others. However, the ſame monarch mitigated this edict the year following, and permitted ſome of the books of that ſect to be delivered from their confinement. In the year 1481, he not only granted a full liberty to the Nominaliſts and their writings, but alſo reſtored that philoſophical ſect to its former authority and luſtre in the univerſity. Moſheim, vol. iii. 8vo. Brucker's Phil. by Enfield, vol. ii.

The Nominaliſts were the founders of the univerſity of Leipſic: there are many yet abroad who pique themſelves on being Nominals.

The Nominals, with the Stoics, admit the formal conceptions or ideas of things, as the ſubject and foundation of univerſality; but to this they add names, which repreſent and ſignify, after the ſame univocal manner, and without any diſtinction, a great variety of ſingle things alike in genus and ſpecies.

Whence it is that they are called Nominals; as pretending, that to become learned, it is not enough to have juſt ideas of things, but it is likewiſe required to know the proper names of the genera and ſpecies of things, and to be able to expreſs them clearly and preciſely, without confuſion or ambiguity. See REALISTS.

NOMINATION, the act of naming and appointing a perſon for ſome function, employ, or benefice.

The word is chiefly uſed for the right of preſenting to a benefice, &c.

In common law, however, there is a difference between *nomination* and *preſentation*; the former being properly a power which a man has, by virtue of a manor, or otherwiſe, to appoint or name a clerk to a patron of a benefice, to be by him preſented to the ordinary. See PRESENTATION.

NOMINATIVE, in *Grammar*, the firſt caſe of nouns which are declineable.

The ſimple poſition, or laying down of a noun, or name, is called the *nominative caſe*: yet it is not ſo properly a caſe, as the matter or ground whence the other caſes are to be formed, by the ſeveral changes and inflections given to this firſt termination. See CASE.

Its chief uſe is to be placed in diſcourſe before all verbs, as the ſubject of the propoſition, or affirmation; as *Dominus regit me, the Lord governs me; Deus exaudit me, God hears me.*

NOMINATOR, he who names or preſents a perſon to an office, or benefice.

Hence *nominee*, the perſon named or preſented.

Errard obſerves, that there are ſome cuſtoms where the nominator is reſponſible for the ſolvibility of the nominee.

NOMINE PŒNÆ, in *Law*, is a penalty incurred for not paying rent, &c. at the day appointed by the leaſe or agreement, for the payment thereof.

NOMINIS IDENTITATE. See IDENTITATE.

NOMION, in *Muſic*, a kind of love-ſong with the Greeks.

NOMIQUE, NOMICAL *Mode*, or that kind of ſtyle in muſic which was ſacred to Apollo, god of verſe and ſong, in which every effort was tried to render it brilliant, and worthy of the divinity to whom it was conſecrated. See MODE, MELOPŒIA, and STYLE.

NOMISNY BAY, in *Geography*, a bay on the river Potomack, on the coaſt of Virginia. N. lat. 38° 11′. W. long. 76° 50′.

NOMOCANON, compounded of νομος, *law*, and κανων, *canon*, or *rule*, a collection of canons, and of imperial laws relative or conformable thereto. See CANON.

The firſt nomocanon was made by Johannes Scholaſticus, in 554. Photius, patriarch of Conſtantinople in 883, compiled another nomocanon, or collation of the civil laws with the canons: this is the moſt celebrated. Balſamon wrote a commentary on it in 1180.

NOMOCANON alſo denotes a collection of the ancient canons of the apoſtles, councils, and fathers; without any regard to imperial conſtitutions.

Such is the nomocanon publiſhed by M. Cotelier.

NOMOCANON is ſometimes alſo uſed for a *penitential* book of the Greeks.

NOMOPHYLACES, Νομοφυλακες, among the Athenians, magiſtrates who were to ſee the laws executed, being not unlike to our ſheriffs. They had the execution of criminals

minals committed to their care, as alſo the charge of ſuch as were confined priſoners. They had alſo power to ſeize thieves, kidnappers, and highwaymen, upon ſuſpicion; and, if they confeſſed the fact, to put them to death: if not, they were obliged to proſecute them in a judicial way.

NOMOPHYLACES were likewiſe officers belonging to the Olympic games, whoſe buſineſs it was to inſtruct thoſe who were to contend in all the laws of the games. See HELLENODICÆ.

NOMOTHETÆ, Νομοθέται, among the Athenians, were a thouſand in number, and choſen by lot out of ſuch as had been judges in the court Heliæa. Their office was not (as their name ſeems to imply) to enact new laws by their own authority, for that could not be done without the approbation of the ſenate, and the people's ratification; but to inſpect the old, and, if they found any of them uſeleſs, or prejudicial, as the ſtate of affairs then ſtood, or contradictory to others, they cauſed them to be abrogated by an act of the people. Beſides this, they were to take care that no man ſhould plough, or dig deep ditches within the Pelaſgian wall; to apprehend the offenders, and ſend them to the archon.

NO NEARER, in *Sea Language*, is the command given by the pilot or quarter-maſter to the helmſman, to ſteer the ſhip *no nearer* to the direction of the wind than the ſails will operate to advance the ſhip in her courſe.

NON, or NUN, in *Geography*, a city of Africa, in the province of Vled de Non, belonging to the empire of Morocco, two days' journey from the ſea-coaſt, and oppoſite to the cape of the ſame name.

NON, or *Nun, Cape*, a cape of the ſame province, diſcovered by the Portugueſe in the beginning of the fifteenth century, and ſo named by them, becauſe thoſe who doubled it firſt never returned. N. lat. 28° 38'. W. long. 11° 5'.

NON, *Vled de*. See VLED *de Non*.

NONA, ŒNONA, a mean ſea-port town and biſhop's ſee of Dalmatia, ſituated on a ſmall iſland, ſurrounded by a harbour formerly capable of receiving large ſhips, but now a fœtid pool, at the mouth of a ſmall muddy river. No veſtige remains of the grandeur of the Roman times, nor any traces of its barbarous magnificence, when it was the reſidence of the kings of the Croat Slavi; 28 miles N.W. of Scardona. N. lat. 44° 28'. E. long. 15° 35'.

NON-ABILITY, in *Law*, an exception taken againſt the plaintiff in a cauſe, on ſome juſt ground why he cannot commence a ſuit in law; as præmunire, outlawry, being profeſſed in religion, excommunicate, or a ſtranger-born. This laſt holds only on actions real, and mixed: and not in perſonal, except he be both a ſtranger and an enemy. The civilians ſay, that ſuch a man hath not *perſonam ſtandi in judicio*. See DISABILITY.

NON-ADMITTAS. See NE *Admittas*.

NONÆ *and Decimæ*, were payments anciently made to the church by thoſe who were tenants of church-farms.

The *nonæ* were a rent or duty claimed for things belonging to huſbandry; the *decimæ* were claimed in right of the church.

NONAGE, in *Law*, an incapacity of doing certain things from want of age.

The term of *nonage* is different, with regard to different things. In matters of inheritance, a man is in his nonage till twenty-one years; for marriage only to fourteen, &c. See AGE and MINOR.

NONAGE, *Nonagium*, alſo denotes the ninth part of a man's moveable goods, anciently paid in the nature of a mortuary; being claimed by the clergy upon the death of thoſe of their pariſh.

At firſt this was a third part of the goods, and was called *tertiagium*; till by a bull of Clement VI. it was reduced to a ninth.

NONAGESIMAL, in *Aſtronomy*, the ninetieth degree of the ecliptic, reckoned from its eaſtern term, or point.

The altitude of the nonageſimal is equal to the angle of the eaſt; and, if continued, paſſes through the poles of the ecliptic: whence the altitude of the nonageſimal, at a given time, under a given elevation of the pole, is eaſily found.

If the altitude of the nonageſimal be ſubtracted from 90°, the remainder is the diſtance of the nonageſimal from the vertex.

NONAGON, a figure having nine angles and ſides.

NONAME, in *Geography*, a lake of North America, extending from N. lat. 60° about 50 miles N., and about 35 miles from E. to W., abounding with fine fiſh.

NONANCOURT, a town of France, in the department of the Eure, and chief place of a canton, in the diſtrict of Evreux; 7 miles W. of Dreux. The place contains 1145, and the canton 9019 inhabitants, on a territory of 172½ kiliometres, in 15 communes.

NONANT, a town of France, in the department of the Orne; 18 miles N. of Argentan.

NONANTOLA, a town of Italy, in the department of the Panaro; 10 miles N.E. of Modena.

NON-APPEARANCE, in *Law*, a default in not appearing in a court of judicature. See APPEARANCE.

NONASPE, in *Geography*, a town of Spain, in Aragon; 18 miles E. of Alcaniz.

NON-ASSUMPSIT, in *Law*, a plea in perſonal actions, whereby a man denies any promiſe made, &c. or that he made any ſuch promiſe within ſix years, which is an effectual bar to the complaint.

NONATELIA, in *Botany*, a genus of Aublet's, ſo called from the name given it by the natives of Guiana, *Nono ateli*. Aubl. Guian. v. 1. 182. t. 70—74. Juſſ. 205. Lam. Illuſt. t 155. (Oribaſia; Schreb. 123.)—This genus, which claims attention from the virtues attributed to an infuſion of the leaves of one of its ſpecies, in the aſthma, is referred by Schreber, p. 822, to PSYCHOTRIA. See that article.

NON-CLAIM, in *Law*, the omiſſion or neglect of him who challenges not his right within the time limited by law: as, within a year and a day, where continual claim ought to be made. See CLAIM.

By ſuch neglect he is either barred of his right; as upon non-claim within five years after a right accrued to him; or of his entry by deſcent, for want of a claim within five years after the diſſeiſin. An infant ſhall loſe nothing by non-claim, or neglect of demanding his right. See FINE.

NON COMPOS MENTIS, a phraſe denoting a perſon not to be of ſound memory or underſtanding.

Of this, in common law, there are ſaid to be four kinds. Firſt, an idiot born; ſecondly, he that by accident loſeth his memory and underſtanding; thirdly, a lunatic, that has *lucida intervalla*, ſometimes underſtanding, and ſometimes not; fourthly, he that by his own act, for a time, depriveth himſelf of his right ſenſes, as a drunkard. But this laſt kind ſhall give no privilege to him, or his heirs.

A deſcent takes away the entry of an idiot, though the want of underſtanding were perpetual. Under the general name of "non compos mentis," which ſir Edward Coke ſays (1 Inſt. 24.) is the moſt legal name, are compriſed not only lunatics, but perſons under frenzies; or who loſe their intellects by diſeaſe; thoſe that become deaf, dumb, and blind, not being born ſo; or ſuch, in ſhort, as are judged by the court

court of chancery incapable of conducting their own affairs. To theſe, as well as to idiots, the king is guardian; and the law, always imagining that theſe accidental misfortunes may be removed, only conſtitutes the crown a truſtee for theſe unfortunate perſons, to protect their property, and to account to them for all profits received, if they recover, or after their deceaſe, to their repreſentatives. (17 Edw. II. c. 10. See LUNATIC.) On the firſt attack of lunacy, or other occaſional inſanity, while there may be hopes of a ſpeedy reſtitution of reaſon, it is uſual to confine the unhappy objects in private cuſtody, under the direction of their neareſt friends and relations; and the legiſlature, to prevent all abuſes incident to ſuch private cuſtody, hath thought proper by ſtatute to interpoſe its authority for regulating private mad-houſes. (See MAD-HOUSE.) But when the diſorder is grown permanent, and the circumſtances of the party will bear ſuch additional expence, it is proper to apply to the royal authority to warrant a laſting confinement. The method of proving a perſon "non compos," is very ſimilar to that of proving him an idiot. The lord chancellor, to whom, by ſpecial authority from the king, the cuſtody of idiots and lunatics is entruſted (3 P. Wms. 108.), upon petition or information, grants a commiſſion in nature of the writ *de* IDIOTA *inquirendo*, to inquire into the party's ſtate of mind; and if he be found "non compos," he is treated in the manner already deſcribed under the article LUNATIC. Perſons that are "non compos," are incapable of making a will, as long as ſuch diſability laſts. In criminal caſes ſuch perſons are not chargeable for their own acts, if committed when under theſe incapacities; not even for treaſon itſelf. 3 Inſt. 6. See LUNATIC.

NON-CONFORMISTS is a general denomination comprehending all thoſe who do not conform to the eſtabliſhed worſhip of the church. Theſe are of two ſorts, *viz.* 1. Such as abſent themſelves from it through total irreligion, and attend the ſervice of no other perſuaſion: who by 1 Eliz cap. 2. 23 Eliz. cap. 1. and 3 Jac. I. c. 4. forfeit one ſhilling to the poor every Lord's day they ſo abſent themſelves, and 20*l.* to the king if they continue ſuch default for a month together: and if they keep any inmate thus irreligiouſly diſpoſed, in their houſes, they forfeit 10*l.* *per* month. And 2. Such as abſent themſelves from the worſhip of the eſtabliſhed church, under the plea of conſcience; and theſe are Proteſtant diſſenters, to whom the term is commonly applied, and Papiſts. See TOLERATION.

The word is ſaid to have had its riſe from a declaration of king Charles I., who appointed that all the churches of England and Scotland ſhould have the ſame ceremonies and diſcipline; the acquieſcence wherein, or diſſenting from which, determined *conformity* and *non-conformity*.

But this diſtinction primarily related to the rites of worſhip and eccleſiaſtical laws, enacted by Edward VI. Thoſe who complied with them were *Conformiſts*, and thoſe who objected *Non-conformiſts*. See PURITANS.

NONCOVERY, in *Geography*, one of the Nicobar iſlands, S.E. of Camorta, ſeparated from it by an arm of the ſea, which might be made an uſeful harbour. The iſland is of a triangular form, of no great extent, and covered with wood. The inhabitants are few, and the produce, timber and hogs excepted, of inconſiderable importance. The iſland abounds with lime-ſtone. N. lat. 8° 5′. E. long. 94° 2′.

NONDAL, a town of Sweden, in the province of Finland; 10 miles W N.W. of Abo.

NON DAMNIFICATUS, in *Law*, is a plea to an action of debt upon a bond, with condition to ſave the plaintiff harmleſs. (Abr. 224.) If the condition of a bond be to ſave harmleſs only, *non damnificatus* is generally a good plea; but if it be to diſcharge the plaintiff, &c. then the manner of the diſcharge is to be ſhewn.

NON DECIMANDO. See MODUS *Decimandi*.

NON DISTRINGENDO, a writ not to diſtrain, uſed in divers caſes.

NONDORF, in *Geography*, a town of Auſtria; 6 miles N.W. of Sonneberg.

NONE, a town of France, in the department of the Po, at the conflux of the rivers None and Riotorto; 7 miles S.S.W. of Turin.

NONE, or *Nones*, *Nonæ*, one of the ſeventh canonical hours, in the Romiſh church. See HOUR.

None, or the ninth hour, is the laſt of the leſſer hours, that is ſaid before veſpers; and anſwers to three o'clock in the afternoon.

This ſingle office, and that for the dead, ends at nones; which, father Roſweyd obſerves, was anciently the hour for the breaking up of the ſynaxis, or uſual meetings at church of the primitive Chriſtians.

The hour of none was alſo the uſual time for taking the repaſt on faſt-days; though ſome would keep the faſt till night.

NONES, *Nonæ*, in the *Roman Calendar*, the fifth day of the months January, February, April, June, Auguſt, September, November, and December; and the ſeventh of March, May, July, and October: theſe four laſt months having ſix days before the nones, and the others only four.

The word apparently has its riſe hence, that the day of the nones was nine days before the ides, and might be called *nono-idus*.

March, May, July, and October, had ſix days in their nones; becauſe theſe alone, in the ancient conſtitution of the year by Numa, had thirty-one days a-piece; the reſt have only twenty-nine, and February thirty. But when Cæſar reformed the year, and made other months contain thirty-one days, he did not likewiſe allot them ſix days of nones.

NON-ENTITY, whatever has no real being, or is only conceived negatively, or claims only a negative denomination. See ESSE, ESSENCE, &c.

NONE-SO-PRETTY, in *Botany*. See SAXIFRAGA.

NON-ESSENTIAL MODES See MODES.

NON EST CULPABILIS, NON *Cul.* q. d. *he is not guilty*, in *Law*, the general plea to an action of treſpaſs, whereby the defendant abſolutely denies the fact charged on him by the plaintiff: whereas, in other ſpecial pleas, the defendant grants the fact to be done, but alleges ſome reaſons in his defence, why he lawfully might do it.

As *non cul.* is the general anſwer in an action of treſpaſs, *i. e.* a criminal action civilly proſecuted; ſo is it in all actions criminally followed, either at the ſuit of the king, or others, wherein the defendant denies the crime objected to him.

NON EST FACTUM, is an anſwer to a declaration, whereby a man denieth that to be his bond or deed, whereupon he is impleaded.

NON EST INVENTUS, is the ſheriff's return to a writ, when the defendant is not to be found in his bailiwick. And there is a return that the plaintiff, *non invenit plegium*, on original writs Shep. Epit. 1129.

NONESUCH, in *Geography*, a river of America, in the province of Maine, which runs into the ſea, N. lat. 43° 30′. W. long. 70° 20′.—Alſo, one of the ſmaller Bermuda iſlands.

NONESUCH *Harbour*, a harbour on the E. coaſt of Antigua. N. lat. 43° 30′. W. long. 61° 23′.

NON IMPLACITANDO ALIQUEM DE LIBERO TENEMENTO SINE BREVI, in *Law*, a writ to prohibit bailiffs, &c. from diſtraining any man touching his freedom, without the king's writ.

NON INTROMITTENDO QUANDO BREVE PRÆCIPE IN CAPITE SUBDOLE IMPETRATUR, a writ directed to the juſtices of the bench, or in eyre, commanding them not to give one that had, under colour of intitling the king to land, &c. as holding of him *in capite*, deceitfully obtained the writ called *præcipe in capite*, any benefit thereof, but to put him to this writ of right. (Reg. Orig. 4.) This writ having dependence on the court of wards, ſince taken away, is now diſuſed.

NON JURIDICI DIES. See DIES.

NON-JURORS, are perſons that refuſe to take the oaths to the government, who are liable to certain penalties; and for a third offence to abjure the realm, by 13 & 14 Car. II. cap. 1. Parſons, vicars, &c. are to take the oaths, and give their aſſent to the declaration (14 Car. II. cap. 4.) or they ſhall not preach, under the penalty of 40*l.* &c. (Stat. 17 Car. II. cap. 2) Eccleſiaſtical perſons not taking the oaths on the Revolution, were rendered incapable to hold their livings: but the king was empowered to grant ſuch of the nonjuring clergy as he thought fit, not above twelve, an allowance out of their eccleſiaſtical benefices for their ſubſiſtence, not exceeding a third part. (1 W. & M. ſeſſ. 1. cap. 8.) Perſons refuſing the oaths ſhall incur, forfeit, and ſuffer the penalties inflicted on Popiſh recuſants, and the court of exchequer may iſſue out proceſs againſt their lands, &c. 7 & 8 Will. III. cap. 27. See the ſtat. 2 Geo. I. cap. 13. and OATHS.

The non-jurors, or high-church men, were particularly diſtinguiſhed by the following principles: 1. They maintained the doctrine of paſſive obedience. 2. That the hereditary ſucceſſion to the throne is of divine inſtitution, and, therefore, can never be interrupted, ſuſpended, or annulled, on any pretext. 3. That the church is ſubject to the juriſdiction, not of the civil magiſtrate, but of God alone, particularly in matters of a religious nature. 4. That, conſequently, the biſhops depoſed by king William III. remained, notwithſtanding their depoſition, true biſhops to the day of their death; and that thoſe who were ſubſtituted in their places were the unjuſt poſſeſſors of other men's property. 5. That theſe unjuſt poſſeſſors of eccleſiaſtical dignities were rebels againſt the ſtate, as well as ſchiſmatics in the church, and that all, therefore, who held communion with them, were alſo chargeable with rebellion and ſchiſm. And, 6. That this ſchiſm, which rends the church in pieces, is a moſt heinous ſin, whoſe puniſhment muſt fall heavy on all thoſe who did not return ſincerely to the true church, from which they have departed. See *High* CHURCH.

NONIUS, MARCELLUS, in *Biography*, a grammarian and peripatetic philoſopher, who flouriſhed about the fourth century, was a native of Tibur, now Tivoli. He is known by a work, entitled "De Proprietate Sermonis," now extant, and which has gone through ſeveral editions, of which the beſt is that printed at Paris in the year 1614. The author, ſays the writer of the article in the Biographical Dictionary, has little claim to the praiſe of accurate learning or judgment, and the work itſelf is chiefly valuable for the paſſages which he cites from authors no where elſe to be met with.

NONIUS, PETER, in Spaniſh *Nunez*, a learned Portugueſe, and one of the ableſt mathematicians of the ſixteenth century, was a native of Alcacer. He was preceptor to don Henry, king Emanuel's ſon, and taught the mathematics in the univerſity of Coimbra. He publiſhed the following works, by which he gained great reputation; "De Arte Navigandi:" Annotationes in theorias planetarum Purbachii:" a treatiſe "De Crepuſculis;" and "A Treatiſe on Algebra." It has been ſaid that Peter Nonius, in 1530, firſt invented the angles of 45 degrees, made in every meridian, that he called them rhumbs in his language, and calculated them by ſpherical triangles. Nonius died in 1577, at the age of eighty: ſee the next article.

NONIUS is a name erroneouſly given to the method of graduation now generally uſed in the diviſion of the ſcales of various inſtruments, and which ſhould be called Vernier, from its real inventor. The method of Nonius, ſo called from its having been invented by Pedro Nunez, or Nonius, and deſcribed in his treatiſe "De Crepuſculis," printed at Liſbon in 1542, conſiſts in deſcribing within the ſame quadrant, forty-five concentric circles, dividing the outermoſt into ninety equal parts, the next within into eighty-nine, the next into eighty-eight, &c. till the innermoſt was divided into forty-ſix only. By this means, in moſt obſervations, the plumb-line or index muſt croſs one or other of thoſe circles very near a point of diviſion: whence by computation, the degrees and minutes of the arc might be eaſily computed. This method is alſo deſcribed by Nonius, in his treatiſe "De Arte atque Ratione Navigandi, lib. ii. cap. 6." where he would perſuade himſelf, that it was not unknown to Ptolemy. But as the degrees are thus divided very unequally, and it is very difficult to attain exactneſs in the diviſion, eſpecially when the numbers into which the arcs are to be divided are incompoſite, of which there are no leſs than nine, the method of diagonals, firſt publiſhed by Thomas Digges, eſq. in a treatiſe intitled "Alæ ſeu Scalæ Mathematicæ," printed at London in 1573, and ſaid to be invented by one Richard Chanſeler, a very ſkilful artiſt, was ſubſtituted in its room. However, Nonius's method was improved at different times; but the admirable diviſion now ſo much in uſe, is the moſt conſiderable improvement of it. See VERNIER.

NON LIQUET, *it does not appear*, in *Law*, a verdict given by a jury, when a matter is to be deferred to another day of trial.

The ſame phraſe was uſed among the Romans: after hearing a cauſe, ſuch of the judges as thought it not ſufficiently clear to pronounce upon, caſt a ballot into the urn with the two letters *N. L.* for *non liquet*.

NON MERCHANDIZANDO VICTUALIA, a writ to juſtices of aſſize to enquire whether the magiſtrates of ſuch a town do ſell victuals in groſs, or by retail, during the time of their being in office, which is contrary to an ancient ſtatute, and to puniſh them if they do. Reg. Orig. 184.

NON MOLESTANDO, a writ which lies for him who is moleſted contrary to the king's protection granted him. Reg. of Writs, 184.

NON-NATURALS, in *Medicine*, *res non naturales*, are the cauſes and effects of diſeaſes, whether near or remote.

Phyſicians have digeſted all the cauſes of diſeaſes into ſix claſſes, which they call the ſix non-naturals. Theſe are, 1. Air. 2. Meat and drink. 3. Motion and reſt. 4. The paſſions of the mind. 5. Excretions and retentions. 6. Sleep and waking. See each under its proper article. They are thus called, becauſe, by their uſe or abuſe, they become either good, *naturals*; or evil, *contra-naturals*.

But the diviſion, in effect, is of no great uſe; the cauſes of

of diſeaſes being much more commodiouſly laid down otherwiſe. See Boerhaave's diviſion of the non-naturals under CAUSE.

NONNUS, in *Biography*, a Greek poet, who flouriſhed in the fifth century, was a native of Panopolis in Egypt, and was author of two works, on very different ſubjects, but generally admitted to be from the ſame pen. The firſt, entitled "Dionyſiacs," a poem of forty-eight books, contains a hiſtory of Bacchus, and is ſaid to comprehend a vaſt miſcellany of heathen mythology and erudition. The ſecond is a metrical "Paraphraſe of the Goſpel of St. John." This is valuable, as affording ſome important, various readings, which have been collected by editors of the New Teſtament. He omits the ſtory of the woman taken in adultery. The "Dionyſiacs" were firſt printed at Antwerp in 1569. They were reprinted, with a Latin verſion, at Hanau in 1605, and afterwards by Cunæus in 1610. Of his paraphraſe there have been a number of editions, but the beſt is that of Daniel Heinſius in 1627. Moreri.

NONO, in *Geography*, a town of Abyſſinia; 100 miles S. of Miné.

NONOABA, a town of Mexico, in New Biſcay; 105 miles W. of Parral.

NON OBSTANTES, *Notwithſtanding*, in *Law*, a clauſe frequent in ſtatutes and letters patent; importing a licence from the king to do a thing, which at common law might be lawfully done; but being reſtrained by act of parliament could not be done without ſuch licence. Vaugh. 347. Plowd. 501.

All grants of ſuch penſions, and every *non obſtante* therein contained, ſhall be void. Henry III. took up the clauſe, *non obſtante* (firſt introduced by the pope), in his grants.

But the doctrine of *non obſtantes*, which ſets the prerogative above the laws, was effectually demoliſhed by the bill of rights at the revolution, and abdicated Weſtminſter-hall when king James abdicated the kingdom. It is enacted by 1 W. & M. ſeſſ. 2. cap. 2. that no diſpenſation by *non obſtante*, of or to any ſtatute, or any part thereof, ſhall be allowed, but that the ſame ſhall be held void and of none effect, except a diſpenſation be allowed in ſuch ſtatute.

NON OBSTANTES, in the *Romiſh Canon-Law*, make the third part of the proviſions of the court of Rome, beginning with *non obſtantibus*, and compriſing abſolutions from cenſures, rehabilitations, and neceſſary diſpenſations for the enjoyment of benefices. None inferior to the pope can uſe the clauſe *non-obſtante*.

NON OMITTAS, a writ which lies where the ſheriff having delivered a writ or proceſs to a bailiff of a franchiſe in which the party it is to be ſerved on dwells, and the bailiff having refuſed or neglected to ſerve it, upon the ſheriff's returning that he delivered it to the bailiff, this ſecond writ ſhall be directed to the ſheriff, charging him to enter the franchiſe, and execute the king's command, either by himſelf or officer.

NON-PAYMENT of eccleſiaſtical dues to the clergy, as penſions, mortuaries, compoſitions, offerings, and whatſoever falls under the denomination of ſurplice fees, for marriages or other miniſterial offices of the church, is a pecuniary injury, cognizable in the ſpiritual courts: redreſſed by a decree for their actual payment. Beſides which all offerings, oblations, and obventions, not exceeding the value of 40*s*., may be recovered in a ſummary way before two juſtices of the peace.

NON PLEVIN, *Non plevina*, a default in not replevying of land in due time. See REPLEVIN.

In Hengham Magna, it is ſaid, that the defendant ſhould be ſure to replevy his lands ſeized by the king within fifteen days; and that if he neglects, then, at the inſtance of the plaintiff at the next court-day, he ſhall loſe his ſeiſin, *ſicut per defaltam poſt defaltam*. But, by ſtat. 9 Edw. III. it was enacted, that no perſon ſhould loſe his land thenceforward becauſe of *non plevin*.

NON PONENDO IN ASSISIS, & JURATIS, a writ granted on divers occaſions to perſons for freeing them from ſerving on aſſizes and juries; as by reaſon of old age, charter of exemption, or the like. This writ is founded on the ſtats. Weſt. 2. 13 Edw. I. ſt. 1. c. 38. and articuli ſuper chartis, 28 Edw. I. ſt. 3. c. 9. F. N. B. 165. 2 Inſt. 127. 447.

NON PROCEDENDO AD ASSISAM REGE INCONSULTO, a writ to ſtop the trial of a cauſe appertaining to one who is in the king's ſervice, &c. till the king's pleaſure be farther known. Reg. Orig. 220.

NON PROS, or *Non* PROSEQUITUR. See NOLLE *Proſequi* and NON-SUIT.

NON-RESIDENCE is applied to ſuch ſpiritual perſons as are not reſident on, but abſent themſelves from their benefices or dignities. See BENEFICE.

Regularly, perſonal reſidence is required of eccleſiaſtical perſons upon their cures; though there are ſome exceptions in favour of particular perſons, as king's chaplains, biſhops, &c. See RESIDENCE.

NON RESIDENTIA PRO CLERICIS REGIS, is a writ directed to the ordinary, charging him not to moleſt the clerk employed in the king's ſervice, on account of his non-reſidence, in which caſe he is to be diſcharged. Reg. Orig. 58.

NON SANÆ MEMORIÆ, or NON *Sane Memorie*, is an exception taken to an act declared to be done by another, importing that it was done at a time when the party that did it was mad, or not in his proper ſenſes. See NON COMPOS.

NON SOLVENDO PECUNIAM, *ad quam clericus mulctatur pro non reſidentia*, a writ prohibiting an ordinary to take a pecuniary mulct, impoſed on a clerk of the king's for non-reſidence. Reg. of Writs, fol. 59.

NON SPISSUM, in the *Ancient Muſic*. See APYCNON.

NONSUCH, in *Agriculture*, a term provincially applied to trefoil and rye-graſs, as *black* and *white* nonſuch.

NONSUCH *Clay*, a particular ſort of earth, which mixed with another clay brought from Worceſterſhire, makes a compoſition very uſeful for making the melting-pots uſed in the green glaſs making.

NON-SUIT, in *Law*, the dropping or letting fall a ſuit or action. Non-ſuit is a renunciation of a ſuit, by the plaintiff or demandant; moſt commonly upon the diſcovery of ſome error, or defect, when the matter is ſo far proceeded in, as that the jury is ready at the bar to deliver their verdict. The civilians term it *litis renuntiatio*.

If the plaintiff in an action neglects to deliver a declaration for two terms after the defendant appears, or is guilty of other delays or defaults againſt the rules of law in any ſubſequent ſtage of the action, he is adjudged *not to follow* or purſue his remedy as he ought to do, and thereupon a non-ſuit, or *non proſequitur*, is entered: and he is ſaid to be *non prof'd*. And for thus deſerting his complaint, after making a falſe claim or complaint (*pro falſo clamore ſuo*) he ſhall not only pay coſts to the defendant, but is liable to be amerced to the king. A *retraxit* differs from a non-ſuit, in that the one is negative and the other poſitive: the non-ſuit is a mere default and neglect of the plaintiff, and therefore he is allowed to begin his ſuit again, upon payment of coſts; but a

retraxit

retraxit is an open and voluntary renunciation of his ſuit, in court, and by this he for ever loſes his action. (See Discontinuance *of Proceſs.*) Before the jury gave their verdict on a trial, it was formerly uſual to *call* or demand the plaintiff, in order to anſwer the amercement, to which by the old law he was liable in caſe he failed in his ſuit. And it is now uſual to call him, whenever he is unable to make out his caſe, either by reaſon of his not adducing any evidence in ſupport of it, or any evidence ariſing in the proper county. The caſes in which it is neceſſary that the evidence ſhould ariſe in a particular county, are either where the action is in itſelf local, or made ſo by act of parliament, as in actions upon penal ſtatutes, &c. or where upon a motion to change or retain the venue, the plaintiff undertakes to give material evidence in the county where the action was brought. (2 Black. Rep. 1039.) If upon the plaintiff's being called, neither he, nor any body for him, appears, he is non-ſuited, the jurors are diſcharged, the action is at an end, and the defendant ſhall recover his coſts. The reaſon of this practice is, that a non-ſuit is more eligible for the plaintiff than a verdict againſt him; for after a non-ſuit, which is only a default, he may commence the ſame ſuit again for the ſame cauſe of action; but after a verdict had, and judgment conſequent thereupon, he is for ever barred from attacking the defendant upon the ſame ground of complaint. But in caſe the plaintiff appears, the jury by their foreman deliver in their verdict (See Jury.) It is enacted by the ſtatute 14 Geo. II. c. 17, that if after iſſue joined, the cauſe is not carried down to be tried according to the courſe of the court, the plaintiff ſhall be eſteemed to be non-ſuited, and judgment ſhall be given for the defendant, as in caſe of a non-ſuit. Bl. Comm. vol. iii.

NON SUM Informatus. See Informatus *non ſum.*

NON TENURE, a plea in bar to a real action, whereby the party (the defendant) urges, that he holdeth not the land mentioned in the plaintiff's count or declaration, or at leaſt ſome part of it. Stat. 25 Ed. III. c. 16. 1 Mod. Rep. 250.

Weſt diſtinguiſhes non-tenure into *general* and *ſpecial.* The firſt where one denies himſelf ever to have been tenant of the land in queſtion. The ſecond where he only alleges, that he was not tenant on the day whereon the writ was purchaſed.

NON-TERM, the time of vacation between term and term. See Vacation.

It was anciently called *the time* or *days of the king's peace.* See Peace *of God and the Church.*

Among the Romans it was called *feriæ*, or *dies neſaſti.*

NONTRON, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Dordogne; 21 miles N. of Perigueux. The place contains 2809, and the canton 12,458 inhabitants, on a territory of 275 kiliometres, in 16 communes. N. lat. 45° 32′. E. long. 0 44′.

NON USER, or Neglect, in *Law*, is of itſelf a direct and immediate cauſe of forfeiture in public offices, that concern the adminiſtration of juſtice, or the commonwealth; but non-uſer of a private office is no cauſe of forfeiture, unleſs ſome ſpecial damage is proved to be occaſioned thereby. Co. Litt. 233.

NONUPLA, in the *Italian Muſic*, denotes a quick time, peculiar to jigs. This ſpecies of time is otherwiſe called *the meaſure of nine times*, which requires two falls of the hand, and one riſe. There are three ſorts of nonupla. 1. *Nonupla di ſemi-minime*, or *dupla ſeſqui quarta*, thus marked $\frac{9}{4}$, where nine crochets are to be in the bar, of which four make a ſemi-breve in common time, *i. e.* in the down ſtroke, ſix, and but three up; it is uſually beat *adagio*. 2. *Nonupla di crome*, or *ſeſqui ottava*, marked thus $\frac{9}{8}$, wherein nine quavers make a bar, inſtead of eight in common time, *i. e.* ſix down, and three up: it is beat *preſto*. 3. *Nonupla di ſemi-crome*, or *ſuper ſetti partiente nona*, thus diſtinguiſhed $\frac{9}{16}$, in which nine ſemi-quavers are contained in a bar, whereof ſixteen are required in common time, ſix down, and three up: it is ordinarily beat *preſtiſſimo*. See Adagio, Presto, and Prestissimo.

Beſides theſe, there are two other ſpecies of nonupla, for which ſee Triple.

NONUS *Humeri Placentini*, in *Anatomy*, a muſcle, called alſo rotundus minor.

NONZA, in *Geography*, a town of Corſica; 8 miles N.W. of Baſtia.

NOODT, Gerard, in *Biography*, a celebrated juriſt, was born in 1647 at Nimeguen, where he was educated. He particularly attached himſelf to the ſtudy of juriſprudence; and in the third year of his academical courſe, ſuſtained two public diſputations. After this he viſited the univerſities of Leyden, Utrecht, and Franeker: at the laſt he took his degree of doctor of law. This was in the year 1669; and after his return to Nimeguen, he was choſen ordinary profeſſor of law, being then only 24 years of age. In 1679 he was elected profeſſor of law at Franeker; and in 1684 he accepted the ſame office at the univerſity of Utrecht. In 1686 he removed to Leyden, where he undertook the profeſſorſhip. This was his final reſidence: he was twice rector of that univerſity, and died there in 1725, at the age of 78. He was laborious in his profeſſion, and animated with a truly philoſophical ſpirit. His writings upon ſome of the moſt important topics of juriſprudence were publiſhed collectively by himſelf, in a quarto volume; of which a better and enlarged edition was given at Leyden, in two volumes, folio, in 1735, with the author's life, by M. Barbeyrac. His treatiſes, "De Jure Summi Imperii et Lege Regia," and "De Religione ab Imperio, Jure Gentium, libera," were tranſlated into the French language by Barbeyrac, and publiſhed ſeparately; the latter under the title of "Diſcours ſur la Liberté de Conſcience." In the firſt of theſe treatiſes, the author ſupports republican principles of government; in the ſecond, he carries toleration in matters of religion to the full extent. Moreri.

NOOGA, in *Geography*, a river of Africa, which runs into the Indian ſea, S. lat. 28° 30′.

NOOGOO, one of the ſmall Friendly iſlands; 3 miles N.E. of Tongataboo.

NOOGOONAMO, one of the Hapaee iſlands; S.E. of Haano.

NOOHEEVA, or *Federal Iſland*, one of the Ingraham iſlands in the Pacific ocean. S. lat. 8° 58′. W. long. 140 5′.

NOOK *of Land*, *Nocata Terræ*. In an old deed of ſir Walter de Pedwardyn, twelve acres and a half of land were called a *nook of land;* but the quantity is generally uncertain.

NOOKEETAH, in *Geography*, a town of Bengal; 45 miles N.E. of Nattore.

NOONGOLAH, a town of Hindooſtan, in Bengal; 12 miles E. of Goragot.

NOONGOTTY, a town of Hindooſtan, in the circar of Sohagepour; 28 miles S.E of Sohagepour.

NOONINGS, in *Agriculture*, a term provincially uſed to ſignify working dinner-times, or a period of reſt for plough teams.

NOONOYAN, in *Geography*, a town on the weſt coaſt

of the iſland of Mindanao. N. lat. 7° 40′. E. long. 122 20′.

NOONY, a town of Bengal, in the circar of Hendooa; 34 miles N. of Nagore. N. lat. 28°. E. long. 87° 7′.

NOOPOUR, a town of Hindooſtan, in Guzerat; 55 miles E. of Surat. N. lat. 21° 11′. E. long. 73° 50′.

NOORALDGEN, a town of Hindooſtan, in Lahore; 35 miles E.S.E. of Lahore.

NOORBATORNZIA, a town of Thibet; 5 miles S. of Peinom Jeung.

NOORGUNGE, a town of Hindooſtan, in Oude; 8 miles W. of Fyzabad.—Alſo, a town in Oude; 30 miles E. of Lucknow.

NOORMEHAL, a town of Hindooſtan, in Lahore; 40 miles E.S.E. of Sultanpour.

NOORNAGUR, a town of Hindooſtan, in Bengal; 22 miles N. of Comillah.

NOORPOUR, a town of Hindooſtan, and capital of a diſtrict, in the ſubah of Lahore; 70 miles N.E. of Lahore. N. lat. 32° 12′. E. long. 75° 5′.—Alſo, a town of Bengal; 20 miles S.W. of Dacca. See NURPUR.

NOORT POINT, the north cape of the port of Coquimbo, in Chili.

NOOSE. See NOOZE.

NOOTKA, or *King George's Iſland*, in *Geography*, an iſland in Nootka Sound. N. lat. 49° 35′. E. long. 126° 40′.

NOOTKA *Sound*, firſt called by captain Cook, on his diſcovery of it in April, in the year 1778, "King George's Sound," a bay of the North Pacific ocean, on the weſt coaſt of North America; the entrance of which is ſituated in the eaſt corner of Hope bay, in N. lat. 49° 33′, and E. long. 233° 12′. This ſound was entered by Cook between two rocky points, lying E.S.E. and W.N.W. from each other, at the diſtance of between three and four miles. Within theſe points the ſound widens conſiderably, and extends in, to the northward, four leagues at leaſt, excluſively of the ſeveral branches towards its bottom, which were not aſcertained. The middle of the ſound preſents a number of iſlands of various ſizes. Here, as well as cloſe to ſome parts of the ſhore, the depth of water is from 47 to 90 fathoms, and even more. The harbours and anchoring places, within its circuit, are numerous. The cove in which the Britiſh ſhips lay was on the eaſt ſide of the ſound, and on the eaſt ſide of the largeſt of the iſlands. Although covered from the ſea, it is expoſed to the ſouth-eaſt winds, which occaſionally blow with deſtructive violence. The land that borders on the ſea-coaſt is of a middling height, and level; but within the ſound, it riſes every where into ſteep hills, terminating in round or blunted tops, with ſome ſharp prominent ridges on their ſides. Their height is moderate, and even the higheſt of them are entirely covered to their ſummits with the thickeſt woods, as well as every flat part towards the ſea. Some few ſpots, which are bare, indicate the general rocky diſpoſition of theſe hills. The only ſoil upon them is a kind of compoſt, produced from rotten moſſes and trees, about two feet deep. The little coves in the ſound have beaches compoſed of fragments of rock, intermixed with pebbles; and they are furniſhed with large maſſes of fallen wood, driven in by the tide, together with rills of freſh water, ſufficient for the uſe of a ſhip, apparently ſupplied from the rains and fogs that hover about the tops of the hills. The water of theſe rills is perfectly clear, and eaſily diſſolves ſoap. The climate, as far as our navigators had any experience of it, is infinitely milder than that on the eaſt coaſt of America, under the ſame parallel of latitude. The mercury in the thermometer, even in the night, was never lower than 42°, and in the day it very often roſe to 60°. Froſt was not perceived in any part of the low ground, but vegetation had made a conſiderable progreſs. The trees, which grow very vigorouſly, and to a large ſize, are chiefly the Canadian pine, white cypreſs, the wild pine, and two or three other ſorts of pine leſs common. Of other vegetable productions there is little variety. Among the rocks, and at the verge of the woods, were found ſtrawberry plants, ſome raſpberry, currant, and gooſeberry buſhes, in a flouriſhing ſtate, with a few ſmall black alder trees. There are likewiſe a ſpecies of ſow-thiſtle, gooſe-graſs, ſome crow's foot, with a fine crimſon flower, and two ſorts of anthericum, one with a large orange flower, and another with a blue one. In the ſame ſituations were found ſome wild roſe-buſhes juſt budding, young leeks with triangular leaves, a ſmall ſort of graſs, water-creſſes, and andromeda in great abundance. Within the woods were moſſes and ferns of different ſorts. As captain Cook and his companions lay in a cove on an iſland, they obſerved in the woods there only two or three racoons, martins, and ſquirrels; and the account they give us of the quadrupeds is taken merely from the ſkins, which were brought by the natives for ſale; and theſe were often in a very mutilated ſtate, and ſcarcely enabled them to determine to what animals they belonged. The moſt common were bears, deer, foxes, and wolves. The ſea-animals ſeen off the coaſt were whales, porpoiſes, and ſeals. The ſea-otter alſo abounds here: and the fur of this animal is ſofter and finer than that of any others; ſo that the diſcovery of this part of the continent of North America, where ſo valuable an article of commerce may be obtained, cannot be a matter of indifference. Birds are ſcarce both as to ſpecies and number: thoſe which frequent the woods are crows and ravens, of the ſame kind with thoſe in England, a blueiſh jay or magpie, common wrens, the Canadian or migrating thruſh, and a conſiderable number of brown eagles, with white heads and tails. Amongſt thoſe which were diſtinguiſhable by their dried ſkins, or certain fragments, were a ſmall ſpecies of hawk, a heron, and the large creſted American king-fiſher. Here alſo are different ſpecies of wood-peckers, ſome ſmall birds of the finch kind, the ſand-piper, and humming-birds. Off the coaſt were ſeen the quebrantahueſſos, gulls, and ſhags, wild-ducks, ſwans, and plovers. Fiſh are more plentiful than birds, though the variety is not great: the principal ſorts are the common herring and ſardine, which come in large ſhoals, and at ſtated ſeaſons. Breams, both the ſilver-coloured and gold-brown coloured, are next to the former in quantity. There are other fiſhes, which are ſcarce. Sharks ſometimes frequent the ſound. The other marine animals are a ſmall cruciated meduſa or blubber, ſtar-fiſh, ſmall crabs, and the cuttle-fiſh. About the rocks are large muſcles, ſea-ears, and ſhells of large chamæ; and the ſmaller ſorts are trochi, murex, rugged wilks, and ſnails. Beſides theſe, there are ſome ſmall cockles and limpets. In the ſound, or upon the coaſt, there is red coral, as it was found in the canoes of the natives. The only animals of the reptile kind obſerved here, and found in the woods, were brown ſnakes, with whitiſh ſtripes on the back and ſides, which are harmleſs; and browniſh water-lizards. The inſect tribe forms a numerous claſs; but of minerals, no ores of any metal were ſeen, if we except a coarſe, red, earthy or ochry ſubſtance, uſed by the natives in painting themſelves, which may probably contain a little iron; with a white and blueiſh pigment, uſed for the ſame purpoſe. Beſides the ſtone or rock that conſtitutes the mountains and ſhores, which ſometimes contains pieces of very coarſe quartz, here were found a hard black granite, a greyiſh whet-ſtone, the common oil-

ſtone of our carpenters. The natives alſo uſe the tranſparent leafy glimmer, or Muſcovy glaſs, and rock-cryſtal.

The perſons of the natives are, in general, under the common ſtature, but not ſlender in proportion; being commonly pretty full or plump, though not muſcular. The viſage of moſt of them is round and full, and ſometimes alſo broad, with high prominent cheeks; and, above theſe, the face is frequently much depreſſed, or falling in between the temples; the noſe is flat at its baſe, the noſtrils are wide, and its point is rounded; the forehead low, the eyes ſmall, black, and rather languiſhing than ſparkling; the mouth round, with large round thickiſh lips; the teeth tolerably equal and well ſet, but not remarkably white. They have either no beards at all, which is moſt commonly the caſe, or a ſmall thin one upon the point of the chin, which is owing not to a natural defect of hair, but to its being plucked out; ſome, and particularly the old men, have not only conſiderable beards all over the chin, but whiſkers or muſtachios. Hence we may conclude, that the remarks of M. de Paw, Dr. Robertſon, and other writers, exemplified in the defect of beards among the American Indians, are unfounded. The eye-brows are ſcanty and narrow; but the hair of the head is abundant, and alſo very coarſe and ſtrong; and, without a ſingle exception, black, ſtraight, and lank, or hanging down over the ſhoulders; the neck is ſhort, the arms and body clumſy; and the limbs ſmall, in proportion to the other parts, as well as crooked, or ill-made, with large feet badly ſhaped, and projecting ankles. It is not eaſy to diſtinguiſh their true colour, as their bodies are incruſted with paint and dirt; but where it could be perceived, the whiteneſs of the ſkin appeared almoſt to equal that of the Europeans, eſpecially thoſe in ſouthern latitudes. The whole body of the people ſeems to be characteriſed by countenances, exhibiting a dull phlegmatic want of expreſſion. The women reſemble the men in ſize, form and colour, nor are the ſexes eaſily diſtinguiſhable; of the females, none even of thoſe who are in the prime of life, have the leaſt pretenſion to be called handſome. Their common dreſs is a flaxen garment, or mantle, ornamented on the upper edge by a narrow ſtrip of fur, and at the lower edge, by fringes or taſſels; this paſſes under the left arm, and is tied over the right ſhoulder by a ſtring before and another behind, near its middle. Over this, which reaches below the knees, is worn a ſmall cloak of the ſame ſubſtance, likewiſe fringed at the lower part. The head is covered with a cap, of the figure of a truncated cone, or like a flower-pot, made of fine matting, having the top frequently ornamented with a round or pointed knob, or bunch of leathern taſſels, and faſtened under the chin. Beſides this dreſs, which is common to both ſexes, the men frequently throw over their other garments the ſkin of a bear, wolf, or ſea-otter, with the hair outward; in rainy weather they throw a coarſe mat about their ſhoulders; and they have alſo woollen garments which are little uſed. As they rub their bodies conſtantly over with a red paint, made of a clayey or coarſe ochry ſubſtance, mixed with oil, their garments contract a rancid offenſive ſmell, and a greaſy naſtineſs. Theſe garments, and alſo their heads, ſwarm with vermin, which they pick off with great compoſure, and eat. Although their bodies are always covered with paint, their faces are often ſtained with a black, a brighter red, or a white colour, by way of ornament; and this gives them a ghaſtly diſguſting aſpect. They alſo ſtrew the brown martial mica upon the paint, which makes it glitter. The ears of many of them are perforated in the lobe with a large hole, and with two others higher up on the outer edge; and in theſe holes they hang bits of bone, quills fixed on a leathern ſtring, ſmall ſhells, bunches of woollen taſſels, or pieces of thin copper. The ſeptum of the noſe is alſo ſometimes perforated, through which they draw a piece of ſoft cord; and others wear, in the ſame place, ſmall thin pieces of iron, braſs, or copper, ſhaped almoſt like a horſe-ſhoe, the narrow opening of which receives the ſeptum, ſo as that the two points may gently pinch it; and the ornament thus hangs over the upper lip. About their wriſts they wear bracelets or branches of white bugle beads, made of a conic ſhelly ſubſtance, bunches of thongs, with taſſels, or a broad black ſhining horny ſubſtance of one piece. About their ankles they alſo wear many folds of leathern thongs, or the ſinews of animals twiſted to a conſiderable thickneſs. On extraordinary occaſions, when they exhibit themſelves as ſtrangers, in viſits of ceremony, and when they go to war, they wear the ſkins of animals, as of bears and wolves, curiouſly ornamented; and on the head a quantity of withe, or half-beaten bark wrapped about it, with large feathers, particularly thoſe of eagles, interſperſed with ſmall white feathers. The face is alſo variouſly painted, with different colours and gaſhes, or beſmeared with a kind of tallow, mixed with paint, formed into various figures, and appearing like carved work. Their hair is alſo ſeparated into ſmall parcels, and tied at intervals of about two inches to the end with thread; and others tie it together. Thus dreſſed, they exhibit a ſavage and incongruous appearance, which is much heightened by monſtrous decorations, conſiſting of a variety of carved wooden maſks or vizors, applied to the face, the head, or forehead. Theſe groteſque appearances reſemble either human faces, the heads of birds, or thoſe of land and ſea animals. It is not certain what views they have in aſſuming theſe extravagant maſquerade ornaments; poſſibly they may adopt them on particular religious occaſion or for diverſion; or for intimidating their enemies, or as decoys to animals in the chaſe. The only dreſs among the people of Nootka, peculiarly adapted to war, is a thick leathern mantle doubled, which ſeems to be the ſkin of an elk, or buffalo tanned. This forms a kind of coat of mail, or complete defenſive armour. They alſo wear a kind of leathern cloak, covered with rows of dried hoofs of deer, diſpoſed horizontally, appended by leathern thongs and covered with quills, which, when they move, makes a kind of rattling noiſe, almoſt equal to that of many ſmall bells. Theſe people, thus formidable in their appearance when they aſſume their military garb, have not the leaſt appearance of ferocity in their countenances, when diveſted of it; but ſeem to be, in a conſiderable degree, deſtitute of that animation and vivacity, which would render them agreeable as ſocial beings. Such is their diſpoſition that, even in the greateſt paroxyſms of their rage, they ſeem unable to expreſs it ſufficiently, either with warmth of language, or ſignificancy of geſtures.

Although there is too much reaſon, from their bringing to ſale human ſkulls and bones, to infer that they treat their enemies with a degree of brutal cruelty, this circumſtance ſeems to be only an indication of general agreement of character with that of almoſt every tribe of uncivilized men, and furniſhes no juſt occaſion for reproaching them with peculiar inhumanity. They appear to be a docile, virtuous, good-natured people; but notwithſtanding the phlegm of their temper, quick to reſent injury, and as prompt to forgive it. Their other paſſions, and particularly their curioſity, ſeem to lie dormant. Nevertheleſs they are not wholly unſuſceptible of the tender paſſions. In proof of this it is alleged that they are fond of muſic, which is moſtly of the grave or ſerious, but truly pathetic ſort. In their ſongs they keep the exacteſt concert; and they ſing in numbers together. Theſe are generally ſlow and ſolemn, with numerous and expreſſive variations, and a cadence or melody power-

fully ſoothing. Beſides their full concerts, ſonnets of the ſame grave caſt are frequently ſung by ſingle performers, who keep time by ſtriking the hand againſt the thigh. The muſic, however, is ſometimes varied from its predominant ſolemnity of air; and ſtanzas are ſung in a more gay and lively ſtrain, and even with a degree of humour. The only inſtruments of muſic which were obſerved among them were a rattle, and a ſmall whiſtle, about an inch long, incapable of any variation, from having but one hole. The rattles are, for the moſt part, made in the ſhape of a bird, with a few pebbles in the belly; and the tail is the handle.

In traffic, ſome of them betray a knaviſh diſpoſition, and carry off goods without making any return. But in general, ſays Capt. Cook, we had abundant reaſon to commend the fairneſs of their conduct. Such, however, was their eagerneſs to poſſeſs iron and braſs, and, indeed, any kind of metal, that few of them could reſiſt the temptation to ſteal it, whenever an opportunity offered; nor did they pilfer any but that which they could convert to uſeful purpoſes, and had a real value in their eſtimation; ſo that they were thieves in the ſtricteſt ſenſe of the word. Amongſt themſelves, ſtealing is a very common practice, and is the occaſion of many of their quarrels.

In the two towns, or villages, which ſeemed to be the only inhabited parts of the Sound, the number of occupiers amounted to about 2000. The houſes are diſpoſed in ranges, riſing one above the other; the largeſt being in front and the others of ſmaller ſize. Theſe ranges are interrupted or disjoined at irregular diſtances, and they are ſeparated by wider intervals. They are built of very long and broad planks, reſting upon the edges of each other, and faſtened by withes of pine bark. Their height at the ſides and ends is ſeven or eight feet; but the back part is a little higher, ſo that the planks ſlant forward, and thus are kept looſe that they may be put cloſe to exclude rain, or ſeparated for letting in light and diſcharging the ſmoke. Upon the whole, however, they are wretched hovels, conſtructed with little or no ingenuity. Their furniture conſiſts chiefly of a great number of cheſts or boxes, piled upon each other; and containing their ſpare garments, ſkins, maſks, and other things which they chiefly value. Their other domeſtic utenſils are moſtly ſquare and oblong pails or buckets, to hold water and other things, round wooden cups and bowls, and ſmall ſhallow wooden troughs, about two feet long, out of which they eat their food; and baſkets of twigs, bags of matting, &c. Their fiſhing implements and other articles are laid, without order, in other parts of the houſe: their ſleeping benches have nothing but the mats. The naſtineſs and ſtench of their houſes is equal to the confuſion. They rather reſemble hog-ſties than human habitations: every thing within and without ſtinking of fiſh, train-oil, and ſmoke. Many of their houſes, notwithſtanding their diſorder and filth, are decorated with images, formed of trunks of large trees, four or five feet high, ſet up ſingly or by pairs at the upper end of the apartment, with the front carved into a human face, the arms and hands cut out upon the ſides, and variouſly painted; ſo that they are truly monſtrous figures. The general name of theſe images is "Klumma," and in one of the houſes were two others, denominated "Natakkoa," and "Matſeeta." A mat is generally hung before each of theſe images, which the natives are not willing to remove; and when they unveiled them, they ſpoke of them in a very myſterious manner. It is their cuſtom to make offerings to theſe images, and they expect others to do the ſame. Hence it may be inferred, that they are repreſentatives of their gods, or ſymbols of ſome religious or ſuperſtitious object; but Cook ſays, they were held in ſlight eſtimation, as for a ſmall quantity of iron or braſs, he could have purchaſed all the gods (if the images were ſuch) in the place.

The chief employment of the men ſeems to be that of fiſhing, and killing land or ſea animals for the ſuſtenance of their families; and the women occupy themſelves in manufacturing their woollen or flaxen garments, or in preparing the ſardines for drying. The women alſo go in ſmall canoes to gather muſcles and other ſhell-fiſh. The young men ſeemed to be the moſt indolent in this community; for they lay about, baſking themſelves in the ſun, or wallowing in the ſand, like a number of hogs, without any covering. But this diſregard of decency was confined to the men: the women were always clothed, and behaved with the utmoſt propriety. Theſe people ſpend much time in their canoes in the ſummer ſeaſon; eating and ſleeping in them, eſpecially in thoſe of the largeſt ſort, which are much more comfortable habitations than their houſes. Their chief food conſiſts of fiſh, muſcles, ſmaller ſhell-fiſh, and ſea animals. Their moſt common vegetables are two ſorts of liliaceous root, which have a mild ſweetiſh taſte, are mucilaginous, and are eaten raw. Another root reſembles our liquorice, and another a fern-root. They have alſo other roots, which they eat raw. It is their common practice to roaſt or broil their food, for they ſeem to be unacquainted with our method of boiling. They are as filthy in their mode of eating as they are in their perſons and their houſes. The troughs and platters in which they put their food do not ſeem to have been waſhed ſince they were firſt made. Every thing ſolid is torn to pieces with their teeth; and having no idea of cleanlineſs, they eat the roots which they dig from the ground, without ſhaking off the ſoil that adheres to them.

Their weapons are bows and arrows, ſlings, ſpears, ſhort truncheons of bone, and a ſmall pick-axe, like the American tomahawk: which is a ſtone, ſix or eight inches long, pointed at one end, and by the other faſtened into a handle of wood. The handle reſembles the head and neck of the human figure, and the ſtone is fixed in the mouth, ſo as to repreſent an enormouſly large tongue: and to make the reſemblance ſtronger, they affix human hairs to it. That their wars are frequent and bloody is evident, from the number of human ſkulls which they offered for ſale. Their manufactures and mechanic arts are more extenſive and ingenious, both as to deſign and execution, than might have been expected among a people in ſo bad a ſtate of civilization, and of ſo indolent a temper. Their flaxen garments are made of the bark of a pine-tree, beaten into a hempen ſtate. Their woollen garments have the ſtrongeſt reſemblance to woven cloth, though they are unacquainted with the uſe of the loom. The wool is taken from different animals, as the fox and brown lynx. The ornamental figures in theſe different garments are diſpoſed with great taſte, and dyed of different colours. Their fondneſs for carving is manifeſted in every thing that is made of wood. Small whole human figures, repreſentations of birds, fiſh, land and ſea-animals, models of their houſhold utenſils and of their canoes, are found among them in great abundance. They alſo practiſe drawing for various purpoſes. The whole proceſs of their whale-fiſhery is painted on the caps they wear. Their rude performances in this way ſerve to ſhew, that though there be no appearance of the knowledge of letters amongſt them, they have ſome notion of commemorating and repreſenting actions in a permanent manner, independently of what may be recorded in their ſongs and traditions. Their canoes are of a ſimple ſtructure, but well adapted to every uſeful purpoſe. The largeſt, which carry twenty people or more, are formed of one tree. Many

are

are forty feet long, ſeven broad, and about three deep. From the middle, towards each end, they become gradually narrower, the after-part, or ſtern, ending abruptly or perpendicularly, with a ſmall knob on the top; but the fore-part is lengthened out, ſtretching forward and upward, ending in a notched point or prow, conſiderably higher than the ſides of the canoe, which run nearly in a ſtraight line. They are moſtly without ornament; nor have they any ſeats, or ſupporters, on the inſide, beſides ſeveral round ſticks, ſomewhat thicker than a cane, placed acroſs, at mid-depth. They are very light, and by means of their breadth and flatneſs they ſwim firmly, without an outrigger, which none of them have, in which reſpect they differ from thoſe of other countries. Their paddles are ſmall and light, and in managing them they are very dextrous. Their implements for fiſhing and hunting, which are ingeniouſly contrived and well made, are nets, hooks and lines, harpoons, gigs, and an inſtrument like an oar; which laſt is about twenty feet long, four or five inches broad, and about half an inch thick. Each edge, for about two-thirds of its length, the other part being a handle, is ſet with ſharp bone-teeth, about two inches long. Herrings and ſardines, and ſuch other ſmall fiſh as come in ſhoals, are attacked with this inſtrument, which is ſtruck into the ſhoal, and the fiſh are caught either upon or between the teeth. Their hooks are made of bone and wood; and the harpoon, which is excellently contrived, is compoſed of a piece of bone, cut into two barbs, in which is fixed the oval blade of a large muſcle ſhell, in which is the point of the inſtrument. To this is faſtened a rope of about two or three fathoms; and for throwing this harpoon they uſe a ſhaft of about twelve or fifteen feet long, to which the line or rope is attached, and to one end of it the harpoon is fixed, ſo as to ſeparate from the ſhaft, and leave it floating upon the water as a buoy, when the animal darts away with the harpoon. In killing land animals of the ſmaller ſort they uſe arrows, and engage bears, wolves, and foxes with their ſpears. In decoying animals they cover themſelves with a ſkin, and run nimbly about upon all fours, making at the ſame time a kind of noiſe or neighing; and on theſe occaſions, they put on the maſks, or carved heads, as well as the real dried heads, of the different animals. Their ropes are made either from thongs of ſkins and ſinews of animals, or of the flaxen ſubſtance, which is the material of their mantles. The chiſſel and the knife are the only inſtruments of iron which they uſe. Their iron tools are ſharpened upon a whetſtone, and always kept bright. The moſt probable method by which they get their iron is by trading for it with other Indian tribes, who either have immediate communication with European ſettlements upon that continent, or receive it, perhaps, through ſeveral intermediate nations.

Of their political and religious inſtitutions eſtabliſhed among theſe people, we have little information. They have among them ſuch men as chiefs, to whom others of their reſpective families appear to be ſubordinate. Beſides the figures already mentioned, and called "Klumma," they have no other indications of religion. Theſe are moſt probably idols; and are the images of ſome of their anceſtors, whom they venerate as divinities. But they ſeemed to receive from the people no act of religious homage.

Their language is by no means harſh or diſagreeable, any farther than their uſing the *k* and *h* with more force than we do; and upon the whole, it abounds rather with labial and dental than with guttural ſounds. The ſimple ſounds, that are either wholly wanting or rarely uſed, are thoſe repreſented by the letters *b*, *d*, *f*, *g*, *r*, and *v*. But they have one common ſound, which is formed by claſhing the tongue partly againſt the roof of the mouth with conſiderable force, and may be compared to a very coarſe or harſh method of liſping; it may be repreſented by ſuch a compoſition of letters as *lſztdl*. This is one of the moſt uſual terminations of their words. In their language there ſeem to be few prepoſitions or conjunctions, and it is altogether deſtitute of an interjection, to expreſs admiration or ſurprize. Each ſingle ſound comprehends ſeveral ſimple ideas; and the language appears not to be ſufficiently copious.

The latitude of the obſervatory erected by our navigators was 49° 36′ 6″ 47‴ north; and the longitude by lunar obſervations 233° 17′ 14″ 0‴ eaſt, and by the time-keeper 235° 46′ 51″ 0‴ according to the Greenwich rate, but according to the Ulietea rate 233° 59′ 24″ 0‴. The variation of the compaſs at the obſervatory was 15° 49′ 25″ eaſt, and on board the ſhip 19° 44′ 37½″. The mean inclination of the dipping-needle, on ſhore, was 72° 32′ 3¼″, and on board 72° 25′ 41¼″. On the days of new and full moon it was high water at 12ʰ 20ᵐ: and the perpendicular riſe and fall of the day-tide was eight feet nine-inches, and the night-tides at the ſame time, *i. e.* two or three days after the full and new moon, roſe near two feet higher. (Cook's Third Voyage, vol. ii.) In 1786, a ſettlement was eſtabliſhed at Nootka ſound by a company of Britiſh merchants reſiding in the Eaſt Indies, under the appellation of the "King George's Sound Company," for carrying on a fur-trade from the weſtern coaſt of America to China; but the ſettlement was ſeized by the Spaniards in 1789. For a further account of the fur-trade at Nootka ſound, &c. ſee FUR-*trade*.

NOOVILLA, a town of Eaſt Florida; 54 miles E.S.E. of St. Mark.

NOOZE, or NOOSE, a name given by ſportſmen to a ſort of horſe-hair ſpringe made to take woodcocks, and very ſucceſsful when the proper precautions are taken. The nooze is made of ſeveral long and ſtrong hairs twiſted together, with a running nooze at one end, and a large knot at the other, which is to be paſſed through the ſlit of a cleft ſtick, to prevent the nooze from being pulled away when the bird is caught in it.

The ſportſman, when he knows his buſineſs, does not ſtay to watch theſe ſnares, but ſets them in the morning, and returns again to them at four in the afternoon, when he ſeldom fails of meeting with a ſufficient number taken. The ſticks are to be about the bigneſs of a man's little finger, and are to be made ſharp at one end, that they may fix the better in the ground: to each of theſe is to be fixed one nooze. The ſportſman is to take out with him ſeveral dozens of theſe bundled up together, and going into the coppice woods, where there lie many leaves upon the ground, he is to ſearch among theſe for the marks of woodcocks frequenting the place; if there come any there, it will ſoon be found out by the leaves, which are ſpread about from ſide to ſide by thoſe birds, in ſearching under them for worms. Their dung alſo, which is of a dark grey colour, being found about the place, is a proof of their frequenting it.

When the place is thus pitched upon, the ſportſman is to take a large circle at ſome diſtance from it, on each ſide, in the way where the woodcocks are ſuppoſed to come to the place; he is here to plant a ſmall hedge-row of furze, or other buſhes, of a conſiderable extent, and pretty thick, leaving gaps in it here and there. The woodcocks, in making up to their place of feeding, when they come to this hedge, will run along by the ſide of it, till they come to one of the gaps,

gaps, and then go through, for they hate to take wing, and will run, at any time, a long way under a hedge, rather than fly over it. On this depends the ſucceſs of the ſport.

The noozes are to be fixed one in each of theſe gaps through which it is known the woodcocks will paſs; the ſtick to which it is faſtened is to be ſtuck firmly in the ground, and the nooze to be ſpread wide open on the ground, leaving only ſome dry leaves to ſupport it. The whole gap being occupied by this nooze, the woodcock, when he comes, cannot eaſily eſcape, being taken by the legs in it, and when once caught he will lie till the ſportſman comes. While a ſportſman is walking about a wood in this view, it is very common for him to find ſpringes, or noozes of horſe-hair, fixed at ſix inches high, in ſeveral places. This may be looked on as a proof that there are partridges in the wood, and theſe are the means uſed by the country people to take them. The woodcocks, though in the day they lie in woods, yet, in the night, they go out, and frequent rivers and brooks, and, in the froſty nights, ſuch ſprings as do not freeze are particularly reſorted to by them.

The ſportſman, when he has ſet his noozes in the woods for the day time, ſhould retire to the watery places near them, and ſearch for the marks of theſe birds coming to them by their dung and other tokens. As ſoon as a place is found which they frequent, there muſt be a ſmall hedge-row built there alſo, in the ſame manner as in the woods; and in the gaps, which are to be made at the diſtance of about ſix feet one from another, there are to be placed either the ſame ſort of noozes as thoſe in the woods, or the ſpringes made with hazel-boughs, and the horſe-hair tied to a pack-thread. In either caſe, there is no doubt of ſucceſs, for the birds which have once frequented a place, will come to it every night, as long as they remain any where near it; but particularly if there be any ſpring near a wood, the water not freezing when other waters are iced over, will be ſure to bring the woodcocks together at it, and noozes planted properly about this place will ſeldom fail of ſucceſs If they have been left a night or two without ſucceſs, the ſportſman is not to deſpair; for though there ſhould happen to be no woodcocks there when they are firſt ſet, theſe birds change place ſo often, that it need not be doubted but ſo proper a rendezvous will be ſoon reſorted to by them.

NOPELN, or CHRISTIANOPOL, in *Geography*, a town of Denmark, in the province of Blekingen; it is fortified, and almoſt ſurrounded by the Baltic; 23 miles N.E. of Carlſcrona.

NOQUET'S BAY, a bay of Canada, on the N.W. coaſt of the lake Michigan; 45 miles long and 18 wide. N. lat. 45° 25′. W. long. 86° 20′.

NORA, a town of Sweden, in the province of Weſtmanland; 28 miles N.N.W. of Upſal.

NORADIN, in *Biography*, the ſon of Sanguin, or Emadeddin, ſultan of Aleppo and Nineveh. When his father was ſlain by his eunuchs at the ſiege of Calgembar, in 1145, Noradin and his brother Seifſeddin divided the ſtates between them. The former obtained the ſovereignty of Aleppo, and by his prudence became one of the moſt potent princes in the Eaſt. He diſtinguiſhed himſelf very greatly againſt the Chriſtians in the time of the Cruſades, and defeated Joſcelyn, count of Edeſſa, and Raymond, prince of Antioch, after which he made himſelf maſter of Egypt. He died in 1174. He is characteriſed as a brave and generous prince, and many inſtances are related of his liberality.

NORAGUACHI, in *Geography*, a town of New Mexico, in the province of Cinaloa; 130 miles N E. of Cinaloa.

NORAGUES, a river of Guiana, which runs into the Atlantic, N. lat. 4° 50′. W. long. 53° 6′.

NORAIE, LA, a town of Canada, on the river St. Laurence; 26 miles N.N.E. of Montreal.

NORAMPOUR, a town of Bengal; 15 miles S.E. of Calcutta.

NORANTEA, in *Botany*, a name of intolerable barbariſm, perverted from the Guiana appellation of this tree, *Corono-antegri*, and juſtly rejected by Schreber.—Aubl. Guian. v. 1. 554. t. 220. Juſſ. 245. Lamarck Illuſtr. t. 447. (Aſcium; Schreb. 358. Willd. Sp. Pl. v. 2. 1172.) See ASCIUM and MARCGRAVIA.

NORBA, in *Ancient Geography*, a town of Italy, in Latium, at ſome diſtance to the left of the Appian way. Its ruins are ſtill viſible here, and conſiſt of a wall about five or ſix miles in circuit, gates, towers, and other traces of buildings.

NORBA *Cæſarea* (Alcantara in Eſtramadura), a town of Spain, in Luſitania, ſituated towards the N.W., on the Tagus. Pliny calls it "Norbenſis Colonia," which proves that it was a Roman colony,

NOR-BARKE, in *Geography*, a town of Sweden, in Dalecarlia; 22 miles W.S.W. of Hedemora.

NORBEKITEN, a town of Pruſſia, in the province of Natangen, on the left bank of the Pregel; 48 miles E. of Königſberg.

NORBERG, a town of Sweden, in the province of Weſtmanland, in the vicinity of which are the beſt iron-mines of the province; 34 miles N. of Stroemſholm.

NORBERG, a town of Denmark, in the iſland of Aſſen. N. lat. 55° 3′. E. long. 9° 46′.

NORBERT, in *Biography*, a ſaint in the Roman calendar, and founder of the Premontrè order of Auguſtine monks, deſcended from ſome of the moſt illuſtrious families of Germany, was born at Santen, a village belonging to the duchy of Cleves, in the year 1082. He was educated in the palace of Frederic, archbiſhop of Cologne, and was afterwards called to the court of the emperor Henry V., to whom he was related. Having made choice of the eccleſiaſtical life, he received deacons' and prieſts' orders in the ſame day, and was inſtantly raiſed to honour in the church. Afterwards the emperor created him his almoner, and offered him the biſhopric of Cambray, which he refuſed. He was diſtinguiſhed by a pleaſing perſon, agreeable manners, wit and humour, qualities that led him into company, by whoſe example he was inſenſibly corrupted, and in the end he diſgraced his profeſſion by giving himſelf up to irregularity and vice. At length his former good principles excited the compunctions of conſcience, and he had fortitude to renounce his connections, and to ſet himſelf ſeriouſly to the buſineſs of reformation. He reſigned his different church-preferments, ſold his patrimonial eſtate, and diſtributed the proceeds among the poor. From this period he zealouſly devoted himſelf to the office of preaching, wandering about from city to city, and from country to country, for the purpoſe of combating hereſies, and reforming the vicious and profligate. The biſhop of Laon beſtowed on him a ſequeſtered dale, named *Premontrè*, to which he retired in the year 1120, and there founded an inſtitution of canons-regular, which took its title from the name of the ſecluded ſpot in which it was eſtabliſhed. To this place he attracted vaſt crowds by the popularity of his ſermons, and gained many diſciples, who ſubmitted to his code of diſcipline, formed on the regulations of St. Auguſtine, with the ſevere injunction of perpetual

perpetual ſilence, and permiſſion to have only one frugal meal on each day. This order was confirmed in 1126 by pope Honorius II., and in a very ſhort time Norbert ſucceeded in founding eight other monaſteries, which adopted his diſcipline. In the year 1127 the people and clergy of Magdeburg prevailed upon him to accept of the archbiſhopric of their city. In 1131 he was preſent at the council of Rheims, which confirmed the election of pope Innocent II.; and he accompanied the emperor Lotharius to Rome, when he advanced with an army to expel from the ſeat of papal government Anacletus II., the rival of that pontiff. He died at Magdeburg in 1134, when he was only fifty-two years of age. He was placed in the catalogue of ſaints in the year 1584. The only part of his writings that has come down to our times is a ſhort moral diſcourſe, in the form of an exhortation to the monks of his order, which is inſerted in the 21ſt volume of the Bibl. Patrum.

NORBERT, a Capuchin friar, famous for his adventures, and his hoſtility to the Jeſuits, was the ſon of a weaver at Bar-le-duc, of the name of Pariſot, where he was born in the year 1697. He embraced the monaſtic life, and after various employments, obtained, about the year 1734, the poſt of attorney-general of the foreign miſſions. In 1736 he went to Pondicherry, and was made a pariſh-prieſt of that city by M. Dupleix, the governor. Here he quarrelled with the Jeſuits, and removed from the Eaſt Indies to America. In different parts of this country he exerciſed the miniſterial functions for a few years, and returned to Rome in 1744. He was now employed in drawing up an account of the religious rites of the Malabar Chriſtians, and that he might not be interrupted by the intrigues of the Jeſuits, he withdrew to Lucca, where he completed his work, under the title of "Hiſtorical Memoirs relative to the Miſſions into the Indies," in two vols. 4to. This work abounds in curious facts, and excited a great ſenſation at its firſt appearance, by diſcovering the means made uſe of by the miſſionaries of the ſociety of Jeſus, in order to increaſe their number of converts. This exaſperated the Jeſuits againſt him, and he was obliged to quit his country; he went firſt to Venice, then to Holland, and afterwards to England, where he eſtabliſhed in the neighbourhood of London two manufactories of tapeſtry. From London he removed to Pruſſia, and from thence into the duchy of Brunſwick. Here he was allowed by the pope to aſſume the habit of a ſecular prieſt. He now aſſumed the name of the abbè Platel, went to France, and from thence to Portugal, where, on account of the perſecutions which he endured, he obtained a penſion. Having completed his great work againſt the Jeſuits, he reviſited France, and committed it to the preſs, in ſix vols. 4to. Afterwards he re-entered the order of the Capuchins at Commercy, but being of a reſtleſs diſpoſition, he ſoon quitted their community, and took up his abode at a village in Lorrain, where he died in 1770, at the age of ſeventy-three.

NORCIA, in *Geography*, a city of Italy, in the duchy of Spoleto, the ſee of a biſhop, ſuffragan of the pope; governed by its own magiſtrates; 18 miles S.E. of Spoleto. N. lat. 42° 37′. E. long. 13° 4′.

NORDBERG, JORAN, in *Biography*, was born at Stockholm in the year 1677. Having completed his education at the univerſity of Upſal, he entered into holy orders in 1703, and being appointed chaplain-extraordinary to the artillery, joined the Swediſh army, then encamped before Thorn, and remained with it during the campaigns in Poland and Saxony till the year 1709. In the courſe of that period he formed an acquaintance with the moſt celebrated of the German literati, and was promoted to be firſt chaplain to the royal life-guards, and chaplain to the court. After the battle of Pultowa he was taken priſoner by the Ruſſians, but was permitted to remain in the ſame place with count Piper, the Swediſh miniſter, alſo a captive, whom he accompanied in all the removals which he experienced during his long confinement. In 1715 he was exchanged, and returned to Stockholm; in the following year he repaired to his ſovereign at Stralſund, and afterwards attended him to Scandinavia, and in his expedition to Norway. Towards the cloſe of the year he was appointed to the living of St. Clara and St. Olaus, at Stockholm, and in 1731 was ſelected to compoſe a hiſtory of Charles XII., a taſk which he executed in a very ample manner, partly from facts derived from his own obſervation, and partly from information communicated to him by various perſons who had accompanied the northern hero in his campaigns. This work, after frequent reviſions, was publiſhed at Stockholm in the year 1740, in two volumes folio, and afterwards tranſlated into the German and French languages. The author of it died in 1744. He was always held in great eſteem by his ſovereign, and after his death he enjoyed the favour of the queen Ulrica Eleonora, the king's ſiſter. Beſides his hiſtory, he publiſhed ſome funeral ſermons, of which he wrote a great number.

NORDEN, FREDERIC LEWIS, a naval officer in the Daniſh ſervice, was born at Glucksſtadt, in Holſtein, in the year 1708. He was ſkilled in mathematics, in ſhip-building, and all the branches of agriculture. In 1732 he obtained a penſion to enable him to travel for the purpoſe of ſtudying the conſtruction of ſhips, particularly the galleys and other rowing-veſſels uſed in the Mediterranean. He ſpent about three years in Italy, and Chriſtian VI. being deſirous of obtaining a circumſtantial account of Egypt, Mr. Norden, while at Florence, received an order to extend his travels into that country. He publiſhed an account of his travels into Egypt and Nubia in the year 1756, which were tranſlated into the Engliſh by Dr. Peter Templeman. In the war between England and Spain, Mr. Norden, then a captain in the Daniſh navy, attended count Ulric Adolphus, a ſea-captain, to England; and they went out volunteers under ſir John Norris, and afterwards under ſir Chaloner Ogle. During his reſidence in London, Mr. Norden was made fellow of the Royal Society, and gave the public drawings of ſome ruins and coloſſal ſtatues at Thebes in Egypt, with an account of the ſame in a letter to the Royal Society, in 1741; after this he undertook a tour into France, and died at Paris in 1742.

NORDEN, in *Geography*, a ſea-port town of Eaſt Frieſland, about three German miles from the ſea, large and commercial, with a good harbour; 15 miles N. of Emden. N. lat. 53° 34′. E. long. 7° 10′.

NORDENBURG, a town of Pruſſia, in the province of Natangen, founded by the Teutonic knights in a lake in 1305; 45 miles S.E. of Königſberg. N. lat. 54° 16′. E. long. 21° 45′.

NORDERNAY, an iſland in the German ocean, near the coaſt of Eaſt Frieſland, about four miles long, and two at its greateſt breadth. N. lat. 53° 40′. E. long. 7° 8′.

NORD FIORD, a bay on the N. coaſt of Iceland, N. lat. 66°. W. long. 17° 46′.

NORDFOE, a lake of Norway, 32 miles in circumference; 50 miles W. of Chriſtiania.

NORDHALBEN, a town of Bavaria, in the biſhopric of Bamberg; 36 miles N.E. of Bamberg. N. lat. 50° 23′. E. long. 11° 37′.

NORDHAUSEN, a city of Germany, ſituated on the Zorge, between the county of Hohenſtein and the lordſhip of Klettenberg, and divided into Old and New; containing

ſeven Lutheran churches and an orphan-houſe. It carries on a good trade in corn to the Upper Harz, and diſtils great quantities of brandy; it has alſo manufactures of marble and alabaſter, the materials of which are brought from Stollberg and Hohenſtein. It was a free imperial city from its foundation. In 1802 it was given among the indemnities to the king of Pruſſia, and in 1807 it was annexed to Weſtphalia, 38 miles N. of Erfurt. N. lat. 51° 28′. E. long. 10° 56′.

NORDHEIM, a town of Weſtphalia, in the province of Calenberg, ſeated on the Ruhme, which, ſeparating into two branches, runs into the Leine. It has one pariſh-church, a grammar-ſchool, and ſome manufactories. Albert the Great raiſed it into a town in 1252; 10 miles N. of Gottingen. N. lat. 51° 40′. E. long. 9° 57′.—Alſo, a town of the duchy of Wurzburg; 7 miles N. of Biſchoffsheim.

NORDINGEN, a town of Sweden, in Angermanland; 21 miles N N.E. of Hernoſand.

NORDKIOPING, a town of Sweden, in the province of Eaſt Gothland, on the river Motala, founded in 980. It is next in extent to Stockholm, a ſtaple town, and formerly fortified; it contains five churches, and about 10,000 inhabitants; its trade is conſiderable, and it has a new and commodious quay. It has two copper-mills, a hammer-mill for braſs, ſeveral paper-mills, fifty corn-mills, woollen manufactures, a ſalmon-fiſhery, &c.; 76 miles S.W. of Stockholm. N. lat. 50° 36′. E. long. 16° 4′.

NORDKIRCHEN, a town of Germany, in the biſhopric of Munſter; 6 miles N. of Werne.

NORDLAND, a province of Sweden, bounded on the N. by Lapland, on the E. by the gulf of Bothnia, on the S. by Proper Sweden, on the W. by Norway, lying between 60 and 67½° N. lat. It is a rocky and mountainous province, diverſified with foreſts, verdant vallies, lakes, and rivers. It abounds with timber and veniſon; but has only a ſmall portion fit for tillage. This province has, beſides timber, ſeveral rich mines, forges, hammer-mills, and other works for metal. Its lakes and rivers ſupply plenty of fiſh, and cattle in great number are bred in the country. It abounds with flights of wild geeſe. Beyond Upland bees are ſcarce. Some ſcattered tracts of land are inhabited by Finlanders. It is divided into ſeven provinces, and is ſuppoſed to contain 95,000 ſquare miles, and 150,000 inhabitants, including the natives of Lapland. The provinces are, Gaſtrickland, Helſingland, Medelpad, Jemptland, Harjedalia, Angermannia, and Weſtro-Bothnia.

NORD-LIBRE, (Condé), a town of France, in the department of the North, and chief place of a canton, in the diſtrict of Douay. The place contains 5978, and the canton 13,621 inhabitants, on a territory of 87½ kiliometres, in 10 communes.

NORDLINGEN, a city of Bavaria, ſituated in a fertile country on the Eger, with abundant paſturage. Until the year 1802, it was free and imperial, when it was given, among other indemnities, to the elector of Bavaria. The burghers are almoſt wholly Lutherans, who have three churches; but the Roman Catholics alſo have a place in which they celebrate their worſhip. The magiſtracy is compoſed of Lutherans. In 1796 it was taken by the French; 30 miles N.N.W. of Augſburg. N. lat. 48° 49′. E. long. 10° 31′.

NORDMALING, a ſea-port town of Sweden, in the province of Angermanland, ſituated in a bay of the gulf of Bothnia. N. lat. 63° 34′. E. long. 19° 24′.

NORDMARSCH, a ſmall iſland of Denmark, in the North ſea; 3 miles N.W. of Nordſtrand.

NORDORF, or Nordtorp, a town of the duchy of Holſtein; 13 miles S.W. of Kiel.

NORDRE Rönnerne, a cluſter of iſlets and rocks in the Cattegat, about four miles from the N.W. coaſt of the iſland of Leſſoe. N. lat. 57° 22′. E. long. 10° 55′.

NORDSTRAND, an iſland of Denmark, in the North ſea, near the coaſt of Sleſwick. The ſea has often inundated it, and in 1634, the impetuoſity of the waves ſwept away 6408 perſons, 1332 houſes, 30 wind-mills, 6 churches, and 50,000 head of cattle; and a great part of the iſland was deſtroyed. It formerly contained 22 pariſhes, and abounded in corn and cattle; but now only one pariſh remains. N. lat. 54° 37′. E. long. 8° 48′.

NORE, a river of Ireland, which riſes at the ſouthern part of the Slieve Bloom mountains, in the Queen's county, very near the riſe of the Suire. After making a ſweep to the eaſtward, it takes a S.S.E. direction through the Queen's county and that of Kilkenny, paſſing the city of Kilkenny and the towns of Thomeſtown and Iniſtioge, and joining the Barrow, which riſes in the northern part of the ſame mountains, a little to the north of New Roſs.—Alſo, a noted place in the river Thames, E. of the iſland of Grain, on which is a light fixed and a floating veſſel. N. lat. 57° 27′. E. long. 0° 44′.

Nore, *Black*, a cape of England, on the coaſt of Somerſetſhire, in the mouth of the Severn; 5 miles S.W. from the mouth of the Avon.

NOREGNA, a town of Spain, in Aſturias; 8 miles N.N.E. of Oviedo.

NORENBERG, a town of Germany, in the New Mark of Brandenburg; 21 miles E.N.E. of Stargard. N. lat. 53° 27′. E. long. 15° 33′.

NORES, Jason de, in *Biography*, a man of letters of the 16th century, was born at Nicoſia, in the iſle of Cyprus. In his youth he ſtudied at Padua, where he graduated. On his return to Cyprus, hearing of the death of his friend, Trifon Gabrielli, a learned man, whoſe houſe he had frequented at Padua, he put into Latin the Commentaries on Horace's Art of Poetry, which he had taken from the mouth of Trifon, and publiſhed them at Venice, with the addition of a brief compendium of Cicero's De Oratore. When Cyprus fell into the hands of the Turks in 1570, De Nores retired to Venice, with the loſs of all his property, and lived there ſome years, probably ſupported by the liberality of ſome of the nobles. In 1577 he was appointed by thoſe of his own nation to plead in their behalf before the doge, and not only obtained for them a ſettlement in the city of Pola, with many privileges, but procured for himſelf an appointment to the chair of moral philoſophy at Padua. In this ſituation he wrote the greater part of his works, and continued to exerciſe his profeſſional charge till his death, in the year 1590. The ſubjects of his ſeveral works are philoſophical, coſmographical, political, and rhetorical. They diſplay much learning, and are written in a good ſtyle. Moreri.

NORFOLK, in *Geography*, a county of England, ſituated on the eaſtern ſide of the iſland, and ſurrounded by the following counties and waters, *viz.* the German ocean, or North ſea, on the north and eaſt, Suffolk on the ſouth, and the county of Cambridge on the weſt The area thus encloſed is nearly of a circular form, and diſplays almoſt a flat ſurface: *i. e.*, it has no prominent hills nor deep vallies. It is ſo ſurrounded by its marine and river boundary, that it may be conſidered almoſt an iſland, being connected with the adjacent land to the ſouth ſolely by a narrow cauſeway, raiſed through the marſhes, near Lopham. The longeſt diameter is in the direction of eaſt to weſt, from Yarmouth to Wiſbeach

beach; and the conjugate diameter, north and ſouth, from Wells to Billingford. Templeman eſtimates the former to be fifty-ſeven miles, and the latter thirty-five. He alſo ſtates the contents to be 1426 ſquare geographical miles; but Mr. Kent, whoſe ſkill and accuracy in ſurveying appears preferable, ſtates, in his "General View of the Agriculture of Norfolk," the greateſt length to be fifty-nine miles, and the greateſt breadth to be thirty-eight, compriſing an area of 1710 ſquare miles, and 1,094,400 ſtatute acres. Mr. Young, not being ſatisfied with this ſtatement, had the lateſt ſurvey of the county carefully meaſured; the reſult of which meaſurement gives 1830 ſquare miles for ſuperficies, and this countenances Mr. Howlett's opinion, that Norfolk is larger than Eſſex, which is eſtimated to contain 1,240,000 ſtatute acres.

Norfolk is divided into thirty-three hundreds, containing one city, four ſea-ports, twenty-five other market-towns, and ſeven hundred and fifty-ſix pariſhes; a greater number than any other county in the kingdom.

Climate, &c.—From the ſituation of the county, parts of it being expoſed to the ocean, and others to a large extent of marſh-land, the air is extremely cold in winter, and at the early part of ſpring. North and north-eaſterly winds, it has been obſerved, are more prevalent here than in any other part of the kingdom. Theſe are ſeverely felt, and vegetation is conſequently backward. The contiguity to the ſea and the marſhes, with the vapours brought from Holland, accounts for the frequent rains during the ſummer months; at which ſeaſon, ſtorms of thunder, lightning, and tornadoes, are not unuſual, though they are ſeldom of ſo long duration as in more hilly diſtricts. Mr. Young conſiders the temperature as rather affecting animal than vegetable life; but there does not appear any juſt ground for the diſtinction. The vital principle, whatever it may be, is evidently homogeneous throughout nature; and whatever operates upon that will produce ſalutiferous or deleterious effects upon vegetables as well as animals, though different in degree, and unequal in importance. Whoever has viſited this county in the ſpring, and has previouſly examined the operations of nature in the midland diſtricts, will be ſurpriſed at the backward appearance of the crops, and at the ſight of nature dwindling under the apparent influence of even a genial ſun. In the hundred of Marſhland, and other fenny parts of the county, the air is not only cold, but exceedingly damp; and the inhabitants are ſubject to intermitting fevers. Theſe are endemial, ſo that ſtrangers, on their firſt reſidence, are generally attacked with agues; on which occaſion they are proverbially ſaid to be "arreſted by the bailiff of Marſhland." The county to the north and north-weſt of Thetford, forming the greater part of Norfolk, conſiſting of a ſandy or gravelly ſoil, is peculiarly ſalubrious and pleaſant.

Surface, general Appearance, and Soil of the County.—The face of Norfolk may be conſidered as leſs varied in its features than that of any tract of country of equal extent in the kingdom. In the northern parts, the general ſurface is ſomewhat broken into moderate elevations and depreſſions; where turf-clad hills and fertile vallies are diverſified by woods, coppices, hedge-rows, and other enlivening ſylvan decorations. The cottages and ſmall farm-houſes are many of them of wattle and dab, or lath and plaſter, and covered with thatch; there are ſome, however, neatly built of brick, and roofed with ſlate or pantile. Numerous good houſes of opulent yeomen, and the ſeats of the nobility and gentry, adorn many parts of the county. The ſurface, Mr. Kent obſerves, except about Norwich, and on the coaſt near Sherringham and Cromer, is chiefly a dead flat, the aſpect uniform; and, as the moſt intereſting parts lie to the ſouth-weſt, where ſtrangers generally enter the county, it muſt offer to them a dreary and forbidding appearance. The entrance from the ſouth, by way of Colcheſter, however, brings the traveller into a fine rich country, towards the north and north-eaſt; and theſe parts being encloſed, well cultivated, and abounding with timber, more than moſt maritime diſtricts, exhibit a variety of cheerful ſcenes and pleaſing views. "As to the ſoil," obſerves Fuller, "here are fens and heaths, light and deep ſand and clay-grounds, meadow-lands, and paſtures and arable, wood-lands, and woodleſs." Mr. Kent divides the county into five parts as to ſoil. Firſt, the diſtrict to the north and north-eaſt of Norwich, compriſing the hundreds of Eaſt and Weſt Flegg, South Walſham, Blofield, Wapping, Tunſtead, and the greateſt part of North and South Erpingham, which conſiſts of a ſandy loam, "equal in value to the beſt part of the Auſtrian Netherlands, to which it is ſimilar." Second, the diſtrict to the ſouth and ſouth-eaſt of Norwich, including the hundreds of Loddon, Clavering, Henſtead, Earſham, Diſs, Deepwade, and Humbleyard, and ſome parts of Forehoe and Mitford, conſiſts of ſtiff wet land, compoſed of a mixture of ſand and clay, and abounds with ſprings. Third, the diſtrict containing the largeſt part of the county, and lying to the weſt and north-weſt of Norwich, compriſes the hundreds of Taverham, Eynsford, Holt, North Greenhoe, Gallow, Launditch, Brothercroſs, Smithdon, Freebridge, and Clackcloſe. This is what generally goes by the name of Weſt Norfolk, and conſiſts principally of light ſandy land, and "is a very inferior country to the two preceding diſtricts." The fourth diſtrict, lying ſouth-weſt of Norwich, compriſes the hundreds of Shropham, Guiltcroſs, Weyland, South Greenhoe, and Grimſhoe, conſiſts of a light ſand; ſo light, indeed, in the latter hundred, that it frequently drifts in the wind, and is bare of vegetation. Marſhland may be conſidered a fifth diſtrict by itſelf, conſiſting of ooze formed by depoſition from the ſea. To this may be added a narrow tract of ſimilar land on the eaſtern part of the coaſt near the mouth of the rivers Yare and Waveney. This extends a conſiderable diſtance up the county towards Norwich; the whole of which, in winter, is generally under water, and in the ſpring it is expedient to drain it for the purpoſes of depaſturing. There are alſo large tracts of ſwampy ground in the vicinity of Lodham, frequently inundated by land floods, and producing little but ſedge and reeds. In the ſouth-weſt part of the county is an extenſive tract of land, which cannot claſs with either of Mr. Kent's diviſions, being eſſentially different from them all. It forms part of that immenſe fenny diſtrict, which extends out of this county into thoſe of Cambridge, Northampton, and Huntingdon, alſo into Suffolk and Lincolnſhire.

The ſoils of this county are deſcribed by Arthur Young in the following table, which ſpecifies the number of ſquare miles and acres occupied by each.

	Square Miles.	Acres.
Light ſand	220	140,800
Good ſand	420	268,800
Marſhland clay	60	38,400
Various loams	900	576,000
Rich loam	148	94,720
Peat	82	52,480

Woods and Plantations.—Norfolk, by ſome writers, has been deſcribed as a well wooded county; and by others as almoſt wholly deſtitute of that intereſting veſture: both opinions have proceeded from a ſuperficial or partial view of the diſtrict. In ſome parts the hedge-rows abound with numerous

numerous trees, which, at a diſtance, by aggregation, give an idea of extenſive woods; and in others the great expanſe of heath and unincloſed lands, ſtript of every timber tree, exhibit a drearineſs which, unrelieved by ſylvan ſcenery, tends to impreſs the mind with the idea that Vertumnus, as well as Pomona, have neglected or refuſed to take this diſtrict under their protection. There are, however, numerous woods, but they are partially ſcattered through the county. The principal are thoſe of Foxley, in the hundred of Eynsford; ſome to the weſtward of Wymondham, in Forehoe; Shotteſham, in Henſtead; Aſhwellthorpe, Hampnell, and Bunwell, in Deepwade; Hethel, Hetherſel, and Hetteringham, in Humbleyard. A laudable ſpirit has prevailed of late among the proprietors of large eſtates to plant, not merely for embelliſhment, but for uſe. Extenſive plantations of timber trees have been made in many parts, but more particularly in the north-weſtern.

Coaſts, Rivers, Canals, Roads, &c.—The coaſt of Norfolk varies conſiderably in its outline and ſubſtance from the ſouth and weſtern ſhores of the iſland. No deep indented bays, nor ſinuous creeks interſect the land, nor beetling rocks and bold impending crags here form an adamantine barrier to the aſſailing waves: and though a continuation of that great bed of chalk, which, commencing in the high cliffs of Dorſetſhire, paſſes through the kingdom, and terminates here, yet it forms on this part of the coaſt no proud elevations nor conſpicuous heights. The ſhores are generally flat. In the vicinity of Cromer is a ſmall bay, where ſome bold headlands preſent themſelves: and ſome wooded hills make a little variety in the neighbourhood of Sherringham. Excluſive of theſe, which are on a ſmall ſcale, Hunſtanton-cliff, commonly denominated St. Edmund's Point, from king Edmund having landed there when he took poſſeſſion of Eaſt Anglia, may be conſidered as the only rocky prominence of much note on the coaſt. The other eminences conſiſt of clay, and are conſtantly becoming a prey to the depredations of the ocean. Much of the coaſt is compriſed of a low ſandy beach, covered with gravel and looſe pebbles, here called ſhingles; which, by the violence of the waves, are frequently thrown up in immenſe heaps. Theſe, by the continual accumulations of ſand, are formed into banks, which are kept together by the matted roots of what is called *ſea-reed graſs*. Numerous banks of this kind lie off the coaſt far out at ſea; and being only diſcoverable at ebb or quarter tides, they are juſtly the dread of mariners, and frequently prove fatal to coaſting veſſels. Of theſe, the moſt remarkable is the large bank running parallel with the coaſt off Yarmouth, between which and the ſhore is a deep channel, where veſſels ride ſafely during tempeſtuous weather. This is known by the name of Yarmouth Roads.

The ranges of ſand-hills on this, like thoſe on the oppoſite coaſts of Holland, tend to preſerve a valuable portion of country from continual inundation. A line of theſe, called the Meals, or Marum Hills, commences at Caiſter, two miles north of Yarmouth, and extends, with occaſional interruptions, to Happiſbury Point, where two light-houſes have lately been erected, and thence to Cromer Bay, where what are called the Mud Cliffs begin, and line the northern ſhore to Lynn Regis. Theſe ſand-banks are not all permanent; they ſometimes ſhift their ſtation by a ſub-marine route. Suddenly they diſappear, and as ſuddenly riſe up in a new ſhape at ſome diſtant point, a curious inſtance of which happened on the coaſt near Yarmouth about two centuries ago; which will be noticed in a ſubſequent account of Yarmouth.

The principal rivers of Norfolk are the Great Ouſe, the Little Ouſe, the Waveney, the Bure, the Wenſum, the Yare, and the Nar. The Great Ouſe, or Ouze, riſes near Brackley, in Northamptonſhire, and having been previouſly joined by the Lark, the Cam, and the Little Ouſe, enters this county to the ſouth-weſt of Downham; paſſes under Stow, Magdalen and German bridges, and then, joined by the Nar from the eaſtward, empties its waters, after a courſe of nearly ſixty miles, into the bay called by Ptolemy Metaris-Æſtuarium, two miles below the harbour of Lynn Regis; where the trade of that port exhibits a crowd of veſſels on its eſtuary, called Lynn-Deeps. The tide flowed up this river many miles further formerly; it now being checked by ſluices, erected near Denver for the purpoſes of drainage and navigation. This river "is remarkable for its extraordinary ſwell or overflowings at the two equinoxes, and eſpecially at the full moon of the autumnal one; when a vaſt heap of waters from the ſea comes in upon it, with every thing in its way, and the very water-fowl ſhun it." It is navigable twenty-four miles above Lynn for barges through this county, and for ſmall boats as far as Bedford; thus forming a communication by means of other collateral rivers and canals with ſeven of the midland counties.

The Little Ouſe, or, as in ſome deeds it is denominated, Brandon river, riſes in a ſwampy meadow near the village of Lopham, in the ſouthern part of this county; and, taking its courſe weſterly by Ruſhford, receives a ſmall ſtream from Ixworth. It is joined by the Thet at Thetford, whence, meandering through a ſandy ſoil, it paſſes under Brandon bridge, and ſtealing along with ſolemn pace through the unintereſting level of the fens is then "wedded," as Drayton calls it, to the Greater Ouſe at Littleport, on the borders of Cambridgeſhire. The Little Ouſe is navigable up to Thetford.

The Waveney alſo takes its riſe at Lopham. It is ſomewhat ſingular, that though the Little Ouſe and the Waveney have their ſources in the ſame tract of ſwampy ground, and near each other, they immediately take oppoſite directions in their courſe to the ſea; the one running due weſt, and the other almoſt directly eaſt. The Waveney is navigable for barges from Yarmouth, to Bungay bridge in Suffolk.

The Bure riſes near Heldolweſton, on the north ſide of the county, and, taking its courſe by Blickling, becomes navigable at Ayleſham. After receiving ſome tributary ſtreams, and flowing under Wroxham bridge, it paſſes the ſcite of St. Bennet's abbey, where it receives the Ant. A little further it is joined by the Thone, flowing from a lake near North Walſham; then paſſing under Acle bridge, and increaſed by the ſuperfluous waters of the marſhes, it joins the Yare, on the northern ſide of Yarmouth.

The Wenſum riſes near Weſt Rudham in this county, and being joined by numerous ſmall rivulets in its progreſs, it paſſes the city of Norwich, part of which it environs. At Trowſe it meets the Taſs, or Taſe, and near Burgh is joined by the Waveney; about two miles weſt of Yarmouth it merges into the Yare.

The Yare is ſuppoſed to riſe near Attleborough, and taking a north-eaſterly courſe joins the Wenſum to the eaſt of Norwich.

The Nar, called alſo Seeky and Seecky river, has its ſource at Litcham, paſſes Caſtle-Acre to Narborough, thence flowing under Seeky bridge, falls into the Great Ouſe near Lynn Regis. It is navigable from the latter as far as Narborough, an extent of about fifteen miles.

The Nene is no otherwiſe connected with Norfolk than ſerving to form part of the weſtern boundary between this county and that of Lincoln.

Moſt

Moſt of theſe rivers riſe in marſhy lands, and, running through a comparatively level country, the fall is conſequently ſmall, and their pace ſlow; ſo that they contribute to keep the adjacent grounds in a ſwampy ſtate, and to fill the atmoſphere with denſe vapours. Swelled by land-floods above, and their mouths commonly choaked by ſilt, thrown up by the violence of the tide below, they often overflow the low lands, and in their courſe form numerous, ſmall, ſhallow lakes or pools, which are provincially termed *Broads* and *Meers*. Theſe are plentifully ſtocked with fiſh, and much frequented by water-fowls. The principal of them are in that diſtrict through which the Bure, the Wenſum, and the Waveney have their courſe. Breedon, or Breydon-Broad, to the ſouth of Yarmouth, is three miles in length, and one mile and a half in breadth. Hickling-Broad is nearly three miles in length, and about one wide. That of Rockland is one mile and a half long, and half a mile wide. In the vicinity of theſe are ſeveral others of ſmaller extent, and of irregular dimenſions. There are others at Quidenham, Diſs, and Hingham. In the fenny diſtricts many temporary ones are formed during the winter ſeaſons, in the neighbourhood of which are numerous decoys for catching wild fowl.

Canals.—With reſpect to inland navigation, little more has yet been done in this county than widening and cleanſing the beds of the natural rivers, and rendering them ſubſervient to the purpoſes of internal conveyance. Much has been accompliſhed for a ſituation ſo circumſtanced as Norfolk, and much more remains to exerciſe the ingenuity, and call forth the public ſpirit of the people. A canal has been completed from Wiſbeach in Cambridgeſhire, to Outwell creek, and Salter's Load in Norfolk, an extent of about ſix miles, to render the navigation of the river Nene more effectual. A few years ago a propoſition was brought forward, and met with conſiderable ſupport, for making the river Wenſum navigable from Norwich to Fakenham: but the difficulties attending the plan, and the expences likely to be incurred in its execution, appeared to preponderate over the probable advantages to be derived from it by thoſe parts of the country through which the line was propoſed to extend. Had the ſcheme been carried into execution, it would have added, ſays Mr. Colhoun, more conſiderable advantage to the county of Norfolk than ariſes from any of the river navigations before enumerated. There are ſeveral ſmall cuts from the navigable rivers to private eſtates for the purpoſes of carrying corn to the markets, and freighting back manure for the improvement of lands.

Roads—From the nature of the various ſoils, the roads of Norfolk might be expected to be bad; but the reverſe of this is generally the caſe. By a comparative ſtatement, according to Mr. Kent, they "are better in their natural ſtate in this than in almoſt any other county." At the time king Charles II. paid a viſit to the earl of Yarmouth at Oxnead, in the year 1671, when roads had not been improved by the aid of tolls, he is ſaid to have remarked, "that Norfolk ought to be cut out in ſtrips to make roads for the reſt of the kingdom." Except in the marſhes and fens, the roads are free from ſloughs and deep ruts; and though the ſuperſtratum is chiefly ſand, yet it reſiſts the preſſure of carriage-wheels, a lit le beneath the ſurface: and the plentiful ſupply of gravel afforded in almoſt every part facilitates their repair at a moderate expence. Although this county claims the credit of having made the firſt road, in compliance with the Turnpike Act; yet, ſince that period, moſt other counties have ſurpaſſed it in ſuch kind of improvements. The number of turnpike roads in the county is ſaid to be ſeventeen, including an extent of about two hundred and fifty miles. Beſides theſe, there are many public ways, thirty and forty feet wide, which are equally commodious for travelling, without the interruption and expence of toll-bars; having mile-ſtones and finger-poſts erected upon them for the direction of travellers. Some of theſe are kept in order by parochial rates, and others are repaired by private gentlemen.

Natural Hiſtory, Productions, &c.—The natural hiſtory of this county has hitherto been much neglected or withheld from the public. Some reſearches have lately been made by a gentleman eminently qualified for ſuch enquiries; the reſult of which, it is hoped, will ſhortly be preſented to the world.

The native cow, a ſmall animal, with ſhort turned-up horns, "approaching to the Alderney," is generally of a red colour; not a good milcher, but hardy, and calculated for barren paſtures. "Great part of this county is known to have been, within the ſpace of a century, a wild, bleak, unproductive diſtrict; comparatively ſpeaking, at leaſt half of it was rabbit warrens and ſheep-walks. The ſheep were as natural to the ſoil as the rabbits, being hardy in their nature, and of an agile conſtruction, ſo as to move over a great ſpace with little labour." Among the farmers this breed of ſheep is called *Norfolks*. It is a hardy horned animal, with a black noſe, and feet of the ſame colour; carries a fleece of nearly two pounds; and, when fatted, weighs about eighteen pounds *per* quarter.

The pig of this diſtrict is comparatively a ſmall, thin, briſtled breed; very prolific, and the fleſh eſteemed ſavoury. The people of this county have an excellent mode of curing hams and cheeks; but the practice of feeding hogs for bacon is very ſeldom adopted here. The quantity of ſwine has been diminiſhed by the decline of dairy farms, and the incloſure of the waſte lands.

Poultry of all kinds are plentiful, and of a ſuperior quality. Owing to the dryneſs of the ſoil, in the ſandy and loamy diſtricts, and the range afforded by the unincloſed parts, turkies are numerous; and the modes of feeding them produces a delicacy of flavour which has ſtamped a kind of impoſing pre-eminence on every bird which bears the name of a Norfolk turkey. The conſumption of theſe is very conſiderable, both in this and the adjacent counties; and yet ſuch is the abundance, that immenſe quantities are ſent to the moſt diſtant parts of the kingdom. It has been computed, that more turkies are bred in this and the adjoining county of Suffolk, than in the whole kingdom beſides. They are commonly driven on foot to London, and to other diſtant places. During one ſeaſon, upwards of three hundred of theſe flocks, of ſome hundreds each, have been noticed to paſs Stratford-bridge, on the river Stour, in their way to the metropolis; beſides what proceeded by different routes to the ſame market.

Norfolk furniſhes large ſupplies of geeſe, which are bred in the fenny parts of the county. The dealers have taught theſe awkward birds to travel on foot as well as turkies; and prodigious numbers of them are ſent annually to London from the neighbourhood of Downham, Wiſbeach, and Lynn. The driving of theſe to market commences about the beginning of Auguſt, when the harveſt being generally houſed, the ſtubbles furniſh proviſions on the road, where they feed during the night. Turkey-polts, goſlings, chickens, &c. uſed to be conveyed by light caravans; but now they are principally ſent by the ſtage coaches. Of ſuch animals as are feræ naturæ, the rabbit claims the precedence; becauſe it is made an object of trade to a conſiderable extent in this county. Theſe profitable little animals are here extremely numerous; occaſioned not only by their natural

fecundity, which is proverbial, but alſo by the congeniality of the ſoil with their peculiar habits. So prolific are they, that it is with difficulty, in ſome places, that they are kept from increaſing to an alarming extent, as anciently they did, according to Pliny, in the Balearic iſles: numbers breed about Caſtle-Riſing, Thetford, Winterton, and Sherringham; but Methwold-heath is a celebrated place for the fineſt and beſt flavoured. This ſpot was noticed as a rabbit-warren ſo early as the reign of king Canute, A. D. 1016.

What is denominated *game* is very plentiful in this county. Hares, pheaſants, and partridges are very abundant, and are protected with great jealouſy and care by the noblemen and gentlemen of Norfolk. Theſe are noted ſportſmen, and where ſo much game prevails, there are alſo many poachers. Hence proſecutions on the Game Laws are very frequent in this county.

The meers and marſhes of Norfolk are alſo much frequented by woodcocks, widgeon, teal, ducks, and other aquatic fowl. But among the curious birds, either reſidents or occaſional viſitors of Norfolk, that which moſt deſerves notice, becauſe now almoſt become a total ſtranger to the iſland, is the otis tardi, or great buſtard. It is the largeſt of the Britiſh land-fowl; the male bird on an average weighing, according to Pennant, twenty-five pounds, and expands his wings nine feet in breadth; its length is about four. He uſually inhabits the heath-lands and moors. They appear occaſionally to the northward, in the wold of Yorkſhire, and ſouthward on Saliſbury Plain, in Wiltſhire, and on the downs of Dorſetſhire. Some are found on the weſtern ſide of this county. They are very ſhy birds, avoiding the haunts of men; and, though powerful on the wing, they ſeldom fly far without reſting, and are never known to wander above twenty or thirty miles from the ſpot where they were firſt fledged.

The *ſtrix otus curtatus*, or ſhort-eared, long-winged owl, is an occaſional viſitant of this county. This ſingular bird is generally fond of uninhabited places, has been obſerved to frequent the hill of Hay, and other elevated ſpots in the Orkney iſles. It does not, like others of the ſame tribe, alight on trees; but lies under long graſs or ſtubble, where it ſits looking compoſedly at the perſon who attempts to diſturb him. Like the hawk, he flies to ſeek his food by day. He is a bird of paſſage, and migrates about the ſame time as the woodcock, travelling northwards towards the Shetland iſles, and thence to Norway.

The *corvus cornix*, or hooded crow, commonly called the Royſton crow, from the number which frequent the vicinity of the town of that name in Cambridgeſhire, is frequently an unwelcome viſitant of the marſhes. This ſpecies is more injurious than any other of the genus.

That ſingular and proteus-like ſpecies of the ſand-piper, the *tringa pugnax*, is found in this county. The males are called *ruffs*, and the females *reeves*; both are diſtinguiſhed by a tuft of feathers on the back of their necks, by which they may be diſcriminated from all other birds.

Environed by a great extent of ſea-coaſt, abounding in rivers and ſtreams, accompanied by numerous broads and meers, Norfolk is well ſupplied with freſh and ſalt-water fiſh. The Bure, and its attendant broads, abound with various kinds; ſuch as pike, tench, trout, perch, &c. The latter are, indeed, ſo plentiful at times, that the inhabitants at Ranworth report they have witneſſed a hundred and twenty buſhels having been, by two nets, caught in one day. In the Yare, or in the Wenſum, are found a ſingular ſpecies of perch, the *perca cornua*, called a *ruffe*; which Dr. Caius has Latinized into *aſpredo*. It is ſmaller and more ſlender than the common perch, and ſeldom exceeds ſix inches in length. Two great piſcatory concerns are carried on along the coaſt and the ſand-banks in the North ſea, the *mackerel* and the *herring* fiſheries. The mackerel, a gregarious and migratory fiſh, appear in vaſt ſhoals on this coaſt in the ſpring and ſummer, and during the ſeaſon furniſh an abundant ſupply of food to the inhabitants, &c. at a very moderate expence. But the herring-fiſhery is the moſt important and moſt profitable purſuit. It commences in September, and continues about three months; at which time vaſt quantities are caught, cured by pickling or drying, and exported to diſtant places. Of this fiſhery ſome account will be given in the ſubſequent hiſtory of Yarmouth.

Minerals, Foſſils, &c.—Few parts of the kingdom are ſo devoid of ſubterraneous treaſures as Norfolk. No mineral or foſſil ſubſtances have been found ſufficient to excite a mining ſpirit; no veins of that invaluable ſubſtance, coal; nor any extent of ſtratification of uſeful ſtone. The ſubſtrata of the county, as far as reſearches have diſcovered, conſiſt of clunch, chalk, in which flints are imbedded, gault, gravel, ſand, ſilt, and peat earth. On Mouſehold-heath, and in ſome other places, there is an expanſive ſubſtratum of clunch, or indurated chalk, which is uſed for walls, and burnt for lime. It appears to have been formerly applied in buildings, particularly for coignes, mullions, and tracery of windows; and for ſepulchral ornaments, and other works of ſculpture, anterior to the general uſe of alabaſter and marble. The chalk-pits in the vicinity of Norwich abound with thoſe large beautiful black flints which compoſe the walls of many buildings in that city; and the deep pits on Mouſehold-heath are probably the places whence they were dug. In the gault, or argillaceous ſtrata, has been found a clay which manufactures into an excellent kind of earthen-ware. Brick-clay abounds in various places, and, with ſand, forms bricks of equal quality to thoſe made in the neighbourhood of the metropolis. The ſilt, or ſea-ſand, finely pulverized, which is found at various depths, is uſed for repairing the roads. Through the whole of the fen lands, the peat earth furniſhes the poor people with an abundant ſupply of fuel.

On the ſhore near Thornham, at low water, is the appearance of a large foreſt having been at ſome period interred and ſwallowed up by the waves. Stools of numerous large timber trees, and many trunks, are to be ſeen, but ſo rotten, that they may be penetrated by the ſpade. Theſe lie in a black maſs of vegetable fibres, conſiſting of decayed branches, leaves, ruſhes, flags, &c. The extent of this once ſylvan tract muſt have been great from what is diſcoverable; and at high water, now covered by the tides, is in one ſpot from five to ſix hundred acres. No hint of the manner or the time in which this ſubmerſion happened can be traced. Nothing like a bog is near, and the whole beach beſides is compoſed of a fine ooze, or marine clay.

Agriculture, artificial Productions, &c.—The agriculture of Norfolk is in a highly reſpectable ſtate; and when the nature of the ſoil, and the condition of the country about 50 years ago, be taken into a comparative account, the ability and induſtry for which the huſbandmen of this diſtrict have been ſo long famed, will be juſtly acknowledged.

The firſt thing that attracts the eye of the ſtranger in Norfolk is the fine *tilth* of the ſoil, and the ſucceſſion of crops. The mode of cultivating the arable lands is worthy of general imitation, wherever it can be adopted. The plough, which is of an admirable conſtruction, is drawn by two horſes harneſſed abreaſt; and theſe are guided by the perſon who holds the plough. Inſtead of working the animals ſeven or eight hours, without drawing the bit, as is the cuſtom in

ſome

ſome counties, "they are here worked eight hours in winter, and ten in ſummer, by two journies, as they are termed, which enables them to do conſiderably more than they would by one journey." The ploughings are repeated till the land is in high tilth, when it is completely pulverized with drags and harrows, which are violently drawn, by the horſes being kept on a trotting pace. The ridiculous cuſtom of letting the land lie idle one year in every three, for the advantage of what is termed *fallowing*, is here very properly exploded. The neceſſity of it is ſuperſeded, and the reaſons for it done away, by a judicious courſe of cropping; ſo that one crop may fertilize, as another exhauſts. The mode of cropping, in general practice, is what is termed a *ſix courſe ſhift*, *viz.* firſt year, wheat; ſecond, barley, with or without clover; third, turnips; fourth, barley or oats, with or without clover; fifth, clover mown for hay; ſixth, grazed and ploughed up for wheat again. The average crops of the whole county may be ſtated at three quarters of wheat, and four of barley, and other articles in proportion, *per* cre.

Oats are ſown only as a ſhifting crop, and there are ſeldom more raiſed than what are conſumed within the county. Other crops are rye, buck-wheat, peas, beans, vetches, or tares, cole-ſeed, clovers, rye and other artificial graſſes; burnet, cocksfoot, chickery, cabbages, mangel-wurzel, lucerne, carrots, and potatoes. Among what are termed *irregular* crops may be reckoned *muſtard*, which is much cultivated between March and Wiſbeach. Saffron is alſo grown in the ſouth-weſtern diſtrict, and in ſome parts adjacent to Cambridgeſhire. Flax is cultivated in the vicinity of Downham, and near Outwell. Hemp is alſo grown near Old Buckenham, Diſs, Harleſton, &c. but not in ſuch abundance as might be expected.

Butter is made here in conſiderable quantities, and exported under the name of *Cambridge* butter. The prevailing ſyſtem being arable, the graſs lands of Norfolk have been too generally neglected: but by the late practice of marling, they are now greatly improved; and by the adoption of under-draining and irrigation, the grazing land is experiencing very conſiderable advantages.

Of particular Improvements, &c.—The part of huſbandry in which Norfolk ſtands pre-eminent, and which has led to eſtabliſhed excellence, is the management of its turnip crops. This valuable winter root was only cultivated in gardens, as a culinary plant, in this country, till the reign of George I., when viſcount Townſhend, who had attended the king to Hanover as ſecretary of ſtate, obſerving the profit and utility of the field cultivation of turnips in that electorate, on his return brought with him the ſeed, and recommended it to his tenants in Norfolk, who occupied land of a ſimilar quality to that of Hanover. The experiment ſucceeded equal to expectation, and the practice gradually ſpread over the county, and made its way into ſeveral other parts of the kingdom. This important root has been progreſſively riſing to its preſent ſtate for upwards of 70 years. "A good acre of turnips in Norfolk will produce between 30 and 40 cart-loads, as heavy as three horſes can draw; and an acre will fatten a Scotch bullock from 40 to 50 ſtone, or eight ſheep. But the advantage of this crop ends not here; for it generally leaves the land ſo clean, and in ſuch fine condition, that it almoſt inſures a good crop of barley, and kind plant of clover; and the clover is a moſt excellent preparative for wheat, ſo that, in the ſubſequent advantages, the value of the turnip can ſcarcely be eſtimated."

No county has exhibited a greater variety and number of implements for facilitating the operations of huſbandry than Norfolk, nor evinced more readineſs in applying them to practice. Among wheel-carriages, the non-deſcript one, called a *wizzard*, or *hermaphrodite*, is curious. It is the common cart, to which, in harveſt, or under preſſing circumſtances, a couple of temporary fore-wheels are placed under the ſhafts, and two oblique ladders to the frame, by which it is made to anſwer the purpoſe of a waggon: "and in ſmall farms it is a real object of utility; and in large ones, of great aſſiſtance in a buſy ſeaſon." Drills are of all kinds, but a drill-roller is perhaps peculiar to this county. It is a large caſt-iron cylinder, with projecting rings round it, at about ten inches diſtance from each other. This being drawn over the ploughed land, makes indentations, and the ſeed ſown broad-caſt, chiefly falls into the drills, and is thus more regularly and better depoſited than in the common mode of ſowing.

The powers of ſteam were firſt applied to the purpoſes of agriculture in this county, and the firſt ſteam-engine was ſet up by colonel Buller of Haydon. It poſſeſſes the power of ten horſes; turns a large threſhing machine, a corn-mill, a chaff-cutter, and performs at the ſame time ſeveral other labours of manual huſbandry. On Mr. Coke's farm an improvement on temporary fencing has been adopted, worthy of univerſal imitation. It is the application of moveable gates and poſts with hurdles, for partially eating off turnips, or depaſturing graſs lands. Regaining land from the ſea has, in ſeveral inſtances, been ſucceſsfully practiſed. At Tichwell, 300 acres were embanked in the year 1786: in 1790, 868 acres were embanked and encloſed in the pariſhes of Terrington St. Clement, and Terrington St. John. But the chief improvement of this kind, which has hitherto been made, was performed in Marſhland by count Bentinck, who, in the proſecution of his plan, loſt his life. His ſon has, however, continued to purſue it, and perſeverance has crowned him with ample ſucceſs. The count's embankment extends about four miles in length.

Ancient Hiſtory and Antiquities of the County.—Anterior to the Roman colonization of Britain, the diſtrict now called Norfolk, with the contiguous country, was peopled by a tribe of Britons called Iceni, and another claſs denominated Cenomanni, or Cenimagni. According to Whitaker, (Hiſtory of Mancheſter, vol. i. 62. 149.) the latter occupied Caſtor, near Norwich, as their venta, or chief city. Theſe, as well as the Trinobantes, who were placed to the ſouth of the former, were repeatedly aſſailed, and often ſubdued by the Romans; and the latter being ultimately conquered, the whole eſtabliſhed ſeveral military poſts, or ſtations, in this diſtrict, as permanent habitations for themſelves, and to overawe the conquered natives. Five of theſe ſtations were formed and garriſoned within the limits of this county, or in its immediate vicinity, *viz.* Branudonum, Garianonum, Venta-Icenorum, Sitomagus, and Ad-Tuam; beſides which, ſeveral ſubordinate, Caſtra-Æſtiva, and Stativa-Hiberna, were alſo formed. Of the latter kind, according to ſome writers, were Buxton, Caſtor near Yarmouth, Buckenham, Caſtle-Acre, and Elham. At theſe places have been diſcovered ſeveral coins, urns, and other remains of that people. Theſe and other fortifications, intended to intimidate the Britons, as well as to repel invaſion, were placed under the ſupreme command of an officer, whoſe title, agreeably to ſome authors, was "Comes tractus maritimi;" and others have it "Comes litoris Saxonici," *i. e.* Count of the Saxon ſhore. Under his controul the ſtations on the eaſt ſide of the iſland were placed, the garriſons of which are ſtated to have conſiſted of 2200 infantry, and 200 cavalry. Theſe numbers are ſet down in the Notitia, which was written in the reign of the younger Theodoſius, about the year 410. But as this allowance of troops was inadequate for the defence of each ſtation, and conſequently inſufficient

to

to ſubdue inſurrection, it is probable that to the Romans were joined Britiſh conſcript troops, not included in this enumeration; as we find that, about 20 years after, the imperial armies in this country were compriſed chiefly of Britiſh auxiliaries, which, together with the few remaining Roman troops, were recalled to defend the Roman capital by Maximus and Conſtantine.

The firſt Saxon leader who eſtabliſhed himſelf in this part of the iſland was Uffa, who, A.D. 575, aſſumed dominion over that part of the country which at preſent compriſes Norfolk, Suffolk, and Cambridgeſhire, giving it the appellation of Eaſt Anglia; and the inhabitants were denominated Uffagines. About this period it is highly probable that the city of Norwich aroſe out of the Venta-Icenorum of the Britons and Romans; and, from its relative bearing to the old city, was called by the Saxons North-ick, or Northwick.

Uffa, who died A.D. 578, was ſucceeded by his ſon Titiſt, on whoſe demiſe, 599, his ſon Redwald aſſumed the reins of government, and embraced Chriſtianity; but, through the influence of his wife, renounced it again. He was ſucceeded, A.D. 624, by his ſon Erwald, who was aſſaſſinated by a relation, named Richbert, A.D. 633. His half-brother Sigebert, or Sigbercht, ſucceeded to the crown, in whoſe reign the biſhopric of Dunwich in Suffolk was eſtabliſhed, and the firſt ceremony for religious inſtruction formed, which led to the eſtabliſhment of an univerſity at Cambridge. Fatigued with the burthen of government, he reſigned both his crown and its cares, A.D. 644, to his kinſman Egric. The Saxon governments were now at variance amongſt themſelves. Penda, king of Mercia, commenced hoſtilities againſt Egric, who called Sigebert from his monaſtic retirement to head his army. They were defeated, and both ſlain in battle. Anna, nephew of Redwald, aſcended the throne, reſtored Cenwalch to his kingdom of Weſſex, and became the moſt celebrated of the Eaſt-Anglian princes. But Penda bringing againſt him the powerful reſources of Mercia, he fell in battle, A.D. 654. From this period, the Mercian princes ſeem to have dictated in the choice of monarchs to the Eaſt-Angles; and in the year 792, Offa, king of Mercia, united the kingdom of Eaſt-Anglia with his own; and ſubſequently it became ſucceſſively ſubject to the power of Mercia, or of Kent. After the whole Saxon kingdoms had been united under one monarchy, the Danes made occaſional deſcents on this coaſt. They firſt came under the command of Hungar and Hubba, in the year 870, and landed their troops near Redeham, oppoſite the town of Yarmouth. They ſoon became formidable, and, previous to the death of Egbert, they poſſeſſed the whole of Eaſt Anglia. On the demiſe of that monarch, Ethelwolf obtained the crown of England. He was totally unequal to the taſk of ſucceeding ſo puiſſant a prince as his father, at this momentous criſis. The Danes proved too powerful and ſubtle for his military knowledge and ſtrength. In numerous engagements they routed and defeated his armies. He died in the year 857, and was ſucceeded by Ethelbald his ſon, who died A.D. 860, when his eldeſt brother aſſumed the government. Ethelred, the third brother, came to the throne in 866. In his reign, the Danes extended their ravages over the greateſt part of his dominions; but under the martial ſpirit and proweſs of his younger brother, Alfred, then inveſted with the title and authority of earl and field-marſhal, they received a ſevere check; and by the continued reverſes they experienced, were conſtrained to abandon Eaſt Anglia entirely, and concentrate their forces in Weſſex, where ſeveral deſperate battles were fought with various ſucceſs, in one of which Ethelred was mortally wounded; and dying in 872, Alfred aſcended the throne, and ultimately ſucceeded in conquering the Danes. He compelled the chieftains and their followers to receive Chriſtian baptiſm, and allotted the province of Eaſt Anglia for their limited reſidence. Here the Danes became domeſticated: they built houſes, and improved the lands, were admitted to the privileges of Engliſhmen, and received a code of laws for their regulation from Alfred. The Daniſh chief had fixed his ſeat of viceroyalty ſometimes at Cambridge, and ſometimes at Norwich; but after this ſignal defeat, and conſequent reſtriction, the principal reſidence of theſe marauders was the latter city. From that period, Norwich continued a royal caſtle, and the county remained, with the other parts of the province, in poſſeſſion of the Saxon line, through the ſucceeding reigns of Athelſtan, Edmund, Edred or Eldred, Edwin or Edwy, Edgar, and Edward the Martyr. In the reign of Ethelred II., the Danes again became extremely troubleſome, and, A.D. 992, invaded with conſiderable force Eaſt-Anglia, and proceeding as far as London, inveſted that city. To revenge this outrage, Sweyne, king of Denmark, aſſembled a numerous army, and with a powerful fleet invaded England; and landing on the coaſt of Norfolk, burnt the cities of Norwich and Thetford, and was proceeding to devaſtate every part of the country. During the whole of the Daniſh dynaſty, this county was the theatre of many ſevere conflicts; and as the Daniſh chiefs prevailed, they either took poſſeſſion for themſelves, or for ſome leader, of a ſtrong fortreſs or town.

In the time of William Rufus Norfolk was a ſcene of confuſion, in conſequence of Roger Bigod having confederated with Robert Curthoſe againſt the king, in which conteſt the county ſuffered very conſiderable devaſtation. During the commotions excited in the kingdom by the unnatural attempt of prince Henry to wreſt the crown from the head of his father king Henry II., this county largely participated in the diſaſters which ariſe from civil diſcord. Earl Bigod eſpouſed the prince's cauſe, but the king's troops being victorious, the Flemings in the pay of the prince were permitted to return to their own country, and Bigod purchaſed his peace at the expence of 1000 marks.

In the turbulent reign of John, Roger Bigod, earl of Norfolk, took part with the refractory barons. And while they were taking towns and cities in one part of the kingdom, John was laying waſte with fire and ſword the baronial poſſeſſions in another. In this career he came to Lynn, where, being well received, he croſſed the waſhes, with the loſs of his baggage, to the abbey of Swineſhead, in his way to Newark caſtle, where he died. After this period, the county was overrun by prince Lewis, who exacted heavy contributions. In Richard II.'s time, a powerful inſurrection broke out, under two brothers, John and Matthew Tiler, commonly called Jack Straw and Wat Tiler, whoſe ſtandards were joined by numbers of the lower claſſes, and Norwich was inveſted by the rebels collected under one Lileſter. But he being taken and arraigned for treaſon, was condemned to be hanged, drawn, and quartered; one portion of his body to be ſuſpended at his own houſe, one in the city of Norwich, one at Lynn, and another at Yarmouth; this ſo diſpirited his adherents, that they diſperſed, and an end was put to the rebellion of the Norfolk levellers. Two rebellions broke out in the reign of Edward VI. owing to a ſyſtem of encloſing adopted by the nobility and gentry, who had been put in poſſeſſion of the abbey lands. Though they happened in remote parts, Norfolk and Devon, the coincidence of theſe ſhew that they were the conſequence of previous communications, and a preconcerted plan. The rebels

rebels having imbibed the ſpirit of the ancient levellers, aboliſhing diſtinction of ranks, they proeeeded to execute their nefarious deſigns under two ring-leaders, of the names of Ket. They fixed their grand rendezvous on Mouſehold-heath, near Norwich. Here the elder, Robert Ket, with aſſiſtant deputies from every hundred, held his councils under a large tree, ſtyled the Oak of Reformation, from which he pretended to adminiſter juſtice, and iſſued his edicts for contributions. Long did the country labour under the exactions and other acts of outrage committed by this banditti; all attempts to quell the inſurrection having been ineffectual, till a large army, raiſed to proceed againſt the Scots, was ſent againſt the inſurgents, under the command of the earl of Warwick, when Robert Ket was taken, and the rebels diſperſed. At the commencement of the unhappy diſſentions which aroſe between Charles I. and his diſaffected ſubjects, Norfolk took a deciſive part. When the parliament had voted the neceſſity of taking up arms July 12th, 1642, the inhabitants of this county generally approved of that determination. At an early period of the conteſt, Norwich was fortified againſt the royal party. Norfolk formed one of the aſſociated counties placed under the command of the earl of Mancheſter; the others were Suffolk, Cambridge, Hertford, and Eſſex, to which Lincoln was afterwards added. In 1643, a tax was levied by parliament for the uſe of its army, to be paid by weekly inſtallments. This county contributed 1250*l.*

Encampments, Roman Roads, &c.—It is evident that Norfolk muſt have been the region of many battles, and have been alternately occupied by warriors of different nations and parties. In proportion to the power and ſkill of theſe, would be the fortifications they conſtructed; and as the latter were deſtroyed, or injured, they would be enlarged and altered by ſucceſſive poſſeſſors. In addition to the five Roman ſtations already mentioned, ſome writers have conſidered Ichborough, north of Brandon, as a ſixth; and have identified it as the Iciani of the Itinerary. Roman coins, and other veſtiges, have been found in various parts of the county, particularly at Brompton, Buckenham, and at Thetford, but theſe furniſh no deciſive proof that ſuch places have either been occupied by the Romans as ſtationary or as exploratory camps.

At South Creak, in the north part of the county, where a deſperate battle was fought between the Anglo-Saxons and the Danes, are veſtiges of a circular encampment, which ſtill retains the name of Blood-gate. Near Weeting are the remains of another, conſiſting of a vallum and foſs, known by the name of the Foſs. Near it are places of ſepulture, called "Grimes Graves." At Narborough is a ſmall circular fort, ſaid to have been occupied, if not thrown up, by the Danes, when they landed on this part of the coaſt, A.D. 1003.

Beſides the military fortifications in the county, ſeveral of the old halls were formerly encompaſſed with moats, and their entrances protected by towers, ſtrong doors, bridges, &c. Remains of ſome of theſe features are ſtill preſerved in Oxborough-hall, Stifkey-hall, Caſtor-caſtle, Baconſthorpe-hall, Hunſtanton-hall, Gaywood, Scales-hall, Fincham-hall, &c.

Of the viæ militares, or great Roman roads, made for the convenience of carriages, and facilitating the marching of the army, few perfect veſtiges remain in Norfolk. But as ſeveral important ſtations were formed within the county, no doubt can be entertained that ſuch roads once exiſted, though the traces of moſt of them are now obliterated. It was the cuſtom of the Romans to open this kind of communication between all their ſtations, and many appearances of ſuch are ſtill to be ſeen in thoſe parts of the adjoining county of Cambridge which abut upon this; and in a direction as if they had come from the eaſtern part. A great Roman road connected the ſouth-eaſtern and north-weſtern parts of the kingdom; and another formed a ſimilar communication between the north-eaſtern and the ſouth-weſtern extremities. This commencing on the coaſt of Norfolk, probably at Burg, near Yarmouth, paſſed by Caſtor, and is now conſpicuous near Downham; croſſing the river Ouſe, it paſſes through the fens into Cambridgeſhire, and proceeding through the central counties, joins the Julia-ſtrata, and terminates at St. David's Head. Sir William Dugdale ſays it was diſcovered in the fens ſixty feet wide, and three feet deep, and formed of compact gravel. Its direction was from Downham in Norfolk, through Plaitfield and Charke to the high grounds about March; then it proceeded by Eldon-hall to Wittleſea and Peterborough, from which laſt place it has recently been traced to Caſtor in Northamptonſhire.

Of the chimini minores, or vicinal roads, ſome traces are ſtill viſible. What is called Pedders-way, paſſing from Thetford by Ichborough, Swaffham, Caſtle-Acre, Fring, Ringſhead, to the ſea near Brancaſter, appears one of this ſort. The road leading by Long-Stratton to Taſburg was probably another, whilſt a third branched off from this to the north-weſt, going through Marſhland, Upwell, and Elm, to Wiſbeach. What is called the *Milky-way* has been conſidered Roman; but it is more probable of later date, and was poſſibly made for the convenience of the devotees who went on a pilgrimage to the chapel of our Lady of Walſingham. It is traceable in ſeveral places, and is pretty perfect in the vicinity of Grimes-Graves.

Several barrows or tumuli are to be found in different parts of the county, particularly in the neighbourhood of Creek, Amnor, Rudham, Sedgeford, Stifkey, Long-Stratton, Weeting, Norwich, and Walſingham. In ſome, which have been opened, different relics have been diſcovered, as human bones, wood-aſhes, and urns made of baked clay. Theſe were ſometimes encompaſſed with large ſtones, forming a ſort of cell or kiſtvaen; and in ſome of the barrows have been diſcovered miſſile inſtruments, with implements, which are conſidered by ſome antiquaries to have been originally employed in ſacrifice.

On Mouſehold-heath, near Norwich, are many excavations in the earth, which Mr. King and ſome other antiquaries have called hiding pits, or Britiſh caves. Several of ſimilar character are to be ſeen on the downs of Wiltſhire and Dorſetſhire.

Eccleſiaſtical Hiſtory and Juriſdiction of the Dioceſe.—Soon after the ſettlement of the Saxons in Eaſt Anglia, the Chriſtian religion was introduced into this part of the iſland; and it is related that Sigebert, ſon of Roderic, king of the Eaſt Angles, was the firſt to eſtabliſh it here. He had been baniſhed, by his eldeſt brother Erpenwald, into France, where he contracted an intimacy with a religious Burgundian, named Felix, who prevailed on him to adopt the Chriſtian faith. On the death of Erpenwald, Sigebert returned to Britain, and ſucceeded his brother as king of Eaſt Anglia. His predilection, after his converſion, increaſed towards Felix, who had accompanied him from France. He firſt made him chaplain and confeſſor, and then encouraged him to undertake the converſion of his ſubjects. Upon this arduous taſk, ſo congenial to his mind, Felix cheerfully entered. Charmed by the impreſſive eloquence of the evangeliſt, and incited by the royal example, numerous converts were ſoon made; ſchools were inſtituted and churches erected for public worſhip. Over theſe Felix was appointed to

preſide under the title of biſhop, and after having been conſecrated by Honorius, archbiſhop of Canterbury, A.D. 630, he fixed his ſeat at Siltheſtow, afterwards called Dunwich, in the county of Suffolk. Such were his piety and zeal, and ſo extenſive was the fame which he acquired by his eminent ſervices in the church, that after his death, which happened in the year 647, he was canonized as a ſaint, and his feſtival, which was annually kept, ſtands on the eighth of March in the Romiſh calendar.

Thomas, who had been deacon to Felix, ſucceeded him. In his declining years, infirm and unable to perform the duties of his dioceſe, he obtained permiſſion to divide the biſhopric into two ſees, fixing one at Dunwich in Suffolk, and the other at North Elmham in Norfolk. Subſequent to this partition of the Eaſt Anglian dioceſe, the biſhops of North Elmham were as follows.

1. Bedwinus, Baldwinus, or Beadwine, was conſecrated 673, and aſſiſted Acea, in 675, to place the veil upon St. Oſſyth.

2. Northbertus, Northbert, or Rothbert, ſucceeded Bedwinus ſome time after the year 679.

3. Hedulacus, Haduac, or Hatholac, was biſhop of this ſee at the time Bede completed his Eccleſiaſtical Hiſtory, in A.D. 731.

4. Edelfridus, Ethelfrith, or Ethelferth, ſucceeded, and

5. Lamferthus, or Lameferd, followed; but at what time is not ſatisfactorily aſcertained.

6. Athelwalfus, or Æthelwolph, occupied the ſee in 811.

7. Unfertus, Alberth, or Alcar, was biſhop, according to Blomefield, about the year 787.

8. Sibba, Sibban, or Siga, ſat in the year 816.

9. Hunferth, Hunferd, or Hufred, was conſecrated by Wilfred, archbiſhop of Canterbury, and was living in the year 824.

10. Humbert, or Humbret, was conſecrated about 826.

11. Wybred, Wyred, or Wildred, was appointed biſhop of both the ſees of Norfolk and Suffolk.

Biſhops of Elmham after the Union of the Sees.—1. Theodred I., or Tedred, is reported to have been an eye-witneſs of St. Edmund's corpſe being found uncorrupt. A.D. 945.

2. Theodred II., ſurnamed the Good, was firſt biſhop of London, and then of Elmham, both of which he held until his death, ſome time after A.D. 962.

3. Athulf, Adulf, or Eadulf, has been erroneouſly placed as ſitting prior to the Theodreds in this ſee.

4. Alfric, Alfrid, or Ailfric, was one of the number who ſigned the charter of king Edgar to the abbey of Croyland, in the county of Lincoln. He died at the end of Edgar's reign in 975.

5. Athelſtane, Edelſtane, or Elſtane, was conſecrated at the end of the ſame year.

6. St. Algare, or Algane, who had been confeſſor to Dunſtan, archbiſhop of Canterbury, was promoted to this ſee in the year 1012. Died Chriſtmas eve, A.D. 1021.

7. Alfwin, Elfwin, or Eldwin, ſucceeded the ſame year. He reſigned, or died, A.D. 1031.

8. Alfric II., Ailfric, or Aluric, ſucceeded and died A.D. 1038.

9. Alfric III., ſurnamed the Little, who had previouſly been prior of Ely, died A.D. 1139.

10. Stigand, who was chaplain to king Harold Harefoot having obtained this ſee by ſimony, was ejected by king Hardicanute 1040.

11. Grimketel, or Grumketel, held it in commendam with the biſhopric of the South Saxons, during the remainder of Hardicanute's reign.

12. Egelmar, or Almar, on the advancement of his brother Stigand, ſucceeded in the year 1067.

13. Herfaſt, or Arfaſt, chaplain to William the Conqueror, was made biſhop at Eaſter, 1070.

A liſt of the biſhops of Norwich will be given in a ſubſequent account of that city.

Extent, Juriſdiction, Revenues, and Liberties of the Dioceſe.—The dioceſe of Norwich compriſes the counties of Norfolk and Suffolk, except four peculiars in the latter county; three of which belong to the ſee of Canterbury, *viz.* Hadleigh, Monk's Illich, and Moulton; and Frekenham to the ſee of Rocheſter. It includes alſo fifteen or ſixteen pariſhes in Cambridgeſhire. Spelman ſays, the dioceſe contains 1121 pariſhes, and Beatſon, in his Political Index, repeats the ſame enumeration; but this, if meant of unconſolidated livings, muſt be very erroneous, as, A.D. 1371, biſhop Henry Spenſer certified to the king, that there were in his dioceſe 1321 pariſhes. And if meant to include pluralities as pariſhes, it will then be far from accurate. Various changes have, however, taken place in this reſpect, and the number is occaſionally fluctuating from different cauſes. The number of eſtabliſhed clergy reſident in the dioceſe, according to a calculation made in the year 1772, was beneficed clergy 550, curates 150, from which it is evident there muſt be a number of pluralities. Mr. Young remarks, that not half the clergymen reſide at their livings.

An anſwer returned to a mandamus of queen Elizabeth, by biſhop Parker in 1563, ſtates, that "the dioceſe contains Norfolk and Suffolk, except four peculiars and eleven churches in Cambridgeſhire, beſides churches void, chapels, and donatives. Thus in the archdeaconries:"

	Deaneries.	Rectories.	Vicarages.	Void Churches.
Norwich	12	168	41	80
Norfolk	12	184	36	uncertain.
Suffolk	13	114	42	——
Sudbury	8	182	31	——

The preſent enumeration from the beſt information that can be obtained is 1354, *viz.* 802 in Norfolk, 537 in Suffolk, and 15 in Cambridgeſhire. Formerly there was but one archdeaconry, that of Norfolk. Sudbury was added in the year 1126, Suffolk in 1127, and Norwich in 1200; thoſe are ſubdivided into 47 deaneries, and theſe, as apportioned to each archdeaconry, are as follows, with the number of pariſhes contained in each:

Archdeaconries.	Deaconries.	Pariſhes.
Norwich	13	365
Norfolk	12	468
Sudbury	8	523
Suffolk	14	

The dioceſe is in the province of Canterbury, and the biſhop is a ſuffragan to that metropolitan. The juriſdiction of the ſee, as reſpects its internal regulations, is veſted in the biſhop, who appoints the four archdeacons as his aſſiſtants, (no ſuffragans having been choſen ſince the time of biſhop Nix) a chancellor, a regiſtrar, and other officers of his conſiſtorial court.

Revenues.—Nurtured by kings, and long under the foſtering care of royalty, this dioceſe rapidly increaſed in wealth, ſo that at the time of the great Norman ſurvey the revenues of it were very conſiderable, as appears from the enumeration of them in Domeſday book. Subſequent to that era, the biſhops of Norwich were generally in the court favour; and

and as favourites were preferred to the higheſt ſtations of emoluments and truſt, the ſee often gained ſome acquiſition of wealth from ſucceeding prelates. In the Conqueror's inqueſt, there is an account taken of twenty-ſeven manors belonging to this ſee, beſides advowſons, fee-farm rents, &c. Biſhop Beaufo died poſſeſſed of forty-three manors, many of which, at his death, were by his will annexed to the epiſcopal poſſeſſions. Hence it appears, that at the time Herfaſt came to it, the ſee was ſeiſed, on a moderate computation, of ſixty manors; and the pipe rolls of king John's reign evince, that biſhop John de Grey, in 1212, anſwered for thirty-five knights' fees; and in the following year obtained a *quietus*, or writ of acquittance, from the Scotch ſcutage, for forty-eight knights' fees and three quarters. And although by a multiplicity of changes from the varied complexion of the times, and the political character of the prelates, theſe were frequently diminiſhed, yet by the act paſſed February 4th, 1535, which veſted the revenues of the dioceſe in the power of the king, it appears that the biſhop poſſeſſed twenty-three manors, ſeventy-three livings, ten palaces, all the knights' fees of the barony, and the firſt fruits of the whole dioceſe, what no archbiſhop ever poſſeſſed; excluſive of all other epiſcopal ſources of emolument. By virtue of that act, the whole of theſe were alienated for ever from the ſee, except a few preſentations, and the palace of Norwich. In lieu of them, to give a kind of colouring to the glaring acts of rapacity, the comparatively ſmall revenues of Holme abbey were granted to the biſhop; and the nefarious tranſaction was gloſſed over under the name of an *exchange*. Some few additions were made in the reigns of king Edward VI., and queen Elizabeth. The biſhopric ſtands charged at preſent in the king's books at 834*l.* 11*s.* 7*d.* It pays firſt-fruits but no tenths, thoſe having been diſcharged by a commutation with queen Elizabeth for the epiſcopal manors of Sudborne and Swanton. The preſent clear yearly value is uncertain, but on the average it is computed to amount to about three thouſand five hundred pounds *per annum*.

Liberties.—At an early period this ſee enjoyed extenſive privileges as well as great revenues. To enumerate them would fill ſeveral pages. The biſhop poſſeſſed all the uſual powers granted to lay baronies, the liberty of coinage, exemption from all taxes, tallage, and cuſtoms, except thoſe of the city of London, jura regalia, within his manors, a coroner, and a priſon for his liberty, and all mulcts, amerciaments from his tenants; the right of chooſing a juſtice for the precinct of his palace, and of acting himſelf as one of the king's juſtices of the peace for the city, county, and liberty. All theſe were confirmed by a charter of *inſpeximus*, granted by king Henry VIII. March 29, A.D. 1512. But through many ancient ſtatutes becoming obſolete, the abolition of feudal cuſtoms, and various ſubſequent parliamentary regulations, many of theſe privileges are abridged if not diſannulled. There is, however, one which the biſhops of Norwich have exerciſed time immemorial, and as it is peculiar to this dioceſe ought not to be omitted. It is the power of uniting any two cures within the dioceſe, at the time of inſtitution, without regard to their value, and that either by perſonal or perpetual union. The perſonal union laſts only during the life of an incumbent, and anſwers to an archiepiſcopal diſpenſation, requiring in this dioceſe only the biſhop's conſent. The perpetual union is made with the joint conſent of patron, incumbent, and biſhop, and is equal to a conſolidation. The biſhop is a peer of the realm, and ſits in the upper houſe, not only in right of his barony, but as titular abbot of St. Bennet's in Holme; and is the only abbot at preſent in England.

Abbies, Priories, and other religious Houſes.—From the preceding account of the prelacy of this ſee, it appears that the Chriſtian religion loſt much of its intrinſic excellence by its connection with ſecular intereſts, and to what a prodigious height of power, wealth, and grandeur, the church had ariſen prior to the reformation. In the account of the monaſtic inſtitutions, this will appear ſtill more evident, and the abuſes which followed ſuch unwarrantable acquiſitions, will be diſplayed in a more prominent degree.

Norfolk teemed with religious houſes; out of one thouſand one hundred and forty-eight monaſteries ſeized by Henry VIII. after his denial of the papal ſupremacy, ſeventy-nine religious or charitable foundations were ſuppreſſed in this county.

Norfolk contained ſeveral alien priories, which were diſſolved before the general ſuppreſſion, and a few decayed hoſpitals, whoſe revenues had been ſequeſtered and appropriated to other uſes.

Ancient Architecture.—From the various circumſtances already mentioned, it may with great probability be inferred, that Norfolk contains various and numerous ſpecimens of eccleſiaſtical architecture; and from the many military tranſactions which occurred within this diſtrict, the antiquary may expect to meet with ſeveral caſtellated remains. Norfolk contains the following caſtles, the chief of which were built or materially altered by the firſt Norman barons. Norwich caſtle at preſent merely conſiſts of part of the large ſquare keep in the upper ballium, ſtanding on a lofty conical hill, and ſurrounded by a deep and wide foſs.

Caſtle Acre.—The fortifications of this place are extenſive and bold. Parts of the wall of the circular keep and ſome other fragments remain.

Caſtle Riſing.—This caſtle diſplays features very diſſimilar to either of the former, and totally different to the generality of fortifications.

At *Middleton*, near Lynn, is a fine gatehouſe or entrance to a caſtellated ſtructure. Caiſtor-hall, near Yarmouth; Oxborough-hall, near Stoke; Winwall-houſe, near Stoke; Stifkey-hall, near Walſingham, and Baconſthorpe-hall; are ancient manſions, all of which exhibit ſome features of a caſtellated character, though they do not appear to have been regularly and completely fortified.

In the claſs of *Eccleſiaſtical Architecture*, Norfolk preſents more curious and ancient than what may be termed *fine* buildings. Of thoſe old churches, towers, &c. which are commonly called Saxon and Daniſh, many ſpecimens are to be found in this county; and it would be highly gratifying to laudable curioſity to aſcertain whether they were really erected by either the Saxons or the Danes, during their alternate dominion in Eaſt Anglia.

The round towers, of which ſeveral ſtill remain in Norfolk and Suffolk, have been called Daniſh by ſir James Burrough and by ſome other antiquaries; and their being found principally in this part of the iſland ſtrengthens that opinion. Though of a circular form, they are diſſimilar in ſize and height to the pillar towers of Ireland, and are ſtill more unlike the circular churches. The architecture, if their conſtruction be entitled to this term, is very ſimple or rude; they conſiſt of a plain wall of flint, rubbiſh, ſtone and mortar, with very ſmall openings or windows in them. The latter are towards the top, and have ſemicircular heads divided into two apertures, with a column between. The pariſh church of Bexwell near Downham, and that of Bychamwell near Swaffham, have round towers. Beſides the acknowledged high antiquity of that form, there is in each a circumſtance certainly not common: both have been ſurmounted by octagon tops about the age of Henry VII. In that of Bex-

well are ten ſmall windows with ſemicircular heads ſurrounding the upper part, but are now bricked up. In that at Bychamwell are four pointed apertures, nearly in the ſame ſituation as the windows in the other tower: the arched parts of theſe and the ſides are formed by plain ſquared ſtones, and the former are diſpoſed in the ſhape of an acute triangle. The tower is of very remote antiquity, and the pointed loops or windows are coeval with the original building. Mr. King, author of Munimenta Antiqua, conſiders theſe ſtructures to be Saxon, and ſays, "another of theſe round Saxon towers is at Wittingham church, near Trowſe in Norfolk, only its top has been raiſed in height and repaired." Other ſpecimens of the ancient circular or Saxon ſtyle of architecture are diſplayed in the following buildings.

The church at South Runcton near Downham, now in ruins, has a ſemicircular eaſt end: and it may be obſerved that a church in this manor was given to the famous abbey at Bury in the time of king Canute.

Thwaite church, near Bungay, has a fine ſemicircular arch of entrance on the ſouth ſide.

In St. Julian's church at Norwich, was formerly an ornamental arched entrance of a ſimilar kind.

The moſt curious and intereſting ſpecimen of the ancient churches is that at Caſtle Riſing.

Of the large and magnificent Norman churches a few fine examples are to be found in this county, the principal of which is the cathedral church of Norwich. This noble edifice diſplays ſeveral intereſting ſpecimens of maſſy columns and ſemicircular arches, with numerous appropriate mouldings, capitals, baſes, &c. In the ruined churches of Wymondham, Attlebury, Binham, Caſtle-Acre, and St. Margaret's at Lynn, are ſeveral examples of nearly the ſame ſtyle and age, and all diſplay conſiderable grandeur of deſign with ſtability of conſtruction. Examples of a later and more elegant ſtyle of architecture are ſeen in St. Nicholas chapel at Lynn, and the Lady Mount chapel at the ſame place; in the fragment of Walſingham priory church; in the churches of St. Peter Mancroft and St. George's, &c. at Norwich; in thoſe of Hingham, Ayleſham, Cromer, Fakenham, Eaſt Deerham, Swaffham, &c. Several of theſe buildings are ornamented with ſcreens, piſcinas, monuments, fonts, &c. Of the latter, particularly fine ſpecimens are to be found in the churches of Binham, Norwich, Walſingham, and Wymondham.

The buildings of a county are uſually conſtructed with the natural materials of the diſtrict, whence the geological character of a province may be generally aſcertained by its public ſtructures; thus, Norfolk producing ſcarcely any ſtone, the builders were obliged to ſubſtitute flints, as being very abundant. Theſe, being uſually found in ſmall irregular pieces, were not eaſily adapted to flat ſurfaces, or to facilitate the making of a wall. In large caſtellated ſtructures, where the walls were required to be very thick, they proved ſuperior to any other ſubſtance; but in thoſe buildings they were commonly encloſed with ſquared ſtones, and ſtrongly cemented with fluid mortar. In this manner they are uſed in the walls of Garianonum and of Venta Icenorum; alſo in Norwich caſtle, Caſtle Riſing, and in ſeveral old churches in this county. In the former Mr. Wilkins, in Archæologia ſtates, that "alternate courſes of ſquared flints were employed." The ſame ſcientific architect further obſerves, that "no material whatever can exceed the durability of flints; for we do not find an inſtance any where of their periſhing by froſty or wet weather; and when ſquared or laid with care they are extremely beautiful. In building, notwithſtanding, they have but little bond, and depend much on the mortar cement they are fixed with; for if wet by any means gets behind them the froſt ſoon levels the work. Many, indeed moſt, of our churches and public buildings in this county are built almoſt wholly of this material; but the moſt remarkable I have obſerved in flints faced and ſquared, and laid in ſmall regular courſes, is the convent gate to Norwich cathedral, which was built in the reign of Edward I., where the walls to the eaſt and the ſouth have a tracery work formed with free-ſtone, and the intervals are filled with ſquare flints; and ſome about Erpingham's-gate, built in penance for Lollardiſm in the reign of Richard II. The chapel of the Virgin Mary on the ſouth ſide of St. Michael's Coſlany church, which is indeed a maſter-piece (where the ſtone tracery is beautifully filled with black flints, as reſemble ſuch old cabinets as we ſometimes ſee inlaid with ivory), was built about the year 1500: and a building in St. Andrew's pariſh, which is recorded as a very rare and beautiful piece of flint work, built in 1403, by William Appleyard, who was the firſt mayor, and ſerved the office in this houſe, which was afterwards ſold to the corporation, and is the preſent Bridewell. Many country churches have been alſo built in this way, as at Cromer, &c. in Norfolk, and many in Suffolk and Eſſex. The art of ſquaring the flints in this curious manner is now almoſt totally neglected, though I am convinced it might very ſoon be brought to perfection again from the facility I obſerved the workman acquire by a little practice in repairing under my ſuperintendance, in biſhop Bagot's time, a tower belonging to the palace." The authorities for the preceding account are, An Eſſay towards a Topographical Hiſtory of the County of Norfolk, by F. Blomefield, 11 vols. 8vo. A general View of the Agriculture of Norfolk, by A. Young, 8vo. 1804. General View of the Agriculture of the County of Norfolk, by N. Kent, 8vo. 1796. Beauties of England, vol. xi., by J. Britton, F.S.A.

Norfolk, a populous maritime county of Maſſachuſetts, in America, lately taken from the ſouthern part of the county of Suffolk, and lying to the ſouthward round the harbour and town of Boſton: it contains 20 townſhips, of which Dedham is the ſeat of juſtice. The number of inhabitants is 27,216.—Alſo, a populous county of Virginia, bounded N. by James' river, which divides it from Warwick. It contains 7758 free inhabitants, and 4735 ſlaves.—Alſo, a port of entry, poſt-town, and ſeat of juſtice in the above county, on the E. ſide of Elizabeth river, immediately below the confluence of the eaſtern branch. It is the moſt conſiderable commercial town in Virginia. The harbour is ſafe and commodious, and large enough to contain 300 ſhips. It contains about 500 dwelling-houſes, a court-houſe, gaol, an Epiſcopal and Methodiſt church, a theatre, and an academy. The number of free inhabitants is 4222, and that of ſlaves is 2724. It is governed by a mayor and ſeveral aldermen. It carries on a briſk trade with the Weſt Indies, Europe, and the different ſtates, and conſtitutes with Portſmouth, which ſtands on the oppoſite ſide of the river, a port of entry. The exports for the year, ending Sept. 30, 1794, amounted in value to 1,660,752 dollars. A canal is formed from the N. branch of Albemarle found in North Carolina to the waters of the S. branch of Elizabeth river, 9 miles from Norfolk; and merchant veſſels of the largeſt ſize may go within a mile from the mouth of the canal; 114 miles E.S.E. of Richmond. N. lat. 36° 55'. W. long. 76° 28'.—Alſo, a townſhip in Litchfield county, Connecticut; 15 miles N. of Litchfield, on the Maſſachuſetts line, containing 1749 inhabitants.—Alſo, a county in Upper Canada, bounded N. and E. by the county of Lincoln and the river Thames, on the W. by lake Erie, until it meets the Barbue (called the Orwell river) thence by a line running

ning N. 16° W. until it interſects the Thames, and thence up the ſaid river until it meets the N.W. boundary of the county of York.

Norfolk *Iſle*, an iſland in the South Pacific ocean, of good height, and five leagues in circuit, diſcovered by captain Cook in October 1774, and ſo called by him in honour of the noble family of Howard. The captain and his companions found it uninhabited, and were the firſt perſons who ever landed upon it. They met with many trees and plants common at New Zealand, and more eſpecially the flax plant, which is here more luxuriant than in any part of that country; but the chief produce is a ſort of ſpruce-pine, which grows very abundantly, and to a large ſize, and very ſtraight and tall. This tree reſembles the Quebec pine. For about 200 yards from the ſhore, the ground is ſo thickly covered with ſhrubs and plants as hardly to be penetrable further inland. The ſoil ſeemed rich and deep. Here were found the ſame kind of pigeons, parrots, and parroquets, as at New Zealand, rails, and ſome ſmall birds. The ſea-fowl conſiſt of white boobies, gulls, tern, &c. which breed undiſturbed on the ſhores and in the cliffs of the rocks. The iſle affords freſh water; and alſo cabbage-palm, wood-ſorrel, ſow-thiſtle, and ſamphire. The cabbage of the tree ſo called is not only a wholeſome vegetable, but very palatable, and affords an agreeable repaſt. The coaſt does not want fiſh, ſome of which is excellent. It is high-water at the full and change, about one o'clock; and the tide riſes and falls about four or five feet perpendicularly. A ſettlement was made upon this iſland by a detachment from Port Jackſon in 1788, and we learn from lieutenant King, that no veſſel of 30 or 40 tons can remain with ſecurity through the year in any place round the iſland, without removing to the lee-ſide as the wind changes. Anchorage is every where good, as the bottom is a coral ſand. The productions of the iſland are timber for the conſtruction of veſſels, pines for maſts, and when the flax-plant can be wrought, a ſufficiency of cordage for the navy of Great Britain: this plant abounds in the iſland, and needs no cultivation. In the ſummer months the ſea-coaſt furniſhes turtle. Banana-trees have been found here; the ſugar-cane grows well; wines, oranges and lemon-trees are in a thriving ſtate; the potatoe alſo furniſhes two crops annually; melons and pumpkins are very fine, and every kind of garden vegetable proſpers. Rice has been ſown twice, but it is ſubject to be blaſted by the S.E. winds; however, that which eſcaped the blight yielded a great increaſe. Cotton and indigo thrive in ſome parts of the iſland. The quantity of ground cleared and cultivated in March 1790, was 30 acres belonging to the crown, and about 18 acres cleared by free people and convicts for their gardens. S. lat. 29° 2′ 30″. E. long. 168° 16′. Cook's Second Voyage, vol. ii.

Norfolk, *New*, a tract of country on the W. coaſt of North America, extending from Croſs Sound to New Cornwall.

Norfolk *Sound*, a bay on the north-weſt coaſt of America. The women here, as well as at Port Mulgrave, and Hippah, one of Queen Charlotte's iſlands, ornament, or rather diſtort, their lips in the manner deſcribed under the article *Port des* Français; and, as Dixon ſays in his Voyage, it ſhould ſeem, that the female who is ornamented with the largeſt piece of wood, is generally moſt reſpected by her friends, and by the community in general. N. lat. 57° 3′. W. long. from Paris 135° 36′.

NORGHES, a town of Aſia, in the principality of Georgia, which was taken in 1395 by Timur Bec, who put the inhabitants to the ſword and razed the walls.

NORHOLM, a town of Norway, in the dioceſe of Chriſtianſand; 16 miles N.N.E. of Chriſtianſand.

NORI, a town of Sardinia; 18 miles N.E. of Cagliari.

NORIA, a town of South America, in the province of Cordova; 21 miles N.N.W. of Cordova.

NORICUM, in *Ancient Geography*, a province of Europe, extending along the S. bank of the Danube, from the mouth of the Inn, as far as mount Cetius. Noricum became a province under the reign of Auguſtus; and, in proceſs of time we find, under the denomination of diſtricts or provinces, "Noricum Ripenſe," adjacent to the Danube, and "Noricum Mediterraneum." This province was bounded on the N. by the Danube, on the E. by Pannonia, on the S. by a ſmall portion of the Save (Savus), and the Julian Alps, and on the W. by Vindelicia. The population of this province conſiſted, according to Ptolemy, towards the W. and N., of the Sevaces and the Alauni, called alſo Ambiſontii, and towards the E., of the Norici, the Ambidrani, and the Amblici. Noricum was ſubject to the Romans in the time of Auguſtus, and they preſerved it from the Germans, the Quadi, the Maſcomani, &c. Afterwards the Goths took poſſeſſion of it, and it has been ſaid that Alaric made it the ſeat of his empire. At a later period, the Suevi, the Heruli, and the Huns occupied it.

NORIE, in *Geography*, a town of Sweden, in the province of Schonen; 16 miles N.N.W. of Chriſtianſtadt.

NORIN, a river of Dalmatia, which runs into the Narenza; eight miles below Citluc.

NORIS, Henry, in *Biography*, a very learned Italian cardinal, deſcended from a family originally from Ireland, was born at Verona in the year 1631. His father, Alexander, was a literary character, and well known by his writings, particularly by his "Hiſtory of Germany." Perceiving that his ſon gave early indications of an excellent underſtanding, and a love of learning, he determined to do juſtice to his talents by procuring for him the advantages of a good education. When Henry had arrived at the age of fifteen, he was admitted a penſioner at the Jeſuits' college at Rimini, where he went through his courſe of philoſophy. Here he began to ſtudy the writings of the fathers, particularly thoſe of St. Auguſtine; and ſoon after he took the habit in the convent of the hermits of St. Auguſtine at Rimini, and applied with inceſſant aſſiduity to the ſtudy of all the branches of ſacred and profane literature, and antiquities in general. When the term of his noviciate expired, he was ſent for by the general of his order to Rome, in order that he might purſue his ſtudies with ſtill greater advantage. Here he ſpent his days, and often his nights too, in cloſe and unwearied application, uſually ſtudying fourteen hours a-day. At the age of twenty-one he began his "Hiſtory of Pelagianiſm," but his progreſs in it was neceſſarily ſlow, owing to the many employments which were aſſigned to him, ſo that ſeveral years elapſed before he could give it to the public. It was printed at Florence in the year 1673. In the following year he was invited by the grand duke of Tuſcany to become his chaplain, and he alſo appointed him profeſſor of eccleſiaſtical hiſtory in the univerſity of Piſa. This employment coincided with his wiſhes, and he retained it many years, poſſeſſing not only the eſteem and friendſhip of many learned men, who at that time adorned Tuſcany, but alſo the protection and favour of the cardinal prince Leopold, and that of Coſmo III. In the mean time his "Hiſtory of Pelagianiſm" had attracted conſiderable notice in the learned world, and while it was highly applauded by one party, it excited the moſt violent cenſures of others. It was twice ſubmitted to the cognizance of the Inquiſition,

and on both occaſions was pronounced free from any paſſages which called for condemnation. From this period (1676) father Noris lived in peace during the ſpace of ſixteen years, and continued all that time to teach eccleſiaſtical hiſtory at Piſa, purſued his various ſtudies with indefatigable ardour, and preſented the public with ſome of the fruits of his labours. Among others, he publiſhed "Diſſertatio Duplex de duobus Nummis Diocleſiani et Licinii, cum Auctuario Chronologico de votis decennalibus Imperatorum et Cæſarum." He alſo publiſhed ſeveral pieces in chronology, of which the moſt conſiderable was entitled "Epochæ Syro-Macedonum paræneſis ad Joannem Harduinum," 1689. This was followed by "A Diſſertation on the Paſchal Cycle of the Latins." While he was ſtudying at Rome, he became known to queen Chriſtina of Sweden, who entertained a great eſteem for him, and profeſſed to read his different publications, as they appeared, with the greateſt ſatisfaction. She made many attempts to engage him to return to Rome, as did likewiſe the popes Clement X. and Innocent XI. At length, in the year 1692, pope Innocent XII. urged him ſo ſtrongly on the ſubject, that he did not deem it prudent any longer to reſiſt, and upon his arrival at Rome, his holineſs immediately appointed him ſub-librarian of the Vatican. This circumſtance excited the jealouſy of his enemies, who endeavoured to undermine his reputation by renewing their attacks upon his writings. A commiſſion was appointed by the pope to re-examine them, and to make a full report. So ſtrongly did they ſpeak in favour of father Noris, that his holineſs immediately appointed him counſellor to the Inquiſition, and in 1695 he raiſed him to the dignity of cardinal. In 1700 he was nominated librarian of the Vatican. Two years after this, he received directions from the pope to apply himſelf to the reformation of the calendar, but he had not made much progreſs in the buſineſs, when he was attacked with an incurable dropſy, which proved fatal in 1704, at the age of ſeventy-three. He was one of the moſt learned men of his time, and was peculiarly well informed in ſacred and profane hiſtory. His genius was lively and penetrating; his powers of memory very conſiderable; as a writer his ſtyle is correct, pure, and frequently elegant. He was author of many other works beſides thoſe already mentioned. The whole of them have been publiſhed collectively at Verona 1729—32, in five volumes folio. Morei.

NORMAL LINE, in *Geometry*, is uſed for a perpendicular line. See PERPENDICULAR, and SUBNORMAL.

NORMAN, in *Sea Language*, a name given to a ſhort wooden bar, thruſt into one of the holes of the windlaſs, in a merchant ſhip, whereon to faſten the cable. It is only uſed where there is very little ſtrain on the cable, as in a commodious harbour, when the ſhip is well ſheltered from the wind and tide.

NORMAN *Architecture*, that ſpecies of building practiſed by the Normans after the conqueſt of England.

This ſtyle of building was merely an adoption of that practiſed by their Saxon predeceſſors; and, therefore, the Normans are not the inventors of this ſtyle of building, as has been generally ſuppoſed.

Before we can have any idea of the ſtyle of building practiſed by the Normans, it will firſt be neceſſary to ſhew the characteriſtic features of the Saxon ſtyle, which were thick walls generally without buttreſſes, which, if introduced, was more for the ſake of ornament than ſtrength, as the ſubſtance of the walls rendered them unneceſſary. The arches employed were all ſemicircular, or at leaſt, if the pointed arch is to be found, it is to be attributed rather to an accidental circumſtance than to any prevailing taſte.

The plan of the firſt Saxon churches conſiſted only of a ſimple oblong extending in its longer dimenſion from eaſt to weſt; but in after times the eaſt end was converted into a ſemicircle: the north and ſouth ſides were each branched out with a wing, ſo as to give the edifice the form of a croſs, and over the interſection of the croſs was erected a tower. The entrance was through the weſt end. The large Saxon churches had three aiſles in a breadth, and the walls of the nave were ſupported by cylindrical or polygonal columns with a regular baſe and capital, which was generally plain; but it was alſo ſometimes enriched with foliage and even animals. The archivolts of the arches, which reſted upon the columns, conſiſted at firſt of faces receding from each other in parallel planes and ſoffits, which were cylindric ſurfaces perpendicular to the naked or general face of the building. The ſhafts of the pillars in the moſt ancient examples were in general plain.

Many diſcordant opinions have been advanced concerning what really conſtitutes Norman architecture.

The only material difference between Saxon and Norman architecture appears in the magnitude of the ſtructures of the latter people, and the more frequent uſe of ſtone.

The Normans were not the inventors of the pointed arch, as ſeveral inſtances of that ſpecies are to be met with prior to the conqueſt; and, indeed, the firſt buildings erected by the Normans had circular arches. The frequent uſe of the pointed arch did not take place till long after the conqueſt, and even then it was often mixed with the circular in the ſame building. The changes of the ſtyle of architecture were not immediate, but effected in ſucceſſion, and though but ſmall at a time, the change was great in the end, ſo that the edifices were much improved in point of grandeur, proportion, and elegance of decoration.

The Norman era may be ſtated to be from A.D. 1066 to 1154, from the conqueſt to the death of Stephen.

The Normans greatly increaſed the dimenſions of the churches. The ornaments formerly uſed in the Saxon arches were retained, and others were added of a much more exuberant kind. The foliage and other carvings were much more elaborate; however, their edifices ſtill wanted the pediments and pinnacles, as in thoſe which afterwards were termed Gothic or pointed.

The prelates in the early Norman reigns were men of conſummate ſkill in architecture; they applied themſelves to the rebuilding of cathedral churches, and alſo the rebuilding of the greater abbeys. No leſs than fifteen of the twenty-two Engliſh cathedrals retain conſiderable portions, which are undoubtedly Norman workmanſhip, and of which the ſeveral dates are aſcertained. The Normans, who either were architects themſelves, or under whoſe auſpices architecture flouriſhed, are Gundulph, biſhop of Rocheſter, who flouriſhed from A.D. 1077 to 1107; Mauritius, biſhop of London, who flouriſhed from 1086 to 1108; Roger, biſhop of Saliſbury, from 1107 to 1140; Ernulf, biſhop of Rocheſter, from 1115 to 1125; Alexander, biſhop of Lincoln, from 1123 to 1147; Henry of Blois, biſhop of Wincheſter, from 1129 to 1169; and Roger, archbiſhop of York.

The works of Gundulph may be ſeen at Rocheſter, Canterbury, and Peterborough. Mauritius of London built old St. Paul's cathedral; Roger of Saliſbury the cathedral of old Sarum; Ernulf completed the work begun by Gundulph at Rocheſter; Alexander of Lincoln rebuilt his own cathedral; and Henry Blois, biſhop of Wincheſter, a moſt

eminent

eminent architect, built the conventual churches of St. Croſs and Rumſey, in Hampſhire; but with reſpect to Roger, archbiſhop of York, none of his works remain.

By theſe architects the Norman ſtyle of architecture was progreſſively brought to perfection in England, and it will be eaſily ſuppoſed, that the improvements made by any of them were only adopted in ſucceſſion.

Many of the churches belonging to the greater abbies were conſtructed in this era; but of theſe, few, indeed, have eſcaped the general demolition at the reformation.

From A. D. 1155 henceforth the ſtyle of eccleſiaſtic edifices begun to aſſume other features; and at this period the conquerors became blended with the conquered, and, therefore, the Norman era properly ceaſes. From this period alſo we may date the commencement of the pointed arch ſtyle, or what is vulgarly called Gothic.

With reſpect to the military ſtructures of the Normans, they knew they could not live in ſecurity without building ſtrong places of defence, they therefore erected a caſtle upon every lordſhip, or aſſimilated with their own, what they found already erected to their hands.

The leading diſcrimination in a Norman fortreſs, is a lofty mound of earth thrown up in the centre of the other works, from the excavations neceſſary in forming the ditch, foſſe, or moat. A ſquare or circular tower, conſiſting of ſeveral ſtories, roſe from the upper ballium, or a low circular ſtory of conſiderable diameter, which was uſually approached by very ſteep ſtone ſtairs on the outſide.

The gateway or tower of entrance, and the barbican or watch tower, had both of them a communication with the keep. Remarkable inſtances in the ſquare form are thoſe of the towers of London, Norwich, Rocheſter, Dover caſtle, Hedingham (Eſſex), Bamborough (Northumberland), Porcheſter, Colcheſter, Kenilworth, Knareſborough, Cariſbrooke, and Oxford. Of the circular are Arundel, Pontefract, and Coniſburgh (Yorkſhire), Lincoln and Tunbridge in Kent. Beſides the above ſtated towers, an irregular form, of which the plan conſiſts of ſeveral ſegments of circles, may be ſeen in Clifford tower in York, and Berkeley caſtle, Glouceſterſhire. Theſe keeps or citadels in ſubſequent eras underwent no alteration, whatever additions or improvements took place in architecture.

Biſhop Gundulph ſeems to have conſidered the lofty artificial mound, originally of Daniſh uſage, as unneceſſary. His central towers are ſo lofty as to contain four ſtories, as was alſo the caſe with moſt other keep towers. The baſement was the dungeon without light: the portal or grand entrance was raiſed many feet above the ground; but his great merit conſiſted in various architectural contrivances, by which as much ſecurity during a ſiege was given to his keeps by ſtratagem, as by real ſtrength. The walls were not unfrequently from 12 to 20 feet thick at the baſe. In the ſouterrain of the vaulted ſtone the military engines and ſtores were depoſited. In the thickneſs of the walls were placed winding ſtaircaſes, the well for water, the vaſt oven, encloſed galleries and chimnies, with an aperture open to the ſky, and communicating with the dungeon, in which priſoners were confined, and to whom it gave all the light and air they could receive. There was alſo a kind of flue for conveying ſound to every part, not more than eight inches in diameter. The ſtate apartment occupied the whole third ſtory, and the ſtaircaſes leading to it were much more commodious than the others, and even ſo large as to admit of military engines. Adjoining to the great chamber was the oriel, lighted by a large window embowed withinſide. In Rocheſter caſtle the chief room was thirty-two feet high, including the whole ſpace within the walls. The walls of the ground-floor ſtory had no light, the ſecond had only loop holes; but the third had large arched windows, placed ſo high as not to be looked through, and ſo defended by an internal arcade, that no miſſile weapon could enter or fall with effect. Each floor had its communication with the well. The chimnies were very capacious, projected conſiderably into the rooms, and reſted upon ſmall pillars; and the ſinks were ſo contrived, in an oblique direction, that no weapons could be ſent up them.

Gundulph is ſaid to have introduced the architectural ornaments of the eccleſiaſtic ſtyle into fortreſſes, both withinſide and without. Moſt of the Norman caſtles had a richly carved door-caſe or portal, as the remains of Arundel and Berkeley amply teſtify. The windows were decorated with moulding, frequently ſculptured. Caſtle Riſing, Norfolk, and Norwich abound in admirable ſpecimens of Norman arcades and mouldings.

The great tower of entrance was built at the foot of the artificial mount, from which was a ſally-port, with ſtone ſtairs leading to the keep. It contained the portcullis and draw-bridge affixed to the arch-way, and ſeveral ſpacious chambers. In point both of formation of the mount and keep, and their connection with the entrance-tower, the remains of Tunbridge, and the more perfect ſtate of Arundel caſtle, exhibit a ſingular reſemblance. The walls were protected by ſtrong buttreſſes, and the round towers had a central ſpace left open to admit the light and air. At Arundel, the corble ſtones which ſupported the beams of timber are ſtill to be ſeen.

The well-authenticated buildings of Norman conſtruction, erected from before A.D. 1100 to 1150, are the abbies of Abingdon, Reading, and Cirenceſter, deſtroyed; Malling, Kent; Tewkeſbury, nave, aiſles, tranſept, and weſt front; Malmſbury, nave and weſt front; Buildwas, Salop; St. Botolph, Colcheſter; Bolton, Yorkſhire; Winborn Minſter, Dorſet; Caſtle Acre, Norfolk; Dunſtable, Bedfordſhire; St. Croſs, Hants; Romſey, Hants; Furneſs, Lancaſhire, the moſt ancient parts; Llandisfarne, Northumberland; Byland, Yorkſhire; Sanercoſt, Cumberland; Sherbourn, Dorſet; Southwell, Nottinghamſhire; Kirkſtall, Yorkſhire, nave. Of thoſe now named, Tewkeſbury, Malmſbury, Winborn Minſter, St. Croſs, Romſey, and Sherbourn, are now uſed as parochial churches.

From A.D. 1155, the ſtyle of architecture practiſed by the Normans began to be mixed with new forms and decorations, and at length to be ſuperſeded by that much more elegant and lofty ſtyle of building, improperly denominated Gothic.

The principal works that may be conſulted in Norman architecture, are the Archæologia, Carter's Ancient Architecture of England, Britton's Architectural Antiquities of Great Britain, and Dalaway's Engliſh Architecture.

NORMAN, *Cape*, in *Geography*, a cape on the weſt coaſt of Newfoundland, on the gulf of St. Lawrence, and the weſt entrance of the narrow bay of Mauco; 20 leagues from Cape Ferrol. N. lat. 51° 39'. W. long. 55° 58'. High water at full and change, at 9 o'clock.

NORMAN'S *Iſland*, a ſmall iſland of America, near the ſouth-weſt coaſt of Martha's Vineyard. N. lat. 41° 13'. W. long. 70° 45'.—Alſo, a ſmall iſland in the Weſt Indies; 18 miles E. of St. John, one of the Virgin iſlands.

NORMANDY, a conſiderable province of France before the revolution, bounded N. by the Engliſh Channel, E. by Picardy and the Iſle of France, S. by Beauce, Perche, and Maine, and W. by Bretagne; about 150 miles from E. to W., and 75 from N. to S.; divided into Upper and Lower, and containing many conſiderable cities and towns.

towns. It is now divided into the departments of the Channel, the Calvados, the Lower Seine, the Eure, the Orne, with a ſmall part of the Eure and Loire; which ſee reſpectively.

Under the Roman emperors, this province was the ſecond "Provincia Lugdunenſis;" and under the kings of the Franks, it conſtituted a part of the kingdom of Neuſtria. It was ceded to piratical Normans, who ſettled in Neuſtria, as a fief of France, in 912, by Charles the Simple, who gave his daughter, Giſle, to their duke and leader, Rollo. The ſucceeding dukes roſe to great power, and William, in 1066, became king of England. In 1135 the male line of this king and duke became extinct in the perſon of Henry I., whoſe daughter Matilda married Godfrey, count of Anjou; from which marriage ſprung Henry II., king of England. Henry III. of England ceded to Louis the Pious, and his ſucceſſors, all claim to this province, which, till the end of the 14th century, ſome kings beſtowed on their eldeſt ſons, with the title of duke of Normandy, till that of dauphin was inſtituted. By the animoſities between the houſes of Orleans and Burgundy, the Engliſh had an opportunity of overrunning not only Normandy, but a great part of France. They held the province about thirty years, and were driven out by Charles VII.

NORMANNORUM TERRA. See TERRA.

NORMOLOCO, in *Geography*, a town of South America, in the province of Tucuman; 70 miles S. of Salta.

NORNDORFF, a town of Germany, belonging to the lordſhip of Fugger, on the Schmuter; 12 miles N. of Augſburg.

NORO, a country of Africa, ſituated ſouth of Caſhna, and north of the Niger.

NOROCHI, a town of Mexico, in New Biſcay; 95 miles W.S.W. of Parral.

NOROY-LE-BOURG, a town of France, in the department of the Upper Saone, and chief place of a canton, in the diſtrict of Veſoul; 6 miles E. of Veſoul. The place contains 1035, and the canton 7813 inhabitants, on a territory of 187½ kiliometres, in 18 communes.

NORPUY, a town of Hindooſtan, in Bahar; 37 miles S.S.W. of Patna.

NORRALA, a town of Sweden, in Helſingland; 5 miles N.N.W. of Soderhamn.

NORRENT, a town of France, in the ſtraits of Calais, and chief place of a canton, in the diſtrict of Bethune. The place contains 1184, and the canton 12,741 inhabitants, on a territory of 142½ kiliometres, in 31 communes.

NORRHO, a town of Sweden, in Helſingland; 16 miles N.W. of Hudwickſwall.

NORRIDGEWOCK, a poſt-town of America, in the ſtate of Maine, ſituated on Kennebeck river, in Kennebeck county, incorporated in 1788, and containing 633 inhabitants; 35 miles N.W. of Auguſta.

NORRIS, JOHN, in *Biography*, an Engliſh divine, was born at Collingbourne, in Wiltſhire, in 1657, and educated at Wincheſter ſchool, from whence he removed to Exeter college, Oxford. In 1680 he was choſen fellow of All-Soul's college, where he took his degree of M.A. In 1689 he was preſented to the rectory of Newton St. Loo in Somerſetſhire, and afterwards to that of Bemerton in Wiltſhire. He died in 1711, leaving behind him the character of a pious, learned, and very ingenious man, but ſtrongly tinctured with the Platonic myſticiſm. He wrote a defence of the Immortality of the Soul, in oppoſition to Mr. Dodwell; but his principal work was publiſhed in 1688, entitled "The Theory and Regulation of Love, a Moral Eſſay," intended to demonſtrate the reduction of all virtue and vice to the various modifications of love. He was author of many other works, of which an account may be ſeen in the Biographia Britannica, and alſo in the General Biographical Dictionary.

NORRISTON, or NOSRITON, in *Geography*, the principal town of Montgomery county, Pennſylvania, ſeated on the north bank of the Schuylkill; 20 miles N.W. of Philadelphia; containing about 20 compact houſes, a court-houſe, and gaol, a handſome edifice for the preſervation of records, and an obſervatory near the manſion-ſeat of the late Dr. Rittenhouſe, by whom it was erected, and where he was interred at his particular requeſt, in June 1796. The number of inhabitants is 922. N. lat. 40° 7'. W. long. 75° 24'.

NORRMARK, a town of Sweden, in the government of Abo; 7 miles N.N.E. of Biorneborg.

NORRO, a ſmall iſland between the coaſt of Finland and the iſland of Alan. N. lat. 60° 34'. E. long. 20° 50'.

NORRON, a ſmall iſland on the weſt ſide of the gulf of Bothnia. N. lat. 60° 48'. E. long. 17° 11'.

NORROY, *North-Roy, q. d.* Northern king; the title of one of the two provincial kings at arms, or provincial heralds. See KING *at Arms* and HERALD.

His juriſdiction lies on the north ſide of the Trent, whence his name; as Clarenceux, on the ſouth.

Norroy is the moſt ancient title of the kings at arms, of whom there have been ſeveral at different times in this realm; and perhaps it is the only one in England, taken from the ſituation of his province, unleſs "Marche" ſhould be conceived to be of that nature: for as to "Clarenceux," he is not from the place, but "Roy des Clarenceux," from the people inhabiting in that place. It is very probable, that the proper title of this northern king is, as he is often anciently written, "Norreys," and "Norreis," king of arms of people reſiding in the north; as "Garter" is ſtyled "Roy des Anglois," of the people, and not "d'Angleterre," of the kingdom; for we learn from ancient hiſtorians, that the inhabitants of the north were called Norreys. It appears by an authentic document, that there was a king of arms for the parts or people on the north of Trent, in the beginning of the reign of king Edward I.; and he is mentioned again, together with the minſtrels, in the 16th year of Edward II.; but in his ſucceſſor's reign, the title "Norroy" was appropriated to a king of heralds, who is afterwards eſpecially called "Rex Norroy, &c." From the 22d year of king Edward III. to the 9th year of Richard II., no mention is made of any ſuch officer. When Edward IV. obtained the throne, this province was placed again under a king of arms, with the old revived title of "Norroy;" and from that time to the preſent, the office of Norroy hath been continued without interruption.

NORRSKAR, in *Geography*, a ſmall iſland on the weſt ſide of the gulf of Bothnia. N. lat. 60° 48'. E. long. 17° 11'.

NORS, a river of Sweden, which runs into the Wenner lake, 4 miles N.E. of Galſta.

NORT, a town of France, in the department of the Lower Loire, and chief place of a canton, in the diſtrict of Chateaubriant; 18 miles S. of it. The place contains 3180, and the canton 10,265 inhabitants, on a territory of 267½ kiliometres, in 6 communes.—Alſo, an iſland of Ruſſia, in the gulf of Finland; 44 miles W. of Revel. N. lat. 59° 15'. E. long. 26° 14'.

NORTELGA, or NOR TELGE, a ſea-port town of Sweden, in the province of Upland, built by Guſtavus Adolphus, and in 1622 endowed with the ſtaple and other privileges, but diſcontinued in 1637. The inhabitants now ſubſiſt

ſubſiſt by navigation and fiſhing; and near it is a forge for making fire-arms; 30 miles N.E. of Stockholm. N. lat. 59° 46′. E. long. 18° 32′.

NORTGAU, a country of Germany, called alſo the "Upper Palatinate," of which Amberg is the capital. See PALATINATE.

NORTH, FRANCIS, *Lord* GUILFORD, in *Biography*, lord keeper of the great ſeal in the reign of Charles II. and James II., was the third ſon of the ſecond Dudley lord North, baron of Kertling, vulgò Catlage, &c. From Bury ſchool, where he made great proficiency in grammar learning, he was removed to St. John's college in Cambridge, and admitted a fellow-commoner in 1653. Here he acquired great reputation by his aſſiduity and attainments, and recommended himſelf to the eſteem of his aſſociates by the ſprightlineſs of his converſation. From the univerſity he removed to the Middle Temple, and proſecuted various ſtudies with ſingular diligence; ſo that he not only gained the knowledge of the French, Italian, Spaniſh, and Dutch languages, but became a good lawyer, and a proficient in hiſtory, mathematics, philoſophy, and muſic. By the variety of his ſtudies, and particularly by the practice of muſic, he was relieved in his other purſuits. Availing himſelf of the friendſhip and inſtructions of ſir Jeffery Palmer, attorney-general, and the Hydes, he became eminent in his profeſſion; and in the Norfolk circuit, which he uſually attended, he was employed as counſel in every important cauſe. Tired of the routine of his profeſſion, after having been both ſolicitor and attorney-general, he aſpired to the poſt of lord chief juſtice of the common pleas, and at length ſucceeded to his wiſhes in obtaining it. Upon the death of the chancellor Nottingham, the great ſeal was committed to his cuſtody, and he was advanced to the peerage with the title of lord Guilford, by letters patent bearing date September 27th, 1683. The number of his avocations, and the unpleaſantneſs of ſome of his connections after the death of king Charles, induced him to requeſt the king's leave to quit the ſeal. Not ſucceeding in his application, he ſought temporary relief by retirement into the country; but he died at his houſe in Wroxton, in 1685. Although his private character was ſtrictly virtuous and unexceptionable, he is charged with having been too much influenced by the court, ſo as even to endanger the Proteſtant religion in this kingdom. His relation and advocate, Roger North, has endeavoured to vindicate him from all reproaches of his public character, in his "Examen," and in his "Life of the Lord Keeper Guilford."

Philoſophy and ſcience, during the 17th century, ſeem to have intereſted themſelves, and lent their aid in the refinement and melioration of muſical ſound, more than at any other period. Sir Francis Bacon, Kepler, Galileo, Merſennus, Des Cartes, Kircher, and, after the eſtabliſhment of the Royal Society in London, lord keeper North, lord Brouncker, Narciſſus, biſhop of Ferns, Dr. Wallis, Dr. Holder, and ſir Iſaac Newton, have all thought harmony, and the philoſophy of ſound, objects worthy of their moſt profound meditations and reſearches. The lord keeper uſed to ſay, 'that if he had not diverted his attention by the ſtudy of modern languages and the fine arts, and by the practice of muſic particularly, he ſhould never have been a lawyer.

He publiſhed, in 1677, "A philoſophical Eſſay of Muſic, directed to a Friend." Though ſome of the philoſophy of this eſſay has been ſince found to be falſe, and the reſt has been more clearly illuſtrated and explained, yet, conſidering the ſmall progreſs which had been made in ſo obſcure and ſubtil a ſubject as the propagation of ſound, when this book was written, the experiments and conjectures muſt be allowed to have conſiderable merit. The *ſcheme*, or table of pulſes, at the beginning, ſhewing the coincidence of vibrations in muſical concords, is new, and conveys a clear idea to the eye, of what the ratio of ſounds, in numbers, only communicates to the intellect. Theſe coincidences, upon which the degrees of perfection in concords depend, being too rapid for the ſenſe of hearing to enable us to count, are here delineated in ſuch a manner, as explains the doctrine of vibrations even to a perſon that is deaf This pamphlet, containing only 35 pages, was publiſhed without the name of the author; but afterwards acknowledged to have been the work of lord keeper North, in the life of that nobleman, written by his brother, the honourable Roger North. His delineation of the harmonical vibration of ſtrings ſeems to have been adopted by Euler, in his "Tentamen novæ Theoriæ muſicæ." The keeper is ſaid, in the Biographical Dictionary, to have compoſed ſeveral concertos in two and three parts. Now no compoſition, in fewer than four or five parts, is ever honoured with the title of concerto; nor was this title given to inſtrumental muſic during the life of lord keeper North, who died in 1685. The concertos of Corelli, Torelli, and Aleſſandro Scarlatti, in ſeven and eight parts, the firſt of the kind, were not publiſhed till the beginning of the laſt century. Fancies in two and three parts, indeed, were, we believe, ſometimes called *conſorts*. And when it is aſſerted, in the ſame dictionary, that lord keeper North may be eſteemed the father of muſical philoſophy, it ſhould have been added, in this country; for Galileo in Italy, and Merſennus in France, had deeply inveſtigated the ſubject of harmonics many years before the publication of the lord keeper North's ingenious eſſay.

NORTH, *The Hon.* ROGER, brother of the preceding, was likewiſe brought up to the law, and was attorney-general to James II. He publiſhed an "Examen into the Credit and Veracity of a pretended complete Hiſtory," *viz.* Dr. White Kennet's Hiſtory of England, and alſo the lives of his three brothers, the lord keeper Guildford, ſir Dudley North, and the Rev. Dr. John North. In theſe pieces there is much curious and truly valuable information, but not without conſiderable partiality.

The Hon. Roger North was adilettante muſician of conſiderable taſte and knowledge in the art, and who watched and recorded its progreſs during the latter end of the 17th, and beginning of the 18th century, with judgment and diſcrimination; leaving behind him, at his deceaſe in 1733, a manuſcript, entitled "Memoirs of Muſic," to which being favoured with acceſs, we found it of great uſe in the hiſtory of Engliſh ſecular muſic, during the period to which his memoirs are confined. See JENKINS, and NICOLA MATTEIS.

This honourable cultivator and patron of muſic lived chiefly at Rougham, in Norfolk, where his life was extended to the age of 83. He had an organ, built by father Smith, for a gallery of 60 feet long, which he erected on purpoſe for its reception. There was not a metal pipe in this inſtrument, which we ſaw and heard in the year 1752, yet its tone was as brilliant, and infinitely more ſweet, than if the pipes had been all of metal.

NORTH, DUDLEY, *Lord*, the third baron of that family, was reckoned one of the fineſt gentlemen in the court of king James, but in ſupporting that character he diſſipated away the greater part of his fortune. In 1645 he appears to have acted with the parliament, and was nominated by them to be adminiſtrator of the admiralty, in conjunction with the great earls of Northumberland, Eſſex, and Warwick. He died at the age of 85. The latter part of his life he paſſed in retirement, and wrote a ſmall folio of miſcellanies, in proſe and verſe, under the title of "A Foreſt promiſcuous

promiſcuous of ſeveral Seaſons' Productions," in four parts, 1659.

NORTH, DUDLEY, *Lord*, ſon of the former, was made knight of the Bath in 1616, at the creation of Charles prince of Wales. He ſat in many parliaments, till excluded by the prevailing party in that which condemned the king. From this period lord North lived privately in the country, and towards the end of his life entertained himſelf with books. He was author of a ſmall tract, entitled "Obſervations and Advices Economical," 12mo. He wrote likewiſe "Paſſages relating to the Long Parliament:" "The Hiſtory of the Life of Lord Edward North," the firſt baron of the family, addreſſed to his eldeſt ſon; and a "Volume of Eſſays."

NORTH, *The Hon.* JOHN, the fourth brother of the family, was born in 1645. He ſtudied at Jeſus college, Cambridge, and entered into holy orders. He was a man of very extenſive learning, and was appointed Greek profeſſor in the univerſity of Cambridge. While in that ſituation, he publiſhed ſome ſelect dialogues of Plato in 1673. He was clerk of the cloſet to the king, a prebendary of Weſtminſter, and in 1677 ſucceeded Dr. Barrow in the maſterſhip of Trinity college, Cambridge. He died in 1683.

NORTH, FREDERICK, earl of Guilford, chiefly known as lord North, under which title he was for many years the premier of England. His lordſhip was born April 13th, 1732, but did not ſucceed to the earldom and eſtates till the year 1790. As a miniſter, he ſucceeded the celebrated Mr. Charles Townſend as manager of the houſe of commons (we could, we think, give the office a more appropriate title than is conveyed by the term *manager*) and chancellor of the exchequer; and in 1770, on the reſignation of the duke of Grafton, he was made firſt lord of the treaſury; in which office he continued till the cloſe of the American war, or rather till the formation of the Rockingham miniſtry, by which he and his party, who had deſolated the empire by a long and bloody war, and by the loſs of the American colonies, were removed. After this he formed a coalition with Mr. Fox, which was eſteemed, by the public, as one of the moſt unnatural junctions ever entered into by political characters. It excited an almoſt univerſal abhorrence, and of courſe did not laſt long. Lord North, in 1790, ſucceeded his father as earl of Guilford, and died Auguſt the 5th, 1792. He was a man of ſtrong mental abilities; and either by his eloquence, or by ſtill more attractive means, he commanded attention and enforced conviction. His lordſhip was one of the loudeſt advocates of what during the preſent reign has been denominated the Conſtitution in church and ſtate. No man was ever more beloved in private life, but as a public character his memory cannot be reſpected by thoſe who are friends to the peace, the liberties, and the happineſs of their country and of the human race.

NORTH, in *Coſmography*, one of the four cardinal points of the horizon being that interſection of the horizon and meridian which is neareſt our pole.

NORTH *Bay*, in *Geography*, a bay of the Eaſt India ſea, on the S. coaſt of Chiampa. N. lat. 10° 36′. E. long. 106° 35′.

NORTH *Cape*, a cape on the N. coaſt of Ireland. N. lat. 55° 15′. W. long. 8° 55′.—Alſo, the moſt northerly point of Europe, on the coaſt of Norway. N. lat. 71° 10′. E. long. 26°.—Alſo, a cape on the coaſt of Aſia, in the Frozen ocean. N. lat. 68° 56′. W. long. 179° 9′.—Alſo, a cape on the E. coaſt of South America, forming the N. boundary of Brazil. N. lat. 1° 48′. W. long. 56° 6′.—Alſo, the N. part of the iſland of St. John, in the gulf of St. Lawrence. N. lat. 47°. W. long. 63° 55′.—Alſo, the N.E. point of the iſland of Cape Breton. N. lat. 47° 2′. W. long. 60° 12′.—Alſo, a cape of Africa, on the W. coaſt of Morocco. N. lat. 32° 45′.—Alſo, the northern extremity of New Zealand, which forms the N. point of Sandy bay, and is a peninſula jutting out N.E. about two miles, and terminating in a bluff head that is flat at the top. The land of this cape has the appearance of an iſland; upon it Cook ſaw in 1769 a hippah or village, and a few inhabitants; and on the S.E. ſide of it there appeared to be anchorage and a good ſhelter from the S.W. and N W. winds.—Alſo, the N.E. point of the iſland of Fernando Po. N. lat. 3° 50′. E. long. 7° 55′.

NORTH, *Department of the*, one of the twelve departments of the ſecond or northern region of France, compoſed of French Flanders, &c., bounded on the N. by the ſea, on the N.E. by Flanders and Auſtrian Hainaut, on the S. by the department of the Aiſne, and on the W. by that of the ſtraits of Calais, in 50° 20′ N. lat. 44 Fr. leagues in length and 10 in breadth, and containing 6030 kiliometres or 278 ſquare leagues, and 774,450 inhabitants. It is divided into 6 circles or diſtricts, 60 cantons, and 671 communes. The circles are Bergues, including 80,242 inhabitants, Hazebrouch, 106,241, Lille, 221,228, Cambray, 108,551, Aveſnes, 91,746, and Douay, 166,442. According to Haſſenfratz, the number of circles is 8, of cantons 59, and of inhabitants 447,910. The capital of this department is Douay. Its annual contributions in the eleventh year of the French era amounted to 6,736,621 fr. and its expences to 514,603 fr. 87 cents. The ſoil of Hazebrouch is marſhy; but the other diſtricts are fertile, yielding abundance of grain, fruits, and paſtures. Hazebrouch contains the foreſt of Nieppe, and in Douay are the mineral ſprings of St. Amand.

NORTH *Coaſts*, *Department of*, one of the nine departments of the N.W. region of France, formerly Upper Bretagne, a maritime territory between Finiſterre and Ille, in 48° 30′ N. lat., bounded on the N. by the Engliſh channel, on the E. by the department of Ille and Vilaine, on the S. by the department of the Morbihan, and on the W. by that of Finiſterre, 30 Fr. leagues in length, 15 in breadth, containing 567½ kiliometres or 353 ſquare leagues, and 499,927 inhabitants. It is divided into 5 circles, 47 cantons, and 376 communes. The circles are Lannion, including 83,633 inhabitants, St. Brieuc, 145,176, Dinan, 96,327, Loudeac, 85,271, and Guingamp, 89,520. The capital is St. Brieuc. According to Haſſenfratz, the number of circles is 9, of cantons 81, and of inhabitants 523,860. The contributions in the year 11 amounted to 2,549,791 fr. and the expences to 306,687 fr. 19 cents. The cultivated tracts in this department yield abundance of grain, wine, flax, fruits, and paſtures. It has iron and lead mines.

NORTH *Company*. See COMPANY.

NORTH *Dial*. See DIAL.

NORTH-*Eaſt*, a rhumb, or point, in the middle between the eaſt and north.

NORTH-*Eaſt Land*, in *Geography*, an iſland in the North ſea, of a triangular form, about 200 miles in circuit, ſeparated from Spitzbergen by a channel, called Hinlopen ſtraits. N. lat. 79° 15′ to 80° 18′. E. long. 18° to 23° 30′.

NORTH-*Eaſt Paſſage*. The advocates for the north-eaſt paſſage, ſays a late writer, have divided that navigation into three parts; and by endeavouring to ſhew that theſe three parts have been paſſed at different times, they conclude from thence, that the whole taken collectively is practicable. Theſe three parts are, 1. From Archangel to the river Lena.

2. From

2. From the Lena round Tſchukotſkoi Noſs, (or the north-eaſtern promontory of Aſia) to Kamtſchatka: and 3. From Kamtſchatka to Japan. With reſpect to the firſt part, no one ever aſſerted that it has been performed in one voyage; from an account of the ſeveral voyages that have been made in theſe ſeas it appears, that there is a cape between the rivers Chatanja and Piaſida, that has never yet been doubled. As to the ſecond diviſion of the north-eaſt paſſage, it has been affirmed, that a paſſage has been effected by ſeveral veſſels, which have, at different times, ſailed round the northern extremity of Aſia. But from the Ruſſian accounts it is inferred, that it has been performed but once, *viz.* by one Deſhneff, who, in 1648, is ſaid to have doubled this formidable cape. Of the third, or remaining part of this paſſage, no doubt can be entertained. The connection between the ſeas of Kamtſchatka and Japan has been eſtabliſhed by many voyages. Coxe's Account of the Ruſſian Diſcoveries, &c. 4to. 1780. See NORTH-*Weſt Paſſage*.

NORTH-*Eaſt Point*, in *Geography*, a cape on the iſland of Jamaica. N. lat. 18° 11′. W. long. 76° 2′.

NORTH *Foreland*. See FORELAND.

NORTH *Haven Point*, a cape on the S. coaſt of England, at the entrance of Pool bay; eight miles E. of Pool.

NORTH *Head*, a cape on the N.E. coaſt of New Holland, and N.W. point of Buſtard bay. S. lat. 24°.—Alſo, one of the ſmaller Orkney iſlands. N. lat. 58° 38′. W. long. 2° 55′.

NORTH *Iſland*, a ſmall iſland in the Eaſt Indian ſea, near the W. coaſt of Borneo. S. lat. 1° 22′. E. long 109° 5′.—Alſo, a ſmall iſland near the S. coaſt of Celebes. S. lat. 5° 38′. E. long. 120° 48′.—Alſo, a ſmall iſland near the S.W. coaſt of the iſland of Boutan. S. lat. 5° 33′. E. long. 122° 50′.—Alſo, a ſmall iſland in the North Pacific ocean, in Dixon's entrance. N. lat. 54° 20′. W. long. 133° 10′.—Alſo, an iſland in the Atlantic, near the coaſt of America, at the mouth of the Great Pedee river, near the coaſt of South Carolina. N. lat. 33° 20′. W. long. 79° 3′.—Alſo, a ſmall iſland in the Pacific ocean, diſcovered by captain King in 1779. N. lat. 25° 14′. E. long 141° 10′.—Alſo, a ſmall iſland in the Eaſt Indian ſea. S. lat. 5° 38′. E. long. 105° 43′.

NORTH *Key*, a ſmall iſland in the bay of Honduras. N. lat. 17° 24′. W. long. 87° 57′.

NORTH *Mountains*, a ridge which branches off from the Alleghany mountains, S. of James' river, extending into Maryland, as far as the river Potowmack.

NORTH-*North-eaſt*, *North-eaſt-and-by-eaſt*, are ſubdiviſions of the compaſs between the north and eaſt. See WIND.

NORTH *Point*, in *Geography*, a cape of England, on the coaſt of Durham. N. lat. 55° 4′. W. long. 1° 2′.—Alſo, a cape on the N. coaſt of the iſland of Morty. N. lat. 2° 45′. E. long. 128° 20′.

NORTH *Pole*. See POLE.

NORTH *Reef*, a reef of the iſland of Hiſpaniola. N. lat. 33°. W. long. 69° 12.

NORTH *River*, a river of the iſland of St. Vincent, which runs into the ſea, one mile N. of Young Point.—Alſo, a river of Canada, which runs into the Utwas; 129 miles W. of Montreal.—Alſo, a river of North Carolina, which runs into Albemarle ſound. N. lat. 36° 6′. W. long. 76° 10′.—Alſo, a river of Maſſachuſetts, which runs into the ſea between Scituate and Marble head.—Alſo, a branch of Hudſon's river.—Alſo, a branch of Fluviana river, in Virginia.

NORTH *Sea*. See SEA.

NORTH *Sound Point*, a cape of the iſland of Antigua, at the E. ſide of the entrance into Parham harbour. N. lat. 17° 16′. W. long. 61° 27′.

NORTH *Star*, the laſt in the tail of the Little Bear; called alſo the *pole-ſtar*; which ſee.

NORTH *Wales*, in *Geography*. See WALES.

NORTH *Wales*, a town of Caroline county, Virginia; 10 miles N.W of Hanover.

NORTH *Wall*. See WALL.

NORTH-*Weſt*, is a point or rhumb, in the middle between the north and weſt. See WEST, &c.

NORTH-*Weſt Bay*, in *Geography*, a bay on the N. coaſt of the iſland of Fernando Po. N. lat. 5° 35′. E long. 7° 35′.

NORTH-*Weſt Company*. See COMPANY and FUR *Trade*.

NORTH-*Weſt Paſſage*. Much difference of opinion has ſubſiſted as to the navigable extremities of our own hemiſphere; particularly as to the exiſtence, or at leaſt, as to the practicability of a northern paſſage between the Atlantic and Pacific oceans, either by ſailing *eaſtward*, round Aſia, or *weſtward*, round North America. If ſuch a paſſage could be effected, it is obvious that voyages to Japan and China, and indeed to the Eaſt Indies in general, would be much ſhortened, and conſequently become more profitable, than by making the tedious circuit of the Cape of Good Hope. To this object the Engliſh, in common with other nations, have directed their attention for more than two centuries. We ſhall now ſay nothing of Cabot's original attempt in 1497, which terminated in the diſcovery of Newfoundland and the Labrador coaſt; but obſerve, that from Frobiſher's firſt voyage to find a weſtern paſſage, in 1576, to thoſe of James and Fox, in 1630, repeated trials have been made by enterpriſing adventurers. In the courſe of theſe voyages, our knowledge of the northern extent of America was enlarged by the diſcovery of Hudſon's and Baffin's bays; and yet the wiſhed-for paſſage on that ſide, into the Pacific ocean, was ſtill unattained. Both our countrymen and the Dutch were equally unſucceſsful, in various attempts to find this paſſage in an eaſtern direction. Wood's failure, in 1676, ſeems to have cloſed the long liſt of unfortunate northern expeditions in that century; and the diſcovery, if not abſolutely deſpaired of, by having ſo often failed, ceaſed for many years to be an object of inveſtigation. Mr. Dobbs, a warm advocate for the probability of a north-weſt paſſage through Hudſon's Bay, in our own times, once more recalled the attention of this country to that undertaking; and by his active zeal, and perſevering ſolicitude, renewed the ſpirit of diſcovery; but it was renewed in vain. For Capt. Middleton, ſent out by government in 1741, and captains Smith and Moore, by a private ſociety in 1746, though encouraged by an act of parliament paſſed in the preceding year, that annexed a reward of 20,000*l.* to the diſcovery of a paſſage, returned from Hudſon's Bay with reports of their proceedings, that left the accompliſhment of this favourite object at as great a diſtance as ever. The object, however, was not abandoned, and captain Cook was ſelected for undertaking a voyage in the proſecution of it. In the project with which he was intruſted, the uſual plan of diſcovery was reverſed; and inſtead of a paſſage from the Atlantic to the Pacific ocean, one from the latter into the former was to be attempted. Accordingly, Capt. Cook was ordered to proceed into the Pacific ocean, and to make his progreſs northward to the principal ſcene of his operations. The commiſſioners of the admiralty drew up inſtructions for his conduct of the voyage, which were ſigned by them on the 6th of July, 1776, and ſubſequently delivered to captain Cook. In order to encourage adventurers in the purſuit of this object, an alteration had been made in the act of parliament, paſſed in 1745, (18 Geo. II. c. 17.), which held out a reward of 20,000*l.* merely to ſhips belonging to any of his majeſty's ſubjects, excluſive of his majeſty's own

own ſhips, and which held out this reward only to ſuch ſhips as ſhould diſcover a paſſage through Hudſon's Bay. In this new ſtatute, (16 Geo. III. c. 6.) it was enacted, that if any ſhip belonging to any of his majeſty's ſubjects, or to his majeſty, ſhould find out, and ſail through, any paſſage by ſea, between the Atlantic and Pacific oceans, in any direction or parallel of the northern hemiſphere, to the northward of the 52° of northern latitude, the owners of ſuch ſhips, if belonging to any of his majeſty's ſubjects, or the commander, officers, and ſeamen, of ſuch ſhip belonging to his majeſty, ſhall receive, as a reward for ſuch diſcovery, the ſum of 20,000*l.* It was alſo enacted, with a view to the diſcovery of a communication between the Atlantic and Pacific oceans, that if any ſhip ſhall approach to within one degree of the north pole, the owner, &c. or commander, &c. ſo approaching, ſhall receive, as a reward for ſuch firſt approach, the ſum of 5000*l.* In order to facilitate the ſucceſs of Capt. Cook's expedition, lieutenant Pickerſgill in 1776, and lieutenant Young in 1777, were ordered to proceed to Baffin's bay, to explore its weſtern parts, &c. The execution of theſe preconcerted voyages did not anſwer the expectations that were formed of them, for reaſons which it is here needleſs to detail. The inſtructions committed to Capt. Cook were founded on an accurate knowledge of what had been already done, and of what ſtill remained to be performed; and this knowledge pointed out the inutility of beginning his ſearch for a paſſage till his arrival in the latitude of 65°, whither he was directed to repair. The Hudſon's Bay company, though for ſome time tardy in the contrivance and execution of plans and voyages towards the diſcovery of a N.W. paſſage, at length exerted themſelves by land-journies as well as by ſea-voyages for the accompliſhment of this great object; but altogether without ſucceſs. Capt. Cook and Capt. Clerke have made ſuch diſcoveries on the weſt ſide of America, and have given ſuch a report of Beering's ſtrait, as will ſerve, in addition to thoſe of Mr. Hearne by land, and of other navigators, to diſcourage future attempts to penetrate into the Pacific ocean, in any northern direction. Phil. Tranſ. N° 482, ſect. 14. Introduction to Cook's Third Voyage, vol. i.

NORTH-*Weſt Point*, in *Gography*, a cape on the weſt coaſt of Africa. S. lat. 16° 36'.

NORTH-*Weſt River*, a branch of Cape Fear river, in North Carolina.

NORTH-*Weſt Territory*, a part of the United States of America, divided into the ſtates of Ohio, Indiana, and the county of Wayne.

NORTH *Wind*. See WIND.

NORTHADSTEDE, in *Geography*, a town of the duchy of Holſtein; eight miles N.E. of Meldorp.

NORTHALBEN, or NORDHEIM. See NORDHALBEN.

NORTHALLERTON, a borough and market-town in the wapentake of Allertonſhire, North Riding of the county of York, England, is ſituated on the ſide of a riſing ground, gently ſloping towards the eaſt, 31 miles diſtant from the city of York, and 225 miles from London. Near this place, in the year 1138, the memorable battle of the Standard was fought between the Engliſh and Scots. David, king of Scotland, taking advantage of the civil war between king Stephen and the empreſs Matilda, ravaged the northern parts of England, and advanced as far as this town, where he was oppoſed by an army under the command of the earls of Albemarle and Ferrers. To animate the Engliſh forces, the biſhop of the Orkneys, acting as deputy to Thurſtan, archbiſhop of York, who was confined by ſickneſs, brought from the convent of Beverley a conſecrated ſtandard, which was a tall maſt, fixed in a four-wheel carriage, and having at the top a pix with the hoſt, and a croſs with the banners of St. Peter and St. John of Beverley: from this circumſtance the battle acquired its name. The Scots, relying on their ſuperior force, ruſhed to the attack, but were totally routed, with the loſs of 10,000 men, and were glad to return to their own country, with the ſhattered remains of their army. The ſpot on which the conflict took place, is ſtill called Standard-hill.

The town conſiſts principally of one ſtreet, the houſes of which are built with brick: the market-place is ſpacious, and ſurrounded with very good houſes. The church is an ancient ſtructure, built in the form of a croſs, and contains ſeveral monuments. The civil government of the town is veſted in a bailiff, who holds his office for life, by the appointment of the biſhop of Durham for the time being. To this ſee the whole of the manor has been ſubject ever ſince the time of William Rufus. Two members are returned to the imperial parliament from this borough: the right of election is in the whole body of houſholders paying ſcot and lot. A market is held on Wedneſdays, and here are five annual fairs, in which horſes and horned cattle conſtitute the chief articles of traffic. In the parliamentary ſurvey of the year 1811, Northallerton was ſtated to contain 2234 inhabitants, occupying 510 houſes. Near this town an hoſpital, dedicated to St. James, was founded by Hugh Puſar, biſhop of Durham, about the cloſe of the twelfth century: it was granted at the diſſolution to ſir Richard Moryſine, and afterwards became part of the endowment of Chriſtchurch college, Oxford. A ſimilar eſtabliſhment, founded by Richard de Moore in the year 1476, is yet in being; but part of its poſſeſſions having been alienated, only four perſons are maintained in it, who are nominated by the earl of Carliſle, the patron. Beauties of England and Wales; Yorkſhire, vol. xvi. by J. Bigland.

NORTH AMERICA comprehends all that part of the continent of America which lies N. of the iſthmus of Darien, extending N. and S. from about the 10th deg. of N. lat. to the north pole; and E. and W. from the Atlantic to the Pacific ocean, between the 57th and 168th deg. of W. long. from Greenwich. Beyond the 70th degree N. lat. few diſcoveries have been made. North America was diſcovered in 1497, in the reign of Henry VII. by John Cabot, a Venetian; and was then thickly inhabited by Indians. It is now ſuppoſed that there are not more than two millions and a half of the aborigines in N. and S. America. Of North America an account has been already given under AMERICA; but we ſhall here ſubjoin ſome further particulars, correcting the details that occur more largely under that article, and adding others that have not been already introduced. The provinces and ſtates comprehended under North America, are here exhibited under the following more enlarged and correct TABLE.

Belong to	Countries, Provinces, and States.		Number of Inhabitants.
Denmark.	Weſt Greenland,	about	10,000
Britiſh Provinces.	New Britain		unknown
	Upper Canada	about	80,000
	Lower Canada	—	150,000
	Newfoundland	—	7,000
	Cape Breton Iſland	—	1,000
	New Brunſwick, Nova Scotia, St. John's Iſland	— in 1783,	35,000 5,000
	Vermont		

Belong to	Countries, Provinces, and States.		Number of Inhabitants.
United States of America.	Vermont	in 1800	154,465
	New Hampſhire	—	183,858
	Maſſachuſetts	—	422,845
	Diſtrict of Maine	—	151,719
	Rhode Iſland	—	69,122
	Connecticut	—	257,002
	New York	—	586,050
	New Jerſey	—	211,149
	Pennſylvania	—	602,545
	Delaware	—	64,273
	Maryland	—	349,692
	Virginia	—	886,149
	Kentucky	—	220,929
	North Carolina	—	478,103
	South Carolina	—	345,959
	Georgia	—	162,686
	Tenneſſee	—	105,602
	Ohio	—	42,159
	Wayne county, a diſtinct government	—	3,206
	Indiana territory, N.W. of Ohio river	—	6,407
	Miſſiſippi territory	—	8,840
	Louiſiana, lately purchaſed by the United States.	See LOUISIANA.	
Span. Prov.	Eaſt Florida	unknown	
	Weſt Florida	—	
	New Mexico	—	
	California	—	
	Mexico, or New Spain	—	

See an account of each of the above-mentioned provinces and ſtates under their appropriate titles.

In July 1779, Capt. Cook, and ſince his voyage Capt. Vancouver and many others, have explored and deſcribed the weſtern coaſt of North America. The former proceeded as far as N. lat. 71°, when he came to a ſolid body of ice from continent to continent. Of the diſcoveries of both theſe navigators, and alſo of Perouſe, &c. ſee an account under CALIFORNIA, NEW ALBION, FRANÇOIS, NOOTKA, and NORTH-*Weſt Paſſage*. The interior country has been explored by Meſſrs. Hearne and Mackenzie. The former went northward to the Frozen ocean, at the mouth of Coppermine river. The latter embarked at fort Chepewyan on the S. of the Lake of the Hills, in N. lat. 58° 40′. W. long. 110° 30′, in June 1789, in a canoe of birch bark, with ten aſſociates, three of whom were in another canoe. His courſe was north-weſterly to ſeek the Frozen ocean. Mountains and vallies, dreary waſtes and wide ſpreading foreſts, lakes and rivers, ſucceed each other in his deſcriptions. Very ſmall bands of wandering ſavages were the only people he diſcovered. After leaving the Lake of the Hills, he entered the Slave river, from which he paſſed to the Slave lake, a large body of freſh water, in about N. lat. 61° and 62°, and W. long. 110° to 120°. The country round wears a barren aſpect, but produces a great variety of berries, and is covered with large trees of ſpruce-pine and white birch. Where theſe are deſtroyed, poplars ſucceed, though none were ſeen before. From this lake he entered Mackenzie's river, a deep and ſpacious ſtream. On its banks he found encampments of Kniſteneaux Indians. This wandering tribe ſpreads over a vaſt extent of country. Their language is the ſame as that of the natives on the waters of the St. Lawrence and the coaſt of Labrador. They are of a moderate ſtature, well proportioned and active. Their dreſs is ſimple, countenance open, and eyes black. Their women are the moſt comely of ſavages, and not inattentive to their own perſons, but ſtill pay more attention to the decoration of the men. Theſe people are affable, indulgent to their children, and hoſpitable to ſtrangers. Chaſtity they conſider not as a virtue; they make temporary exchanges of wives, and a proffer of them to ſtrangers is a part of their hoſpitality; inceſt and beſtiality are not uncommon. At their funerals the mourners cut off their hair, lacerate their fleſh, blacken their faces; and widows, as in the eaſt, ſometimes ſacrifice themſelves. Smoking precedes all matters of importance. This ſacred rite ſettles all differences between contending perſons; it is never violated. No perſon may join in this ſolemn act, who has cohabited with a woman within 24 hours—he "is unclean."

After proceeding down this river to N. lat. 69° 1′, and about W. long. 134°, he reached the tide waters of the Frozen ocean; but in the middle of July was forbidden to proceed any further by extenſive fields of ice, and returned to Chepewyan *fort*, having been abſent 102 days. In October 1792, he proceeded on a voyage to the N. Pacific ocean. From the Lake of the Hills he aſcended the Peace river, which in the drieſt ſeaſon is a quarter of a mile in breadth; the ſoil on each ſide is low and rich. Like other unchriſtianized people, the Indians on this river practiſe polygamy. The women are in the loweſt ſtate of debaſement; more indecent and filthy than the men. The females perform all the drudgery allotted to brutes in civilized ſociety, excepting what aid they receive from a few ſmall dogs. While the men carry nothing but a gun, their wives and daughters follow with ſuch oppreſſive burdens, that if they lay them down they are unable to raiſe them again. This help the men will not deign to lend them; they often, therefore, lean againſt a tree for a partial, temporary relief. Theſe people are total ſtrangers to the moſt ſimple remedies in time of ſickneſs. At their funerals, among other extravagant tokens of grief, the females, for the death of a favourite ſon, or huſband, or father, ſometimes cut off a finger at the firſt joint. Some of the old women have not a whole finger on either hand. The property of the perſon deceaſed is all deſtroyed, that the ſight of things connected with him may not renew their grief. Theſe ſavages are great gameſters, purſuing the buſineſs ſometimes for a ſucceſſion of days and nights.

In the mountains which ſeparate the waters of the Atlantic and Pacific oceans, are ſeveral chaſms, which emit ſmoke and fire with a ſulphureous ſmell. Finding the ſtreams of the weſt did not tend directly to the ſea, Mr. Mackenzie proceeded by land for a conſiderable time, finding in general a tolerable road or path made by the ſavages. As he advanced nearer the ocean, the ſettlements of the natives were more numerous and permanent; the manner of living more comfortable, the ſtate of ſociety ſomewhat improved: men took a ſhare in domeſtic labours, and women were more reſpected. Architecture was improved; painting and carving had made ſome progreſs. The timber of a houſe was ſeen hewn on two ſides; the end of the ridge-pole was carved in the form of a ſnake's head; the inſides of ſeveral buildings were decorated with painted hieroglyphics. In ſome of their villages are temples ſupported by pillars, carved in the ſhape of men. Theſe are painted black and red. Their waters are ſtored with ſalmon, and they hoſpitably invite the ſtranger to ſhare in their plenty; a variety of berries enrich the feaſt. Copper, iron, and braſs are frequently ſeen near the ſea, which the natives had purchaſed of European ſhips. The ſoil is good; alder trees are $7\frac{1}{2}$ feet in circumference, and 40 feet without a branch; cedars are 24 feet in circumference and proportionably high. Wil-

lows, ſpruce, birch, and hemlock are common. Their canoes of cedar carry 50 perſons. In ſome inſtances, when a perſon dies he is buried till another of the family ſhall deceaſe, then he is taken up and burned, and the other perſon laid in the ſame grave. They believe in a good and evil ſpirit, and have ſeaſons for public and private worſhip. In N. lat. 52° 21′ 33″, and W. long. 128° 2′, Mr. Mackenzie reached the Great Pacific ocean, and with vermilion inſcribed on the ſide of a rock by the ſhore—

"Alexander Mackenzie, from Canada by land, the twenty-ſecond of July, one thouſand ſeven hundred and ninety-three."

NORTHAMPTON, the principal and county-town of Northamptonſhire, England, is memorable in the annals of political and local hiſtory for the number of councils and ſynods held there; for its formidable ancient caſtle, with the provincial earls; alſo for numerous monaſtic foundations, and military events; and laſtly, for its modern improvements and pleaſantneſs of ſituation, as a place of buſineſs or retirement. It may be ſaid to be divided into four almoſt equal parts, by two ſtreets running eaſt and weſt, and north and ſouth. Both theſe ſtreets are wide and commodious, and each extends nearly a mile in length. Moſt of the houſes are built of a reddiſh-coloured ſand-ſtone, dug from quarries in the neighbourhood; but ſome are conſtructed with ſtone of a yellowiſh tint, and a few are brick buildings. At the eaſtern extremity of the town a pleaſant walk has been made, which is called Vigo Paradiſe Walk, or the New Walk, and was formed at the expence of the corporation. At the lower extremity of it is a ſpring of chalybeate water, and near the upper end is another ſpring of clear water, known by the name of Thomas à Becket's Well. On the north ſide of the town is a tract of land, which, in the year 1778, was an open field of 894 acres; but in that year an act of parliament for encloſing it was obtained. About 129 acres of this were then allotted to the freemen of the town, for cattle, &c.: but it was provided in the act that the ſame may be claimed and uſed as a race-courſe for any two days between the 20th of July and the 20th of October.

Ancient Hiſtory.—It is ſtated that a town was formed at this place during the Anglo-Saxon dynaſty, and that the ſame was attacked, plundered, and burnt by the Danes, in their different predatory incurſions into this part of the iſland. The Northumbrians, under earl Morcar, took poſſeſſion of this town in the year 1064; and in the genuine ſpirit of ſavage warriors, murdered many of the inhabitants, burnt the houſes, and carried away multitudes of cattle and priſoners. According to records there were then ſixty burgeſſes in the king's lordſhip, and ſixty houſes; but at the era of the Norman conqueſt fourteen of the latter were waſte. By the Domeſday Survey, it appears that there were then only forty burgeſſes in North-hamtune. "William the Conqueror gave to Simon St. Liz, a noble Norman, the town of Northampton, and the whole hundred of Falkely (Fawſley), then valued at forty pounds *per annum*, to provide ſhoes for his horſes." In 1106, the Saxon Chronicle ſtates, that Robert, duke of Normandy, had here an interview with his brother, king Henry I., to compromiſe the differences then ſubſiſting between them. In his twenty-third year, that monarch and his court kept the feſtival of Eaſter at Northampton, with all the pomp and ſtate peculiar to that age; and in the thirty-firſt year of the ſame reign a parliament was held in this town, when the nobles ſwore fealty to the empreſs Maud, on whom the king had ſettled the right of ſucceſſion. In 1138, king Stephen, in order to attach the clergy to his intereſt, a meaſure in thoſe days eſſentially neceſſary, ſummoned a council to meet him at Northampton, when all the biſhops, abbots, and barons of the realm attended, for the purpoſe of making promotions in the church. In 1144, Stephen held his court here, when Ranult, earl of Cheſter, who came to tender his ſervices, was detained as a priſoner till he had ſurrendered the caſtle of Lincoln, and other fortreſſes, as ſecurity for his allegiance, he being ſuſpected of conſpiring with the duke of Normandy againſt the king. When the celebrated ſtatutes of Clarendon were eſtabliſhed (10 Hen. II.) for the good order of the kingdom, and for the better defining the boundaries of eccleſiaſtical juriſdiction; and archbiſhop Becket alone refuſed his aſſent (a refuſal attended with a train of evils, vexatious to the king and fatal to the prelate), a council of the ſtates was convened at Northampton, before which the archbiſhop was ſummoned to appear, and anſwer to the charges of contumacy, perjury, &c. which ſhould then be exhibited againſt him. In the 20th year of this reign, Anketil Mallore, who ſupported prince Henry's unnatural rebellion, marched with a conſiderable force from Leiceſter to Northampton; where, having defeated the Royaliſts, he plundered the town, and returned to Leiceſter with his booty, accompanied by nearly 200 priſoners. In the 26th year of this monarch's reign, a convention of the barons and prelates was aſſembled here to amend, confirm, and enforce the conſtitutions of Clarendon. By this council the kingdom was divided into ſix circuits; and juſtices itinerant were aſſigned to each. From the formation of this convention, the advice of the knights and burgeſſes being required, as well as that of the nobles and prelates, it has been conſidered as the model by which parliaments have been conſtituted in ſucceeding times. The king of Scotland, with the biſhops and abbots of that kingdom, attended this council to profeſs their ſubjection to the church of England. In the 10th of Richard I., Geoffrey Fitzwalter paid 40*s.* to be diſcharged from the inſpection of the coinage here: this is the firſt official mention of a mint at Northampton, though there are reaſons to believe it of greater antiquity. How long it ſubſiſted is uncertain, but mention is made of it in the two ſucceeding reigns. On the death of king Richard, John, his ſucceſſor, being then in Normandy, a great council of nobles aſſembled in this town, and were prevailed on by the adherents of the new monarch to take an oath of fealty to him, and ſupport his claim to the crown. King John, in the 10th year of his reign, having been diſpleaſed with the citizens of London, commanded the exchequer to be removed to Northampton. In his 13th year, in a council of lay nobles convened here, the king met the pope's nuncios, Pandulph and Durand, in order to adjuſt thoſe differences which had long ſubſiſted between him and the holy ſee. The king made large conceſſions; but as he would not, or could not, reſtore to the clergy their confiſcated effects, the treaty was broken off, and the king was ſolemnly excommunicated by the legates. During the reign of Henry III. Northampton was frequently honoured with his reſidence, and with particular marks of his favour: and in the wars between that king and the confederate barons, it was alternately beſieged and poſſeſſed by each of the contending parties. About this time a kind of univerſity was eſtabliſhed here, conſiſting of ſtudents, who at different times, and from various cauſes, had deſerted Oxford. The new ſeminary at firſt was countenanced by the king; but the ſcholars, having taken a decided part in favour of the barons, were commanded to return to Oxford. A ſimilar emigration took place from the univerſity of Cambridge; but was ſoon ſuperſeded by a royal mandate, which compelled the ſtudents to return to their old ſeminaries; and further

provided

provided that no univerſity ſhould ever be eſtabliſhed here. It is, however, a manifeſt indication of the importance attached to Northampton, that both the univerſities ſhould make choice of this place as their aſylum and abode.

On Good Friday, in the ſeventh year of Edward I., the Jews reſiding in this town attempted to crucify a Chriſtian boy, who fortunately ſurvived their cruelty: for this atrocious act fifty of them were drawn at horſes' tails, and publicly hanged. In the preceding year fifty had been hanged for clipping the coin. Theſe. and other enormities, rendered the Jews ſo odious, that in the 18th year of this reign a ſtatute was paſſed for their total expulſion from the kingdom, and for the confiſcation of their property. Edward I. frequently reſided at Northampton in great ſplendour; and on his death a parliament was held here to ſettle the ceremonial of his burial, and the marriage and coronation of his ſucceſſor. Another parliament met here in 1317, in which an impoſtor, John Poydras, ſon of a tanner at Exeter, was brought to trial for affirming that he was the real ſon of Edward I., and that the king was a carter's ſon, and ſubſtituted at nurſe in his ſtead: producing no evidence, however, in ſupport of his aſſertions, he was condemned and executed. In the 11th year of Edward III., the mayor, bailiffs, and burgeſſes of Northampton, obtained the royal licence to hold an annual fair for twenty-eight days; which fair is now diſcontinued. In this reign ſeveral parliaments were held here. The laſt parliament that aſſembled at Northampton was 4 Richard II., when the poll-tax was levied, which cauſed a rebellion, wherein Walter Tyler was the chief. The next memorable event reſpecting this town, was a deciſive battle fought in its vicinity between the Yorkiſts and Lancaſtrians (38 Henry VI.), when that unfortunate monarch was made priſoner. Northampton was viſited by queen Elizabeth in 1563, and by king Charles I. in 1634: it was ravaged by the plague in 1637; and in 1642 was ſeized by the parliamentary forces, by whom it was fortified; the ſouth and weſt bridges being converted into draw-bridges, and additional works thrown up in the defenceleſs places. In the north-eaſt part of the town parts of a foſs and baſtion of earth are yet viſible. The town ſuffered greatly by a flood, May 6th 1663. Northampton has ſuſtained ſome very ſevere loſſes by fire; but theſe have ultimately proved beneficial to the place, for the uniformity and ſubſtantial character of the houſes, width of the ſtreets, and general arrangement of the town, are all to be attributed to thoſe calamitous events. According to Leland's ſtatement, moſt of the houſes were made of wood in his time. On Midſummer day, 1566, a fire deſtroyed ſeveral houſes: but the moſt memorable occurrence of this nature was in the year 1675, when the greater part of the town was conſumed, and many of the poorer inhabitants reduced to great diſtreſs. The general loſs of property was eſtimated at 150,000*l.* Above 600 dwelling-houſes were then burnt, and more than 700 families thereby deprived of their habitations and property. A ſubſcription was ſoon inſtituted, and it appears, by a liſt of benefactions, that above 20,000*l.* were raiſed for the ſufferers.

The town of Northampton was formerly ſurrounded by embattled walls, and was defended by a large fortreſs, or caſtle, and by baſtion towers. In the walls were four gate-houſes, named, from their relative ſituations, Eaſt Gate, Weſt Gate, North Gate, and South Gate. Thoſe towards the ſouth, north, and weſt, had rooms or dwellings over them, and that to the eaſt, according to Bridges, "was the faireſt of all," being lofty, and embelliſhed with ſhields, arms, and other ornaments. Southward of this was a ſmaller gate or poſtern, called the Durn Gate. By an inquiſition taken in the time of Edward I., it appears that the walls were embattled; and at different places had ſteps to aſcend them. Like the walls round the city of Cheſter, theſe ſerved for a public walk; where the infirm and indiſpoſed inhabitants were accuſtomed to "take the air." They alſo conſtituted the beſt foot-path in the winter, from one extremity of the town to another. This walk is reported to have been wide enough for ſix perſons to walk abreaſt. Leland mentions the walls and gates as ſtanding when he viſited Northampton. The ſame topographer ſays, "The caſtel ſtandeth hard by the Weſt Gate, and hath a large kepe. The area of the reſideu is very large, and bullwarkes of yerth be made afore the caſtelle-gate." That ſome fortreſs was erected at Northampton before the Norman conqueſt, may be inferred from the events that occurred here during the Saxon and Daniſh dynaſties; but of that building no accounts have deſcended to the preſent times. It is, however, recorded, that Simon de Senliz, or St. Liz, the firſt earl of Northampton of that name, erected a caſtle here in the reign of William the Conqueror; but as no mention is made of it in the Domeſday Book, it appears not to have been completed till after that ſurvey was taken. It was ſituated on an eminence without the Weſt Gate of the town; and was defended on three ſides by a deep trench or foſs, whilſt a branch of the river Nen ſerved as the natural barrier on the weſtern ſide. In Henry II.'s reign it was poſſeſſed by the crown; and was afterwards entruſted to ſome conſtable or caſtellan appointed by the ſovereign. But in the civil war of 1264, between Henry III. and his nobles, we find it in the occupation of the confederate barons, under the banner of the earl of Leiceſter, whoſe ſon, Simon de Montford, was then its governor. The king having received conſiderable reinforcements from the northern barons, his adherents beſieged the caſtle with great vigour; but its admirable ſituation and ſtrength, with the undaunted courage of the garriſon, compoſed of the fineſt troops in the ſervice of the earl, and, under the direction of officers of diſtinguiſhed ſkill and valour, baffled all the efforts of the royal troops, and convinced them that force was totally inadequate to their arduous enterpriſe. At length they had recourſe to a ſtratagem, not altogether juſt or manly in principle, but which effectually ſerved their purpoſe. While the barons were engaged in a parley, under pretence of negociation, a choſen body of the royal forces was diſpatched to make a breach in the oppoſite wall. The plan ſucceeded: the garriſon, thus taken by ſurpriſe, were, notwithſtanding a brilliant diſplay of courage, completely diſcomfited, and ſurrendered themſelves priſoners of war: in this capitulation were included fourteen of the moſt potent barons and knights bannerets, and forty inferior knights. The caſtle thus reverted to the crown, till, in the 3d year of Edw. III., Thomas Wake, then ſheriff, claimed the cuſtody of it as annexed to the county, and belonging to his juriſdiction; and it being found by inquiſition, then taken, to have been immemorially attached to that office, it was ordered to be given up to be held by the ſaid ſheriff and his ſucceſſors. Within the caſtle was a royal free chapel, dedicated to St. George. Previous to the year 1675, this fortreſs was uſed as the county gaol; and the two courts of juſtice were held here. In 1662, purſuant to an order of the king and council, the walls and gates and part of the caſtle were demoliſhed; and the ſcite of the latter ſold ſoon after to Robert Haſelrig, eſq. in whoſe family it ſtill remains. It appears, indeed, from the account of Norden, that even in the year 1593 the caſtle was much decayed, and the walls defenceleſs. "This towne," ſays he, "is a faire towne, with

with many faire old buildings, large ſtreets, and a very ample and faire market-place; it is walled about with a wall of ſtone, but meane too of ſtrength; neare unto the towne there ſtandeth an eminent caſtle, ruynous." Since Norden's time, moſt of theſe ruins have been ſwept away or levelled: and now only a few fragments of foundation walls, and parts of the foſſes, remain. The inner ballium was nearly circular, and ſurrounded by a lofty wall with baſtion towers at irregular diſtances. This again was encompaſſed by a deep and wide foſs. A broad ballium, or area for the garriſon, extended ſome diſtance, and was guarded by an outer vallum with barbican, &c. The general extent and character of the earth-works may ſtill be traced.

Northampton is both a corporate and borough-town; its firſt charter of corporation appears to have been obtained from king Henry II., but ſince that reign ſeveral other charters, to alter or enlarge the privileges of the corporate body, have been granted. For the firſt of theſe, the burgeſſes gave a fine of 200 marks, to hold the town of the king *in capite*. By a ſubſequent charter from king John, they were exempted from all "toll, laſtage, and murage; alſo from being impleaded out of the town;" and were inveſted with other liberties in as ample a manner as the citizens of London. In theſe privileges they were bound to pay annually into the king's exchequer 120*l*. In the 41ſt year of Henry III. a new charter was obtained, confirming and extending the liberties, &c. of the burgeſſes. Again in the 27th of Edward I., and in the 4th of Henry VII., the charter was renewed and confirmed; and in the 9th year of the latter reign, the mayor, bailiffs, &c. obtained the liberty of chooſing a recorder, and appointing two burgeſſes, who, with the mayor, were inveſted with the powers of juſtices of peace within the town. By a charter bearing date 3d of Auguſt, 15th Charles II., the corporation is ſpecified to conſiſt of a mayor and two bailiffs, and ſuch as have been mayors and bailiffs, with 48 burgeſſes, called common council, recorder, chamberlain, and town-clerk. Though this charter was ſurrendered in 1683, and a new one iſſued, yet the former continued in force till 1796, when an altered, or as it is commonly called, a new charter was obtained.

The recorder and town-clerk uſually continue for life, though ſubject to annual election. This corporation is inveſted with extenſive juridical powers; being qualified to try all criminal cauſes, though they ſeldom extend their juriſdiction beyond petty larcenies. For this purpoſe, therefore, they hold a court of record once in every three weeks. As a borough, Northampton has continued to return two members to the Britiſh ſenate ever ſince the 12th of Edward I., when it ſent two repreſentatives to the parliament held at Acton-Burnel, in Glouceſterſhire. In the firſt year of Edward II. the parliament was held at Northampton; and John de Longueville, and Robert de Bedford, were members for this place. Few boroughs have been more noted in the annals of conteſted election than Northampton, as it is commonly conſidered an open borough: *i. e.* every inhabitant houſholder, paying ſcot and lot, has the liberty of voting. This Mr. Pennant calls "a cruel privilege for ſuch, who have, of late years, been ambitious of recommending their repreſentatives." If cruel to the ambitious, it is certainly important to the humble part of the public, for though corruption, intrigue, and bribery, may ſeduce a few, theſe are not ſo likely to operate on the many. The number of voters is nearly 1000. A memorable election conteſt for this borough occurred in 1768, when the earls of Halifax, Northampton and Spencer were oppoſed to each other; or rather each exerted his reſpective influence to return a member. Never perhaps was bribery ſo extenſively and laviſhly employed: and though all the parties were not poſitively ruined, yet each was materially injured in fortune. It is ſtated that lord Spencer expended above 100,000*l*. and each of the other noblemen nearly 50,000*l*.

Churches.—There were formerly ſeven pariſh-churches within the walls of Northampton; reſpectively dedicated to All-Saints, St. Giles, St. Gregory, St. Mary, St. Michael, St. Peter, and St. Sepulchre. Beſides theſe, there was St. Catharine's, a chapel of eaſe to All-Saints, in the town; St. Edmund's church, without the eaſt gate, and St. Bartholomew's, without the north gate. Of theſe ſtructures four only are remaining at preſent, into which number of pariſhes the town is divided; All-Saints, St. Giles's, St. Peter's, and St. Sepulchre's. The church dedicated to All-Saints, ſituated about the centre of the town, having been conſumed by fire in 1675, was begun to be rebuilt ſoon afterwards, and was completed in the year 1680, and the firſt ſermon was preached by the biſhop of Peterborough, Sept. 5th. 1680. The interior of this is very unlike the generality of churches. The windows and architectural ornaments are neither Gothic, Grecian, nor of any regular order or ſtyle. It conſiſts of one large room or ſpace, with a ſquare chancel at the eaſt end, and a tower at the weſt end: near the centre are four large columns ſupporting a flat roof, from which riſes a dome or cupola. Attached to the weſt end of the church is a tablet recording the name of John Bailes, who was born in this town, and lived to a very advanced age; retaining his faculties of "hearing, ſight, and memory to the laſt. He lived in three centuries, and was buried the 14th of April, 1706." Bridges obſerves, that "his age appears to have been aſſigned conjecturally to 126; he was at moſt but 114 years old." After his death he was diſſected by Dr. James Keill, who publiſhed an account of the appearances, &c. of the corpſe, in the Philoſophical Tranſactions, N° 306, art. 8.

St. Giles's church is ſituated near the eaſtern end of the town, immediately within the ancient town-wall. This is a large pile of building, and conſiſts of a nave, aiſles, tranſept and tower riſing from the centre. At the weſt end is an ancient door-way, with a ſemicircular arch, and Norman mouldings.

St. Peter's church is ſeated at the weſtern extremity of the town, in the vicinity of the caſtle, and was probably erected by one of the firſt Norman earls of Northampton. From the regiſter of St. Andrew's priory in this town, it appears that the rectory of St. Peter's was given to that monaſtery by Simon de St. Liz, and was confirmed to it with the chapelries of Kings-thorpe and Upton, by Hugh Wells, biſhop of Lincoln. The architecture of this church is curious and intereſting. In ſome particulars it may indeed be conſidered an unique edifice. It conſiſts of a nave and two aiſles of equal length, having ſeven columns on each ſide, three of which are compoſed of four ſemi-columns. The four ſingle ſhafts are ornamented with ſtone bands, of four mouldings near the centre; but the cluſtered columns, which ſeemed more to require this appearance of binding, have no ſuch appendage. All the capitals are charged with ſculpture of ſhell-work, heads, animals, &c. Theſe capitals have lately been cleaned, and the rich and curious ſculpture with which they are charged is fully diſplayed. This arduous and laudable taſk was performed by Miſs A. Baker of Northampton. On each ſide of the nave are eight ſemicircular arches, with indented zigzag mouldings on the face and ſoffits. Over theſe was a ſeries of ſix ſmall windows, with ſemicircular heads on each ſide. But the moſt decorated and curious part of the interior of this ſingular ſtructure, is the great archway,

archway, beneath the tower, at the weſtern end of the nave. This conſiſts of three receding arches, each charged, both in elevation and ſoffit, with zigzag mouldings. On each ſide of the archway are three pilaſter columns, ſome of which are ornamented with ſpiral and lozenge mouldings. The exterior of the church and tower is equally curious, though the architectural and ſculptural decorations are not ſo profuſe or elaborate. At the ſouth-weſt and north-weſt angles of the tower are buttreſſes of peculiar form. Each conſiſts of three ſemi-columns, gradually diminiſhing at every ſtory. On the north and ſouth ſides of the ſame are two ſeries of arcades; and at the weſt end one range correſponding; with a blank arch, having three rows of flat ſtones, charged with varied tracery in the pannels.

St. Sepulchre's church, near the northern extremity of the town, is another ſingular and curious ſpecimen of the eccleſiaſtical architecture of England. This alſo, like St. Peter's, may be conſidered unique, having ſome features and peculiarities unlike any other of the country. It conſiſts of a ſquare tower with a ſpire at the weſt end; a circular part, and a ſquare eaſt end, of three aiſles. This and the tower are additions, of a comparatively modern date to the original edifice. Part of the circular building is evidently very ancient, probably before A.D. 1200; but various alterations have been made at different times. Within a circular exterior wall, is a ſeries of eight columns alſo diſpoſed in a circle. From theſe ariſe eight arches in the pointed ſtyle, but completely plain and unadorned. Over the columns the wall aſſumes an octangular ſhape. Four of the pillars have ſquare baſes and capitals, whilſt thoſe of the others are circular. A ground plan, or elevation of one ſide of the nave, a perſpective view of the interior, and another of the exterior, with a hiſtory and deſcription of this edifice, are publiſhed in the ſecond volume of the Architectural Antiquities of Great Britain.

Northampton formerly contained ſeveral monaſtic eſtabliſhments and edifices, but few of theſe are now remaining. The priory of St. Andrew was ſituated at the north-weſtern part of the town, near the river, and was founded anterior to the year 1076; for in 1084 Simon de St. Liz repaired the buildings, and augmented he endowments.

The Franciſcans, or Grey friars, had an eſtabliſhment in Northampton ſoon after their coming into England. They originally hired an habitation in St. Giles's pariſh, but afterwards built one on ground given them by the town in the year 1245. Near this houſe was a priory of Carmelites, or White friars, founded in 1271, by Simon Mountfort and Thomas Chetwood.

The Dominicans, or Black friars, were ſettled here before 1240. John Dalyngton was either founder, or a conſiderable benefactor to this eſtabliſhment.

William Peverel, natural ſon to the Conqueror, founded here, before 1112, a houſe of Black canons, in honour of St. James.

The Auſtin friars, or Friars Eremites, had a houſe in Bridge-ſtreet, founded in 1332, by ſir John Longueville, of Wolverton, in Buckinghamſhire; and ſeveral perſons of his name were interred here.

The college of All-Saints was founded in 1459, with liberty of purchaſing to the value of 20 marks. It conſiſted only of two fellows.

The hoſpital of St. John, for women, an ancient building in Bridge-ſtreet, conſiſts of a chapel, a large hall, and other apartments. It was founded for the reception of infirm poor perſons, probably by William St. Clere, archdeacon of Northampton, who died poſſeſſed of that dignity in 1168.

Near this place, cloſe to the ſcite of the ſouth gate, is St Thomas's hoſpital for women, founded in 1450, in honour of St. Thomas Becket. It was firſt endowed for twelve poor people, but an additional revenue was granted by ſir John Langham, in 1654, for ſix more.

Among the public buildings and eſtabliſhments of the town, none is of greater utility or larger ſize than the General Infirmary, which was begun in 1791, and opened in 1793. It ſtands on the eaſtern ſide of the town, but detached from it, on the brow of a hill which gradually ſlopes to the ſouth. The building, which coſt about 10,000*l.* conſiſts of three ſtories above ground, and one beneath, and is admirably diſpoſed for the reception and accommodation of the ſick. One ſide of the houſe is appropriated to male, and the other to female patients. The whole was deſigned and built by Mr. Saxton, architect, and is faced with ſtone from the Kings-thorpe quarries, the proprietor of which made a preſent of the whole. The eſtabliſhment is ſupported by the intereſt ariſing from numerous legacies, and from annual ſubſcriptions. According to the report of the committee in Auguſt, 1809, there appear to have been cured during the preceding year, "1859 in and out-patients," and ſince the firſt opening of the infirmary, in 1744, there have been 44,147 perſons "perfectly cured," beſides 5780 who had received "great benefit." Excluſive of medical and ſurgical aid, the eſtabliſhment provides, what are no mean auxiliaries in the cure of diſtempers, *proper accommodations, conſtant attention, with wholeſome and nutritious food.* "In our charitable abode," ſays the committee, "nothing is denied that can any way promote recovery."

Near All-Saints church is the old county gaol, now converted into the turnkey's lodge and debtor's priſon. It was originally built by ſir Thomas Haſlewood as a private houſe. Behind this is the new gaol, which was begun in 1791, and finiſhed in 1794.

The town-gaol in Fiſh-lane is a ſmall modern building.

Near the eaſt end of All-Saints-church is the county-hall, or ſeſſions-houſe, a large room fitted up for the two courts of niſi prius and crown.

At the northern extremities of the town is a range of modern buildings, erected in 1796, and appropriated to barracks. A new theatre has been built in Gold-ſtreet.

Schools.—A blue-coat ſchool was eſtabliſhed here about the year 1710, by John Dryden, eſq. of Cheſterton. There are alſo a brown-ſchool, a green ſchool, and a girl's ſchool, eſtabliſhed in this place, Latterly there have been ſchools eſtabliſhed here on Lancaſter's and Bell's plans.

In the year 1778, an act of parliament was obtained for paving, lighting, watching, &c. the town; but this being found inſufficient, a new act was procured in 1797. To carry this into effect, the commiſſioners expended about 10,000*l.*, to meet the intereſt of which, a rate of 1*s.* 6*d.* in the pound is levied on the rental of the houſes. In conſequence of this act, nearly all the ſtreets and lanes of Northampton are paved, both for carriages and for foot-paſſengers; and as the town is chiefly built on the ſlope, and near the top of a hill, it is generally clean and pleaſant. Near its centre is a large open area, ſurrounded by ſhops and private houſes, called the ſquare, or market-place. In the town are ſeveral chapels, appropriated to different ſects or religious ſocieties. That called the Caſtle-hill meeting, is a large, commodious building, and belongs to the Independents. The juſtly celebrated Dr. Doddridge preached here for 22 years, and alſo ſuperintended an academy, which, by his learning and judicious management, obtained conſiderable reputation.

Another meeting-houſe for Independents was erected here

in 1776, in which are ſeveral ſmall but handſome monumental memorials. The Baptiſts' meeting, a large building, was formerly noted by the preaching of the Rev. S. Ryland, who officiated in it for ſome time, and was buried here. The Moravians, Methodiſts, and Quakers have alſo chapels in the town. In the year 1811, this town was found to contain 1623 houſes, and 8427 inhabitants.

Northampton has given birth to ſome perſons of eminence, who may properly be claſſed among the worthies of the county. Richard and Adam of Northampton were both born here, and both were advanced to the epiſcopal ſee of Ferns, in Ireland; the firſt in 1282, and the ſecond in 1322.

John of Northampton, or, according to his Latin name, Joannes Avonius, was a Carmelite friar in this his native place. He was the inventor of the *Philoſopher's Ring*, a kind of perpetual almanac.

Dr. Samuel Parker, biſhop of Oxford, was a native of this place; as were Dr. Thomas Cartwright, biſhop of Cheſter; William Beaufu, a Carmelite friar; and Robert Brown, the celebrated founder of the Browniſts.

About one mile ſouth of Northampton, on an elevated bank adjoining the public road, is an elegant ſtone croſs, which was erected by king Edward I., in memory of his deceaſed queen Eleanor. This intereſting monument of ancient architecture and conjugal affection, has been already noticed in a preceding volume of our work under the word Cross. On the ridge of a hill weſt of this place is an ancient encampment, called Hunſborough, of nearly an oval form, conſiſting of a double vallum, with a ſingle foſſe, and containing an area of about one acre. One mile S.W. of Northampton is Delapre abbey, the ſeat of Edward Bouverie, eſq. The preſent houſe occupies the ſcite of a nunnery, which was founded in the time of king Stephen, by Simon de St. Liz, jun. earl of Northampton. In the neighbouring village of Hardingſtone was born James Harvey, author of "Meditations among the Tombs," &c. Hiſtory and Antiquities of Northamptonſhire, by J. Bridges, eſq. and the Rev. P. Whalley, 2 vols. folio. Beauties of England, vol. xi. by J. Britton, and the Rev. J. Evans.

Northampton, a large uneven county of Pennſylvania; in the N.E. corner of the ſtate, on Delaware river, which ſeparates it from New Jerſey and New York; it is divided into 27 townſhips, and contains 30,062 inhabitants:—Alſo, a townſhip in Buck's county, Pennſylvania, including 942 inhabitants.—Alſo, a town in Northampton county, Pennſylvania, on the S.W. bank of Lehigh river, five or ſix miles S.W. of Bethlehem, containing 573 inhabitants.—Alſo, a county of Halifax diſtrict, North Carolina, bounded N. by the ſtate of Virginia, containing 12,331 inhabitants, of whom 6206 are ſlaves.—Alſo, a maritime county of Virginia, on the point of the peninſula, which forms the E. ſide of the entrance into Cheſapeak bay; having the ocean E., and Accomack county N.; its ſouthern extremity being Cape Charles, in N. lat. 37° 11′, and W. long. 75° 57′, off which is Smith's iſland. This county, the lands of which are low and ſandy, contains 3585 inhabitants, and 3178 ſlaves. In this county is "Northampton court-houſe," 40 miles S.S.W. of Accomack court-houſe; 43 miles N.E. of Norfolk.—Alſo, a reſpectable poſt-town and capital of Hampſhire county, Maſſachuſetts, ſituated within a bend of Connecticut river, on its W. ſide; 40 miles N. of Hartford; and containing a ſpacious congregational church, a court-houſe, gaol, and about 250 dwelling-houſes, of which many are handſome buildings. Its meadows are extenſive and fertile; and it carries on a conſiderable trade. This townſhip was incorporated in 1685, and contains 2190 inhabitants.—Alſo, a townſhip in Burlington county, New Jerſey, comprehending about 56,000 acres, half improved and half moſtly pine-barren. The chief place is "Mount Holly." It contains about 150 houſes, an epiſcopal church, a Friends' meeting-houſe, and a market-houſe; 22 miles from Trenton.

NORTHAMPTONSHIRE, a county of England, and nearly in the centre of the iſland, is bounded by Leiceſterſhire, Rutlandſhire, and Lincolnſhire on the north; by Cambridgeſhire, Bedfordſhire, and Huntingdonſhire on the eaſt; by Buckinghamſhire and part of Oxfordſhire on the ſouth; and the Charwell ſecures it from another part of Oxfordſhire, whilſt the river Leam, for a ſhort diſtance, and the old Roman Watling-ſtreet, ſeparate it from Warwickſhire on the weſt. The extent of Northamptonſhire may be eſtimated at nearly 66 miles in its longeſt diameter, *viz.* from its moſt weſtern verge at Aynho to the remoteſt north-eaſtern limit near Crowland. Its greateſt breadth, from Hargrave in the eaſt to Barby in the weſt, is eſtimated at about 30 miles; yet its average width, perhaps, is not 20 miles; and from Brockley acroſs to Aſtrop in the ſouth, alſo from Peterborough in a northerly direction to Peakirk, it does not exceed eight miles. The circumference may be conſidered 216 miles, and the ſuperficial area of the whole has been computed at 550,000 acres; but the lateſt authorities referred to in the poor returns to parliament, ſtate it to be 617,000 acres, of which 290,000 are ſaid to be arable; 235,000 in paſturage, and about 86,000 uncultivated, including woodlands. It contains 1 city, 11 market-towns, 336 pariſhes, and, according to the population return of 1811, there were then 28,995 houſes, and 141,353 inhabitants.

At the time of the general Norman ſurvey, there were 30 hundreds and wapentakes in the county of Northampton, as we find them recorded in Domeſday Book. When this ſurvey was made, a conſiderable part of Rutlandſhire was included in the county of Northampton; but in the fifth year of king John we have mention made of it as a ſeparate ſhire; and by an inquiſition taken in the fourth of Edward I. it was certified to have been given by Henry III. to the king of Almains. By a later diviſion the hundreds were reduced to twenty-eight, and in the reign of Edward II. they were further contracted to the preſent number of twenty, and were called by the names which they now bear; ten being comprehended in the eaſtern diviſion of the county, and ten in the weſtern.

Roman Antiquities, &c.—When the Romans took poſſeſſion of the central part of Britain, they found it occupied by a tribe of people known by the name of Coritani; theſe being ſubjugated, their conquerors ſoon began to form military roads and fortreſſes. Two great roads, or via-ſtrata, croſſed the county; and were directly, or collaterally, connected with ſeveral permanent ſtations, temporary encampments, and vicinal ways. The Watling-ſtreet, in proceeding from the ſouth towards the north, enters Northamptonſhire at or near Stratford, and, continuing in almoſt a direct line acroſs the county, leaves it at Dove-bridge. On this courſe there appears to have been three ſtations, as mentioned both in the ſecond and ſixth Iters of Antoninus; and alſo in the Itinerary of Richard of Cirenceſter. Theſe were Lactodorum, 17 Roman miles from Magiovinium, Bennavenna, or Iſannavotia, 12 miles from the firſt; and Tripontium, 12 miles diſtant from the latter. Much difference of opinion has prevailed among antiquaries reſpecting the ſcites of theſe ſtations; and it will not be an eaſy taſk to reconcile the diſputes of thoſe who argue from maxims of theory rather than

than the evidence of remains, ſituations, and probable deſcriptions. From the known and indiſputable ſtation of Verulam, St. Alban's, the Watling-ſtreet, in its progreſs northward, paſſed Durocobrivis, near Dunſtable, and Magiovinium in the vicinity of Stratford. From this to Lactodorum was 17 miles, which diſtance, with the name ſtill retained of Towceſter, and the veſtiges of the place, are tolerably ſatisfactory proofs as to the ſcite of this ſtation. The biſhop of Cloyne ſays that Towceſter, unequivocally, "muſt have been the Lactodorum." The next Roman town on this road was Benaventa, or Bennavenna, which has been placed at Wedon-Bec, at Caſtle-Dykes, and near Daventry; but the ſuperior claims of the latter are deciſive from a mere curſory view of each place. Here is the immenſe encampment called Borough-Hill; alſo the remains of other fortifications named Burnt-Walls, &c. in a valley to the weſt. In an adjoining wood, cloſe to the preſent turnpike road, are other military works, called John of Gaunt's caſtle, which probably conſtituted part of the Roman ſtation. Twelve miles north of this was Tripontium, a name deſcriptive of its ſituation and character. This ſtation is uſually aſſigned to Lilburn, where is a conical, artificial hill, poſſibly the keep of a fortreſs, and ſome caſtrametations. Cauſeways, pavements, and other ancient veſtiges, have been found here.

Beſides the ſtations and roads already noticed, there appear to have been other works of the Romans on the weſtern ſide of this county. The great encampment called Caſtle-Dykes, ſouth-weſt of Wedon, appears to have been either formed or altered by the Romans. It was a fortreſs of great ſtrength and magnitude. About three miles to the eaſt is Nethers Heyford, where part of a teſſellated pavement was diſcovered in 1699. This was, however, only a fragment of a common floor, though Moreton deſcribes it as "a noble piece of art, exceeding all that I have ſeen or read of."

About three miles ſouth-weſt of Daventry is Arbury Banks, a large encampment on the ſummit of a hill. Moreton and Reynolds attribute this to the Romans; and the former deſcribes it as being on "one of the higheſt hills in the county." At Guilſborough are ſome entrenchments called "The Boroughs," which Dr. Stukeley pronounced to be "traces of a Roman camp." In the ſouth-weſtern angle of the county, between the village of Aynho and Newbottle, is another entrenchment, called Raynſbury camp. From what has been already ſtated, it is evident that the weſtern ſide of Northamptonſhire abounded with military poſts during the Roman colonization of England; and from reviewing this diſtrict with the parts of Warwickſhire and Oxfordſhire immediately adjoining, we ſhall find ſuch other traces of the Romans, as may ſerve to develope their general ſyſtems of military and political tactics. In nearly a direct line ſouth from Raynſbury camp, in the county of Oxford, the remains of a Roman road, called the Porkway, point towards Aldceſter and Cheſterton; and nearly parallel with that ſtreet, is a raiſed mound named Aveditch-bank. Theſe appear to have formed a communication between the fortreſs of Cheſterton, and that of Raynſbury: it is, indeed, extremely probable that the ſame road continued to, and formed a connecting line with, the other great works at Caſtle-Dykes, Borough-Hills, &c.

For the other ancient remains which may be ſtrictly attributed to the Romans, we ſhall refer to the eaſtern ſide of the county, where the Roman road called the Forty-foot-way, or Ermine-ſtreet, is found. This enters the county from Huntingdonſhire near the village of Caſtor, where it paſſed the Nen river. Parts of this road are ſtill lofty and conſpicuous between Caſtor and Upton; and again in the pariſh of Barnack. The only ſtation in this county on the line was Durobrivæ, which was at or near Caſtor.

In order to ſhew that the Romans occupied places and eſtabliſhed permanent habitations in other parts of the county, it will be ſufficient to point out the ſpots where veſtiges of thoſe people have been found. The moſt conſiderable of their remains are ſome teſſellated pavements, or floors of different rooms, which were found at Weldon in the year 1738. The plan diſplayed a long gallery about 90 feet by 10; which communicated with ſeven other apartments. The whole formed nearly a parallelogram of 100 feet by 30; and conſiſted of foundation walls and floors made of teſſeræ, laid in the common patterns. Numerous coins of the lower Roman empire, and ſeveral of Conſtantine, Conſtans, &c. were diſcovered at the ſame time.

At Cotterſtock, near Oundle, a teſſellated pavement was found in the year 1736. It meaſured about 20 feet ſquare; and among the rubbiſh were found fragments of urns, with ſhells, tiles, horns, and bones of beaſts. In the year 1798 ſome further diſcoveries were made in the ſame field; conſiſting of one pavement nearly perfect, and fragments of others; alſo ſeveral coins, &c.

At Thorpe, near Peterborough, Dr. Stukeley ſays that a Moſaic pavement was found; and at Stanwick, near Higham-Ferrers, Bridges deſcribes a teſſellated floor to have been found. The names of Ilcheſter and Cheſter near Wellingborough, induce us to expect ſomething Roman there, and accordingly we find the remains of an encampment at Cheſter, of nearly a ſquare form, which included an area of about 20 acres within its outer banks. Parts of brick pavements, coins, foundations of walls, and other ancient relics, have been found at this place, which is on the banks of the river Nen.

Near the ſame river in Woodford field are "manifeſt ſigns," according to Moreton, "of a place poſſeſſed by the Romans." Fragments of teſſellated pavements, an urn, and ſome other remains have been found at this village.

Such are the chief veſtiges which have been diſcovered relating to the Romans in this county; and from theſe it is evident, that nearly the whole of the open parts of it was ſubſervient to their military domination. On the banks of the Nen and Welland, it is probable that they occupied other fortreſſes and villas; but theſe have never yet been ſufficiently explored, or the entrenchments ſatisfactorily deſcribed.

Saxon and Norman Eras, Encampments and Caſtles.—Soon after the Saxons had uſurped poſſeſſion of Britain, they ſubdivided it into different kingdoms or ſtates; and the preſent county was included within the Mercian monarchy. Under this the great monaſteries of Medenhamſtead, now Peterborough, and Croyland in the ſame diſtrict, were founded. Indeed the former was the firſt, in the time of formation, and moſt important in ſize and conſequence within the kingdom of Mercia; and this, like its neighbour at Croyland, was plundered and burnt by the Danes in their different predatory excurſions into this part of the iſland. Medenhamſtead, however, became ſo famous, that it was called Urbs-Regia, the royal city; and juſt before the Roman conqueſt it was pre-eminently diſtinguiſhed by the title of Aurea Civitas, or golden city. From king Wulfere's charter of endowments and privileges to this monaſtery, dated 664, we learn that ſeveral places in the vicinity were tributary to it. Among theſe, the following names of towns and villages occur, Wansford, Cliff, called King's Cliff, Eſtune, now Eaſton, and Northborough. Other places are named in king's Edgar's charter, anno 972.

Oundle, then called Undale, is recorded in the Saxon Chronicle, A.D. 709, when biſhop Wilferth died there. In Edgar's charter this place is mentioned as a market-town of conſiderable note.

At Stamford Baron the monks of Medenhamſtead kept a monetarium, or mint.

It is not only probable, but well authenticated, that the Saxons, Danes, and Normans alternately and ſucceſſively took poſſeſſion of the chief Roman ſtations, and adapted them to their reſpective modes of attack and defence. In this county Toſeceaſter, or Towceſter, was burnt by the Danes, but king Edward ordered it to be rebuilt, and about the ſame time it was encompaſſed with a wall of ſtone.

Eccleſiaſtical Hiſtory, &c.—During the Saxon dynaſty, this county was under the epiſcopal juriſdiction of Dorcheſter, in Oxfordſhire, and after the year 1072 ſubject to that of Lincoln. It continued a part of that dioceſe, till Henry VIII., having ſeized the temporalities, and ſecularised the abbey of Peterborough, appointed this town and church as one of the new ſees in the year 1541; at the ſame time he ordained, by letters patent, that it ſhould conſiſt of a biſhop, a dean, ſix prebendaries, and an archdeacon. A further account of the cathedral and its eſtabliſhments, with ſome particulars of the biſhops, will be given under the head PETERBOROUGH.

Geographical Features, Natural Hiſtory, Rivers. Canals, Foreſts, &c.—At a former period the greateſt portion of Northamptonſhire was occupied by the foreſts of Salcey, Whittlewood, and Rockingham; and theſe ſtill cover above 18,000 acres of land. This ſpace, however, is not wholly devoted to woods. For within the boundaries numerous deer, cattle, horſes, and ſheep are fed. Many of theſe are afterwards fattened on the rich grazing lands of the county and then ſent to the London markets. The prevailing ſyſtem of huſbandry is grazing, and many of the farmers are juſtly noted for their ſkilful management, both of their land and ſtock.

The ſurface of this county is peculiarly advantageous for cultivation, having neither dreary waſtes nor rugged mountains; but is every where ſufficiently regular for all the purpoſes of huſbandry and tillage. Every hill is cultivated, or may be kept in a profitable ſtate of paſturage, and every inequality in the ſurface contributes to its ornament and beauty. The upper and middle parts of the county are abundantly covered with extenſive woods, which are interſected with numerous viſtas and lawns.

Mr. Donaldſon, in his "General View," ſtates, that there are 316 pariſhes in this county, 227 of which are in a ſtate of incloſure, and 89 in open field; beſides which, there are many thouſand acres of woodlands, and a large tract of rich, valuable land, called the Great Peterborough Fen, in a ſtate of commonage; ſo that ſuppoſing the incloſed part of the county under the moſt approved modes of management, there is above one-third of the whole, by no means in the beſt ſtate of cultivation, of which it is ſuſceptible. Without enumerating the various ſmall commons, or the nature and extent of the common rights of paſturage, it may be ſufficient to mention particularly the Great Peterborough Fen, a tract of fine level land, containing between ſix and ſeven thouſand acres of a ſoil equal perhaps to any in the kingdom, and capable of the higheſt cultivation. It is ſituated between Peterborough and Croyland, towards the north-eaſtern angle of the county, and is ſubject to the diſpaſturage of the cattle, horſes, and ſheep of thirty-two pariſhes, or townſhips, which comprize what is commonly called the Soke of Peterborough. The right of commonage is conſidered to be ſcarcely of any value, but if this portion of land was converted into private property, and divided into farms of a proper ſize, advantages both of a public and private nature muſt neceſſarily be the reſult.

Woodlands.—The extenſive tracts of woodlands in this county conſiſt either of foreſts, chaſes, or purlieu woods. Of the foreſts, the principal is that of Rockingham, which is ſituated in the northern part of the county, and extends for nearly twenty miles in one direction. The two large foreſts of Whittlewood and Salcey lie towards the ſouthern border of the county. There are two chaſes, Geddington and Yardly; the former was once a part of Rockingham foreſt; but permiſſion was given by the crown, many years ſince, to the anceſtors of the Montague family to diſafforeſt it, and convert it into a chaſe. Yardly chaſe was once a part of Salcey foreſt, but has alſo been diſafforeſted. Purlieu woods are thoſe which are ſituated in the vicinity of the foreſts, and which at one time formed a part of them; but the reſpective owners, having at ſome former periods obtained grants from the crown to diſafforeſt them, and to conſider them as their own private property, they are not now ſubject to any of the regulations of the foreſt woods. The purlieu woods are numerous and extenſive in this county, particularly towards the ſouthern ſide, and upon the borders of Rockingham foreſt; and beſides theſe, there are ſeveral ſmall tracts of woodland very advantageouſly ſituated in various parts of the county. The underwood in the foreſts and chaſes principally conſiſts of black and white thorn, aſh, ſallow, maple, and a ſmall proportion of hazel. As the hiſtory, extent, rights, and peculiarities of the foreſts, conſtitute a natural feature in the topographical annals of this county, it will be requiſite to detail them more fully.

The foreſt of Salcey is ſituated near the ſouth-eaſtern border of the county, where it joins Buckinghamſhire. From a perambulation made in the time of king Edward I., it appears, that the limits had been extended by king John; but that the woods and lawns, afforeſted by that monarch, were diſafforeſted by Edward, according to the tenour of the Charta de Foreſta, and in conſequence of a grant of a fifteenth part of the moveables of all his ſubjects.

The lands now conſidered as foreſt, and in which the crown is poſſeſſed of the timber and other valuable rights, extend in length about two miles and a half, and in breadth nearly one mile and a half, and contain 1847 acres, 23 poles. The whole is divided into four walks, *viz.* Hanſlop, Piddington, Hartwell, and the Deputy Ranger's walk. By the cuſtom of this foreſt, the underwood of the ſeveral coppices is cut in rotation at twenty-one years growth; and after each cutting the coppices are incloſed ſo as to exclude the commonable cattle of the foreſt for nine years; but the deer are admitted into them two years ſooner by means of creeps and deer leaps made in the fences. At the end of nine years they are again thrown open, and continue ſo the remaining twelve years, until the period of cutting the underwood returns. This foreſt is under the government of the following officers, *viz.* a warden or maſter foreſter, lieutenant or deputy warden, two verderers, a woodward, three yeomen-keepers of the ſeveral walks of Hanſlop, Piddington, and Hartwell, one page keeper, and the ſurveyor general of the woods and foreſts.

The number of deer kept in this foreſt is about 1000 of all ſorts; and the number killed annually is about 28 brace of bucks, and 20 of does; of which four bucks and four does are ſupplied for the uſe of his majeſty's houſhold, in purſuance of warrants from the board of green cloth.

In

In a ſurvey taken in 1783, there were reported then to be in this foreſt only 2918 oak trees fit for the navy, (including all trees down to 30 feet of timber,) containing by computation 3745 loads of timber, ſquare meaſure; and only 194 ſcrubbed, dotard, or defective trees of above 30 feet each; beſides browze trees, of which there were 8266 oak trees, containing by computation 7338 loads of timber, ſquare meaſure, and 8914 browze aſhes: ſo that the timber fit for the navy, according to this ſurvey, was little more than one-tenth part of the quantity fit for naval uſe, growing in this foreſt in 1608.

The foreſt of Whittlewood, though principally belonging to the county of Northampton, extends into the adjoining counties of Oxford and Buckingham, and has been formerly of very conſiderable extent. This foreſt, as well as that of Salcey, is part of the honor of Grafton. A perambulation made in the reign of Edward I., deſcribes ſeparately the parts lying within the three counties above named. The bounds of the foreſt, and the operation of the foreſt laws, were greatly extended in the 15th of Charles I.; but an act of parliament, in the next year, reſtored the ancient limits, as preſcribed by the perambulation of Edward I., and confirmed, 20 James I. But a part only of the lands within thoſe limits ſeems now to be conſidered as foreſt: that part contains 5424 acres, 1 rood, 11 poles, and is almoſt entirely encompaſſed with a ring mound, which has been its boundary beyond the memory of the oldeſt man.

The whole is divided into five walks, *viz.* Hazelborough, Sholbrook, Wakefield, Hanger, and Shrobb: the firſt ſituated in the pariſhes of Whitfield and Silverſtone; the ſecond in that of Whittlebury; the third in the pariſhes of Whittlebury, Potterſbury, Paſſenham, Denſhangen, and Lillington Dayrell; the fourth and fifth in the pariſh of Paſſenham. By grant of 11 Ann, the duke of Grafton holds the office of lord warden, or maſter foreſter, which gives him the poſſeſſion of the chief lodge, called the Wakefield Lodge, with the gardens, pleaſure-grounds, and incloſed meadow-lands, containing together nearly 117 acres, with the paſturage for cattle, in common with the dean, in an incloſed lawn, called Wakefield Lawn, containing upwards of 245 acres. His grace has alſo, as hereditary keeper, the cuſtody and management of the deer. No more, however, ſeems to have been required from his family, ſince the date of the patent, than to anſwer certain warrants for the ſupply of his majeſty's houſhold, and the public offices, or others accuſtomed to have veniſon from the royal foreſts. The reſidue appears to have been left to the diſpoſal of the lord warden.

The number of deer at preſent kept within the foreſt is computed to be about 1800 of all ſorts; and the number killed, one year with another, is about 138 bucks, and 100 does.

In the ſurvey made in the year 1608, Whittlewood foreſt is ſtated to contain 51,046 timber trees of oak, then valued at 25,755*l.*, and 360 decaying trees, valued at 123*l.* 6*s.* 8*d.* The quantity of timber is not mentioned; but, according to the computation mentioned in Salcey foreſt, it muſt have been from 40 to 50,000 loads, girt meaſure, or from 60 to 75,000 loads, ſquare meaſure.

By the ſurvey taken in 1783, there appeared to be growing in this foreſt 5211 timber trees fit for the navy, containing 7230 loads of timber, ſquare meaſure; and 402 ſcrubbed, dotard, and decayed trees, containing 569 loads. The ſame ſurvey ſtates, that there were 18,617 trees in the foreſt conſtantly lopped for browze for the deer, *viz.* 6335 oak trees, computed to contain 8907 loads of timber, ſquare meaſure, (being more than a load and quarter each on the average,) and 12,282 aſh trees, containing 3512 loads; ſo that the number and contents of the browzed oaks was greater than of the oak trees reported to be fit for the navy, of which the number in the coppices was not quite three trees to every two acres of land.

The foreſt of Rockingham is ſituated in the northern part of the county, and is eſteemed to have been formerly one of the largeſt foreſts in the kingdom. In a perambulation, dated the 14th of Edward I., it is deſcribed as extending from Northampton to Stamford, being about 30 miles in length; and from the river Nen on the ſouth to thoſe of the Welland and Maidwell on the north-weſt, being a medium breadth of nearly eight miles. This extent was limited ſoon after the acceſſion of Henry II.; but the bounds were particularly ſpecified and ſettled in the 17th of Charles I. The foreſt conſiſts of three ſeparate diſtricts, called the bailiwicks of Rockingham, Brigſtock, and Clive, or Cliffe, ſituated at the diſtance of between two and four miles from each other. Theſe three bailiwicks were formerly under the ſuperintendance of one warden or maſter foreſter of the whole foreſt; which office was granted, in the 1ſt of James I., to Thomas, lord Burleigh, for three lives. Charles I. divided, or rather aboliſhed, that office, and conſtituted three maſter foreſters of ſeparate diſtricts. The maſter foreſterſhip of Rockingham bailiwick, with Geddington woods, was granted to Edward, lord Montague, for three lives; but no ſubſequent grant of it appears. That of Cliffe bailiwick was granted, in the 5th of Charles I., to truſtees for Mildmay, earl of Weſtmoreland, for three lives, and is now held by the preſent earl of Weſtmoreland on the ſame tenure; and that of Farming woods, the patent for which was not ſued out in that reign, was granted, in the 27th of the next, to ſir John Robinſon for three lives, and is now held by the earl of Upper Oſſory. The other officers of this foreſt, in the reigns of James I. and Charles I., beſides the warden, were a lieutenant, four verderers, a ranger of the foreſt, and under-ranger of each bailiwick, a bow-bearer, maſter keepers, and under-keepers of the reſpective walks, and twelve regarders for each bailiwick, beſides woodwards and under-woodwards.

The bailiwick of Rockingham compriſes divers extenſive woods in the pariſhes of Cottingham, Middleton, Great and Little Oakley, Gretton, Little Weldon, and Corby, all of which are reputed to contain about 3500 acres.

The number of deer ſupplied from this bailiwick, for the uſe of the crown, is four brace and a half of bucks, and the ſame number of does; and for the foreſt officers, eleven brace of each: in the whole, fifteen brace and a half of each.

The bailiwick of Brigſtock, which is the leaſt of the three diviſions, comprehends that part of the town and fields of Geddington which lie to the north of the river Iſe; certain woods called Geddington woods, containing about 700 acres; the town and part of the fields of Brigſtock; the woods called Farming woods, containing alſo about 700 acres; and a lodge called Farming-wood Lodge, with an incloſed lawn adjacent to it, ſaid to contain about 200 acres. The number of deer ſupplied from this bailiwick is 34 bucks, and as many does.

The bailiwick of Cliffe is the largeſt diviſion of the foreſt, and comprehends four extenſive tracts of woodland, namely, Weſthay woods, belonging to the earl of Exeter; Moorhay woods, belonging to the earl of Weſtmoreland; Earl's woods in Moorhay walk, the property of the Rev. Abraham Blackhome and others; and Sulchay woods, belonging alſo to the earl of Weſtmoreland. Thoſe woods, with the open plains and waſtes adjoining, and two incloſed lawns, called

Moorhay lawn and Sulchay lawn, held by lord Weſtmoreland, in right of the keeperſhip of thoſe walks, contain together about 4582 acres. The town and fields of Kings-Cliffe, except Cliffe park and parts of the towns and fields of Duddington, Apethorpe, Newton, Naſſington, and Yarwell, are all compriſed within the limits of this bailiwick; but the woods and lawns above mentioned are the parts which are chiefly ſubject to the haunt and feed of deer. For further particulars relating to the foreſts, purlieu-woods, chaſes, &c. of this county, with ſome judicious ſtrictures on their general injurious ſyſtem of management, the reader is referred to Pitt's General View of the Agriculture of Northamptonſhire, 8vo.

Canals, &c.—The firſt artificial canal that was made to render any benefit to this county was the Oxford, which paſſes through the pariſhes of Aynho, Boddington, Braunſton, and Barby, all on the weſtern verge of the ſhire. At Braunſton it joins the Grand Junction Canal, which croſſes the weſtern ſide of this county. This navigable cut was planned for the purpoſe of opening a water communication between the river Thames and the principal inland canals of the kingdom. See CANAL.

Rivers.—Northamptonſhire may juſtly boaſt, and we believe excluſively, that in the important article of water it is entirely and completely independent: for of the ſix rivers, which flow through or interſect it, every one originates within its boundaries; and not a ſingle brook, however inſignificant, runs into it from any other diſtrict; whilſt there is not a county bordering upon it, that is not in ſome degree ſupplied from its various and ample aquatic ſtores.

The Nen, or Nyne, though, in point of intrinſic celebrity, yielding the palm to the Ouſe and Avon, yet continuing longeſt in, and being moſt beneficial to, the county, has the faireſt claim to priority of notice. It has two ſources: one at Chapel-well, in Naſeby; the other at Hartwell, near Staverton; and both uniting at Northampton, form no inconſiderable river, winding through richly fertile meadows, reaching Peterborough, through Wiſbeach to Lynn, where it is abſorbed in the German ocean.

The Welland, in local importance, ranks the ſecond in this county, and takes its riſe near the vicarage houſe at Sibbertoft, whence having meaſured the ſhort ſpace of four miles, reaches the ſkirts of the county, which adopts its devious wanderings as the line of boundary during a lengthened courſe of nearly fifty miles, by Harborough, Rockingham, and Stamford, where it becomes navigable, through Deeping, to Croyland, when it enters Lincolnſhire, and falls into the Foſsdyke Waſh, near Boſton.

Northampton derives, comparatively, but little benefit from the four other rivers to which it gives riſe, though two of them, the Ouſe and the Avon, ſtand in the firſt claſs of Britiſh rivers; but they are both mere rivulets when they firſt iſſue from the earth, and ſoon deſert their native diſtrict.

The Ouſe (according to Morton) originates at Ouſewell, in the pariſh of Farthingho, near Brackley, and ſpeedily entering Buckinghamſhire, reviſits its parent county near Old Stratford.

The Avon, or Leſſer Avon, commences its courſe at Avon-well, near Naſeby, and flows in a weſterly direction into Warwickſhire.

The Leam, ſpringing from the village of Hellidon, is immediately joined by other rills from Cateſby and Staverton, and paſſes into Warwickſhire.

The Charwell derives its name from a ſmall ſpring called Charwell, near Charwelton.

Roads, Bridges, &c.—There are four great mail roads through this county, which are wide, level, and good; a few of the collateral turnpike roads are alſo kept in a good ſtate; but the croſs roads are ſhamefully neglected. They are generally very narrow, and the farmers are either careleſs of performing the ſtatute duty, or wholly neglect them. Each tenant who occupies a farm of 50*l.* is bound to give ſix days' labour with a cart and two men every year; but if the farmer be remiſs in this duty, it appears that thoſe empowered to interfere are equally negligent, and the public traveller is thereby ſubjected to much inconvenience, and even to danger.

Manufactures.—Northamptonſhire is not a manufacturing county; but ſtill many of its inhabitants are employed in, and derive a livelihood from, different ſpecies of handicraft buſineſs. The making of ſhoes, lace, woollen ſtuffs, and wool ſtapling, are the chief objects of manufacture, and particularly the firſt.

Ancient Architecture, Sepulchral Monuments, &c.—Peterborough cathedral, and its contiguous buildings, diſplay ſome fine examples of the early Norman architecture. The churches of Caxton, Barnack, Earls'-Barton, St. Peter's, and St. Sepulchre's at Northamptom, Barnwell, Twywell, and Stratton, are all diſtinguiſhed by ſemicircular arches, ſhort columns, with correſponding mouldings, &c. In ſome of theſe churches are ancient piſcinas, fonts, ſtone ſtalls, &c. At Fotheringhay is a ſpacious, handſome, collegiate church, with a lofty tower; and at Oundle, Luffwick, Kettering, Higham-Ferrers, Wellingborough, and Finedon, the churches are large and elegant. The croſſes at Geddington, and near Northampton, are intereſting examples of the architecture and ſculpture of Edward I.'s reign. Of ancient manſions, the following are remarkable for their extent, and for their ſtyles of architecture: Burleigh, Kirby, Caſtle-Aſhby, Fawſley, Ruſhton, and Drayton. In Warkton church are three large marble monuments with ſtatues, &c. to the Montague family; and in Weekly church are altar tombs, with effigies to the ſame family. At Brington are ſeveral coſtly tombs in memory of the Spencers of Althorpe. The church of Stowe is remarkable for a very intereſting altar monument with a recumbent figure, probably a portrait, by N. Stone, of Elizabeth Latimer, wife, firſt to ſir John Danvers, and ſecondly to ſir Edmund Carey. The church at Eaſton-Neſton is rendered memorable by ſeveral ſepulchral memorials to the Fermors, earls of Pomfret. In Stamford Baron church are ſome gorgeous monuments to the Cecils of Burleigh. The cathedral church of Peterborough contains ſome ſepulchral mementos, but few of theſe are of diſtinguiſhed importance. The perſecuted Mary queen of Scots is recorded by a cenotaph; Catherine of Arragon, firſt wife to king Henry VIII., was alſo interred here.

In the church at Rockingham, the Watſons, now baron Sondes, have uſually been interred, and ſome monuments have been raiſed to their memories. Lufwick church is not more diſtinguiſhed for its architecture than for the monuments that adorn its interior; for here are ſeveral to the different families of Stafford, Vere, Mordaunt, Green, &c. It contains alſo ſome fine ſpecimens of ſtained glaſs. In Caſtle-Aſhby church are ſome old braſſes, and an ancient tomb with an effigy of a knight armed.

The church of Eaſton Maudit contains three or four monuments with ſtatues, canopies, &c. to the Yelvertons. In Horton church is a curious tomb to William lord Parr, uncle to Catherine; alſo braſſes to Roger Saluſbury and his two wives. Hardingſtone church has two old tombs and a fine monument by Ryſbrack. At Fawſley are ſeveral mural ſlabs, braſſes, and finely ſculptured monuments to different perſons of the Knighty family. In Stean church a branch of the Crewe family of Cheſhire was formerly interred, and

ſeveral tombs are preſerved to record the names of different perſons. Marham church contains ſome monumental memorials to the Fitzwilliams of Milton. NORTHERN *Hemiſphere*. See HEMISPHERE.

NORTHERN *Indians*, in *Geography*, a name given to the wandering tribes that inhabit the region of North America, which lies between N. lat. 59° and 68°, being 500 miles wide, bounded E. by Hudſon's bay, W. by the country of Athapuſcow Indians, S. by Churchill river, and N. by the Dogribbed and Copper Indians. In their perſons they are generally above the common ſize, ſtrong, but not corpulent. They are neither active nor lively in their diſpoſitions; they have very low foreheads, ſmall eyes, high cheek-bones, Roman noſes, full cheeks, and generally long, broad chins. On each cheek they have three or four parallel ſtrokes marked black. In their diſpoſition, theſe are moroſe, covetous, and ungrateful; and much addicted to deceit and impoſition, and when treated with reſpect, inſolent. Among their good qualities, we may enumerate their mildneſs, temperance in drinking, and averſion from riot and violence. In their marriages, they have no ceremony; the women have no choice, being betrothed by their parents in childhood. Polygamy is allowed, and wives are made to ſubmit to the hardeſt labour. The men are jealous, and divorces are very common. Many of theſe people boil their food in veſſels of birch bark, by caſting in hot ſtones; and for want of wood they often eat their meat and fiſh raw. Among their dainties, they reckon maggots, lice, and blood. Fiſh and game are plentiful, and ſupply the chief part of their food; and when theſe fail, a black hard moſs collected from the rocks is a ſubſtitute; this is boiled, and affords conſiderable nouriſhment. Their principal diſeaſes are the ſcurvy, conſumption, and flux. They are very much under the influence of ſuperſtition. When any of their principal Indians die, they believe that they are conjured to death. The dead are left on the ground till they are devoured by fowls and beaſts. The aged are always treated with neglect, and fed with the meaneſt food. A cuſtom prevails among them of exchanging a night's lodging with each other's wives. This is conſidered as a pledge of friendſhip between two families; and when either of the men dies, the other conſiders himſelf bound to ſupport the family deprived of a huſband and father. Two or three ſiſters are often wives to the ſame huſband. Of religion, in principle and practice, they ſeem to be lamentably deſtitute; though their conjurers pretend to converſe with ſpirits. The preſent evil alone diſturbs their minds, and they ſeem to have no idea of futurity. Hearne. Morſe. See INDIANS.

NORTHERN *Signs*, are thoſe ſix on the north ſide of the equator. See SIGN.

NORTHFIELD, in *Geography*, a townſhip of America, in Orange county, Vermont, between 20 and 30 miles W. of Newbury, containing 204 inhabitants.—Alſo, a pleaſant poſt-town in the N. part of Hampſhire county, Maſſachuſetts, on the E. ſide of Connecticut river; 30 miles N. of Northampton, containing 1047 inhabitants; incorporated in 1673, repeatedly deſtroyed by the Indians; and rebuilt in 1713.—Alſo, a ſmall town in Rockingham county, New Hampſhire, on the E. ſide of Merrimack river; incorporated in 1780, and containing 925 inhabitants.—Alſo, a townſhip in Richmond county, Staten iſland, New York, containing 1387 inhabitants.

NORTHFLEET, a village and pariſh in the lower half hundred of Toltintrough, lathe of Aylesford, and county of Kent, England, is ſituated near the banks of the Thames, two miles diſtant from Graveſend, and 20 miles N.E. of London. It was anciently the property of the ſee of Canterbury, but was alienated by archbiſhop Cranmer, in exchange for other lands, with Henry VIII.; it has ſince had ſeveral intermediate poſſeſſors. but was finally granted by the crown to the late earl of Beſborough, about the year 1758, at the annual rent of ſix ſhillings and eight-pence. Of this nobleman it was purchaſed by the late John Calcraft, eſq. The north-weſt part of this pariſh is a low marſh, which was formerly covered by the Thames, and is now croſſed by a high cauſeway and bridge, with floodgates to prevent the tides flowing beyond it. The village is irregularly built round Northfleet Green, and on the ſides of the high road. The pariſh church, which is one of the largeſt in the dioceſe, conſiſts of a nave, aiſles, and chancel, with a low tower, erected at the beginning of the laſt century, within the ſcite of the foundation walls of the ancient ſtructure, but by no means correſpondent with the reſt of the building. The nave is ſeparated from the aiſles by octagonal, maſſive columns, ſpreading off into pointed arches, without the intervention of capitals. The church contains ſeveral monuments of the fourteenth century; and on the north wall is one of alabaſter, to the memory of Dr. Brown, eminent for his knowledge in natural hiſtory, and phyſician to king Charles II. In the return made to parliament, purſuant to the population act of the year 1811, Northfleet was ſtated to contain 372 houſes, occupied by 2031 perſons; of theſe a great number derive employment from the contiguous chalk works, which extend from the northern ſide of the village to the Thames; their width on an average being nearly a quarter of a mile. The chalk pits are immenſe; the cliffs where the chalk has been dug preſenting, in many places, a precipitous ſurface from 100 to 150 feet in perpendicular height. The chalk forms a conſiderable branch of commerce, and along the ſhore are ſeveral wharfs for the convenience of ſhipping it off, both in its natural ſtate, and when burnt into lime, for which purpoſe here are ſeveral large kilns. The flints alſo, which pervade the chalk in thin ſtrata, are collected for ſale; theſe form a material ingredient in the compoſition of the Staffordſhire ware; and great quantities are exported to China.

On

On an elevated ſituation in the vicinity of Northfleet is Ingreſs, formerly called Ince-grice, the ſeat of Henry Roebuck, eſq. It was the property of John Calcraft, eſq. who died in 1772; this gentleman arranged in an elegant ſummer houſe, built in a hollow of the chalk cliffs, a valuable collection of Roman altars, brought from Italy; with ſtatues and other ſpecimens of Roman ſculpture, placed in various parts of the garden. Haſted's Hiſtory and Topographical Survey of Kent, 12 vols. 8vo. Beauties of England and Wales, vol. vii. by E. W. Brayley.

NORTHFORD, a pariſh of Branford, New Haven county, Connecticut, in which are a poſt-office, and alſo a Congregational and an Epiſcopal church; 10 miles E. of New Haven.

NORTH HAMPTON, a townſhip of New Hampſhire, in Rockingham county, containing 653 inhabitants; incorporated in 1742.—Alſo, a townſhip in Montgomery county, New York; containing 996 inhabitants.

NORTH HAMPSTEAD, a townſhip in Queen's county, Long iſland, New York; containing 2413 inhabitants, of whom 269 are ſlaves.

NORTH HAVEN, a townſhip of Connecticut, ſituated in New Haven county, on the E. ſide of Eaſt river; 32 miles S. by W. of Hartford, ſettled in 1660, and containing 1157 inhabitants.

NORTH HUNTINGTON, a townſhip in Weſtmoreland county, Pennſylvania, including 1484 inhabitants.

NORTHING, in *Navigation*, the difference of latitude, which a ſhip makes in ſailing towards the *north pole*.

NORTH KINGSTOWN, in *Geography*, a town of America, in Waſhington county, Rhode iſland, which carries on a conſiderable trade in the fiſheries, and alſo ſome to the Weſt Indies; its harbour is called Wickford; eight miles N.W. of Newport. The townſhip contains 2794 inhabitants, including 39 ſlaves.

NORTHLEACH, a ſmall market town in the hundred of Bradley, Glouceſterſhire, England, is ſituated in a bottom amongſt the Cotſwold hills, near the ſource of the little river Leach, at the diſtance of 20 miles from the city of Glouceſter, and 82 miles from London. The manor was given by king Ethelred to the abbey at Glouceſter, to the monks of which Henry III. granted the privilege of two annual fairs, and a weekly market. After the diſſolution the manor paſſed into lay hands; it came into the Dutton family at the beginning of the laſt century; and is now the property of James Dutton, who was created lord Sherborne in 1784.

About the beginning of the ſixteenth century Northleach was of conſiderable importance as a clothing town; but not having a ſufficiency of water to ſupply the increaſed demand of the manufacture, it gradually declined. Here was formerly a public market for wool and cloth; ſome of the buildings for the reception of theſe articles are mentioned by Rudder, in his Hiſtory of Glouceſterſhire, as remaining, having a ſpacious area in the centre, and communicating, when he wrote, with each other by galleries. The town conſiſts chiefly of one long, irregular ſtreet: the market houſe is an ancient ſtructure, ſupported by columns; near it are ſeveral ſteps, and the baſe of an ancient croſs. The church, which is a ſpacious edifice, conſiſts of a nave, chancel, and ſide aiſles, an elegant ſouth porch, and a lofty tower at the weſt end, with open-worked battlements. The ſouth porch is embelliſhed with tracery, externally and internally. The whole ſummit of the building is embattled, and ornamented with pinnacles. The church contains many ſepulchral memorials of opulent clothiers who lived in the fifteenth century. A free grammar ſchool was founded here, in 1559, by Hugh Weſtwood, eſq., who endowed it with the impropriation of Chedworth, then producing nearly 120*l. per annum*: every fourth year an exhibitor is ſent from this ſchool to Pembroke college, Oxford, on the foundation of George Townſend, eſq. The civil government of the town is veſted in a bailiff and two conſtables. In the population return in the year 1811, the inhabitants of the pariſh are ſtated to be 647 occupying 142 houſes. The market is held on Wedneſday; and here are now three annual fairs.

At Eaſtington, a tything in Northleach pariſh, Dr. Woodward made a great part of his valuable collection of foſſils, which he preſented to the univerſity of Cambridge. This tything is alſo remarkable for being the ſcite of an ancient encampment, called Norbury, which Baxter ſuppoſes to be a corruption of Morbyrig, or the Great Camp. It was of an oblong form, incloſed with a double agger, and contained about eighty acres; but the ground having been long cultivated, the banks are in many parts levelled. From the proximity of this to the Foſs-way, it has been conſidered as Roman.

About five miles from Northleach is the village of Sherbourn, or Sherborne. The manor belonged to the abbey of Winchcomb from before the Conqueſt till the Diſſolution. It afterwards became the property of the Duttons; and is now poſſeſſed by lord Sherborne, who has a ſeat here called Sherborne Houſe. It is an extenſive manſion, and conſiſts of two quadrangles; the eaſtern and moſt ancient part of which is ſuppoſed to have been the reſidence of the abbots of Winchcomb. Two parks belong to this houſe, each between three and four miles in circumference; in one of them is a neat lodge.

Sherbourn was the birth-place of Dr. James Bradley, who ſucceeded Dr. Halley as aſtronomer royal at Greenwich. He was born in 1692, died in 1762, and was buried at Minchin-Hampton in Glouceſterſhire. Rudge's Hiſtory &c. of Glouceſterſhire, 2 vols. 8vo. Beauties of England, vol. v.

NORTHLINED LAKE, a lake of America, about 160 miles S. of the head of Cheſterfield inlet, about 80 miles long, and 25 broad, full of iſlands. N. lat. 60° 40′. W. long. 98° 30′.

NORTHORN, a town of Germany, in the county of Bentheim, on the Vechte; eight miles N. of Bentheim.

NORTHPORT, a townſhip of America, in Hancock county, Maine, incorporated in 1796, and containing 482 inhabitants.

NORTH SALEM, a townſhip of America, in Weſt Cheſter county, New York, oppoſite to Ridgefield in Connecticut, containing 1145 inhabitants.

NORTHUMBERLAND, the moſt northerly county of England, lies between 54° 51′ and 55° 48′ N. lat., and between 1° and 2° 27′ W. long. It is bounded on the eaſt by the German ocean; on the weſt by Roxburghſhire and Cumberland; on the north by Berwickſhire; and on the ſouth by the county of Durham. Including the detached portions of the latter county, called Northamſhire, Iſlandſhire, and Bedlingtonſhire, it extends 64 miles in length, and in ſome places 48 in breadth; and compriſes an area of 1980 ſquare miles, or 1,267,200 acres; of which 817,200 are level and ſuſceptible of cultivation, while the remaining 450,000 are of a mountainous character, and not adapted to agricultural purpoſes.

Hiſtorical Events.—This county, previous to the Roman invaſion, is conjectured by Camden to have formed a part of that diviſion of Britain which was occupied by the Ottadini or Ottatini, a tribe of the Meätæ, who are mentioned by Dio Caſſius as poſſeſſing the territories adjoining the Picts wall.

wall. Theſe people were ſituated more to the ſouth and eaſt than the Gadeni, and had for their chief city Bremenium, the ruins of which are ſtill ſeen near Rocheſter in Reedſdale. After the armies of Rome had extended their conqueſts to the Forth, Northumberland was included in the province of Valentia. Under the Saxon government it conſtituted part of the extenſive and powerful kingdom of Northumbria, which is generally ſuppoſed to have reached from the north bank of the Humber to the Frith of Forth. This monarchy was begun by Ida, who arrived in Britain in the year 547, and having conquered a conſiderable extent of territory, aſſumed the purple under the title of king of Bernicia; and was ſucceeded by his ſon Adda. In the firſt year of this prince's reign, Ælla, a noble chieftain of Saxony, who had accompanied Ida in his expedition, made war upon the Britons in the province of Deïra, drove them from their territories, and ſettling his followers therein, aſſumed the regal authority. Adda, king of Bernicia, dying in the ſeventh year of his ſovereignty, was ſucceeded by four princes, Glappa, Theolwald, Frethulf, and Theodric, of whom nothing is known but their names, and the number of years they reſpectively ſwayed the ſceptre. On the death of the laſt of theſe monarchs Ælla acquired the ſovereignty of both kingdoms, which he united under the name of the kingdom of Northumberland. This prince enjoyed his conjunct rule only three years, when he died, leaving iſſue a ſon and a daughter, Edwin and Acca, but as the former was yet too young to take upon himſelf the government, Ethelric, the ſecond ſon of Ida, was raiſed to the throne. His reign laſted during five years of profound peace, at the end of which time he departed this life, and left the kingdom to his ſon Ethelfrith, who, the better to inſure the ſtability of his ſway over Deïra, which of right ſhould have deſcended to Edwin, eſpouſed Acca, the ſiſter of that prince. Ethelfrith, ambitious of military renown, was conſtantly engaged in war for the firſt twenty years of his reign, either with the Britons or the Scots, whom he defeated in ſeveral deſperate engagements, and ſpread the terror of his arms even among the Saxon ſtates. This train of ſucceſs, having ultimately led to peace with all the neighbouring kingdoms, Ethelfrith had leiſure to examine more cloſely his affairs at home. He looked with a jealous eye on young Edwin, whoſe title to the throne of Deïra was unqueſtionably preferable to his own, and fearing that he might one day be induced to aſſert his rights, reſolved to remove this obſtacle to his happineſs, by murdering the prince. He, however, being by ſome means made acquainted with the intended treachery againſt him, fled from Northumberland, in company with his wife, and ſought refuge at the court of Redwald, king of the Eaſt Angles. This prince, by the perſuaſion of his queen, determined rather to hazard the fortune of war, than deliver up Edwin to the meſſengers of the Northumbrian monarch, who demanded him with all the arrogance of a conqueror towards his vaſſals. Accordingly collecting his forces, he followed the ambaſſadors with ſuch expedition as aſtoniſhed Ethelfrith, who, nevertheleſs, advanced againſt him with perfect confidence of ſucceſs. Both armies met upon the banks of the river Idle, where a ſanguinary engagement enſued, in which Regenhere, the ſon of Redwald, was ſlain. Victory, however, declared for the Eaſt Anglian; and as Ethelfrith himſelf alſo fell in the action, and his ſons were yet infants, Edwin found little difficulty in obtaining poſſeſſion of the Northumbrian crown.

Of all the princes of the heptarchy at this period, Edwin was undoubtedly the greateſt, being no leſs diſtinguiſhed for his influence abroad, than for his rigid and impartial adminiſtration of juſtice within his own dominions. He reclaimed his ſubjects from the licentious life to which they had hitherto been accuſtomed, and eſtabliſhed ſo excellent a ſyſtem of police in every part of his kingdom, that it became proverbial to ſay, a perſon might do any act with as much ſafety as a woman or child could paſs through Northumberland with a purſe of gold in their hand; meaning thereby, that there was not the ſmalleſt danger to be apprehended from its execution. Every individual placed near his throne loved him; and he was one of thoſe few monarchs who could boaſt of the ſincere attachment of his miniſters and favourites. Of this happy fortune, there is a remarkable inſtance upon record. Guichelme, king of Weſſex, envying his glory, but fearing to wage open war againſt ſo gallant and powerful a prince, determined to cut him off by treachery. With this view, he ſent as ambaſſador to his court, one Eumer, a villain adequate to the moſt bloody and atrocious deed, who having obtained admittance to the king, under the pretence of delivering a meſſage from the Weſt Saxon prince, drew his dagger, and would have murdered Edwin on the ſpot, but for the noble conduct of Lilla, an officer in his army. This heroic ſoldier perceiving the danger of his prince, and having no other means of defence, ſuddenly interpoſed his own body between him and Eumer's dagger, and was pierced to the heart. Exaſperated at this barbarous deſign, which, though it failed of its avowed purpoſe, had deprived him of ſo valuable a friend as the murdered Lilla, he marched an army into Weſſex, and being every where ſucceſsful, either ſlew or made priſoners all who had any ſhare in his intended aſſaſſination, and rendered the kingdom tributary to the crown of Northumberland.

About this time the Eaſt Angles having conſpired againſt their king, Redwald, put him to death, and offered the ſceptre to Edwin. But this prince, notwithſtanding his vaſt ambition, poſſeſſed a mind ſuperior to the baſe feeling of ingratitude. Inſtead, therefore, of graſping at the opportunity thus afforded him, of adding another powerful kingdom to his already extenſive territories, he remonſtrated with the deputies on the barbarity of their regicide, and declared his determination to ſupport Earpwold, the ſon of Redwald, on the throne of his father. Hitherto the Northumbrian Saxons continued to worſhip idols, and though ſome attempts had been made to convert them to Chriſtianity, all had failed to effect that deſirable object. The period, however, was now arrived in which they were deſtined to receive the bleſſed doctrines of the goſpel. Edwin's firſt wife having died while he reſided at the court of Redwald, he married, for his ſecond, Ethelburga, the daughter of Ethelbert, king of Kent, who was already converted, and had eſtabliſhed the religion of Jeſus throughout every portion of his dominions. That lady, emulating the glory of her mother, Bertha, by whoſe zeal that happy reſult had been accompliſhed, carried Paulinus, a learned biſhop, along with her, and beſides ſtipulating a toleration for the exerciſe of her own worſhip, which was readily granted, uſed every effort in her power to induce her huſband to adopt it alſo. Edwin, like a prudent prince, promiſed to examine the principles upon which her faith was founded, and declared that if they appeared more agreeable to the dictates of reaſon than the foundations of his own, he would willingly comply with her requeſt. Accordingly he held ſeveral conferences with Paulinus, canvaſſed the arguments with the wiſeſt of his counſellors, and after a ſerious and long inquiry, decided in favour of Chriſtianity. But though allowed to exerciſe their judgments on the great queſtion of their ſalvation, the people did not reject the truths offered to their conſideration. The Northumbrians, almoſt to a man, threw off the ſhackles of idolatry, and embraced the new religion. Unhappily, however, the

ſucceſſion

ſucceſſion of events which followed this important era proved hoſtile to the immediate conſummation of the glorious deſtiny ſo auſpiciouſly begun. Penda, the Pagan king of Mercia, ſtimulating Ceadwallo, king of the Britons, to take up arms, and throw off the Northumbrian yoke; the two monarchs joined their forces, and waited the advance of Edwin, who had already taken the field with a powerful force to quell the inſurrection. A place called Hatfield Chace, in Yorkſhire, was the ſcene of conteſt. Both armies performed prodigies of valour, but Edwin and his ſon being killed in the action, the Northumbrians, loſing confidence, immediately gave way, and in the end were defeated with immenſe ſlaughter.

Penda and Ceadwallo now penetrated into the kingdom of Northumberland, and ſpread death and deſolation every where around them. Penda in particular, if belief can be given to the monkiſh hiſtorians, directed his ſavage vengeance with ten-fold cruelty againſt the Chriſtian inhabitants; till at length ſated with blood, both he and the Britiſh monarch retired to their own dominions. Eanfred, the ſon of Ethelfrith, now returned with his brothers Oſwald and Oſwy from Scotland, and took poſſeſſion of Bernicia, his paternal kingdom; and Oſric, the couſin-german of Edwin, eſtabliſhed himſelf in Deïra, the inheritance of his family. Hence the monarchy of Northumberland was again divided into two diſtinct ſovereignties; and as the kings of each renounced the doctrines of Chriſtianity, which they had embraced during their exile, Paganiſm once more became the court worſhip in both kingdoms. This apoſtacy, however, did not ſhield them from the rage of Ceadwallo; but moſt probably gave a keener edge to his ſword, as he himſelf was profeſſedly a Chriſtian. Again entering Northumbria, he ravaged the country with ſtill more ferocious barbarity than before. Oſric fell in the defence of his own city; and Eanfrid, terrified at his fate, went in perſon to the camp of the Welſh king to ſue for peace, and implore his clemency; but notwithſtanding the ſacred purpoſe of his viſit, he was arreſted and put to death by the murderous tyrant.

Upon this event Oſwald, the only ſurviving legitimate brother of the murdered prince, reſolving to revenge the wrongs of his family, and taking advantage of the hatred with which the treachery of Ceadwallo had inſpired his countrymen, raiſed a conſiderable army, and marched to offer battle to the execrable oppreſſor. A moſt ſanguinary action enſued, in which, notwithſtanding his inferiority in numbers to his enemy, Oſwald was completely ſucceſsful, Ceadwallo and the chief of his nobility being ſlain on the field, and the reſt of his army routed and diſperſed. This glorious engagement was fought at Dennis, on the borders of the county; and eventually enabled Oſwald to aſſume the crown of Northumberland, by a re-union of the kingdoms of Bernicia and Deïra. Oſwald likewiſe reſtored the Chriſtian religion, and ſucceeded, by his judicious conduct, in wholly extirpating Paganiſm from his dominions. He is much celebrated by the monkiſh writers for his ſanctity and charity, which procured him the honours of canonization. Oſwald died in battle againſt Penda, king of Mercia, and was ſucceeded by his natural brother Oſwy, who eſtabliſhed himſelf on the Northumbrian throne, by putting to death Oſwin, the ſon of Oſric, the laſt king of the race of Deïri. His ſon Egfrid ſucceeded him, who was ſlain in an engagement with the Picts, without leaving any children; becauſe Adelthrid, his queen, refuſed to violate her vow of chaſtity. Alfred, his natural brother, conſequently acquired poſſeſſion of the kingdom, which he governed for nineteen years, and left it to Oſred, his ſon, a boy only eight years of age. This prince reigned eleven years, and was murdered by his kinſman Kenred, who enjoyed his uſurped dignity little more than a year, having ſuffered the puniſhment of his barbarity by a ſimilar fate. Oſric, and after him Celwulph, the ſon of Kenred, next mounted the throne; which the latter relinquiſhed in favour of Eadbert, his couſin-german. He, imitating his predeceſſor, abdicated the crown alſo, and retired into a monaſtery. Oſwolf, ſon to Eadbert, periſhed in an inſurrection ſoon after his acceſſion, when the ſovereignty was ſeized by a nobleman named Mollo, who reigned ten years, and was ſlain by the treachery of Alured. This prince, a deſcendant from Ida, firſt king of Northumberland, now obtained the ſceptre, but, conducting himſelf tyrannically, was expelled by his ſubjects: Ethelred, his ſucceſſor, was likewiſe compelled to renounce his authority; and Celwald, the next king, was depoſed and ſlain by the people, and his place filled by Oſred, who, after reigning one year, made way again for Ethelred, whoſe death was equally tragical as that of almoſt all his predeceſſors. An univerſal anarchy now prevailed in Northumberland for ſeveral years, 'till at length Egbert, king of Weſſex, ſubdued the kingdom, and rendered it tributary to his crown. From this time Northumberland remained in ſubjection to the Weſt Saxon yoke, till it was conquered, after a bloody ſtruggle, by the Danes, who nearly extirpated or expelled the whole of the Saxon proprietors, and ſettled themſelves in the deſerted territories.

Thus ended the powerful monarchy of Northumberland, after it had ſubſiſted three hundred and thirty years. As the poſſeſſors of the land were now entirely Danes, Daniſh laws prevailed throughout its entire extent, and continued in force till the time of Edward the Confeſſor, when they were incorporated with the Weſt Saxon and Mercian codes, and the whole made common to England under the name of the laws of Edward. The governors ſubſequent to this period were hereditary earls, who ſometimes aſſumed the title and inſignia of royalty. Edgar, however, deeming the hereditary rule of ſo extenſive a country an elevation too high for a ſubject, divided it into two diſtinct portions; and not long after granted all the diſtrict, from the Tweed to Edinburgh, to Kenneth, king of Scotland, to be for ever annexed to his dominions. Other grants cut off additional diſtricts about the ſame era, ſo that previous to the Norman conqueſt Northumberland was reduced to its preſent limits. Theſe events led to important changes. This county, now rendered a frontier diſtrict with Scotland, became the principal theatre of the border wars, which raged from the time of Stephen to the union of the two crowns in the perſon of king James. The people of Tindale and Reedſdale, in common with the borderers of Cumberland and Scotland, were, in thoſe days, nothing leſs than clans of lawleſs banditti, who were conſtantly engaged in depredatory excurſions. The tract which they occupied extended about 50 miles in length, and ſix in breadth, and was called "the Debateable Land," both nations laying claim to it, though in fact it belonged to neither, as their utmoſt efforts were ineffectual for the ſubjection of its inhabitants, whoſe dexterity in the art of thieving was ſuch, that they could twiſt a cow's horn, or mark a horſe, ſo that its owner could not know either again. The Engliſh borders were divided into three marches. The weſtern march extended from the Solway Frith to Tindale; the middle march compriſed Tindale and Reedſdale; and the eaſtern march reached from Reedſdale to Tweedmouth. The marches were under the juriſdiction of a lord-warden general, an office of a military nature, and uſually held by one of the dukes or earls of Northumberland. The executive part of the duties, however, was uſually confided to a deputy, under whom were three inferior wardens. One of theſe officers ſat, by the king's commiſſion, as judge in the

march courts, and aſſiſted in framing border laws and ſettling treaties with Scotland. Their common buſineſs was to regulate the watches, diſcipline the militia, and take meaſures for aſſembling them in arms at the firſt alarm of an enemy in the time of war; but during peace they were chiefly employed in ſuppreſſing the inſolence and rapine of the borderers.

Beſides the mere border conteſts, ſeveral important battles have been fought within the boundaries of this county. The battle of Otterburne, where the brave earl Douglas loſt his life in 1388, was decided in the neighbourhood of Otterburne-caſtle. This action terminated in favour of the Scots, notwithſtanding the fall of their leader; ſir Henry Percy, the commander of the Engliſh, being wounded and taken priſoner. John Nevil, marquis of Montague, general of Edward IV., gained a deciſive victory at Hexham over the forces of the depoſed king, Henry VI., and was, on that account, raiſed to the dignity of duke of Northumberland. Near Branxton was fought the celebrated battle of Flodden, in which James IV. of Scotland was ſlain with the flower of his nobility; and at Newburn the army of king Charles I. ſuſtained a complete overthrow from the Scots under the command of general Leſley, who ſoon after beſieged and took the town of Newcaſtle, though bravely defended by ſir John Morley, the mayor.

In former times the lands of Northumberland were held of the king by knights' ſervice. The barons and people of higher condition dwelt in caſtellated manſions, or moated towers. The middling claſſes of the people held their lands of the barons chiefly in ſocage tenure, and reſided in buildings called peels or piles, conſiſting of a ground floor, in which their cattle were kept during the night, with a floor above, occupied by the family. The lower orders, in common with the middle claſs, were ſubject to the grievous ſervice of keeping night-watches at all the fords, paſſes, and inlets of the vallies, to guard againſt the incurſions of the borderers, or of the Scots, during hoſtilities. When either a troop of banditti, or an enemy, made their appearance, every man within hearing of the horn was bound, under pain of death, to riſe and aſſiſt in the protection of the country. In this ſtate of things, as may be ſuppoſed, the occupations of peaceful life were little attended to. Agriculture was ſuffered to languiſh, and every art, but the art of war, was eſteemed mean and diſhonourable. Fortunately the events of the two laſt centuries have materially altered this dreadful aſpect of human life. Since the union of Scotland and England thoſe ſcenes of contention and barbariſm which rendered exiſtence and property equally precarious, have been gradually diſappearing. The country has been incloſed far up the vallies of Tindale and Reedſdale, and the refinements of civilization, and the ſocial and enchanting harmony of rural life now prevail, where, before that happy event, ſcarcely a ſound was heard, but the "warder's tread," or the agonized ſcreams of the widow and the fatherleſs, whoſe kind protector lay weltering in his blood, while the flames devoured their little cottage, and left them no ſhelter from the rude blaſt of the pitileſs winter.

General Aſpect, Soil, and Climate.—The aſpect of Northumberland diſplays as much variation as that of any other county in England. Along the ſea-coaſt the land is, for the moſt part, a perfect level. Towards the middle the ſurface is more diverſified, and thrown into large ſwelling ridges. Theſe parts are well incloſed, and, in ſome ſpots, enriched with woods and plantations. The weſtern and northern diſtricts of the county, with the exception of a few intervening vales, may be characteriſed as an extenſive ſcene of open, mountainous country, where the hand of cultivation can rarely be diſcovered. Of theſe diſtricts, that towards the north is the moſt valuable, exhibiting in general a ſeries of fine green hills, thrown into numberleſs combinations of forms, and incloſing and ſheltering many deep, narrow, and ſequeſtered glens. The more ſouthern diviſion, on the other hand, is not marked by any ſtriking irregularities of ſurface, but, like the Highwolds of Yorkſhire, preſent a range of widely extended ſolitary waſtes, producing little elſe but heath, and ſcarcely affording ſubſiſtence to the few flocks of ſheep by which they are depaſtured. With reſpect to ſoil, it may be obſerved, that a ſtrong, fertile, clayey loam covers the level tract along the ſhore. This ſoil is admirably adapted for the culture of any ſpecies of grain. A ſandy, gravelly, and dry loam, is chiefly apparent in thoſe vallies which are watered by rivers; but particularly in the vales of Breamiſh, Till, and Beaumont, and on the outſkirts of the Cheviot mountains. In the middle and ſouth-eaſt parts of the county, a wet, cold, clayey bottom is found to exiſt throughout a great extent of country; and in moſt of the mountainous diſtricts black peat earth is more abundant than any other kind of ſoil. The climate is as changeable as the nature of the country is various. Upon the mountains ſnow ſometimes lies for ſeveral months in conſiderable depth, though there is none in the vallies, or lower diſtricts. The weather is extremely inconſtant, but moſtly runs in extremes. In the ſpring dry eaſterly winds are very prevalent, and continue late; ſo that ſummer ſeldom commences till near the cloſe of June, when milder breezes from the ſouth pour in their life-inſpiring balm, and quicken the drooping plants into vigorous vegetation. Hence the autumn of the year is properly the ſummer of Northumberland. The months of September and October are uſually fine ſettled weather, but no ſooner has November begun, than winter ſets in with the utmoſt keenneſs and ſeverity.

Agriculture.—In a country exhibiting ſuch diverſity of ſurface and climate, as has been mentioned above, a correſponding difference of produce and management may be expected to prevail. Wheat is ſeldom raiſed, except on the lands near the ſhore. Drilling has been introduced, and is practiſed to a conſiderable extent. The manures in uſe are chiefly the produce of the ſheep-fold in the higher diſtricts, and lime, marle, and ſea-weed in the lower. A large quantity of manure is likewiſe brought from London, as ballaſt, in the coal veſſels. Great attention is paid to rearing ſtock. The favourite and almoſt excluſive breed of cattle is the ſhort-horned, or Dutch kind; and this preference is given in conſequence of the ſuperior rapidity of their growth. The Devonſhire kind is only in the poſſeſſion of one proprietor; and in Chillingham park, belonging to the earl of Tankerville, is a ſtock of wild cattle, probably the only remains of the true and genuine breed of that ſpecies in Great Britain. Their colour is invariably white, muzzle black, with ſmall tips of red behind the ears. The horns partake of the ſame colour as the body, and are tipt with black. Some of the bulls have a thin, upright mane, about an inch and a half, or two inches, long. On the firſt appearance of a ſtranger, theſe animals gallop off at full ſpeed to a conſiderable diſtance, then wheeling round, they come up boldly again, toſſing their heads in a menacing manner. On a ſudden they make a full ſtop, and again fly off. This they repeat ſeveral times, approaching nearer and nearer every return, till they come within a few yards, when it is uſually thought prudent to leave them. When the cows calve, they hide their offspring in ſome ſequeſtered ſpot, and go and ſuckle them two or three times a day. If any perſon approaches a calf ſo ſituated, it claps down its head cloſe to the ground, and lies, like a hare, in a form to conceal itſelf, and ſhould he be ſeen to touch it, by the mother, he may rely

upon being inſtantly attacked by the whole herd. Such of them as may happen to be wounded, or grown weak and feeble through age or ſickneſs, are ſet upon by the reſt, and gored to death. (See Bewick's Hiſtory of Quadrupeds.) The ſheep of Northumberland are of three ſorts, the Cheviot-ſheep, the heath-ſheep, and the long-woolled ſheep. Of theſe the Cheviot breed is the moſt remarkable for its beauty; the ſecond ſort are peculiarly adapted to the bleak and heathy diſtricts; the third kind have the advantage of fatting at an early age, and producing great quantities of good wool.

The tythes of this county offer no peculiar feature, except that the tythes of hay and corn, being for the moſt part in the hands of opulent laymen, renders commutation for money leſs practiſed than it otherwiſe might be. The annual value of eſtates riſes from the ſmalleſt ſum to upwards of 30,000*l.* One eſtate only is ſaid to yield more than 80,000*l.* a-year. In the mountains, eſpecially near the ſources of the Tyne, there are ſeveral ſmall eſtates from thirty pounds to three hundred a-year, farmed by their proprietors, and as theſe have generally been handed down through ſeveral generations, a ſtrong attachment to ancient methods of huſbandry have deſcended with them, and improvements have been ſlowly adopted. The largeſt farms are thoſe in Glendale and Bamborough wards; and ſome tenants in the northern parts of the county rent from 2000*l.* to 4000*l.* *per annum*. Dry loams let for fifty, or fifty-five ſhillings *per* acre, and the old rich grazing paſtures for ſixty or ſeventy ſhillings, tythe free. All the rents are paid in money, and four or five months credit is uſually given to the farmers; many of whom are deſervedly held in high eſtimation for their agricultural ſkill, and by their liberal and ſcientific views have contributed to exalt their profeſſion to a high point in the ſcale of practical ſcience.

The rivers of Northumberland are numerous, and ſpread, by a great variety of branches, throughout almoſt every part of the county. The principal of them are the Tyne, the Tweed, the Blythe, the Wanſbeck, the Cocquet, the Aln, and the Till. The Tyne riſes from two ſources, one behind Croſs Fell, and another on the borders of Scotland, which, till the junction of their ſtreams, are denominated the North and South Tyne. This river was formerly celebrated for its ſalmon fiſheries; but theſe are now entirely deſtroyed. It is ſtill, however, of high importance in a commercial view, being navigable for veſſels of large burden far above Newcaſtle, which is one of the firſt trading towns on the eaſtern coaſt of our iſland. The conſervatorſhip of the Tyne is veſted in the mayor and corporation of Newcaſtle, whoſe juriſdiction extends to high water mark, on both ſides of the river from the ſea to Hedwin ſtreams, above Newburn, which diſtance is ſurveyed annually on Aſcenſion day. The Tweed divides England from Scotland, and conſequently forms the northern boundary of the county. It riſes at a place called Tweed's Croſs in Tweedale, and receives, in its progreſs through North Britain, three rivers, much celebrated in ſong, the Ettrick, the Leader, and the Tiviot. The annual rental of the ſalmon fiſheries on this river amounts to the enormous ſum of 15,766*l.*; and the yearly value of the ſalmon ſold is eſtimated at 60,000*l.* Near the mouth of the river, a rent of 800*l.* *per annum* is paid for a fiſhery not exceeding two hundred yards in length. (See SALMON, alſo BERWICK-*upon-Tweed.*) The Blythe and Aln both fall into the German ocean, and form eſtuaries which are navigable for a ſhort diſtance, and hence are extremely convenient for the exportation of coal. The Cocquet pours its waters into the ſea near Warkworth, where there is a fiſhery for ſalmon-trout and gilſe. By a recent alteration in its channel, this river ſeems to be preparing itſelf for being an excellent harbour for ſmall veſſels. The Wanſbeck is the moſt noted of any ſtream in the county for the beauty of its banks; and is immortalized by Akenſide in his Pleaſures of Imagination. The Till, riſing among the Cheviot hills, is called Brennich as far down as Wooler. This river, after being joined by the united currents of the Bovent and Glen, falls into the Tweed. The Bovent is remarkable for fine pebbles.

Mineralogy.—In a mineralogical eſtimate, Northumberland is a county of diſtinguiſhed importance. Lead-ore is found in great abundance, particularly in its weſtern parts. Allendale mines have been wrought for time immemorial, and at preſent afford an annual produce of about 12,000 bings of ore, which is ſmelted and refined at Dukefield, and yields ſeven or eight ounces of ſilver for each fother of lead. The ores here have the calcareous or fluor-ſpar for their matrix, and the ſides of the mines are often richly decorated with pellucid and poliſhed cryſtals of various minerals; but never ſhew ſo much magnificence and glory as when they are interſperſed with yellow ore of copper, and with pyrites and black jack, which, in hard veins, diſplay a combination of the moſt beautiful colours nature or imagination can depict. The other lead-mines are at Shilden, near Corbridge, and at Little Houghton, in the vicinity of Bamborough. Indications of the ſame metal alſo appear near Simonburn, and in different places ſouth of the Tyne. There likewiſe have been mines in Rothbury foreſt, and at Newborough; and ore is obtained in conſiderable quantities at Fallow-Field, but the ſmall quantity of ſilver it contains is not equal to the neceſſary expence of ſmelting it. Zinc abounds in moſt of the lead-veins, and iron-ſtone lies imbedded in vaſt quantities in the ſtrata of indurated clay, throughout the whole of the coal diſtrict, which is computed to extend (including a ſmall portion of Durham) 20 miles in length, and 15 in breadth, being an area of 300 ſquare miles. The caking-coal is found in the greateſt abundance, and of the beſt quality, in that range of country lying between a line drawn from Alnemouth to Tinemouth; from thence, by the ſouth boundary of the county, into the pariſh of Bywell; and again from Bywell to Alnemouth. This diſtrict, as far as it has been examined, is found to conſiſt of various kinds of ſilicious ſtone, ſchiſtus, and coal. Beds of ſchiſtus uſually conſtitute the matrix of the coal-ſeams, both above and below, and frequently exhibit beautiful impreſſions of foſſil plants, as ferns, vetches, ears of barley, &c. and, what is remarkable, pine-apple leaves. Layers of iron-ſtone are frequent in theſe beds, generally of a rhomboidal form, but ſometimes in nodules. At Kenton, in particular, are diſcovered immenſe foſſilated trees, ſome of which have been hewn into ſeats, and ſhew the yearly rings of their growth, and alſo the roughneſs of the bark. The ſtrata of Northumberland uſually dip or incline towards the eaſt; and each ſtratum keeps its paralleliſm, with reſpect to thoſe immediately over or under it, through all the confuſion of the perpendicular rents and chaſms, which are denominated by miners dikes, ſlips, hitches, and troubles. Some of theſe chaſms are filled up with clay, ſand, and round ſtones, which have dropped in from the ſurface, according to the opinion maintained by Werner in his late work on the formation of mineral veins. Many of them are the receptacles of metals and beautiful ſpars; and others of baſalt, a ſubſtance bearing a near reſemblance to lava, and hence ſuppoſed to have been thrown up in a fuſed ſtate from the internal cavities of the earth, and to afford an appoſite illuſtration of the Huttonian theory. A baſalt dyke, thus formed in the coal-mine at Walker, is caſed with the cinders of coals; but in what manner this phenomenon has occurred,

occurred, it is not eaſy to determine. The great operations of nature in the economy of the globe are yet but imperfectly known; and perhaps, in the preſent ſtate of the ſcience on which their explanation peculiarly depends, cannot be inveſtigated with any proſpect of attaining a correct ſolution: nor indeed do we conceive that it ever will be poſſible to eſtabliſh their theory upon the ſame demonſtrative evidence, by which Newton and La Place have been enabled to explain the complicated, but uniform, movements of the heavenly bodies. Chemiſtry is a ſcience only admitting of the partial application of geometry, or the calculus; and therefore, of neceſſity, many of its theoretical concluſions muſt continue to reſt on a ſpecies of moral evidence alone. As far, however, as the human mind can reach in the purſuit of truth, abſtractedly from mathematical accuracy, we are hardy enough to think that geologiſts may one day carry the deciſion of the curious and intereſting queſtion, which now divides the chemical philoſophers of Europe.

Beſides the minerals already mentioned, ſeveral others of inferior importance are diſcovered in Northumberland. Lime-ſtone, of an excellent quality, abounds in almoſt all parts of the county, except in the coal diſtrict, the boundaries of which have been deſcribed, and in the porphyry tract of the Cheviot hills. Stone-marle is plentiful in many places near the Tweed, and ſhell-marle is found in a few places in Glendale Ward, principally at Wark, Sunnylaws, and Learmouth, where it has been formed by a depoſit of various kinds of ſhells, both univalve and bivalve, many of which are ſtill perfect, and form a ſtratum, ſeveral feet in depth, of fine calcareous earth. In the centre of this bed of marle is a horizontal ſtratum of ſand, about twelve inches thick, certainly a matter of curious ſpeculation to the natural hiſtorian. Some years ago, a red ſtag, in the attitude of running, and entire, was dug up here; as well as the ſcalp and horns of ſome animal of the bos taurus ſpecies, being more than twice the dimenſions of the horns of any ox or cow of the preſent day, an inhabitant of this iſland.

Roads and Canals.—The turnpike roads in this county are moſtly in good order, but have one material defect, which is, that they are frequently diſgraced with ſteep banks, when a trivial alteration of the line would have thrown them on a level. This remark is peculiarly applicable to both the roads paſſing over Rimſide-Moor, and to the great poſt-road, which aſcends and deſcends a great number of hills, without even the plea of being nearer, as the leveller track would have been ſhorter, travelled in leſs time, and with far leſs fatigue. Of the townſhip roads, ſome are good, but by much the larger proportion are extremely bad. As to canals, it is to be remarked, that though frequently planned, and even the neceſſary fund raiſed for their execution, not one has hitherto been put in actual progreſs.

Manufactures and Commerce.—Northumberland cannot be ſaid to poſſeſs any decided ſtaple manufacture. Many arts, notwithſtanding, are practiſed here upon a large ſcale; the principal of them, as may be ſuppoſed from what has been ſtated, being derived from, or connected with, the coal trade and mines, as ſhip-building, roperies, forges, founderies, copperas, coal-tar, ſoda or marine alkali, white lead, potteries, glaſs works, and a variety of others which it ſeems unneceſſary to mention. Hexham has been long noted for its manufacture of gloves, which employs about 300 perſons. Small manufactures of woollens are likewiſe eſtabliſhed at Alnwick, Mitford, and Acklington, and cotton-mills have been lately erected at Nether-Witton. The commerce of the county conſiſts in the exportation of all the articles it produces in any conſiderable quantity, and particularly in the exportation of coal, of which 12,490,707 tons were exported from the Tyne only, in eight years, from January 1ſt, 1802, to December 30th, 1809. The imports embrace almoſt every article of neceſſity, convenience, or luxury, not ſupplied within its own boundaries. Newcaſtle, Berwick, and Alnemouth are the chief ſea-ports; but numerous ſmaller harbours are diſperſed along the coaſt, and alſo on the banks of the navigable rivers.

Political and Eccleſiaſtical Diviſions and Government.—Northumberland is politically divided into ſix wards, and ſix hundred and thirty-five conſtableries. The names of the wards are Tindale, Morpeth, Caſtle, Glendale, Balmborough, and Cocquetdale; which contain the following borough and market-towns: Newcaſtle-upon-Tyne, Berwick-upon-Tweed, Alnwick, Bamburgh, Corbridge, Belford, Hallwhiſtle, Haydon-bridge, Bellingham, Hexham, Morpeth, North Shields, Ovengham, Rothbury, Stamfordham, Warkworth, and Wooley. It ſends eight members to the national council, *viz.* two knights of the ſhire for the county, and two repreſentatives for each of the three boroughs of Newcaſtle, Morpeth, and Berwick. The balance between the ariſtocracy and the popular party in the county is nearly equal, the intereſt of the duke of Northumberland returning one member, and the independent gentlemen and yeomen another. The church diviſions are into five deaneries, Newcaſtle, Corbridge, Bamburgh, Alnwick, and Morpeth, and ſeventy-three pariſhes, including thoſe of Bedlington, Berwick, Holy Iſland, and Norham, which, though within the confines of Northumberland, are under the civil juriſdiction of the courts of Durham. All the deaneries are within the archdeaconry of Northumberland, dioceſe of Durham, and province of York. The churches of Hexham, Allondale, and Johnlee, with their reſpective chapels, are peculiars of the metropolitan ſee; and Throckington is a peculiar in the advowſon of the dean and chapter of York cathedral.

Population.—According to the parliamentary returns of 1801, this county, with Berwick-upon-Tweed, compriſed 28,052 houſes, 35,503 families, and 157,101 perſons, of whom 73,357 were males, and 83,744 females. By the ſame eſtimate, 25,738 perſons were reported as employed in trade and manufactures, and 23,190 in agriculture. From the late returns (1811), a conſiderable increaſe appears to have taken place. Theſe ſtate the houſes at 29,552, the families at 37,743, and the individuals at 172,161 in number, *viz.* 80,385 males, and 91,776 females. The families engaged in trade are computed to amount to 16,547, and thoſe employed in agriculture to 10,945.

Antiquities form the only remaining ſubject which it ſeems requiſite to notice in this article; and it may be juſtly ſaid that few diſtricts of the ſame extent offer a more fertile, or a more intereſting field for the gratification of antiquarian curioſity.

Having been ſituated on the confines firſt of Roman Britain, and afterwards of the Engliſh monarchy, Northumberland, probably, exhibits more veſtiges of military art than any other portion of our iſland. The wall of Severus, and Hadrian's vallum, paſs through the ſouthern part of this county, and are laſting monuments of Roman induſtry and of Caledonian valour. Hadrian's rampart conſiſts of a principal agger or mound of earth, thirty feet broad at the baſe and ten feet high, and a ditch, ten feet deep and fifteen feet wide; a ſecond mound, three feet high, and ſix feet in breadth at the baſe; another ditch, twelve feet deep and twenty-four over, beſides a third agger, ſituated about ſeventy feet from the reſt of the work, meaſuring thirty feet broad at the baſe, and ten feet high. All theſe valla are of ſemicircular form,

and, as well as the ditches, conſtantly run parallel to each other. They are compoſed of turf, ſtones, and earth thrown up looſely together, and the whole work extends from near the mouth of the Tyne, entirely acroſs the iſland to the Solway Frith. The wall of Severus is ſituated only at a ſhort diſtance from this rampart, and appears to have been built of ſtone, ſometimes formed on oak piles, and was in its original ſtate from ſeven feet, to ſeven feet four inches, broad at the foundation. This wall reached beyond the vallum of Hadrian, keeping a conſtant paralleliſm with that work, and was defended at ſhort intervals by ſtrong towers, all of which, except one near Harlow-hill, are mentioned by Gough as being ſixty-ſix feet ſquare, the wall itſelf conſtituting the northern ſide of each. Beſides theſe poſts on the wall, the Romans had various ſtations diſperſed through the county, of which Bremenium, Habitancum, and Corſtopium were the principal. Bremenium, indeed, was a Roman ſtipendary city of primary importance, having been, as already mentioned, the chief town of the Ottadini before the arrival of theſe mighty conquerors. This place is ſituated on the Watling-ſtreet, as well as Habitancum and Corſtopium, and ſtill retains ſtrong marks of its ancient conſequence. It is defended by three ramparts of earth, and a wall ſeven feet thick, fancifully chequered with aſhlar work of different colours. Here was formerly a hypocauſt, which has been deſcribed by Hutchinſon; and many veſtiges of antiquity, ſuch as urns, inſcribed ſtones, &c. have been frequently dug from the ruins. But ſuch relics, it may be remarked, abound in almoſt every part of the county; and are by far too numerous to admit of even a general notice, much leſs a particular deſcription, in an article like the preſent. The ſame thing may be ſaid with reſpect to the caſtellated manſions and religious ſtructures of later erection, the bare enumeration of which would occupy a volume of conſiderable magnitude. Several of theſe, however, will be found mentioned under the names of the borough or market-towns at or near which they may happen to have been placed. Some Druidical circles are likewiſe ſeen in this county, alſo croſſes, cairns, and other minor monuments of the conteſts and illuſtrious deeds of our brave though ferocious anceſtors.

The encampments here are of every form and ſize in which they are diſcovered in Great Britain; ſome of them, doubtleſs, Britiſh and Roman, and others of the Saxons, Danes, Normans, and Engliſh, and not unlikely ſucceſſively altered and occupied, after their original conſtruction, by the armies of one or more of the ſucceeding nations, who ſpread their dominion over England. The Roman roads in Northumberland are numerous. One road accompanies the Roman barriers throughout their whole extent from eaſt to weſt. The Maiden-way, called by the country people the Made-way, interſects the weſtern diviſion of the county, reaching from Caervorran to Whitley-caſtle, and thence to Whillop-caſtle in Weſtmoreland. Watling-ſtreet enters Northumberland at Ebcheſter, and croſſing the Tyne at Corbridge, divides into two branches at Bewcley, a ſhort diſtance north from the great wall. One branch paſſes through Reedſdale into Scotland, by Riſingham and Rocheſter, and the fine encampment at Mackendon: the other branch is uſually called the Devil's Cauſeway. It has at firſt an eaſterly direction paſt Ryal, towards Bolain, whence ſweeping northwards over Rimſide Moor, it enters Scotland weſt from Berwick-upon-Tweed. Connected with this road is a paved way from the eaſtern gate at Rocheſter, over Boleyard Lees by Hallyſtone to Sharperſton. Near Hallyſtone it is ten feet wide, and is ſtill very perfect. General View of the Agriculture of Northumberland, by J. Bailey and G. Culley, 8vo. 3d edit. 1805. The Natural Hiſtory and Antiquities of Northumberland, &c. 2 vols. 4to. 1767, by John Wallis, A. M. A View of Northumberland, by William Hutchinſon, 2 vols. 4to. A Hiſtorical and Deſcriptive View of the County of Northumberland, &c." 2 vols. 8vo. Newcaſtle edit. 1811. Beauties of England, Northumberland, vol. xii., by the Rev. Mr. Hodgſon, 1812.

NORTHUMBERLAND, a town of America, in Grafton county, New Hampſhire, ſituated on the E. ſide of Connecticut river, at the mouth of the Upper Amonooſuck; incorporated in 1779, and containing 205 inhabitants.—Alſo, a county of Pennſylvania, bounded N. by Lycoming; S. and W. by Dauphin and Mifflin counties; divided into 24 townſhips, and containing 27,797 inhabitants. The chief town is Sunbury.—Alſo, a flouriſhing poſt-town in the fore-mentioned county, ſituated on the point of land formed by the junction of the N. and W. branches of the Suſquehannah; regularly laid out, and containing about 120 houſes, a Preſbyterian church, and an academy; two miles N. by W. of Sunbury.—Alſo, a county of Virginia, bounded E. by Cheſapeak bay, and W. by Richmond, containing 3900 free inhabitants, and 3903 ſlaves; 12 miles from Kinſale.—Alſo, a county in Upper Canada, bounded E. by the county of Haſtings, and the portage of the Preſq' Iſle de Quinte, S. by lake Ontario, until it meets the weſternmoſt point of Little Bay; thence by a line running N. 16° W., until it meets the ſouthern boundary of a tract of land belonging to the Miſſaſſaga Indians, and thence along the tract parallel to lake Ontario, until it meets the northweſternmoſt boundary of the county of Haſtings. This county comprehends all the iſlands near to it in lake Ontario, and the bay of Quinte; and the greater part of it fronts lake Ontario.

* NORTHUMBERLAND *Iſlands*, a chain of iſlands in the South Pacific ocean, near the N.E. coaſt of New Holland, running parallel to the main land, at the diſtance of five to eight miles; differing in height and ſize, ſcarcely one of them being more than 15 miles in circumference, and many not four. S. lat. 21° 28′ to 22° 26′. W. long. 209° 50′ to 210 54′

NORTHUMBERLAND *Straits*, a narrow channel of the Eaſt Indian ſea, between the iſlands of Calamianes and the ſhoals of Apo.

NORTHWICH, a large and ancient market town, partly in the hundred of Eddiſbury, and partly in that of Northwich, in the county of Cheſter, England, is ſituated near the conflux of the rivers Dane and Weaver, at the diſtance of 18 miles from the city of Cheſter, and 174 miles from London. The ſtreets are irregular and badly paved, and many of the houſes are of conſiderable antiquity. The townſhip of Witton adjoins to Northwich, and is conſidered as forming part of the town. In the town is a parochial chapel, a ſpacious edifice, which is remarkable for the peculiarity of its choir, being ſemicircular; the roof of the nave is adorned with numerous figures of wicker baſkets, ſimilar to thoſe uſed in the manufacture of ſalt. A grammar ſchool was founded and endowed here in the year 1558, by the Rev. ſir John Deane, rector of St. Bartholomew the Great in London. The government of the ſchool is veſted in twelve truſtees, by whom the maſter and ſcholars are appointed. From the central ſituation of Northwich, the increaſe of its population, and the extenſion of the ſalt trade, this town is become a place of great reſort. A very conſiderable market is held on Fridays; and two fairs annually, which continue nearly a fortnight each, for the ſale of Yorkſhire and Manchеſter goods, and for various other commodities. In the return made to parliament in the year 1811, Northwich was ſtated to contain 324 houſes, and 1382 inhabitants.

bitants. The lower claſſes of the people derive employment from a cotton factory recently eſtabliſhed, and from the *ſalt* trade, which, though carried on to great extent in ſeveral parts of this county, is chiefly concentrated in the neighbourhood of Northwich. Here the ſalt is manufactured not only from the brine ſprings, but alſo from the natural rock, a circumſtance peculiar to this town and its vicinity: the annual quantity of rock ſalt delivered from the pits is from 50,000 to 60,000 tons; in addition to which, the brine pits yield a yearly ſupply of not leſs than 45,000 tons. See SALT.

About four miles from Northwich is Vale Royal abbey, the ſeat of Thomas Cholmondeley, eſq. A monaſtery of this name was founded here, for Ciſtercian monks, by prince Edward, afterwards king Edward I. No part of the ancient abbey is now remaining, though ſome places retain appellations connected with monaſtic diſcipline. The hall of the preſent manſion was erected in the beginning of the ſeventeenth century; it is nearly ſeventy feet in length. The wings have been recently rebuilt. The apartments are embelliſhed with numerous portraits, ſome of which are of diſtinguiſhed eminence. The library is large and valuable. Lyſons' Magna Britannia, vol. ii. Beauties of England, vol. ii. by J. Britton, and E. W. Brayley.

NORTHWOOD, an interior and elevated townſhip of America, in Rockingham county, New Hampſhire, in which, and on its borders, is a number of ſmall ponds, whoſe waters ſupply Piſcataqua and Suncook rivers; incorporated in 1773, and containing 950 inhabitants; about 39 miles N.W. of Portſmouth. Cryſtals and cryſtalline ſpars are found here.

NORTH YARMOUTH, a poſt-town of Cumberland county, in the ſtate of Maine, on a ſmall river which falls into Caſco bay; 17 miles W. by S. of Brunſwick. The townſhip, which is extenſive, was incorporated in 1713, and contains 2600 inhabitants. It is divided from Freeport on the N E. by Cuſſens river.

NORTON, CHIPPING, a borough and market town in the hundred of Chadlington, and county of Oxford, England, is ſituated 20 miles diſtant from the city of Oxford, and 74 miles from London. Its appellation, Chipping, ſhews it to have been a town of note in the Saxon times, as Ceapan, whence it is derived, ſignifies a market or place of trade, as all the places appear to have been which have the name of Chipping prefixed. The town is incorporated, and the government is veſted in two bailiffs and twelve burgeſſes, who are empowered by charter from James I. to hold a court and determine all actions under 4*l*. The church is a ſpacious edifice, being 98 feet long and 87 broad, and the middle aiſle 46 feet in height. Here is a free grammar ſchool, which was founded by king Edward VI. In the enumeration made purſuant to act of parliament in 1811, Chipping-Norton is ſtated to contain 383 houſes, occupied by 1975 perſons. Six annual fairs are held, and a weekly market on Wedneſday. Two burgeſſes were ſent to parliament in the 30th year of Edward I., and alſo in the 32d and 33d years of Edward III., ſince which period no return has been made.

About three miles from Chipping-Norton is an ancient monument, called the Rowldrich, or the Roll-rich-ſtones, ſtanding in nearly a circular form, the diameter from north to ſouth being 35 yards, and from eaſt to weſt 33 yards. The ſtones appear to have been originally ſixty in number; at preſent twenty-two are ſtanding, few exceeding four feet in height, and ſixteen inches thick, except one in the very north point, which is ſeven feet high, and five feet and a half broad; eighty-four yards north-eaſt from the circle, is a large ſtone called the King-ſtone, eight feet in height, ſeven feet in breadth, and about twelve inches in thickneſs. Camden thinks this monument to be a memorial of ſome victory, perhaps erected by Rollo the Dane, who invaded England in 816. But Dr. Stukeley aſcribes it to the Druids; as Rholdrwg, he ſays, ſignifies the *circle* or *church* of the Druids. To the ſame origin he attributes the ſeveral barrows contiguous to this ſpot, one of which is ſixty feet long, and twenty broad. Mr. Gough conſidered the doctor's opinion as carrying more probability with it than the crude conjectures of earlier writers. Gough's Camden, vol. i.

NORTON, a townſhip of America, in Briſtol county, Maſſachuſetts; 33 miles S. of Boſton; incorporated in 1711, and containing 1481 inhabitants. Here are manufactures of nails and of ochre.—Alſo, a ſettlement on the N.E. coaſt of Cape Breton iſland.—Alſo, a town of South Carolina; 22 miles S.S.E. of Columbia.

NORTON *Sound*, a large bay on the N.W. coaſt of North America, diſcovered by Capt. Cook in 1778, and ſo called in honour of ſir Fletcher Norton, afterwards baron Grantley. This bay extends to the northward as far as N. lat. 64 55′. The people adjoining to this bay did not appear to our navigators to differ, either as to their ſize or features, from thoſe whom they had found on every other part of the coaſt, King George's ſound (Nootka) excepted. Their clothing, which conſiſted principally of deer ſkins, was made after the ſame faſhion; and they obſerved the cuſtom of boring their under lips, and fixing ornaments to them. Their dwellings conſiſted of a ſloping roof, without any ſide walls, compoſed of logs, and covered with graſs and earth; the floor was laid with logs, the entrance being at one end; the fire-place juſt within it; and a ſmall hole was made near the door to let out the ſmoke. Brooms and ſpruce, and alſo fiſh, were obtained in exchange for knives, beads, and other trifles; but the article chiefly valued was iron. The berries which were procured here were wild currant berries, hurtle berries, partridge berries, and heath berries. From the elevated ſpot on which Mr. King ſurveyed the ſound, he could diſtinguiſh many extenſive vallies, with rivers running through them, well wooded, and bounded by hills of a gentle aſcent and moderate height. One of theſe rivers, which runs to the N.W., appeared to be conſiderable, and to empty itſelf into the ſea at the head of the bay. The trees were found to be larger by thoſe who advanced from the bay farther into the country. The bay in which our navigators anchored, lay on the S.E. ſide of it, and was called by the natives "Chacktoole." The ſtation was indifferent, being expoſed to the S. and S.W. winds; nor is there a harbour in all the ſound. From 77 ſets of lunar obſervations, the longitude of the anchoring place, on the W. ſide of the ſound, was found to be 197° 13′. Lat. 64° 31′. Variation of the compaſs 25° 45′ E. Dip of the needle 76° 25′. The night-flood roſe almoſt two or three feet; and the day-flood was hardly perceivable. Cooke's Third Voyage, vol. ii.

NOI.VI, a town of the iſland of Sardinia; 16 miles N.E. of Saſſari.

NORUM, a town of Sweden, in Weſt Gothland; 20 miles S. of Uddevalla.

NORUNGAH, a town of Hindooſtan, in Bahar; 33 miles W. of Gayah.

NORWALK, a pleaſant poſt-town of America, in Fairfield county, Connecticut, on the N. ſide of Long Iſland ſound, containing a Congregational and Epiſcopal church, and between 40 and 50 compact houſes; 13 miles W. by S. from Fairfield. The townſhip, which was ſettled in 1651, is ſituated in a fertile wheat country. It has iron works, and a number of mills; it carries on a ſmall trade to

New

New York and the Weſt Indies, and contains 5146 inhabitants.

NORWALK *Iſlands*, a cluſter of ſmall iſlands in Long Iſland ſound, near the coaſt of Connecticut. N. lat. 41° 4'. W. long. 72° 22'.

NORWAY, anciently *Norrik*, or the *Northern kingdom*, a country of Europe, anciently an independent kingdom, but for many years ſubject to Denmark; bounded on the S. by the entrance from the Baltic, called the Scaggerac, or Categate, on the W. and N. by the northern ſea, and on the E. by a long chain of mountains under different names, which ſeparates it from Sweden. Its extent and dimenſions have not been preciſely aſcertained. Geographers have differed about its limits northward, and, therefore, ſome have made its length 1100 miles, and others have ſtated it at 750 miles, its breadth at 170, and its area in ſquare miles 71,400. Its capital has been either *Bergen* or *Chriſtiana*, which ſee. Norway is formed by nature into two great diviſions, *viz.* Northern, and Southern or Proper Norway, ſeparated from each other by the ſmall Swediſh province of Herndahl. *Northern* Norway is a long and narrow ſlip of land, extending as far as North Cape, beyond the 71ſt degree of latitude, the moſt northern point of Europe; it is divided into Nordland and Finmark, and comprehended in the government of Drontheim. *Southern* or *Proper* Norway is bounded as we have already ſtated, and is divided into four dioceſes or governments, *viz.* Aggerhuus or Chriſtiania, Chriſtianſand, Bergen, and Drontheim, which ſee reſpectively. Although Norway comprehends a large tract of territory; yet, on account of its rocky ſoil and unfavourable climate, the number of inhabitants does not correſpond to the extent of the country. The amount of its population is eſtimated at 700,000, or 750,000 ſouls. The Norwegians being the ſame race with the Danes, and long connected with them in religion and government, ſpeak the ſame language, which is a dialect of the Gothic, intermixed with ſome provincial expreſſions. In their diſpoſition and manners, they occupy a kind of middle place between the ſimplicity of the Greenlanders and Icelanders, and the more poliſhed ſtate of the Danes. They are in general robuſt and brave, but irritable and reſentful; the women are handſome and courteous; and the Norwegian forms, both of living and of enjoying property, are mild, and much reſemble that of the Saxon anceſtors of the preſent Engliſh. Every inhabitant is an artiſan, and ſupplies his family with all neceſſaries from his own manufactures; ſo that in Norway there are few, who by profeſſion are hatters, ſhoemakers, taylors, tanners, weavers, carpenters, ſmiths, and joiners.

Every peaſant, few excepted, in Norway breathes the air of freedom. This freedom they derive from a particular code, called the "Norway law," compiled by Grieffelfeld, at the command of Chriſtian V., the great legiſlator of his country. By this law, the palladium of Norway, liberty is extended to all peaſants, except a few who belong to certain noble eſtates near Frederickſtadt. And even to theſe ſerfs the ſpirit of the ſame law communicates its influence; for no proprietor can have more than one of theſe privileged eſtates, and unleſs he poſſeſſes a title or certain rank, and reſides on his eſtate, he loſes his privilege, and the peaſants become free. The benefits of this code, ſays Mr. Coxe, are ſo viſible in its general effects on the happineſs and in the appearance of the peaſants, that a traveller muſt be blind, who does not perceive the difference between the free peaſants of Norway, and the enſlaved vaſſals of Denmark, previouſly to their emancipation, though both living under the ſame government. Many of the peaſants derive their lineage from the ancient nobles, and ſome even from the royal line; on this ſuppoſed deſcent they much pride themſelves, and are careful not to give their children in marriage but to their equals in birth and blood. For the cuſtom prevalent in Norway, favourable to the peaſants, called "Odel's" or "Odhel" *right*, ſee that article. The Norwegian peaſants, ſays the author now cited, poſſeſs much ſpirit and fire in their manner; they are frank and undaunted, but not inſolent; never fawning on their ſuperiors, and yet paying proper reſpect to thoſe above them. Their principal mode of ſalute is by offering their hand, and they return thanks for a favour, not by words or a bow, but by ſhaking hands with great frankneſs and cordiality. The peaſants are well clothed and well lodged, and apparently poſſeſs more comforts than any except the Swiſs. They weave their ordinary cloth and linen, and manufacture a kind of ſtuff like Scotch plaid. The coats of the men are principally made of a ſtone-coloured cloth, ornamented with rich button-holes and metal buttons. The women, when employed in their houſhold affairs, frequently appear only in a petticoat and ſhift, with a collar reaching to the throat and a ſaſh tied round the waiſt. Their linen is very fine, and diſplays the figure to the higheſt advantage. Although their dreſs is in many reſpects accommodated to their climate, yet cuſtom enables them to outbrave the inclemency of the weather; for they expoſe themſelves to cold without any covering on their breaſts or necks. The Norwegians maintain their ſtrength and ability for labour, in many inſtances, to an advanced age. The common food of the peaſant is milk, cheeſe, dried and ſalted fiſh, and ſometimes, but rarely, fleſh or dried meat, oatmeal called "flad brod," baked in ſmall cakes like pancakes, uſually made twice a-year. In times of ſcarcity they alſo uſe the bark of trees, generally of the fir, which is dried and pulveriſed, mixed with oatmeal, baked and eaten like bread. As a luxury, the peaſants eat "ſharke," or thin ſlices of meat ſprinkled with ſalt, and dried in the wind, like hung beef; alſo a ſoup made like haſty-pudding of oat-meal, or barley-meal, which is renderend palatable, by adding a pickled herring or ſalted mackerel. The uſe of potatoes has been lately introduced, though they do not grow to any ſize in a country where the ſummer is ſo ſhort: Fabricius ſtrongly recommends, in times of ſcarcity, the moſſes and lichens, and particularly the "lichen iſlandicus," which yields a nouriſhing ſuſtenance, and is commonly uſed for food in Iceland.

The Norwegians maintain their own army, which conſiſts of 24,000 infantry and 6000 cavalry. The troops are much eſteemed for their bravery, and like the Swiſs mountaineers, exceedingly attached to their country. The horſes, which ſupply the cavalry, are ſmall, but ſtrong, active, and hardy. Every peaſant, not born in a town, or on ſome noble eſtate, and thoſe on the coaſt, who are claſſed as ſailors, excepted, is by birth a ſoldier, and enrolled at the age of ſixteen. From that year he continues to ſerve until he arrives at thirty-ſix, when he receives his diſcharge. The militia take the field every year in June, and remain encamped about a month. Norway can furniſh about 14,000 excellent ſeamen. This country contributes to the annual revenue about 290,000*l*.

As to the climate of Norway, it varies according to its extent, and its poſition towards the ſea. Extending along the weſt ſide of the Scandinavian Alps, and expoſed to the vapours from the Atlantic, it is not ſo cold as we might be naturally led to imagine. If we compare the climate of Norway, with that of London, March in London is like April and the beginning of May in Norway, and the March of Norway is our January. On account of the frequent

ſpring

ſpring froſts, ſeeds ought not to be ſown in gardens before the 20th of May, and the froſts of the latter end of Auguſt are no leſs detrimental. The heat and cold vary ſo much in Norway, that in June or July the mercury in Fahrenheit's thermometer not unuſually riſes at Sydeborg to 88, and on the 1ſt of January 1782 fell to — 22, or 54° below the freezing point. At Eger it fell on the ſame day to — 36½, and at Kongſberg to — 40, or 72 below the freezing point, a degree of cold by which quickſilver is congealed. This extreme riſe and fall of the mercury makes a difference of 110° between the greateſt heat and greateſt cold at the ſame place; and this difference is much more conſiderable than that at Upſal or Stockholm, which lie nearly in the ſame latitude as Sydeborg. In ſome places vegetation is ſo quick, that corn is ſown and cut in ſix or ſeven weeks. Tillage cannot be ſuppoſ d to flouriſh in a country ſo rocky as in many parts to defy the plough, and where the climate is ſo ſevere that the hoar-froſts begin in September, and the cold in the highlands prevents the maturity of the corn. The ſmall vallies and the intervals between the rocks are uſually provided with a fruitful ſoil, and the induſtry of the peaſants covers the naked rocks and ſandy grounds with a new earth; yet the arable grounds are few, and no parts of Norway yield ſufficient corn for interior conſumption, except the diſtricts of Hademark, Foten, and Ringerike. Many other circumſtances counteract the induſtry of the farmer; ſo that in the moſt favourable ſeaſons, a conſiderable importation of corn is annually neceſſary; but in unfavourable harveſts the utmoſt dearth is experienced in the inland parts, as the tranſport of the corn from the ſea-coaſt is very expenſive. In order to dry the corn expoſed to heavy rains, the peaſants fix in the ground forked poles ten feet high, on which they pile the ſheaves, the lowermoſt row hanging about two feet from the ground. They are alſo frequently obliged to bake the corn in wooden ſheds, heated by means of ſtoves.

Norway, however deficient in arable land, is very rich in paſture, and abounds in cattle. The mode of keeping cows reſembles that of Switzerland. About the middle of May they are turned into meadows; towards the middle of June driven to the heights, or to the foreſts, where they continue till autumn. The cows are uſually tended by a woman, who inhabits a ſmall hut, milks them twice a day, and makes butter and cheeſe on the ſpot. On their return the cattle are again paſtured in the meadows, until the ſnow ſets in about the middle of October, when they are removed to the ſtables, and fed during winter with four-fifths of ſtraw and one-fifth of hay. The horſes are uſually foddered with hay during the winter, and are ſeldom ſent to graſs before the beginning of June. In ſome places the cattle are fed with ſalted fiſh.

Of late years agriculture has been improved in Norway, and of courſe the value of eſtates has riſen nearly one-third. This melioration is principally owing to the exertions and encouragement of the Patriotic Society, which gives premiums for the beſt improvements and inſtructions in every part of farming.

The fiſheries, particularly on the weſtern coaſt, furniſh to the natives employment and wealth, and are the means of ſupplying the beſt ſeamen for manning the Daniſh fleet in times of war. The principal fiſh, which, when dried and ſalted, ſupply a very conſiderable article of exportation, are the cod, the ling, and the whiting: and beſides, the livers yield train oil, and the ſmalleſt fiſh ſerve as fodder for the cattle. The herring fiſhery has lately been depretiated in value, as the ſhoals, which uſed to frequent the coaſt of Norway, in their progreſs from the North pole, keep at a greater diſtance from the ſhore, and thus by firſt approaching the rocks of Maeſtrund and Stroemſtrand, the chief herring fiſhery has been transferred to the Swedes. Salmon is taken partly in the bays, and partly in the rivers, as they aſcend the ſtream in ſpring for the purpoſe of ſpawning, and is cured by ſalting and ſmoking. Againſt mackerel the Norwegians have conceived a prejudice from a ſtrange notion, that ſhoals of this fiſh often attack and devour the human ſpecies when bathing in the ſea.

Norway is almoſt wholly an alpine country. The mountains of Joglefeld conſtitute the ſouthern extremity of the grand chain that ſeparates it from Sweden. In proceeding northwards Joglefeld is ſucceeded by Buglefeld, and Hakleſeld. Hardangerfeld forms a more extenſive denomination, and detaches a branch towards the S.W. Under the parallel of 61° the chain aſſumes the name of Filifeld, followed by Sognefeld and Langfeld, which terminates a little beyond the 62d degree of N. lat. The chain now aſſumes a winding direction from N. to E., and this part, which is eſteemed one of the higheſt, is ſtyled Dofrafeld. After turning to the N.E. we arrive at the parts towards the parallel of Drontheim, which are generally reckoned the moſt elevated, for towards Lapland the mountains decline in height. The ſucceſſive names of this central portion are Rudfeld, Shersfeld, and Salafeld. Jornafeld and Berrafeld, and ſome other local appellations, are mentioned by the general name of the mountains of Kolen, which paſs along the E. and S. of Daniſh Lapland.

In a more general point of view, the ſouthern part of the Scandinavian chain, running nearly N. and S. and terminating at the province of Kamſdal, is called "Langfiall," or the long mountains. Hence the part called "Dofrafiall" extends towards the E., ending above the lake of Aurſund or Oreſund, where it again proceeds almoſt due N. Hence alſo a conſiderable branch proceeds by Swakku, &c. towards Sweden. Swakku, according to Catteau, is 2262 Daniſh ells (each two feet) above lake Fæmund. Bergman computes its height above the ſea to be 9000 feet. The third part of the range from the N. of Oreſund and the vicinity of the copper-mines of Roras, is called the chain of "Kolen," extending between Norway and Swediſh Lapland, and afterwards bending, in the form of a horſe-ſhoe, on the S. of Finmark. The height of theſe mountains has been variouſly eſtimated. From ſome late ſurveys we learn that the higheſt in the dioceſe of Drontheim are not more than 600 fathoms above the ſurface of the ſea; that the mountains fall to the weſtern ſide from the diſtance of eight or ten Norwegian miles; but to the eaſtern from that of 40. The higheſt is Dovre-fial in Drontheim, and Tille in Bergen. Kinnakalle, in Weſtrogothia, is only 815 Engliſh feet above the lake Wepern, or 931 above the ſea. Areſkutan, a ſolitary mountain of Jemptland, about four or five Swediſh miles from the higheſt Alps, which ſeparate Norway and Sweden, is ſaid to be 6162 Engliſh feet above the neareſt river; Swackuſto, within the borders of Norway, 4658 above lake Fæmund, and that lake is thought to be 2 or 3000 above the ſea; and Sylfiællen, on the borders of Jemptland, is 3132 feet perpendicular from the height to the baſe. As to the conſtruction of the Norwegian mountains, nothing abſolutely certain is known, as they have not been much explored. Some of them conſiſt of ſandſtone, of the ſiliceous, argillaceous, or calcareous kind. According to Bergman, many of the mountains of Norway are of pudding-ſtone, ſometimes of quartz pebbles, cruſted by a grey micaceous cement. Some are of hornblende ſlate in which garnets appear. This country abounds with marble, and the lapis ollaris is found in great quantities, ſo that the cathedral of Drontheim and other

other edifices were built with it. This is uſually found in the vicinity of granite; aſbeſtos and amianthus alſo indicate granite; and rock-cryſtals are found of large ſize and beauty, with talc, garnets, and amethyſts. Chalk and flints are unknown. Norway abounds in various metals. Some gold ore was found in 1645 near Arindal; the gold mine of Edſwold, about 30 miles N. of Chriſtiania, was diſcovered in 1758, but its produce was inconſiderable: it is on a vein of quartz and pyrites. The ſilver mines of Kongſberg, about 40 miles S.W. of Chriſtiania, have been long reputed the richeſt in Europe. According to Bergman's account of them, the rock conſiſts of vertical banks of micaceous ſchiſtus, with garnets, lime-ſtone, and quartz. The richeſt veins are in thoſe of a greyiſh quartz mingled with ſmall black mica, and reddiſh petroſilex; but eſpecially on a fine-grained white quartz, and a little calcareous earth, or where the quartz and mica are in alternate ſtrata. The ferruginous layers are moſt productive. Theſe mines of Kongſberg were diſcovered by the threads of native ſilver on the rock; and Jars ſays, that moſt of the mines now worked were diſcloſed by the ſame means. The gangarts are calcareous ſpar, fluor, and mountain rock; and the native ſilver is alſo found in a grey rock (hornblend), which may be regarded as the top and bottom of the mine. The diſcovery of the mines of Kongſberg was made in 1623 by two peaſants, who were diverting themſelves with throwing ſtones; and in conſequence of this diſcovery the town of Kongſberg was founded; which became a flouriſhing town of 6000 inhabitants. They are wrought by 36 ſhafts, and uſed to yield about 70,000*l.* annually, when 4000 men were employed. Norway alſo poſſeſſes other ſilver mines at Iarlſberg, about 30 miles N.E. of Kongſberg, diſcovered in 1726, but of ſmall account. The important copper mines of Roras, about 46 miles S.E. of Drontheim, were diſcovered in 1644. They are in the ſouthern ſlope, the chain of Dofra. Theſe mines are very productive, and a ſource of conſiderable revenue. The copper mines are at Quickne and Selboe, about 50 miles E. of Drontheim, and at other places, as Meldal and Foledal. There are alſo mines of cobalt at Foſſan, which are ſaid to produce a clear annual revenue to the crown of about 35,000*l.* But the iron mines of Norway are the moſt profitable; they are chiefly ſituated not far from Arindal, in the province of Chriſtianſand, and near Skeen, between Arindal and Kongſberg. Lead appears in the vicinity of Kongſberg; and there are alum works near Chriſtiania. Jade and magnets, and rock-cryſtals, are alſo found in Norway, with curious garnets, eſpecially the green.

The Norwegian mountains are generally clothed with pines and firs; and almoſt the whole country may be regarded as a foreſt, which ſupplies Europe with maſts and other timber. The timber is applied to ſeveral purpoſes, being exported in large quantities, and uſed for ſpars, beams, and planks, for building, as moſt of the houſes in Norway are conſtructed of wood, for the roads, which, eſpecially in the northern parts, are almoſt entirely formed of wood, for turpentine, for fencing and incloſing the fields, for fuel, and for manure. The pine or fir, and alſo the elm, are dried and powdered, and mixed with meal for feeding ſwine. The birch is uſed for various purpoſes; the outer bark is employed for covering the roofs of houſes, and the inner is applied like the bark of oak for tanning hides, fiſhing nets, and ſails. It ſupplies alſo, by tapping, a kind of wine. The twigs of the birch, as well as the alder and aſpen, are given to horſes in ſcarcity of fodder. A decoction of oak-leaves is uſed by the peaſants as a fomentation for the rheumatiſm.

Norway abounds with lakes and rivers. Many of the former are ſo large that they appear like inlets of the ſea. The moſt extenſive are in the ſouth of Norway. The chief of theſe are the lakes of Mioſs, Rands, Tyri, Ojeren, Or, Kowen, Tonhof, Tind, Huide, Niſſer, Kiel, and Syredal. Farther to the N. is the lake of Fæmund, that of Sælbo, and thoſe of Beitſtadt and Snaaſen. The largeſt rivers are called Elven or Elben. The chief river of Norway is the Glom or Glomen, full of cataracts and ſhoals; it ſprings from the lake of Oreſund, and runs nearly S. about 300 miles. Next to this is the Dramme, which flows into the bay of Chriſtiania, not to mention the Louwen, the Torriſals which runs by Chriſtianſand, and others flowing from numerous lakes. Among the quadrupeds of Norway we may reckon its horſes, which are ſmall, cows, ſheep, goats, ſwine, dogs, cats, deer, roebucks, hares, rabbits, rein-deer, bears, elks, wolves, lynxes, foxes, gluttons, martins, ſquirrels, badgers, otters, ermines, beavers, porcupines, moles, rats, and mice. Of its birds we ſhall mention only the elk or razor-biil, peculiar to this country, and uſeful on account of its feathers, and the eider-duck, valued alſo for its feathers. It has great variety of fiſh. See KRAKEN.

The general exports of Norway are tallow, butter, ſalt, dried fiſh, timber and planks, horſes and horned cattle, ſilver, alum, Pruſſian blue, copper, and iron. The number of ſhips above 10 *laſts* belonging to Norway, in the year 1799, was 747. The religion of this country is the Lutheran, and its biſhoprics are four. (See DENMARK.) The Norwegian coaſt preſents one continued ſeries of ſmall and unimportant iſlands, moſt of which are uninhabited; among theſe we may name Karm, Bommel, Jartar, Hitteren, and others at the entrance of the gulf of Drontheim, the Vikten or Vikton iſlands; and thoſe of Loffodee, noted for the whirlpool of Malſtrom. For many years the Norwegians held the iſles of Orkney and Shetland.

Norway, as we have already ſaid, was formerly an independent kingdom, and governed by its own hereditary ſovereigns Its original population conſiſts of Fins and Laplanders; and its ſovereignty, originally founded in the S.E. part of Norway, around the modern city of Chriſtiania, was gradually extended, and Harold Harfagre, about A. D. 910, became maſter of all Norway. In the reign of Olaf I. Norway and Zealand were converted to Chriſtianity. On the demiſe of Hagen or Haken V. in 1319, without male iſſue, his grandſon in the female line, Magnus Smok, united the kingdoms of Sweden and Norway. Magnus was ſucceeded on the throne of Norway by his ſon Hagen or Haken VI., who married Margaret, daughter of Waldemar III., king of Denmark, A. D. 1363; and in conſequenee of this marriage the three crowns of the north were united. On the death of her ſon Olaf V. Margaret aſcended the throne of Denmark and Norway in 1387, and that of Sweden in 1389. On her death the crown deſcended to her huſband, as ſome ſay, or according to others, to her nephew, Eric of Pomerania. Sweden was afterwards ſeparated from Denmark by the valour and addreſs of Guſtavus Vaſa; but Norway has continued united to the crown of Denmark. Coxe. Pinkerton. See DENMARK and SWEDEN.

NORWAY, a townſhip of New York, in Herkemer county, incorporated in 1792, and containing 1911 inhabitants.—Alſo, a poſt-town in Cumberland county, Maine, incorporated in 1797, having 609 inhabitants.

NORWAY *Rat*, in *Zoology*. See MUS.

NORWICH, in *Geography*, a city of Norfolk, England, is diſtinguiſhed in the commercial annals of Great Britain for its manufactures, and in the topographical hiſ-

tory of the iſland for the memorable events that have occurred here, for its numerous antiquities, and for various other objects, which we are about to inveſtigate and explain. The city chiefly occupies the top and ſides of a gentle hill, which runs parallel with the river Wenſum on its weſtern ſide, and terminates at a ſudden bend of it. At this turn, and near that termination, a caſtle, or military ſtation, appears to have been eſtabliſhed at an early period, and as the people congregated round it for perſonal ſecurity, or private advantage, they gradually formed and augmented the town. Of Norwich, in its preſent ſtate, it has been ſaid that it ſtands upon more ground, comparatively with its population, than any city in the kingdom, the buildings being generally interſperſed with gardens, which latter circumſtance has given riſe to its appellation of a "city in an orchard." The ſhape, or plan, is irregular, approaching that of a cornucopia, or bent cone; and has not unaptly been compared to the figure of a ſhoulder of veniſon. It is rather more than one mile and a half in length, from Conisford gate, in King-ſtreet on the ſouth, to Magdalen gate on the north; and one mile and a quarter broad, from Biſhop's gate on the eaſt, to St. Benedict's gate in the weſt.

Beſides the cathedral, it contains thirty-ſix churches, and ſeveral chapels or meeting-houſes of various denominations: it has five bridges over the river, one of iron and four of ſtone. The whole city was formerly ſurrounded, except on the ſide towards the river, by an embattled wall, flanked with forty towers, and had twelve gates; the former is dilapidated, and the latter have been taken down.

Hiſtorical Events.—The original foundation of Norwich is eaſily to be aſcertained. Soon after the Romans eſtabliſhed themſelves in Britain, they either erected fortreſſes near the Britiſh towns, or invited the ſubdued natives to aſſemble round the Roman military ſtation. Hence it is that many of our chief cities and towns occupy the ſcites of ſuch fortified poſts, or are in the immediate vicinity of them. Thus it is probable that Norwich originated in the decay of Venta-Icenorum, as Saliſbury aroſe out of Sorbiodunum, or Old Sarum. An old diſtich commemorates the former event.

"Caſtor was a city, when Norwich was none;
And Norwich was built with Caſtor ſtone."

"I have nowhere met with the name of Norwich," ſays Camden, "before the Daniſh invaſion. So far from its being founded by Cæſar or Guiteline the Briton, as is pretended by thoſe who embrace every ſtory without weighing it." On the origin of the name, multifarious opinions have been formed; leaving the wild conjecture of Polydore Virgil, who thought he plainly diſcovered Norvicus in the word Ordo-vices, the name of a Britiſh tribe who inhabited the oppoſite part of the iſland, which opinion was afterwards adopted by Dr. Caius; there can be no room for doubt that this place received its appellation from the Saxons; the word Northwic, in their language, ſignifying a northern ſtation, caſtle, or town. And on the Saxon coins of various reigns, the word occurs in their exergue, with the mint-maſter's name. Blomefield, in his Hiſtory of Norwich, has enumerated ſeveral of theſe. Thus it appears from the moſt authentic documents, that Norwich was a place of note previous to the Daniſh dynaſty.

On the dereliction of Britain by the Romans, the Saxons ſent their own troops to this part of the coaſt, under a pretence of aſſiſting the Britons againſt their northern enemies. But quickly changing the character of auxiliaries into that of invaders, they began to erect fortreſſes to defend the poſſeſſions they had ſeized, and enable them to execute their plan of finally occupying the whole iſland. At this period the caſtle of Norwich, or the fortification on the Wenſum, was probably conſtructed. The elevated ſpot on which this caſtle ſtands,—a promontory at the north-weſtern extremity of a ridge of land which extends from the ſcite of the ancient Caſtor to the Wenſum, and commands a proſpect over a large ſpace of country,—pointed it out as an eligible place to fix an advanced poſt. The Eaſt Anglian monarchy was probably eſtabliſhed between the years 530 and 540, and the caſtle erected about the ſame period. In the year 642 it is ſaid to have been a fortified royal ſeat of Anna, the ſeventh king of the Eaſt Anglian line. During the numerous incurſions of the Danes it was frequently poſſeſſed by them and by the Saxons alternately. Its ſituation rendered it an object of importance to the former, and it appears to have been occupied by Ingwar, a Daniſh chief, in the year 870, when king Edmund was aſſailed in his palace at Hoxne, and killed by his enemies. The Danes took poſſeſſion of the country, wintered at Thetford, and uſurped the monarchy of Eaſt Anglia. The reign of Alfred was diſtinguiſhed by his repeated and deciſive victories over thoſe northern marauders; and one grand object of that monarch's care was to fortify the principal parts of his kingdom againſt hoſtile attacks; caſtles and cities which had been deſtroyed or dilapidated, he rebuilt, and conſtructed ſeveral new and ſubſtantial fortifications, which enabled him to make ſuch military diſpoſitions as the impetuous invaders were never able effectually to counteract. At that time finding the walls or ramparts of Norwich caſtle incompetent for repelling the mode of attack adopted by the Danes, he cauſed others to be erected with the moſt durable materials, whereby he greatly improved its fortifications. That it was a military ſtation of note, and a royal caſtle, in his time, is evident from the coin ſtruck here about the year 872. In the reign of Etheldred, the caſtle is deſcribed to have been utterly deſtroyed by the army under Sweyne, king of Denmark, in the year 1004. This monarch was afterwards defeated by the Saxon earl Ulfkettle, and obliged to fly to Denmark. In 1010 the Danes again returned, and ſettled at Norwich, which they fortified. The caſtle appears to have been rebuilt by Canute, on his acceſſion to the throne of England, about the year 1018, at which time its cuſtody was entruſted to Turkil. The government was afterwards beſtowed on Harold, who, ſucceeding to the Engliſh throne, conferred this caſtle on a Saxon thane, named Leofric. Soon after the Norman conqueſt, king William appointed Ralph de Waher to the earldom of Norfolk, and gave him this caſtle for his reſidence. That nobleman joined in rebellion with Waltheof, the powerful earl of Northumberland, but, having been defeated, he retreated to his caſtle of Norwich, which being inveſted by the royal army, he withdrew to Normandy, leaving to his counteſs the charge and defence of the fortreſs. The garriſon, chiefly conſiſting of Armorican Britons, made an obſtinate reſiſtance, not yielding to the beſiegers till compelled by the imperious neceſſity of famine; and then it obtained an honourable capitulation. The earldom and caſtle, thus confiſcated, were conferred, A.D. 1077, on Roger Bigod, another of his Norman followers. After he was poſſeſſed of this important fortreſs, being in the intereſt of Robert Curthoſe, duke of Normandy, he retained it againſt William Rufus. Peace being ſigned between the two royal brothers, earl Bigod was guaranteed, by a prior ſtipulation, in his landed poſſeſſions, and the government of the caſtle. In the reign of Stephen it was ſeized by the crown, but again conferred upon the family of Bigod. In the reign of Henry II. it is ſtated by ſome writers, that Roger Bigod, who

who then poſſeſſed this fortreſs, rebuilt, or materially altered, the caſtle, and that the preſent keep-tower is part of the work then erected. The ſame authors obſerve, that the caſtle was now rendered impregnable, but this is evidently a mis-ſtatement, for in the reign of king John, Hugh Bigod was expelled, and William Marſhall, earl of Pembroke, with John Fitzherbert, aſſociated in the ſhrievalty of Norfolk and Suffolk, and were appointed, by patent, conſtables of the caſtles of Norwich and Orford. Of theſe fortreſſes, Hugh de Burgh, afterwards earl of Kent, was made governor. In the year 1240, the cuſtody was committed to Hamon Paſſelow, to hold during the king's pleaſure. In the reign of Henry III., Lewis of France ſent troops into England, to aſſiſt the barons, when Norwich caſtle was beſieged, and forced to capitulate. Thomas de Brotherton, ſecond ſon of Edward I., obtained the honor and cuſtody of it from the Bigods. In the time of Edward II. the honor conſiſted of one hundred and twenty knights' fees; which were equal to eighty-five thouſand acres of land. The power of the earls appears ſoon after this to have been abridged, for the ſheriff of the county was authorized by the king to uſe the caſtle for a priſon, to keep perſons charged with crimes in ſafe cuſtody, till the itinerant juſtices ſhould hold their courts of oyer and terminer. This authority of the ſheriffs was repeatedly reſiſted by the earls, which occaſioned an act to be paſſed in the fourteenth year of Edward III., empowering the former to have the privilege of the ſame gaols and priſons as they formerly uſed.

Of the Architecture, ancient and preſent State of the Caſtle.—Some antiquaries contend that the chief part of the preſent fabric was conſtructed by king Canute; and Mr. Wilkin, in the "Archæologia," remarks, that "although the building is of *Daniſh* workmanſhip, it is, notwithſtanding, in the taſte of architecture practiſed by the Saxons, long before England became ſubject to the Danes; and is the beſt exterior of this kind of architecture extant." Blomefield conceives that the preſent ſtructure was erected by Roger Bigod, in the time of William Rufus, and that it occupies the ſcite of a *brick* building, which was raiſed by Canute. He alſo thinks it was conſiderably repaired and beautified by Thomas de Brotherton, in the time of Edward II. Gurdon, in his Eſſay towards a Hiſtory, &c. of this Caſtle, contends for its Daniſh origin, and ſays that Canute's arms were "lions paſſant guardant;" and that the impoſt ſtones of the great portal, in the eaſtern front, have two lions carved on them in baſſo-relievo. From the ſame circumſtance, Camden aſcribes the building to Bigod. Mr. King, while he contends for the architecture being Saxon, ſuppoſes the keep-tower to have been built in the time of Canute. "As to the keep, or maſter tower," he obſerves, "the only conſiderable part now ſtanding, the ſtyle of its architecture is, in many reſpects, ſo different from that of the towers erected in the reigns of William Rufus, and Henry I. and II., and the ornaments are ſo different from thoſe which were in uſe in the reign of Edward II., when pointed arches had been long introduced, and were eſteemed the moſt elegant of any, that I cannot but think the building of much greater antiquity (*i. e.* than the time of Bigod and Brotherton), and completely Saxon, though it is poſſible the ſtaircaſe might be repaired, or even rebuilt, by Thomas de Brotherton, whoſe arms are to be ſeen on part of the wall. In ſhort, as to the main body of the building, I take it to be the very tower which was erected about the time of king Canute, who, though himſelf a Dane, yet undoubtedly made uſe of many Saxon architects, as the greater part of his ſubjects were Saxon. And I am the more induced to form this concluſion, becauſe I can find no authentic account whatever of the deſtruction of the caſtle built in Canute's time, either by war or by accident, or of its being taken down, in order to erect the preſent ſtructure, as is ſuppoſed by ſome."

The promontory on which the keep is built, appears to be a natural elevation, excepting ſome little addition which may have been made by art, by throwing out the earth from the inner foſs; for it is obſervable that the ground from the caſtle a mile ſouthward, is nearly on a level with the upper ballium, although it declines to the weſt, and is rapidly declivous towards the river on the eaſt. The area of the ancient caſtle, including its outer works, contained about twenty-three acres, the whole of which was ſurrounded by a wall. This ſpace comprehended three *ballia*, each defended by a lofty vallum and deep foſs. The principal entrance was by *Bar*, now Bere-ſtreet, through Golden-lane, by the Barbican gate, which was flanked by two towers, and connected with the external vallum by a wall. On the eaſtern ſide, towards the river, was a poſtern, which led to a circular advanced redoubt, where the river forms a double or horſe-ſhoe bend. On the inſide verge of the outer vallum was a ſtrong wall, the ſpace included between which and the middle foſs conſtituted the firſt ballium. The ſecond ballium compriſed the ſpace between the middle and inner foſs, and was defended by a ſimilar wall. The upper ballium, as it was termed, becauſe its altitude far exceeded the other two, circumſcribed the citadel. The walls, according to Groſe, "were commonly flanked with towers, and had a parapet embattled, crenellated, or garreted; for the mounting of it there were flights of ſteps at convenient diſtances, and the parapet often had the merlons pierced with long chinks, ending in round holes, called œilets."

The walls of the city, built in the year 1294, were thus formed; but it does not follow that thoſe of the caſtle, erected at a more remote period, were ſo conſtructed. They have long been down, the outer and inner valla levelled, and the foſſa filled up for building, and other purpoſes. Near the ſouth-weſt angle of the inner ballium is the ſquare keep-tower, the antiquity and architecture of which have afforded a very fertile theme for diſputation. "Its extent from eaſt to weſt, including a ſmall tower, through which was the principal entrance, is 110 feet 3 inches; and from north to ſouth, 92 feet 10 inches; and the height to the top of the merlons of the battlements, 69 feet 6 inches. The height of the baſement ſtory is about 24 feet, the outſide of which is faced with rough flint, and has no external ornament, except two arches on the weſt ſide." From the baſement ſtory upwards, the whole building conſiſts of three ſtories, each ſtrengthened by ſmall projecting buttreſſes, between which the walls are ornamented with ſemicircular arches, reſting upon ſmall three-quarter columns. The backs of ſome of theſe arcades are decorated with a kind of reticulated work, formed by the ſtones being laid diagonally, ſo that the joints reſemble the meſhes of a net. To give it a greater richneſs of effect, each ſtone had two deeply-chaſed lines, croſſing each other parallel with the joints, ſo as to exhibit a moſaic appearance. On the eaſt ſide of the keep is a projecting tower, of a richer kind of architecture, called Bigod's tower; and as it is evidently of the Norman ſtyle, it was probably an addition to the original building, made by Roger Bigod, in the time of William Rufus. The interior of the keep is an unroofed area, but was formerly divided by floors, covered in at top, and ſeparated into ſeveral ſpacious apartments. The baſement floor appears to have been vaulted over with ſtone, ſome veſtiges of which are ſtill to be traced. It is conjectured, that the well was ſituated

nearly

nearly in the middle of the keep. Within this fortreſs there was formerly a royal chapel, exempt from all epiſcopal juriſdiction.

The caſtle precinct contains ſix acres, one rood, and thirteen perches, and the ſummit of the hill is in circumference 360 yards: the whole of the latter is incloſed with iron paliſadoes and gates. Under an act of parliament, paſſed in 1806, the caſtle and its limits are veſted in the juſtices of the peace for the county, in truſt; by which they are empowered to build, repair, or alter any part belonging to it, as they may think proper.

Civil Hiſtory of the Town and City, its Progreſs, Charters, Liberties, Wards, Pariſhes, political Hiſtory, Population, &c.— The town of Norwich probably ſoon ſucceeded the building and eſtabliſhment of the caſtle, and was originally occupied by the Romanized Britons from Venta Icenorum, and the Saxons, who came firſt to aſſiſt, and afterwards to ſubdue them. During the Daniſh incurſions, it is ſaid to have been burnt by Sweyne, who ſailed with his fleet up the Wenſum. According to ſome writers, it was chiefly occupied, at this time, by merchants and fiſhermen: but if ſo, conſiderable alterations muſt have taken place in the courſe and extent of the river; for it muſt appear ſtrange that ſuch perſons would form a ſettlement at a place between 30 and 40 miles from the ſea. It is evident, that very material alterations have been effected in the tide rivers on the Engliſh coaſt, ſince the Romans left the country; and theſe changes have occaſioned much embarraſſment to topographers, and produced apparent contradictions in their writings. If the town was rebuilt by Canute the younger, in the year 1018, it muſt have had a rapid increaſe; for in the time of the Confeſſor, it appears to have had 25 churches, and 1320 burgeſſes. At this time, the property, excluſive of the Newburgh, was divided amongſt four proprietors. Of the part in which dwelt 1238 burgeſſes, the king and the earl of Norfolk had *ſac* and *ſoc*; 50 were amenable to the court of Stigand; and of 32, Harold had the *ſoc*, *ſac*, and patronage. Hence, at that period, the town appears to have exceeded, in the number of burgeſſes, either Lincoln, Ipſwich, Cambridge, or Canterbury. It was then deemed a hundred of itſelf, containing 833 acres of land and meadow, having alſo a ſheep-walk within its juriſdiction; ſo that it muſt have extended nearly a mile beyond the limits marked out by the preſent foundations of its walls. During the peaceable reign of Edward, and that of his ſucceſſor Harold, it continued rapidly to increaſe both in wealth and population; but in the year 1075, by the ſiege it endured in the rebellion of Ralph de Waher, it ſuffered prodigiouſly, and experienced a ſerious decreaſe. Many of the citizens, who had eſpouſed the earl's cauſe, fled; others were baniſhed by the king's general, Waleram, as aiders and abettors; and ſome were forced to quit the place from circumſtantial neceſſity, it having been partially burnt during the ſiege, by which they were deprived of the means of reſidence. Between the years 1083 and 1086, in which the general ſurvey of the whole kingdom, contained in Domeſday-book, was made, it appears that numerous houſes were vacant, though the number of churches had increaſed; there being, by the firſt part of the ſurvey, 25, and, by the ſecond part, 54.

The number of burgeſſes, at this time, began again to increaſe, and the houſes amounted to 738; which, allowing ſix perſons for each houſe, makes the number of inhabitants at that time 4428. Though Norwich then contained this comparatively ſmall population, yet it was in ſize ſecond only to York, excluding the metropolis, as appears by the following eſtimate of the moſt conſiderable places in the kingdom. York contained 1118 families, Norwich 738, Ipſwich 538, Exeter 315, Canterbury 262, Hertford 146, Warwick 113, Southampton 84, Bath 64, and Northampton 60. Enjoying an interval of domeſtic peace, in the reign of William Rufus, and the biſhop's ſee being removed here from Thetford, a conſiderable addition was made to its population, by the vaſt influx of Jews, who about that time came over from Normandy. They had firſt been allowed to ſettle in England by the Conqueror, as chapmen for the confiſcated goods of his ſubjects; and, encouraged by his ſon and ſucceſſor, their numbers were greatly increaſed. In the reign of Henry I., the government of the city was ſeparated from the caſtle juriſdiction; and in the following reign of Stephen, Baker, in his Chronicle, ſays, "the king gave licence to the city of Norwich to have coroners and bailiffs; before which time they had only a ſerjeant for the king, to keep courts." This was conſidered as the dawn of the corporation; and in the time of Richard I., A.D. 1193, the inhabitants of Norwich were recogniſed under the title of citizens. In conſequence of a repreſentation how much the place had ſuffered, in the rebellion of the barons againſt king John, and at other times, the citizens obtained leave to ſurround the city with a wall, and to erect gates and bulwarks for its defence. Theſe were begun in the year 1297, and finiſhed 1320; but they were not completely fitted up and fortified till the reign of Edward III., A.D. 1342. At that time, Richard Spynk, a wealthy citizen, erected additional walls, and towers, with portculliſes to the gates, and furniſhed the garriſon with various military engines, ammunition, &c.

The year 1336 will ever be memorable to the inhabitants of Norwich, for the influx of a numerous body of ingenious Flemings, and the introduction of the worſted manufactures, which are ſtill denominated Norwich-ſtuffs. This city has ſuffered greatly, at various times, by the plague, and ſcarcity; and few places have ſuſtained greater loſſes from accidental fires. Theſe are attributable, not only to the quantities of timber uſed in building, but to the imprudent practice of covering the houſes with ſtraw, a cuſtom not yet entirely diſuſed. Two deſolating fires, which happened at the cloſe of Henry VIIth's reign, induced the corporation to iſſue an order, that no new erected buildings in the city ſhould be covered with thatch. The proſperity of the place, which had begun to decline, was revived in 1566, by the ſettling here of three hundred and thirty Dutch and Walloons, who had fled from the Netherlands during the violent perſecution under the duke of Alva. In 1571 the number had increaſed to 3925, and by the invention of bombazines, and other articles in the weaving manufacture, they contributed much to the general population of the place. In 1574, when a rumour was ſpread of invaſion, by means of the Invincible Armada, Norwich, towards the general defence, exhibited on its muſter-roll 2120 able men; 400 of whom were armed. In 1578 queen Elizabeth made a progreſs through the county, and took up her abode for ſeveral days in this city, where ſhe was entertained with great hoſpitality and loyalty. In the time of Charles I. the city declared for the parliament, and during that rebellion it was poſſeſſed by their forces, till Cromwell was declared protector of the realm. In the year 1663 the charter was renewed by Charles II.; it was reſumed by James II., or at leaſt the privileges ſuſpended, and reſtored to its full extent again in 1688. By virtue of this, the government is veſted in a mayor, recorder, ſteward, two ſheriffs, twenty-four aldermen, of whom the mayor is one, and ſixty common councilmen; a town-clerk, chamberlain, ſword-bearer, and other officers. In the third year of queen Mary's reign, A.D. 1556, the extent of ground, called "the city and county of

Norwich," was aſcertained and confirmed, by which it appears to be fourteen miles in circumference, comprehending nearly 6630 acres. The meaſurement from the Guildhall, in the market place, to Mile-croſs, on the north, is one mile and ſix furlongs; to Thorpe, eaſt, one mile and four furlongs; to Harford bridges, ſouth, two miles and two furlongs; to Earlham Bounds, weſt, two miles and four furlongs.

Norwich was early repreſented in parliament; it received the firſt ſummons in the twenty-fifth year of Edward I. to ſend members to the national council; but it is unknown who were returned on that occaſion; the liſt of parliamentary burgeſſes commencing the following year. In 1403, the fourth year of Henry IV., the king's writ ſummoned *four* citizens to be returned to parliament for this city: but ſo far was amplitude of repreſentation then from being conſidered an extent of patronage, that the city employed John de Alford to obtain the king's licence to ſend *two only*, as before; whoſe ſervices were remunerated by the payment of three pounds. The king evidently meant to confer additional honour upon the citizens by this extraordinary privilege; but burgeſſes in parliament at that period were allowed wages for their attendance, and the citizens objected to this diſtinguiſhed mark of royal favour, upon the ground of additional expence. The city at preſent ſends two members, who are choſen by the freeholders, and by certain other perſons who are free of the city by inheritance, ſervitude, or purchaſe. The ſheriffs for the time being are the returning officers. By a private ſtatute, paſſed in the year 1738, "for the better regulating elections in the city of Norwich," it is enacted, "that the right of election is in the freeholders, and ſuch freemen of the city only as are entered in the books, and do not receive alms or charity."

Till within a few years, the population of Norwich had been increaſing. From the year 1693, in which the firſt accurate enumeration was taken, to 1752, the number of inhabitants had increaſed 7288, which is rather more than 123½ annually. From the year 1752 to 1786, the increaſe was 3882, or rather above 121 for each year.

Manufactures, &c.—No place in the kingdom, Mancheſter excepted, has made a more diſtinguiſhed figure in the weaving trade than the city of Norwich. At what era of our hiſtory the art of manufacturing cloth from wool was firſt practiſed in this iſland, is not recorded. Like many other neceſſary and uſeful arts, its origin is wrapped in the oblivion of diſtant ages, and from that circumſtance, it is highly probable, this was amongſt the moſt early diſcoveries. Anterior to the time of William the Conqueror, woollens of various qualities and texture compoſed the principal manufactures; but ſoon after that period a ſort of cloth work was introduced, which, though not a new diſcovery, had not been previouſly practiſed in England. This was a totally different production from what had uſually been denominated cloth; the preparation being by a combing inſtead of a carding proceſs. By the former the wool is drawn out to a very long, in the latter to a ſhort ſtaple; that is, the fibres of the fleece are extended the whole length in the one inſtance, and broken and interwoven in the other. The art of combing wool is attributed, as a diſcovery, to Blaſius, a biſhop of the eaſtern church, in the fourth century, who is ſtill venerated by the woolcombers as the patron ſaint of their trade. Reſpecting the time it was firſt exerciſed in this county, different opinions have been entertained. Owing to an inundation in Flanders, numbers of the inhabitants of that province came over to this country in the time of Henry I. Some of them ſettled in Pembrokeſhire, and Blomefield ſuppoſes, that others fixed their abode, firſt at Worſtead, and afterwards at Norwich; and from their ſetting up the making the articles manufactured from jerſey, or combed wool, at the former place, ſuch have ever ſince been denominated worſted ſtuffs. In the reign of Edward II., a patent was granted to John Pocock, inveſting him with the excluſive privilege of meaſuring every piece of worſted ſtuff made in the city of Norwich, or county of Norfolk. But this having been found to operate as a reſtraint on the trade, the letters were ſoon afterwards recalled. What tended to increaſe, and raiſe to an enviable height, this ſpecies of manufacture, was the number of Flemiſh artiſans who came over in the year 1336. Their arrival was occaſioned by the great intercourſe at that time kept up between this country and the Netherlands, the Engliſh king having married Phillippa, daughter of William, earl of Hainault. The diſcovery of fullers'-earth, about this period, a ſubſtance ſo uſeful in the trade, and with which England abounds, contributed greatly to further their exertions in the weaving craft. Various ſtaples were appointed for the ſale of wool, and its exportation was prohibited under heavy penalties. On this occaſion, the city of Norwich was fixed for the ſtaple of the counties of Norfolk and Suffolk. In the time of Richard II, and ſucceeding reigns, various ſtatutes were enacted for the encouragement and regulation of the trade, by further prohibitions againſt ſending unmanufactured wool out of the kingdom, and for the meaſuring the manufactured articles, as well as for the ſale of cloth. In the twenty-third year of Henry VI., an act paſſed, ordering four wardens to be choſen for the city of Norwich, and four others for the county of Norfolk, "to do right, and make due ſearch of worſteads in Norwich and Norfolk, and which ſhall ſet down orders for the *true making thereof.*" It having been diſcovered in the following reign, "that divers perſons in Norwich and Norfolk make *untrue* wares, by which means they loſe their ancient eſtimation beyond ſea, &c." The number of wardens was increaſed. From this act it ſeems, the trade had arrived at ſuch a degree of excellence, as to rival other nations in the foreign market; and Engliſh goods probably then obtained an extenſive ſale in thoſe very countries whence the art had firſt been imported. In the time of Henry VIII., according to Blomefield, the ſale of ſtuffs made in the city of Norwich only, amounted to the annual ſum of 200,000*l.*, excluſive of ſtockings, which was computed at 60,000*l.* more. Not only did the trade thus flouriſh at Norwich and Worſtead, but it had now ſpread over the country; for, by an act paſſed in the fourteenth year of this reign, it appears "that the making of worſteds, ſaies, and ſtammins, which had greatly increaſed in the city of Norwich, and county of Norfolk, was now practiſed more buſily and diligently than in times paſt at Yarmouth and Lynn." The wardens of theſe towns, therefore, were put under the controul of the juriſdiction of Norwich. During the reigns of Edward VI. and queen Mary, new articles of manufacture continued to be introduced, and new regulations paſſed for the making of ruſſels, ſatins, ſatins-reverſes, and Naples-fuſtians, as had been done before for the making of hats, dornicks, and coverlets; and the manufacturers of ſuch new articles were formed into a corporation, endowed with excluſive privileges. Subſequent to this the trade fell into decay, and a new era of its revival commenced. By the advice of the duke of Norfolk, queen Elizabeth was induced to offer an aſylum in her dominions to the inhabitants of the Low Countries, who had fled from the perſecution of the duke of Alva. Theſe people brought with them their arts and induſtry; they were allowed to ſettle in Norfolk, and each maſter to bring with him ten ſervants at the duke's charge. They rapidly increaſed, and the county was eſſen-

tially benefitted by their ſkill and exertions. New fabrications were introduced by the intermixture of ſilk, mohair, and wool; and ſeveral new articles were manufactured, as various in their qualities as their names; ſuch as bayes, ſayes, arras, and mochades. In 1575, the Dutch elders preſented in court a ſpecimen of a novel work, called bombazines, for the manufacturing of which elegant ſtuff this city has ever ſince been famed. In the reign of George I., an act was paſſed to compel the makers of any kind of ſtuff to become freemen of Norwich, as the manufacturers of ruſſels and fuſtians had formerly been. The preamble ſtates, that it was made to furniſh the city with a proper ſupply of able magiſtrates; but the policy of the meaſure lay deeper than the ſtatement. In the twenty-fifth year of George II., a ſtatute was enacted to open the port of Great Yarmouth, for the importation of wool and woollen yarn; a circumſtance which proved highly beneficial to the general trade of this city and county. From a ſtatement furniſhed by a maſter manufacturer in the year 1724, it appears that 120,000 perſons were then employed in the woollen, worſted, and ſilk manufactures. Not that the whole of theſe perſons reſided in the city, but they were employed in ſome branch of the trade, and their labours were conducive to the productions of Norwich.

The ſtaple articles of this manufacture, at preſent, are bombazines, worſted damaſks, flowered ſatins, and fine camblets; for the latter, the Eaſt India Company have given annually large orders, which has afforded ſome relief during the torpor of the trade to Italy and Spain. To theſe articles has been recently added the manufacturing of cottons, ſhawls, and other fancy goods, adapted both for furniture and dreſs, which for elegance, at preſent, ſurpaſs any thing of the kind made in England. The making of cotton thread-lace has alſo been introduced; and the trade in linen, called Suffolk hempen, is in a flouriſhing ſtate. The ſtaple manufacture of Norwich furniſhes about fifty diſtinct occupations, reckoning from the ſhearer who procures the fleece, to the mariner, who ſhips the bale goods; and when trade is very briſk it employs one hundred thouſand perſons. The Lincolnſhire and Leiceſterſhire wools are chiefly uſed, while thoſe of Norfolk are moſtly ſent for the uſe of the Yorkſhire clothiers. "The earnings of the manufacturers are various. Dyers and hot-preſſers earn about 15*s.* a week, combers about 12*s.*, ſome of the beſt weavers from 14*s.* to a guinea; weavers in general, on an average not more than 6*s.*, but then many women can earn as much, and children, by ſpinning, pipe-filling, and tyre-drawing, earn from 9*d.* to 2*s.* 6*d.* *per* week."

Of the Churches, religious Houſes, and other eccleſiaſtical Subjects of the City.—At an early period Norwich was diſtinguiſhed for its numerous monaſtic ſtructures. Herbert de Loſinga eſtabliſhed the ſee at Norwich in the year 1094, and laid the foundation ſtone of the cathedral in the year 1096. It has been ſaid, that "the firſt building was chiefly compoſed of wood;" but this is not very probable, as there can be no doubt that parts of it ſtill remain. How much was completed by Herbert is not clearly defined; though it is ſtated, that the choir, with its aiſles, alſo the tranſept and tower, were erected by him. To this Eborard, his ſucceſſor in the ſee, added the nave, with its two aiſles, extending from the antichoir, or rood-loft, to the weſt end.

Thus it ſtood, though not fitted up till 1171, when it was damaged by fire. John of Oxford, the fourth biſhop, repaired this injury, ſupplied the church with proper veſtments, and decorated it with ornaments, about the year 1197. Walter de Suffield, the tenth biſhop, made another addition, by erecting the Virgin chapel at the eaſt end, which has ſince been demoliſhed. In the year 1272, the cathedral was again injured by fire, but was repaired A.D. 1278. Soon after the tower, or the ſteeple, appearing to have been materially injured by the fire, it was taken down, and another erected at the ſole expence of biſhop Ralph de Walpole. The old chapter-houſe was built by the ſame bounteous prelate, who alſo erected that part of the cloiſter, which extends from the entrance of the chapter-houſe to the grand door-way into the church. Three more arches, on the ſame ſide, were executed by the clerk of the works, Richard de Uppehall. The remaining five arches, and the ſouth ſide of the cloiſter to the arch, where the eſpouſals was carved, were erected by biſhop Salmon, with the aſſiſtance of the monks; who, on this occaſion, ſuppreſſed the office of pittancer, and expended on the work the pittances of the convent. The north ſide, towards the church, was built by Henry de Well, who gave 210 marks himſelf, and obtained ſeveral donations to carry on the work. He was alſo allowed a portion of the pittance money. The weſt ſide, from the carving of the eſpouſals, the highly ornamented entrance towards the refectory, the lavatories, and the door-way into the pilgrims' hall, were built by Jeffery Simonds, the then rector of St. Mary-in-the-Marſh. The part extending from the pilgrims' hall door-way, to the entrance into the church inclufive, was the work of biſhop Wakeryng, who erected the new chapter-houſe, which was afterwards deſtroyed in the civil wars. In the year 1430, in the one hundred and thirty-third year from its commencement, this ſpacious, elegant, and juſtly celebrated cloiſter was finiſhed, in the preſidency of biſhop Alnwick, by whoſe executors the weſt end of the cathedral was rebuilt. In 1361, a hurricane blew down the upper part of the ſteeple, and at that time the preſent ſpire was built.

Plan, Dimenſions, Diviſions, Architecture, &c. of the Cathedral.—The architecture of this noble pile of building is chiefly of that ſtyle called Norman, wherein the ſemicircular arch, and large ſhort column, are the leading features. Theſe are conſiderably varied in ſize, mouldings, and ornaments, in different parts of the ſtructure. The plan diſplays a nave, with ſide aiſles, a tranſept, a choir, with ſemicircular eaſt end, and an aiſle ſurrounding it. Attached to, but projecting from this aiſle, near the eaſt end, is a ſmall chapel dedicated to Jeſus, and on the oppoſite ſide, at the ſouth-eaſt angle of the church, is another, called St. Luke's chapel. Weſt of this is a ſquare building, projecting from the aiſle, now uſed as the conſiſtory court. Between this and the tranſept is Heydon's chapel, and the old chapter-houſe. Abutting to the ſouth tranſept, are the precincts gaol or dungeon, and St. Edmund's, or the priors' chapel. Weſt of theſe, and attaching to the ſouth ſide of the nave, are the cloiſters. Such are the component parts of the cathedral, which joins to the biſhop's palace on the north ſide, and to the deanery, &c. on the ſouth. The following are given as the meaſurements: extreme length of the church, from eaſt to weſt, 411 feet, and of the nave, from weſtern door to tranſept, 140 feet. The extreme width of the latter is 191 feet, of nave, with aiſles, 72 feet. The cloiſters form a ſquare of 174 feet within the walls. They branch off from the ſouthern tranſept, and incloſe a ſquare court or area: eleven windows, or arched openings, are on the weſtern ſide, twelve on the oppoſite ſide, eleven to the north, and the ſame number on the ſouthern ſide. All theſe windows are divided into three lights, by two columns, and all are decorated with tracery; the latter preſents much variety and diſſimilarity. At the ſouth-weſt angle is a large lavatory. The roof is ſupported by groins, ſpringing from cluſtered columns, and ornamented with very bold boſſes at their points

points of interſection. The door-way leading from the eaſtern aiſle of the cloiſters to the nave is very curious. It is in the pointed arch ſtyle, with four columns on each ſide, having correſponding archivolt mouldings, in front of which are ſeven canopied niches, with richly ſculptured crockets, and each including a ſtatue.

The weſt front of the cathedral diſplays a large central compartment, fronting and correſponding with the width and height of the nave; alſo two lateral diviſions correſponding with the ſide aiſles. The elevation of the former ſhews a large central window, divided into three leading compartments in height, and the ſame number in width. Theſe are again ſubdivided by ſmall mullions, and the whole produces a highly ornamented effect. Beneath it is the grand entrance door-way, formed by a bold pointed arch, having its ſpandrils and ſide faſcia much enriched with mouldings, niches, pedeſtals, ſtatues, and other ſculptured decorations. The nave and aiſle on the ſouth ſide preſent five tiers or ſtories of windows and arcades, though part of the lowermoſt is obſcured by one ſide of the cloiſters. Above this is a ſeries of blank arches, or arcades, of the ſemicircular ſtyle, divided into fourteen compartments, by a flat buttreſs between each, and every diviſion conſiſts of ſix arches. In the next tier upwards, each compartment ſhews three ſemicircular arches, the central of which is opened and glazed, whilſt the other two are blank. Over this is a flatly pointed arch window, with two mullions in each diviſion. This conſtitutes the elevation of the aiſle, which is unuſually lofty and narrow. Above this is a ſeries of arches to the upper part of the nave, diſplaying in each compartment a pointed arched window in the middle, with a ſemicircular moulding over it, and two lateral blank arches. The ſides and front of the tranſept nearly correſpond, in the number and ſtyle of arches, with the diviſion juſt deſcribed. At the interſection of this tranſept, with the nave and choir, riſes a lofty tower, ſurmounted by a ſpire, the whole height of which is 315 feet. The former exhibits four ſtories, beſides that of the battlements; and each is covered with arcades, columns, and tracery mouldings, of very varied and curious workmanſhip. It is an intereſting ſpecimen of the Norman ſtyle of architecture, exemplifying it at that period, when the ſemicircular and interſecting arches with tall light columns were prevalent, and juſt before the pointed arch was generally adopted. The battlements and pinnacles at the angles are of a later ſtyle, as is the octangular ſpire, which has bold crockets attached to, and running up, the ribs at each angle. In the interior of the choir and its aiſles a very diſſimilar ſtyle of architecture is exhibited; for the former has large lofty windows, with pointed arches, ornamented with mullions and tracery, whilſt the latter diſplays ſeveral windows with ſquare heads, divided by three mullions and tracery. Theſe windows are curious and rare examples of form. Bold buttreſſes project from the upper part of the choir, acroſs and over the aiſle. Of the interior it muſt ſuffice to remark, that it is grand and ſolemn in the general effect; that the piers, columns, arches, and mouldings, are in a bold and ſubſtantial ſtyle. It is much to be regretted by every architect, antiquary, and man of taſte, that the modern fittings up of the choir, pewing in the aiſle, encumbered ſtate of the tranſepts, &c. tend to disfigure the building, and deſtroy all harmony, propriety, character, and beauty. The preſent choir, or part appropriated for cathedral ſervice, is made to extend from the ſemicircular eaſt end acroſs the tranſept, and to the third column in the nave. This ſpace is nearly encloſed with boarded and painted partitions, filling up the arches, and ſhutting out the ſight from all general and comprehenſive views of the building.

Tombs, &c.—The cathedral contains various ſepulchra memorials. The tomb of biſhop Herbert, the founder, was deſtroyed in the time of the civil war; and a new altar monument was erected to his memory by the dean and chapter in the year 1682. It ſtands in the central part of the choir, incloſed with an iron paliſade. This part of the church contains alſo the graves of moſt of the prelates who have filled the ſee; but few intereſting monuments now remain. There are mural ſtones to the memory of biſhops Scambler and Overall. Between the ninth and tenth pillars, reckoning from the weſt, was a chapel, now thrown open, where is an altar-tomb, deprived of its braſſes, under which was interred ſir James Hobart, who was attorney-general to king Henry VII. Till the reformation this chapel was the chantry, belonging to the Hobart family. In Jeſus chapel ſtands a tomb, removed from the chapel of the Virgin Mary, erected to the memory of ſir Thomas Wyndham, who was knighted by ſir Edward Howard, in the fourth year of king Henry VIII.; he died at his ſeat at Felbrigge, October 22, 1521. Among other celebrated perſons, whoſe place of ſepulture is in this church, may be noticed John Heydon, eſq. a great favourite of Edward IV.; ſir Henry Heydon, knt., who built at his own expence Salthouſe church; ſir William Boleyn, great grandfather to queen Elizabeth; ſir Roger Bigod, knt. ſewer to king Henry I.; ſir Walter de Berney, Calthorp, Boſvill, Baconthorpe, &c. In the chapel called our Lady the Leſs, is an arched mural monument to ſir William Beauchamp, the founder, who lived in the reigns of Edward I. and Edward II.

The biſhops palace, on the north ſide of the collegiate precinct, is not the one built by the founder of the cathedral, though it ſtands upon the ſame ſcite. The original building was pulled down, and a larger ſtructure erected by biſhop Salmon, in the year 1318; in the rebellion it partook of the general injuries which were committed on eccleſiaſtical buildings, by the fanatic ſpirit of the times. The greater part was let out in tenements, and the grand hall converted into a meeting-houſe. Jeſus chapel, in the cathedral, was originally appropriated to the uſe of the prelate; but being found inconvenient, biſhop Salmon erected another near the palace. In this, which was one hundred and thirty feet long by thirty broad, were buried the founder, and ſeveral other prelates. In 1619, it was licenſed for the Walloon congregation. During the rebellion it was greatly injured, and its fine painted windows mutilated.

A Liſt of the Biſhops of Norwich.—1. Herbert Loſinga, having removed the ſee from Thetford, held it till his death, in 1119.

2. Eborard, or Everard, after a vacancy of nearly three years, was advanced to the prelacy in 1121. He retired in 1146, and was ſucceeded by

3. William Turbus, on whoſe death, in 1175,

4. John of Oxford, dean of Saliſbury, was elected. He died in 1200, when

5. John de Grey was promoted to the ſee. He died at Poictou in 1214. The biſhopric was then vacant above ſeven years, and was conferred, in 1222, on

6. Pandulphus, the pope's legate. On his death,

7. Thomas de Blandeville was conſecrated in 1226; dying in 1236.

8. Ralfo was elected in his ſtead; and died the following year.

9. William de Raleigh, after a conteſt of three years, obtained the ſee in 1240. On his tranſlation to Wincheſter, in 1244,

10. Walter de Suffield, or Suthfield, was elected: he died in 1257, and was ſucceeded by

11. Simon

11. Simon de Waltone, who died in 1265; when,

12. Roger de Skerewing was conſecrated; he held the ſee thirteen years: on his death

13. William Middleton, archdeacon of Canterbury, ſucceeded in 1278. He died in 1288, when

14. Ralph de Walpole, archdeacon of Ely, was elected. Being tranſlated to the ſee of Ely in 1299, his place was ſupplied by

15. John Salomon, or Salmon, who enjoyed the biſhopric twenty-ſix years, and died in 1325.

16. Robert de Baldok was elected to ſucceed him, but out of ſubmiſſion he reſigned in the ſame year.

17. William de Ayrminne was conſecrated in 1325, and died in 1336.

18. Thomas Hemenhall was elected in 1337, but being in the ſame year removed to the ſee of Worceſter,

19. Anthony de Beck was appointed biſhop by the pope's mandate: he died in 1343, and was ſucceeded by

20. William Bateman, dean of Lincoln, who founded Trinity-hall, Cambridge, for the expreſs purpoſe of ſupplying his dioceſe with a ſucceſſion of qualified paſtors. He died at Avignon in 1354.

21. Thomas Percy, brother to the earl of Northumberland, ſucceeded by papal authority, though but twenty-two years of age. On his death, which took place in 1369,

22. Henry Spencer was conſecrated by the pope in perſon. This prelate was the firſt who quartered the epiſcopal arms with his own. He died in 1406.

23. Alexander de Tottington, prior of Norwich, was promoted to the ſee on the death of Spencer, and held it till 1413; when, on his death,

24. Richard de Courteney, chancellor of Oxford, was elected; but died within two years.

25. John Wakeryng, archdeacon of Canterbury, was elected in 1416; and died in 1425.

26. William Alnwick, archdeacon of Saliſbury, ſucceeded, by papal mandate, in 1426. He was tranſlated to Lincoln in 1436, when

27. Thomas Brown, or Breus, biſhop of Rocheſter, was tranſlated to Norwich by a bull of pope Eugenius IV. He died in 1445, when John Stanberry, a Carmelite friar, was elected but never conſecrated, through the interference of the pope.

28. Walter Hart, or Lyhart, maſter of Oriel college, Oxford, was then appointed by papal mandate. He held the ſee twenty-ſeven years, and died in 1472.

29. James Goldwell, the pope's prothonotary, was conſecrated at Rome by pope Sixtus IV. in 1472. On his death, in 1498, Chriſtopher Urſwyke was elected, but on his refuſal of the honour,

30. Thomas Jane, archdeacon of Eſſex, was conſecrated in 1499, but died the next year.

31. Richard Nykke, archdeacon of Exeter, ſucceeded, and having filled the epiſcopal chair thirty-five years, died in 1535.

32. William Rugg, or Reppes, abbot of St. Bennet's in Holme, was advanced to the biſhopric by Henry VIII. for his aſſiſtance in forwarding the king's divorce. He died in 1550, when

33. Thomas Thirlby, the firſt and laſt biſhop of Weſtminſter, was promoted to the ſee of Norwich, whence he was tranſlated to that of Ely, in 1554.

34. John Hopton, prior of the Dominican monaſtery, ſucceeded; and died in 1559, when

35. Richard Coxe, who in the following year was tranſlated to Ely by queen Elizabeth, who nominated in his ſtead

36. John Parkhurſt, who was conſecrated Sept. 1, 1560, and died Feb. 2, 1574.

37. Edmund Freke, biſhop of Rocheſter, was tranſlated to Norwich, July 13, 1575, and hence to Worceſter, December 1584, when

38. Edward Scambler, biſhop of Peterborough, ſucceeded. He died May 7, 1594.

39. William Redman, archdeacon of Canterbury, was elected December 1594, and died September 25, 1602.

40. John Jeggon, dean of Norwich, was advanced to the biſhopric February 20, 1603, and died March 13, 1617.

41. John Overall, biſhop of Lichfield and Coventry, was tranſlated to the ſee of Norwich, May 21, 1618, but held it only one year. On his death

42. Samuel Harſnett, biſhop of Chicheſter, was tranſlated to this ſee; whence he was preferred to the archbiſhopric of York, November 6, 1627, and was ſucceeded here by

43. Francis White, biſhop of Carliſle, who was tranſlated hence to the ſee of Ely, December 8, 1631, when

44. Richard Corbett, biſhop of Oxford, was promoted to Norwich, where he died July 28, 1635.

45. Matthew Wren, biſhop of Hereford, and father of that eminent architect ſir Chriſtopher Wren, was tranſlated to this ſee November 16, 1635, and was removed to that of Ely, April 1638.

46. Richard Montague, biſhop of Chicheſter, was tranſlated to Norwich, May 4, 1638, and died April 1641.

47. Joſeph Hall, biſhop of Exeter, was tranſlated to this ſee November 1641; but was deprived of his rights by the uſurped authority of the houſe of commons.

48. Edward Reynolds was conſecrated January 6, 1660, and died July 28, 1676.

49. Anthony Sparrow, biſhop of Exeter, was tranſlated hither Auguſt 28, 1676. He died May 19, 1685.

50. William Lloyd, biſhop of Peterborough, was promoted to Norwich June 11, 1685; but, on the acceſſion of king William, refuſing to take the oath of abjuration, he was deprived of his biſhopric. In his ſtead

51. John Moore was elected May 21, 1691, and having held the ſee ſixteen years, was tranſlated to that of Ely. He was the moſt celebrated collector of ſcarce and valuable books in England. On his deceaſe, George I. purchaſed his immenſe library, and preſented it to the univerſity of Cambridge.

52. Charles Trimnel, archdeacon of Norwich, was conſecrated biſhop February 8, 1707, and was tranſlated to Winchester in 1721; on which

53. Thomas Green, archdeacon of Canterbury, was advanced to this ſee; whence he was removed to that of Ely, September 4, 1723.

54. John Long, chaplain to George I., was promoted to this biſhopric October 2, 1723, and died October 26, 1727.

55. William Baker was tranſlated from the ſee of Bangor to Norwich, in 1727. He died December 4, 1732. He was ſucceeded by

56. Robert Butts, dean of Norwich, who was conſecrated biſhop January 25, 1733, and was tranſlated to Ely in 1738, when

57. Thomas Gooch, biſhop of Briſtol, was removed hither. In 1748 he alſo was tranſlated to the ſee of Ely, and was ſucceeded here by

58. Samuel Liſle, biſhop of St. Aſaph, who held this ſee only one year.

59. Thomas

59. Thomas Hayter, prebendary of Weſtminſter, was elected to this ſee in 1749, and was tranſlated to that of London in 1761, when he was ſucceeded at Norwich by

60. Philip Yonge, biſhop of Briſtol, who held this biſhopric twenty-two years, and died in 1783.

61. Lewis Bagot, biſhop of Briſtol, was then advanced to this ſee, whence he was removed to that of St. Aſaph in 1790, and was ſucceeded at Norwich by

62. George Horne, dean of Canterbury, who enjoyed his dignity but two years. On his death

63. Charles Manners Sutton, dean of Windſor, was advanced to this ſee. On his promotion, in 1805, to the metropolitan ſee of Canterbury, he was ſucceeded by

64. Henry Bathurſt, dean of Worceſter, who is the preſent reſpected biſhop.

The priory, built by biſhop Herbert Loſinga, about the year 1101, for ſixty monks of the Benedictine order, to officiate in the cathedral, ſtood on the ſouth ſide of it, in what at preſent is called the Lower Cloſe. On pulling down the work-houſe, in the year 1804, to improve the entrance to the deanery, ſome ruins were diſcovered, ſuppoſed to have been remains of the refectory and dormitory of that once celebrated monaſtery. The ſhafts of three maſſive cluſtered pillars, each nine feet long, are preſerved, and exhibit intereſting ſpecimens of the architecture of the age.

The charnel-houſe, now appropriated to the free-ſchool, at the weſt end of the cathedral, was founded by biſhop Salmon, about the year 1316. He endowed it for four prieſts, one of whom was to be principal or cuſtos, to ſing maſs for his own ſoul, thoſe of his father and mother, and of all his predeceſſors and ſucceſſors in the ſee for ever. It conſiſted of a chapel, with a vault beneath, and proper offices for the reſidence of officiating prieſts. The upper part of the charnel was the chapel, and the under vault was uſed for the purpoſe of a charnel-houſe; the ſacriſt of the cathedral having been permitted to bring all bones, in a proper ſtate for removal, to depoſit there, "to be reſerved till the day of reſurrection."

St. Ethelbert's parochial church was erected anterior to the cathedral, as appears by the pariſh being partially included within the precinct. It was burnt down in the grand civic inſurrection in the year 1272. In lieu of which the citizens were compelled, among other reſtitutions for the injuries they had committed, to build the preſent handſome gate, with the chapel over it, dedicated to St. Ethelbert. Excluſive of this, there were formerly four other gates belonging to the precinct. One, now demoliſhed, led into St. Vedaſt-lane; another leads to St. Giles's hoſpital; a third opens into St. Martin's plain; and a fourth faces the weſtern end of the cathedral. The latter is called Erpingham's gate, from having been built by ſir Thomas Erpingham, knt., as a penance for his being an abettor of Lollardiſm, or favourer of Wickliffe. This is a peculiarly elegant ſpecimen of the architecture and ſculpture of the time. It ſerves alſo as a memorial of religious cuſtoms. Its elevation diſplays a lofty pointed arch, which is enriched with columns, mouldings, and numerous ſmall ſtatues, in canopied niches. The ſpandrils are alſo highly decorated with tracery mouldings, incloſing ſhields, &c.; and the whole is included in a ſort of ſquare frame, with ſemi-octagonal buttreſſes.

Of the many religious houſes which once evinced the devotion and charity of the place, few veſtiges now remain. The materials with which they were erected, and the revenues by which they were ſupported, have long been appropriated to other uſes. The ſcite of the White Friars is nearly all built upon, and the hall is converted into a meeting-houſe, for a congregation of Baptiſts, who have a ſmall burial-ground on the ſouth ſide; and the remainder of the cloiſter now forms a cellar to a public houſe. Some part of the college of St. Mary-in-the-Fields is yet ſtanding. The ſcite of the priory of St. Leonard's, built by biſhop Herbert, containing fourteen acres, is walled in, and part of the ruinated gate-houſe ſtands. Of the monaſtery of Black, or Preaching friars, more remains perhaps than of any friary in the kingdom. The cloiſter, including a place of ſepulture, is on the north ſide of the church. The conventual kitchen was appointed, in 1625, as a place of induſtry for the poor, ſince which time various appropriations have been ſucceſſively made. The church, a noble and beautiful pile, is ſtill intire, except the ſteeple, which fell down November 6, 1712.

Among the numerous churches in this city, few, after the cathedral, are deſerving of particular attention as architectural objects. St. Julian's church, founded anterior to the Conqueſt, was given by king Stephen to the nunnery of Carhow. It exhibits ſome ſpecimens of Saxon architecture.

The church of St. Peter Maucroft, is a large, regular, handſome building; and, next to the cathedral, is diſtinguiſhed, for its ſuperiority in ſize and architecture, to any of the ſacred ſtructures in this city. It ſtands, on an elevated ſpot, at the ſouth-weſt corner of the market-place Blomefield ſtates that it was finiſhed and conſecrated in the year 1455. Among the ſepulchral monuments, here is one raiſed to the memory of ſir Thomas Browne, who died October 19, 1682, aged 77 years.

The church of St. Lawrence ſtands upon the ſpot, which at a remote period was the quay for landing all fiſh brought to the city. Alfric, biſhop of Eaſt Anglia, in the year 1038, granted the quay, ſtaithe, and hagh, to the abbey of St. Edmund's Bury, on condition that the abbot would erect a church. The conventual chapter, on the fulfilment of the condition, obtained poſſeſſion of the grant, and beſtowed the rectory on one of their own body, reſerving a laſt of herrings to be annually paid to the monaſtery. This quit rent was compounded for in the reign of Henry III., by the cellariſt of the convent, on the yearly payment of 40*s*. From this payment the rectory was releaſed in the time of Henry VII., on account of the ſmallneſs of the profits. The preſent regular and handſome church was erected, in the year 1472, at the expence of the monaſtery of St. Edmund's Bury, aided by private benefactions. The tower is a bold ſquare building, 112 feet in height. Over the weſt door are ſeveral figures ſculptured in ſtone. Previous to the civil war, the church was highly decorated with various altars, &c. and the windows ornamented with painted glaſs. In 1643, the communion rails were broken down, the floor of the chancel taken up, and the ſtained glaſs defaced. In the pariſh regiſter is this entry; "Laid out to Goodman Perfett, for the putting out of the ſuperſtitious inſcriptions in the church windows, and the pulling down of crucifixes, 1*s*. 8*d*."

Norwich, like many other ancient places, is indebted to monachiſm for numerous charitable inſtitutions. Among theſe is the free grammar-ſchool, which was originally founded by biſhop Salmon, A.D. 1325, and annexed to a ſmall collegiate chantry. At the diſſolution, a proviſion was made for maſters to be employed in the education of youth. For this purpoſe, in the firſt year of Edward VI., the city, by the hoſpital charter, was obliged to appropriate a portion of its revenues. The maſter has 50*l*. a-year, and the uſe of a houſe; the uſher has 30*l*. a-year. It is further endowed with ſcholarſhips and fellowſhips belonging to Caius college,

in

in the univerſity of Cambridge. The Boys' hoſpital, ſituated in the pariſh of St. Edmund of Fiſhergate, owes its riſe to Thomas Anguiſh, who was mayor of the city in the year 1611. By his will, bearing date the 22d of June, 1617, it was incorporated, in the year 1628, under the title of "The Children's Hoſpital in the City of Norwich, of the Foundation of King Charles." By this eſtabliſhment, fourteen boys were to be fed, clothed, and educated; and by the laudable management of the corporation, and from additional benefactions, the revenues, in 1742, amounted to 448*l.* 16*s.* 8*d.* *per annum*, and the number of boys was augmented to thirty-ſix. Since that time both have been greatly increaſed. The inſcription over the door of the Girls' hoſpital, ſituated in Golden Dog lane, aſcribes its firſt endowment to Robert Baron, who was mayor of this city in the year 1649. It provides for the boarding, clothing, educating, and teaching to work a certain number of female children. Two, the firſt number, was in 1742 increaſed to twenty-one, and as the income has been augmented, more children have been regularly added. They are decently clothed in blue, and taught, under a matron, to read, ſpin, ſew, &c. ſo as to prepare them for uſeful ſervices. St. Giles's, commonly called the Old Man's hoſpital, was founded by biſhop Suffield, A.D. 1249. It ſtands on the north-eaſt ſide of the cathedral, and at preſent conſiſts of the hoſpital church, which has a ſquare tower at the ſouth-weſt corner. The choir is converted into lodgings for the women, and part of the nave and aiſles for the men, the remaining part being ſtill uſed for divine worſhip. By this charity proviſion is made for fifty aged men, and alſo for fifty aged women, who are under the government of a maſter, elected by the corporation. Doughty's hoſpital, ſituated in the pariſh of St. Saviour, was founded in purſuance of the will of William Doughty, gent. dated April 25, 1517. In this city are twelve charity-ſchools, ſupported by the intereſt ariſing from paſt donations, caſual benefactions, and annual ſubſcriptions; in theſe, numbers of poor children are clothed, maintained, and educated Out of thoſe which do honour to modern times may be ſelected the Infirmary, or hoſpital for the reception of the ſick; and Bedlam, an aſylum for lunatics. The Norfolk and Norwich hoſpital, a large brick building, ſtands without St. Stephen's gate, and was erected, in 1772, by voluntary contribution, at the expence of 13,323*l.* 8*s.* 11*d.* A new wing, which was added in 1802, completed the original plan. From a general abſtract of the regiſter it appears, that from the time of its being firſt opened for out-patients, July 11, and for in-patients, November 7, 1772, till the end of the year 1806, a period of thirty-four years, there have been on the admiſſion liſt of out-patients 10,961, and of in-patients 14,344; making the total number 25,305: out of which 16,427 have been diſcharged as cured, and 3596 relieved.

Bethlehem hoſpital, or, as it is uſually called, Bedlam, was founded, agreeably to the requeſt of her huſband, by the widow of the Rev. Samuel Chapman, rector of Thorpe, Norwich, in the year 1713, "for the convenient reception and habitation of lunatics, and not for natural born fools or idiots." For its endowment ſhe ſettled by will all her eſtates on a body of truſtees, who were to have the management of the houſe for ever.

This city may be ſaid to poſſeſs two civic theatres, or public places deſigned for the meetings of the municipality, the Guildhall and St. Andrew's hall; the former was originally a ſmall thatched building, erected for the purpoſe of collecting the market-tolls, whence it took the name of the toll-booth. In the time of Edward III., "a room built of ſtud, and covered with ſtraw," was added; and it was then dignified with the appellation of the Guildhall, though it contained only ſufficient ſitting-room for the firſt magiſtrate and ſix other perſons. In Henry IV.'s time, A.D. 1407, a committee was formed, and a warrant granted them to raiſe money, and "preſs all carpenters, carters, and other workmen," for the erection of a new guildhall; and the ſame year the arched vaults deſigned for the city priſon were raiſed; but the whole building was not completed till the year 1453, when the windows of the council-chamber were glazed. In this were various hiſtoric and emblematic paintings, alluſive to the adminiſtration of juſtice, but they have been miſerably mutilated; two ſmall windows at the eaſt end being all that remain perfect. St. Andrew's hall, called in ſome inſtances the New hall, is a noble fabric, and was formerly the conventual church of the Benedictine monaſtery of Black friars. It was firſt began, in 1415, by ſir Thomas Erpingham, knt., and finiſhed by his ſon, ſir Robert Erpingham, who was rector of Bracon, and a monk of the fraternity. It conſiſts of a nave and two aiſles, which remain nearly perfect. Formerly it had a handſome ſteeple, which ſtood in the centre, between the nave and the choir; but for want of repairing attention, it fell down November 6, 1712. The aiſles are ſeparated from the nave by ſix ſlender elegantly proportioned columns, which ſupport the roof. At the diſſolution, the city, through the intereſt of the duke of Norfolk, obtained a grant of it from king Henry VIII., in the thirty-ſecond year of his reign, "to make of the church a fair and large hall for the mayor and his brethren, with all the citizens, to repair unto at a common aſſembly, &c." At that period the choir was converted into a chapel for the corporation and ſeveral guilds to hear maſs performed, morning, and evening, and make their reſpective offerings. The ancient and numerous guild of St. George uſually held their meetings at a ſtone, lately removed, which was placed in the ſouth aiſle, over the grave of Robert Bernard, eſq. This guild company, firſt aſſociated A.D. 1385, was a ſociety of brothers and ſiſters, formed in honour of St. George the Martyr, for the purpoſes of charity and poſthumous prayer. In 1416 they received a charter of incorporation. From that time the guild was in great repute; and it reckoned among its members ſome of the firſt perſons of ability, rank, and fortune; and at one period their annual feaſts were held in the grand hall of the biſhop's palace. In 1550, they granted all their temporals to the hoſpital called God's Houſe, in Holme-ſtreet.

The tower in the Hoſpital meadow, called the Dungeon, or Cow Tower, is a circular building, about 52 feet in height, and 24 feet diameter, with a round, ſpiral ſtaircaſe reaching to the top. It is ſituated at the eaſtern extremity of the city, on the weſtern bank of the Wenſum, where the ſtream forms a conſiderable angle. There can be little doubt but it was originally an advanced poſt and watch-tower to the caſtle, for the defence of the river-paſs. Blomefield thinks it was built, "in order to levy the tolls then belonging to the prior and church," and ſays it was uſed as a priſon for the juriſdiction of the cathedral. The preſent tower is ſtated to have been built in the year 1390, at the expence of the city. The dukes of Norfolk formerly had a magnificent palace in this city. It was made a ducal reſidence in the time of Henry VIII., but pulled down in the year 1602, when a more ſtately pile was erected on its ſcite by Henry, duke of Norfolk. This was ſoon afterwards defaced by his grandſon, out of umbrage taken at the conduct of the mayor, who refuſed the duke's company of comedians to enter the city with trumpets, &c. From that time it was entirely neglected; part of the ſcite was uſed as a common ſtathe, and the remaining buildings hired of

the duke for the city workhouſe; but ſince the poor-houſe in St. Andrew's pariſh was enlarged, the whole ſcite has been ſold, and built on by different proprietors. Fuller ſays this palace was the largeſt he had ever ſeen out of London. Among its various accommodations for amuſement, were a theatre, tennis-court, and bowling-alley. The latter was the firſt of the kind in England, and when Thomas, duke of Norfolk, was accuſed of aſpiring to the throne of Scotland, by his intended marriage with Mary, queen of Scots, he proteſted to Elizabeth, that when in his bowling-alley at Norwich, he conſidered himſelf equal to a king of Scotland. On the north ſide of Newgate ſtands Surry houſe, a curious ſpecimen of domeſtic architecture; in the windows of which were emblazoned, on glaſs, many armorial bearings.

Among the more eminent natives of this city, are William Bateman, better known in records by the name of William de Norwico, from the place of his birth. He was ſon of William Bateman, who ſerved the office of bailiff, and in 1326 repreſented the city in parliament. Mathew Parker a pious and learned divine, and archbiſhop of Canterbury in the time of queen Elizabeth, was born in the pariſh of St. Saviour, in this city, Auguſt 6, 1504. John Kaye, better known by his latinized name of Caius, an eminent phyſician in the reigns of queens Mary and Elizabeth, was born at Norwich in the year 1510. Edward Browne, a diſtinguiſhed phyſician in the reign of Charles II., the eminent ſon of an eminent father, ſir Edward Browne, was born in this city about the year 1642. Dr. Samuel Clarke, a learned and polemical divine, who was diſtinguiſhed in the latter part of the ſeventeenth, and beginning of the eighteenth century, was the ſon of Edward Clarke, eſq. who was alderman of Norwich, and for ſeveral years one of its repreſentatives in parliament. He was born October 11, 1675. William Cuningham, a phyſician of Norwich, was born in the year 1531. Thomas Legge, antiquary, born in 1535. John Coſin, biſhop of Durham, the eldeſt ſon of Giles Coſin, a citizen of Norwich, was born November 30, 1594. Edward King, F.R.S. and F.S.A. deſcended from a Norfolk family of high reſpectability, was born at Norwich 1734. He died in London April 16, 1807. Annals of Norwich, in Watſon's Anglia Sacra, a complete hiſtory of the famous city of Norwich, 8vo. 1728. A hiſtory of this city forms two volumes of Blomefield's collection, for the county of Norfolk. Beauties of England, vol. xi. 1809, by J. Britton, F.S.A.

Norwich, a conſiderable townſhip in Windſor county, Vermont, on the W. ſide of Connecticut river, oppoſite to Dartmouth college; containing 1486 inhabitants.—Alſo, a townſhip in Hampſhire county, Maſſachuſetts, 14 miles S.W. of Northampton; incorporated in 1773, and containing 959 inhabitants.—Alſo, a city and poſt-town of Connecticut, and of the ſecond rank in New London county, ſituated at the head of Navigation or Thames river, 14 miles N. of New London. This is a convenient city, and has an extenſive and rich back country; and being ſituated on a navigable river, has convenient ſeats for mills and water machines of all kinds. The inhabitants manufacture paper of many kinds, ſtockings, clocks and watches, chaiſes, buttons, ſtone and earthen ware, oil, chocolate, wire, bells, anchors, and all ſorts of forge-work. It contains about 500 dwelling-houſes, a court-houſe, two churches for Congregationaliſts, and one for Epiſcopalians, and 3476 inhabitants. The town conſiſts of three diviſions, *viz.* Chelſea at the landing, the Town, and Bean hill, in which latter diviſion is an academy, and in the town is an endowed ſchool. The courts of law are held alternately at New London and Norwich. This town was ſettled in 1660, by 35 perſons, principally from Saybrook; 251 miles N.E. of Philadelphia. N. lat. 41° 34'. W. long. 72° 29'.—Alſo, a townſhip in Chenango county, New York, incorporated in 1793, ſettled principally by people from Connecticut, bounded ſoutherly by Oxford, lying 55 miles W. of Cherry valley, and containing 2219 inhabitants.—Alſo, a place now called "Whitby," in Upper Canada, on the N. ſhore of lake Ontario.—Alſo, a townſhip in Norfolk county, Upper Canada, E. of and adjoining Dereham.

NOSAG, a town of Bengal; 20 miles S.S.E. of Palamow.

NOSAPOUR, a town of Hindooſtan, in the circar of Hindia; 10 miles N.E. of Hurdah.

NOSCHALSKOI, a town of Ruſſia, in the province of Uſting; 68 miles S.E. of Lalſk.

NOSE, in *Anatomy* and *Phyſiology*, the organ of the ſenſe of ſmelling.

The noſe conſiſts of two large cavities, called noſtrils (nares), a right and left, formed by the bones of the face, extending from before backwards, placed between the two orbits above, and immediately over the palate below, and ſeparated from each other by a perpendicular flat partition, called the ſeptum narium.

The noſtrils, of which the right and left are perfectly alike, are ſurmounted in front by a pyramidal organ, compoſed of cartilage, and called in common language the noſe. At the baſis of this are two openings, leading into the noſtrils. Theſe cavities terminate behind, by two much larger apertures, in the upper and front part of the pharynx.

The bones compoſing the noſe are deſcribed individually in the article Cranium, which contains alſo a general account of the cavities reſulting from their union. The bony hollows are lined by a vaſcular membrane, called the pituitary or Schneiderian, on which are diſtributed the olfactory nerves, the immediate ſeat of the ſenſe.

As the noſtrils are open in front to the external air, and behind to the pharynx, on the ſurface of which the entrance of the air into the trachea (rima glottidis) is found, they ſerve, as well as the mouth, for the paſſage of the atmoſphere in reſpiration to and from the lungs. Odours diſſeminated in the air are thus brought in contact with the pituitary membrane, and impreſs the olfactory nerves in that membrane.

In the detailed deſcription of the apparatus of the ſenſe of ſmelling, we ſhall notice, 1, the external organ; 2, the general poſition, figure, and dimenſions of the noſtrils or internal cavities; 3, the communications of the latter with the pharynx; 4, the membrane lining them and its nerves; 5, the developement of the noſe; 6, the phyſiology of ſmelling.

I. The noſe, which covers and completes the organ of ſmelling towards the front, occupies the middle and upper part of the face, bounded above by the forehead, below by the upper lip, and on the ſides by the orbits and cheeks. The ſize and form are ſubject to numerous varieties; but the latter is moſt commonly that of a triangular pyramid, with its baſis downwards, its apex upwards; a poſterior ſurface confounded with the noſtrils, and two lateral ones. Each of the latter is ſeparated from the cheek behind by a ſemicircular groove, which then advances a ſhort way upon the lateral ſurface. The two lateral planes meet together in front in a ridge of various breadth, directed obliquely from above forwards and downwards, and called in Latin dorſum naſi (dos du nez). This ridge ends below in a prominence conſtituting the tip of the noſe (le lobe).

The baſis of the noſe preſents two oval openings, ſeparated

rated by a partition continuous with that which divides the noſtrils. Their outer ſides are moveable, and are called the alæ naſi. The openings are always patulous, and thus afford a conſtant paſſage to the air in reſpiration; the cartilaginous nature of their ſides provides for this circumſtance.

The top of the noſe is continuous with the forehead and eyebrows; behind, it is joined in the middle by the ſeptum of the noſtrils, and it is continued on the ſides with the cheeks.

The noſe is covered in front by a double layer of muſcle and ſkin, and lined internally by a mucous membrane. But the eſſential part of the organ is a bony arch above, formed by the two oſſa naſi, and, below this, membranous fibro-cartilages. Hence it is ſolid and capable of great reſiſtance at the upper part, ſo as to protect the correſponding portion of the noſtrils, the immediate ſeat of ſmelling made up of the thin brittle plates of the ethmoid, from external injury; comparatively weak, and ſuſceptible of motion below, ſo that the openings may be expanded, contracted, or even entirely cloſed. The middle, although compoſed of cartilage, does not move; the dimenſions of the openings are altered by movements of the ſides or alæ naſi.

Cartilages of the Noſe.—The moſt conſiderable of theſe is a piece which forms the ſides of the anterior opening, and is called by Bichat fibro-cartilage des ouvertures naſales. Its figure is curved, as it conſiſts of two portions or branches united in front at an obtuſe angle at the tip of the noſe. The external branch correſponds to the alæ naſi, and extends upwards and backwards to terminate in a point; it is covered by the compreſſor muſcle, and by the ſkin on one ſide; by the mucous membrane on the other. The inner branch lies along the ſide and front edge of the ſeptum, and contributes greatly, with the correſponding one of the oppoſite ſide, to the thickneſs of this part of the noſe. It is broad in front, and terminates in a point behind. One ſurface of it is contiguous to the ſeptum; the other is covered by the ſkin, and the commencement of the mucous membrane. The union of theſe two branches forms a prominence at the point of the noſe, of which the convexity is very variable. There is generally a ſlight groove, which is ſometimes hardly apparent, ſeparating this from the correſponding part of the oppoſite ſide.

Another ſmall piece is placed at the lower and back part of the alæ naſi, where it is continuous with the cheek; it is merely a flat portion of irregular figure, ſurrounded on every ſide by a kind of fibrous membrane, which unites it to the outer branch of the former, to the cartilage of the ſeptum, and to the naſal proceſs of the ſuperior maxillary bone. This is placed between the ſkin and the mucous membrane.

The parts juſt deſcribed are of the fibro-cartilaginous texture; they retain their form, when no force is applied to them; ſo as to leave the noſtrils free for the purpoſe of reſpiration; but they yield eaſily to the muſcles connected with them.

The middle of the noſe is formed by a piece of true cartilage, poſſeſſing greater firmneſs than the parts juſt deſcribed. It is called the cartilage of the ſeptum, and by Bichat cartilage naſal. It is made up of three portions; two exterior and anterior, forming the ſides of the upper part of the noſe, and one poſterior and middle completing the ſeptum narium. Theſe three portions are united in front, at the dorſum of the noſe, at an acute angle. They are deſcribed diſtinctly by moſt authors, under the names of cartilage of the ſeptum, and lateral cartilages.

The middle and poſterior is the moſt conſiderable portion, and belongs to the internal cavities, as well as to the external organ. It is a broad flat piece ſituated on the middle line of the noſe, and has a triangular figure. Its direction is ſometimes perpendicular; ſometimes it deviates towards one ſide or the other; in the former caſe, its lateral ſurfaces are plane, in the latter convex and concave. Theſe have ſeveral inequalities and pores, to which the membrane of the noſe adheres very cloſely. The upper edge has an oblique direction, backwards and downwards; it is irregular, and either encloſed between two plates of the perpendicular lamina of the ethmoid, or, if that be ſingle, ſimply continuous with it. The inferior margin is received behind between two plates of the lower, and is here rather oblique in the direction forwards and downwards; in front it is rounded, not adherent to any part, but placed between the internal branches of the right and left fibro-cartilages of the openings of the noſe, and concurring with them to form the partition between thoſe openings. The anterior edge forms the middle of the back of the noſe; it is thick above, where it is ſubcutaneous and prominent, thin below, where it is entirely concealed by the internal branches of the fibro-cartilages of the naſal openings, between which it ends in an obtuſe angle, formed by its union with the inferior margin, and correſponding to the tip of the noſe.

This portion of the cartilage is porous and unequal on the ſurface; leſs flexible than the pieces deſcribed previouſly, and breaking much more readily when bent. Its ſtructure, in ſhort, is more perfectly cartilaginous, and gives it ſolidity correſponding to its functions, in which there is no motion.

The upper half of the anterior edge of the part juſt deſcribed gives origin to the lateral portion on each ſide. This is continuous with the middle piece at this part, but ſeparated from it below by a cellular interval. Its form is triangular, and ſize variable; and it is directed obliquely along the ſide of the noſe. Above, it is connected to the os naſi and ſuperior maxillary bone by ſhort ligamentous fibres; below, by a looſe ligamentous tiſſue, to the external branch of the fibro-cartilage of the naſal opening. The external ſurface is convex, and covered by the compreſſor and ſkin; the internal is concave, and lined by the pituitary membrane. It is thin, and therefore has ſome flexibility, but its motions are always inconſiderable. When the openings of the noſe are dilated, the ala is the part that moves chiefly.

The cartilages juſt deſcribed are connected to each other, and to the edges of the bony opening by a thin, but tolerably firm fibrous membrane; to the inſide of which the pituitary adheres very cloſely. They vary very much in ſize and figure, and hence ariſe numerous differences in the outward appearance of the organ in different individuals. Theſe variations are of no importance anatomically ſpeaking. The bony part of the noſe is conſtituted by the oſſa naſi and the naſal proceſſes of the ſuperior maxillary bones. Theſe are united above to the frontal bone, and form a ſtrong arch, by which the interior of the organ is protected.

The naſal fibro-cartilages give inſertion to various muſcles, which form a ſtratum covering them under the ſkin. Theſe are the EPICRANIUS, COMPRESSOR *narium*, DEPRESSOR *alæ naſi*, NASALIS *labii ſuperioris* (ſee thoſe words), and the *levator labii ſuperioris* and *alæ naſi*, (ſee DEGLUTITION.) The motions of the cartilages have reference to two effects, *viz.* the dilatation and contraction of the openings. In the former the alæ are drawn upwards and outwards, ſo as to enlarge the aperture laterally; we obſerve this motion in a perſon breathing very laborioufly, and in ſome paſſions of the mind. The ala is drawn downwards, and applied againſt the ſeptum, when the opening is cloſed; this is a motion not very frequently performed.

The ſkin of the noſe is looſely connected to the ſubjacent parts above, and more firmly below. It is remarkable in

the latter ſituation for poſſeſſing a conſiderable number of ſebaceous glands, the ducts of which appear on the ſurface, when the cuticle has been removed, in the form of numerous pores. Their contents may be ſqueezed out after death in ſlender white threads.

The organ is covered internally by a mucous lining, which forms the tranſition from the common integuments to the pituitary membrane. It is ſoft and vaſcular, has a very diſtinct cuticle, and numerous ſtrong hairs, which are ſometimes long enough to project at the opening.

II. *Cavities of the Noſtrils.*—For their general figure, the bones compoſing them, &c. ſee CRANIUM.

The noſtrils are ſeparated from the cranium by the cribriform plate of the ethmoid; the palatine portions of the ſuperior maxillary and palate bones form the inferior boundary, by which they are parted from the mouth. The orbital ſurface of the ethmoid and the os unguis cloſe them towards the orbit; and they extend laterally to the projection of the cheek, under the eyes, if we include the maxillary ſinuſes.

Their direction is nearly horizontal, from the openings by which they commence in the face, to their termination in the pharynx: at the back part, however, they ſlope a little downwards, principally on account of the inclined ſurface of the body of the ſphenoid. The inferior boundary, compoſed of the bony palate, is ſtraight and horizontal. The ſuperior is curved from before backwards, and compoſed in front of the oſſa naſi, in the middle, of the cribriform plate of the ethmoid, and behind, of the body of the ſphenoid. The oſſa naſi ſlant downwards and forwards from the front of the ethmoid, and the ſphenoid downwards and backwards from the back of the ſame bone. Hence the perpendicular meaſurement of the noſtril is greateſt in the middle, from the ethmoid to the ſuperior maxillary bone, and it gradually decreaſes from this point towards the front and back openings. The antero-poſterior diameter is the moſt conſiderable; the longeſt meaſure of this is in the middle; it diminiſhes upwards on account of the curved figure of the roof of the noſe, and it alſo diminiſhes downwards, but not ſo much.

The tranſverſe meaſurement is greateſt below, and becomes ſmaller as we aſcend: the ſuperior concha is very nearly in contact with the ſeptum. Indeed, that the tranſverſe diameter of the noſe is on the whole inconſiderable, muſt be apparent from the fact, that the ſwelling of the membrane in cold very often entirely obſtructs the paſſage of air through it.

III. The opening of the noſtrils behind into the pharynx is placed immediately under the baſis cranii, and over the velum palati. There are two nearly oval apertures, about an inch in length, by half an inch wide, ſeparated by the poſterior edge of the vomer. The body of the ſphenoid above, its internal pterygoid plates at the ſides, and the back edge of the oſſa palati below, form theſe openings, which muſt be inſuſceptible of change in their dimenſions, as all theſe parts are fixed. The velum palati may be drawn up, ſo as to cloſe theſe apertures, and prevent the air from paſſing through the noſe in breathing, or to prevent the food in deglutition, or the contents of the ſtomach in vomiting, from being admitted into the noſtrils. See DEGLUTITION.

IV. The cavities of the noſe are lined throughout by a mucous membrane, which conſtitutes the eſſential organ of ſmelling. It is extended over all the eminences of the noſtrils, and enters all the cavities. In front it is continuous with the ſkin, and behind with the mucous ſurface of the pharynx.

If we begin to trace it from the floor of the noſe, we ſee it aſcending along the ſeptum to the roof of the cavity, forming no fold in its courſe, and eaſily detached from the bone and cartilage that compoſe the ſeptum. It is continued on the under ſurface of the cribriform plate, of which it cloſes the foramina: in front it paſſes to the back of the oſſa naſi, and behind to the under ſurface of the ſphenoid, entering and lining the cells of that bone, ſometimes contracting their orifice, ſometimes leaving it as wide as in the ſkeleton.

The pituitary membrane is then continued over the external ſurface of the noſtril, firſt covering the flat plate of the ethmoid and the ſuperior concha, and then reflected at the convex edge of the latter, to enter the ſuperior meatus. The fold is looſe, and deſcends rather lower than the edge of the concha, ſo as to contract the entrance of the meatus: behind it is continued towards the pharynx, beyond the poſterior end of the concha. Here it cloſes the ſphenopalatine foramen, through which the pituitary receives veſſels and nerves. The membrane lines the poſterior ethmoid cells, then covers the middle concha, is reflected at its inferior edge, and thus enters the middle meatus, which it lines. It is prolonged through an opening, generally very narrow, into the maxillary ſinus, which it lines. The entry to the ſinus is near the front of the meatus; and the aperture leads into the upper and anterior part of the cavity. After removing the middle concha, a bony plate is expoſed, covered by the pituitary membrane, and terminating above by an unattached edge: this plate conceals the narrow entrance of the ſinus. The large opening of this cavity in the ſeparate maxillary bone is diminiſhed by the appoſition of the ſurrounding bones; but it is ſtill farther contracted by the membrane, of which there are two layers at this part; one belonging to the noſe, the other to the ſinus. Above the entrance of the maxillary ſinus there is an aperture, by which the membrane paſſes into the anterior ethmoidal cells and the frontal ſinus, without forming any fold.

From the middle meatus the membrane is continued over the inferior concha, forming a very thick and large fold at its margin, by which the apparent depth of the concha is much increaſed. At the edge of the inferior concha the membrane paſſes into the inferior meatus, lines it, is continued with the mucous lining of the ductus naſalis, and then paſſes to the floor of the noſe, from which part we firſt traced it.

In front the pituitary membrane lines the cartilages of the noſe: behind it goes out at the poſterior naſal apertures to join the membrane of the pharynx, paſſing above under the body of the ſphenoid, below over the velum palati. At the back edge of the ſeptum, the membranes of the two noſtrils are continuous with each other. Towards the outſide of the opening it forms a more or leſs diſtinct perpendicular fold; behind which, juſt where the noſe and pharynx join, it covers the cartilage of the Euſtachian tube, forming above it a deep cul de ſac.

The pituitary or Schneiderian is analogous to other mucous membranes in the fluid, which it produces, but differs from them in its thickneſs, which is much more conſiderable. Its colour is generally very red; but this differs in different parts and ſubjects. A fibrous layer, which is only the perioſteum or perichondrium of the naſal cavities, is joined to a mucous ſtratum, in order to form the pituitary membrane, which muſt conſequently be claſſed among the fibro-mucous organs. This ſtructure may be very eaſily ſhewn by breaking the ſeptum, and removing the fragments; the fibrous portion is not injured, becauſe it adheres leſs firmly

to

to the bone than to the mucous ſurface, while the perioſteum in other ſituations is much more cloſely attached to the bone than to the ſurrounding parts. When the pituitary is thus ſeparated, it forms a very thick membrane, whitiſh, denſe, and ſtrong on the ſurface next to the bone; ſpongy, ſoft, and red towards the noſe. Yet, though the external appearance and nature of the two laminæ are ſo different, they are inſeparably connected together. The mucous layer is compoſed of a well defined corion, to which its thickneſs is owing. Its ſpongy texture is obſervable, particularly about the conchæ, and more eſpecially at their edge. Many anatomiſts have ſuppoſed that mucous glands exiſt in this membrane; but we cannot demonſtrate them. However, numerous ſmall pores and cavities are obſervable on many parts of its ſurface, which may be conſidered as mucous lacunæ. There are no papillæ on it. The capillaries are very numerous and ſuperficial, and often bleed from very ſlight accidents: fine injections penetrate through the membrane in every direction, and give a general deep red colour.

In the proper cavity of the noſtril, the pituitary membrane has throughout nearly an uniform ſtructure; but its appearance is very different in the ſinuſes. It is thin, not ſpongy, but ſmooth on the ſurface, eaſily detached from the bone, and poſſeſſing a much ſmaller ſhare of capillaries, except when it is inflamed.

The ſoft ſurface of the pituitary membrane is every where covered by a mucous fluid, either ſecreted by glands, if ſuch exiſt, or furniſhed by the exhalant arteries of the part. This fluid is thick, tenacious, and whitiſh, and more abundant in the cavities of the noſtrils than in the ſinuſes. The paſſage of the air dries it, and converts it into a hard cruſt of different appearances. In that affection of the noſe, which conſtitutes a cold, this mucous fluid is poured out in increaſed quantity, firſt tranſparent and thin, afterwards thick, tenacious, and white, or yellow. The naſal mucus, under ordinary circumſtances, is probably, in part, evaporated by the conſtant current of air in breathing to and from the lungs: it is partly expelled by the ſtrong current of air directed through the noſtrils in the act of blowing the noſe, and probably flows through the back openings into the pharynx. The latter is the courſe which it takes in the act of hawking: by drawing the air into the lungs entirely by the noſtrils, the mucus is forced from thoſe cavities into the pharynx, and expelled from it again by the mouth.

The openings of the frontal and ethmoid ſinuſes are ſo diſpoſed, that the mucus poured out in them will by its gravity paſs into the noſe: but this is not the caſe with the ſphenoid or ſuperior maxillary cavities. The mucus may run out of the latter, when the head lies on its ſide, but we do not ſee how it can be evacuated in the erect poſition.

It is, perhaps, hardly neceſſary to notice here the erroneous notion, which for ſo long a time prevailed univerſally in phyſiology and pathology, and which is generally entertained to this day by thoſe who are ignorant of anatomy, that the naſal mucus comes from the head, that it is a kind of excrement of the brain diſtilling through the foramina of the ethmoid. When we ſee an opinion, which an eaſy anatomical labour would have deſtroyed, univerſally maintained for centuries, we may conclude with certainty that the opportunities of reſearch were extremely limited, and that the anatomical works of the ancients muſt be completely deſtitute of information for us. Even Veſalius adopted the general error, which was not clearly refuted until after the middle of the 17th century, when C. V. Schneider publiſhed his work De Catarrhis, and ſhewed that there is no connection between the brain and noſe, that the dura mater covers the cribriform plate above, and a peculiar membrane below, and that the latter, extended over the whole naſal cavity, is the ſource of the fluid generated in catarrh.

In conſidering the action of the air on the pituitary membrane and its ſecretions, we muſt bear in mind that that portion which is ſent from the lungs is moiſt air; that it is loaded with the watery vapour formed in the proceſs of reſpiration.

The *nerves* of the pituitary membrane are derived from different ſources. The origin of the olfactory, and its courſe to the ſuperior ſurface of the cribriform plate, are deſcribed in the article Nervous *Syſtem*. From the ſoft ganglion which it forms in the cranium numerous branches ariſe, and paſs through the holes of the cribriform plate. They acquire a firm covering in this paſſage, ſo that they are as hard on the outſide of the cranium as any other nerves. They paſs through the bony canals of different lengths, which are continued from the foramina juſt mentioned. The filaments, which penetrate the internal ſeries of holes, are expanded on the anterior and middle portion of the ſeptum narium: they divide into branches, which again ramify, and are ſometimes united by communications: they are ſo involved in the texture of the membrane, that they can hardly be traced below its middle. The outer ſeries of twigs is expanded in a ſimilar way on the ſuperior and middle turbinated bones, but cannot be traced beyond the convex edge of the latter. They are ſpent on that ſurface of theſe bones, which forms a part of the cavity of the noſtril, and not on that which is concerned in forming the ethmoid cells.

The lower and poſterior part of the ſeptum, and the inferior concha, receive branches from the ſuperior maxillary nerve: The naſal branch of the ophthalmic nerve is loſt upon the front of the ſeptum, and the tip of the noſe. See the deſcription of the ramifications of the nerves. For excellent deſcriptions and repreſentations of the naſal nerves, ſee J. Hunter on the Animal Economy, and Scarpa Annot. Academ. lib. ii., particularly the latter. The pituitary membrane poſſeſſes two kinds of ſenſibility, correſponding to the two kinds of nerves diſtributed on it. The firſt is that peculiar ſpecies, by which it is enabled to perceive odours; it reſides in the olfactory nerves. The ſecond is common ſenſation, or the power of receiving thoſe general impreſſions which affect all organs poſſeſſing ſenſibility, and which, in this caſe, is exerciſed by the branches of the nerves of the fifth pair. That theſe properties are in ſome degree independent, is rendered obvious by the phenomena of diſeaſe. A tumour preſſing on the olfactory nerve, or any local diſeaſe affecting the ſame nerve, deſtroys the ſenſe of ſmelling; which ceaſes alſo in the inflammation accompanying a common cold: yet in both theſe inſtances, the common ſenſation of the part continues; and a foreign body, introduced into the cavity, will produce the ſame inſupportable tickling as in a perfectly healthy ſubject.

The pituitary membrane has very cloſe ſympathetic connections with other parts. Irritation of it by ſtimulating powders, acrid fumes, even by its own ſecretion in increaſed quantity, &c. will cauſe a flow of tears, and excite that convulſive action of the reſpiratory muſcles, called ſneezing. (See Lungs.) Certain odours excite nauſea, and even ſickneſs; and ſome cauſe fainting. It has been aſſerted, that the impulſe on the retina, when a perſon comes ſuddenly from a dark place into a bright light, will cauſe ſneezing. The brain is moſt readily excited in ſyncope, by applications to the noſe. This is a fact univerſally known, ſo that burnt feathers, ammoniacal ſubſtances, &c. are immediately applied to the noſe of a perſon diſpoſed to faint. It will be obſerved,

obſerved, that in almoſt all theſe caſes, an irritation of the pituitary membrane affects other parts; and that the pituitary is affected ſympathetically, only in the inſtance of ſneezing, or expoſure to a ſtrong light, even if that be admitted.

V. *Progreſſive Developement of the Noſe.*—The eye, at the time of birth, is as large and as perfect in its ſtructure as it will be at any ſubſequent period of life; and moſt parts of the internal ear are equally complete in their formation, at the ſame time. But the caſe is very different with the noſe, of which the formation, at the time of birth, is very incomplete.

Inſtead of the diverſities which are obſerved in the noſes of adults, that of the fœtus and the child has almoſt invariably the ſame form, character, and ſize. It is flattened, and extends more laterally. The uniformity of its figure coincides with the general uniformity of the face at this age; and its difference from the ſhape of the adult noſe correſponds with the general difference of character in the countenance of the child and grown perſon. The back openings are very ſhort from above downwards, and very oblique: the latter circumſtance ariſes from the inclination of the pterygoid proceſſes forwards.

The cavities of the noſtrils are remarkable for their ſmallneſs: the perpendicular diameter is very inconſiderable, the antero-poſterior is longer, and the tranſverſe does not differ ſo much from that of the adult as the others.

In the ſeptum, the lamina of the ethmoid is cartilaginous, and forms a ſingle layer with that of the proper cartilage of the ſeptum: the vomer is already oſſified. The conchæ are long, but very narrow. The ethmoid cells do not yet exiſt, this part of the bone being almoſt entirely cartilaginous; but ſlight traces and rudiments of them may be diſcerned. The frontal, ſphenoidal, and maxillary ſinuſes are not yet formed. The pituitary membrane is leſs denſe, and its capillaries are very abundant. The roof of the cavity, formed by the cribriform plate, and its floor, are conſiderably advanced in their formation. The olfactory nerve is remarkably large, ſo as to preſent a ſtriking contraſt to the ſize of the organ: it is proportionably larger than the optic. The nerves of the body in general do not correſpond in ſize with the developement of the organs, as the arteries do.

It ſeems probable that the power of ſmelling is very imperfect in the infant: odours appear to affect them very little. Blumenbach notices a relation between this ſtate of the ſenſe and the condition of the individual, at the age we are now conſidering. "Cuivis attendenti quoque patet, nullo quam hoc ſenſu infantes tenellos facilius carere: nec hebetiorem diutius perferre poſſe alium, quam ipſum odoratum. Partem enim nimis adhuc imbeciles ſunt, ut ſibi ipſi alimenta quærere nequeant, nec ad diſtinctionem eorum acri odoratu indigent, verum pro reſpectu vario longe diutius, quam quodvis aliud animal, aliena cura egent. Partem quoque debiliore odoratu ipſis conſultum videtur, cum ex ipſa eorum imbecillitate nonnulla in ipſos incommoda redundent, quorum injucunditate, delicatiore naſo magis afficerentur." De Sinib. Frontal. p. 7.

The ſinuſes do not begin to be developed till ſome time after birth: the maxillary does not appear before the teeth, and its developement coincides with that of thoſe organs, but is not ſo rapid. The frontal and ſphenoidal do not begin to appear until after the maxillary. All of them are formed very ſlowly, and they are by no means of their full ſize, when the growth of the body in general has ceaſed. The change of the voice at puberty, and after caſtration, is independent of any peculiar developement of the ſinuſes.

The general cavity of the noſe has reached its full ſize in adult age, but the ſinuſes ſtill increaſe. This growth is not, however, indefinite, although we cannot aſſign the preciſe period when it ſtops. In the old ſubject, the pituitary membrane loſes its redneſs, and becomes more denſe. The power of ſmelling, as well as that of taſting, is leſs frequently loſt in old age than that of ſeeing and hearing: the former, Bichat obſerves, are more cloſely connected with the organic life, of which the functions go on in old age, after thoſe of the animal life have partly ceaſed.

VI. In the laſt diviſion we have anticipated many remarks, that might be arranged under the head of the phyſiology of ſmelling.

The nature of odours is very little underſtood, and has been the ſubject of few, if any, experimental inveſtigations. The remark of Haller is ſtill applicable to it: "Neſcio quomodo factum ſit, ut in ſalium figuras, lucis radios, aeris tremores, ſubtiliſſimis experimentis ſit inquiſitum, ad corpuſcula vero, quæ odorem excitant, cognoſcenda, adeo exigua hominum fuerit curioſitas," &c. (Elem. Phyſiol. t. v. p. 154.) The notion generally entertained is, that moſt, or perhaps all, bodies conſtantly give off a ſomething, called odorous particles or effluvia, which is expanded in the ſurrounding air. We know only that the preſence of odorous bodies is perceived by us through the medium of the atmoſphere; and that the element, whatever it be, which affects us, is of almoſt infinite diviſibility. A ſmall particle of muſk will ſcent a room for many days, and affect numerous ſucceeding atmoſpheres; yet there is no perceptible loſs of ſubſtance in the muſk. Two grains of camphor diſſolved, filled a room with its peculiar ſmell; whence it was found by calculation, that a particle not heavier than $\frac{1}{22633440000}$ of a grain, muſt have been perceived by the noſe. Haller mentions that a large quantity of papers were ſcented by a ſingle grain of ambergris, and that the odour was retained at the end of 40 years; therefore, at the loweſt calculation, a ſquare inch of paper received its odour from $\frac{1}{269106240000}$ of a grain. We ſhall not be ſurpriſed, after conſidering ſuch examples, which indeed are quite familiar, to read the accounts of travellers, who ſtate that the ſpicy fragrance of Arabia, Sumatra, Ceylon, &c. is diſcovered by the noſe at the diſtance of many miles (30 or 40, for example) from the ſhore. The power of tracing their prey by the ſcent, in animals, is another proof of the wonderful ſubtilty of the odoriferous particles; although we may be permitted to doubt ſome of the examples commonly referred to this head, as that of a dog following his maſter 100 leagues after ſome days, of the vultures being attracted from Aſia by the effluvia of the bodies after the famous battle of Pharſalia, &c. &c.

Haller concludes that the odoriferous effluvia are more groſs than light, heat, or magnetic and electric fluids; ſince they penetrate glaſs, which the former do not.

Although the odoriferous effluvia ſeem, from the preceding accounts, to be extremely ſubtle, they are capable of producing very conſiderable and well-marked effects on the human frame. Not to mention the well-known action of very unpleaſant odours in exciting nauſea, and even vomiting, Haller has collected many caſes in which purging, convulſions, and even fainting, have been cauſed by ſmelling particular ſubſtances. Ambergris, muſk, roſes, &c. have had the latter effects. The idioſyncraſies, in conſequence of which the ſmell of a cat, of cheeſe, &c. cannot be tolerated, are well known. Examples are not wanting of death produced by very offenſive ſmells, particularly of the putrid kind; and it is related that very powerful aromatic ſcents have been equally fatal. The ſmell of ſaffron is ſaid to be capable of producing ſleep, even in the mules who carry it.

Haller

Haller has attempted to arrange odours into certain claſſes; but he ſeems to have arrived at no very ſtriking reſults. The diſtinctions of them, according to their effect of exciting pleaſure or averſion in us, are not quite conſtant. Although in general, as Haller obſerves, all mankind are pleaſed by the ſmell of the roſe, the violet, and cinnamon, &c., and deteſt that of a putrifying body, of fæces, or of the polecat; yet peculiarities of conſtitution, habit, and aſſociation, have great effect in making us like or diſlike particular ſmells. Haller ſays, that he could not bear the ſmell of cheeſe, of meat at all approaching to putrefaction, of garlick, or any ſtrongly ſmelling ſubſtance. We ſoon approve of the ſmell of things which are ſerviceable in miniſtering to our wants. "Gratus hinc Grænlandiæ incolis odor olei balænarum, et phocarum; quibus populis in ea ultimæ terræ habitabilis infecunditate, nihil præter piſces, natura reliquit præſidii. Eos ergo rancidiſſimos adipes eadem cum voluptate potant, cum qua Europæi calyces Falerni ſiccant. Gratus odor Siamenſibus ovorum incubatorum, qui ejuſmodi ovis veſcuntur: gratus caſei odor iis, qui hoc cibi genus amant. Africani cadaveribus putridis elephantorum paſcuntur. Romani fœtidiſſimum garum, putridorum nempe hepatum piſcium liquamen, habebant in deliciis." Elem. Phyſiol. tom. v. p. 170.

The noſe is the moſt common paſſage for the atmoſpheric air to and from the lungs in reſpiration: when the mouth is open, that alſo partly tranſmits the air, but if we continue to breathe long in this way, a diſagreeable dryneſs of the tongue, &c. is produced. The odoriferous effluvia are carried into the noſe by the air, brought into contact with the pituitary membrane, and thus impreſs the olfactory nerves, ſo as to cauſe perceptions of odours; hence we ſmell without any particular action or effort, in the ordinary proceſs of breathing. When we wiſh to explore the odorous qualities of a body more accurately, we cloſe the mouth, and draw in the air by repeated ſmall inſpirations, ſo as to bring ſeveral freſh portions into contact with the pituitary membrane: this is called ſniffing.

It is only by the medium of the atmoſphere that odours are conveyed into the noſe; if the paſſage through theſe cavities be obſtructed, as by elevating the velum palati, cloſing the front openings, by polypi, &c. the perception of odours ceaſes.

We do not conceive that the whole noſe is equally the ſeat of this ſenſe, which, on the contrary, appears confined to the upper region of the cavity, to the ſuperior turbinated bones, and the upper part of the ſeptum, on which the olfactory nerve is diſtributed. That the ſinuſes are not eſſential to ſmelling, muſt be concluded from the circumſtance that children ſmell before theſe cavities are formed. No affection of the noſe, no diſeaſe of its bones, which does not involve the parts juſt ſpecified, injures the ſenſe. The curiouſly convoluted ſtructure of the ſuperior conchæ, the artificial arrangement of the foramina and canals, both in theſe and in the ſeptum, and the numerous nerves diſtributed here, all concur in making us fix on theſe parts as the organs of ſmelling. In the plain bony excavations forming the ſinuſes, in the thin membrane lining them, and provided with hardly any diſcernible nerves, we ſee no marks of a ſtructure denoting an organ of ſenſe. In birds and fiſhes there are parts analogous to the conchæ, with ſimilar diſtribution of olfactory nerves; but no ſinuſes.

It is not, perhaps, ſo eaſy to determine the uſe of the ſinuſes. Some have conceived that they are connected with the power of ſpeech or voice, and contribute to render it more ſonorous. This notion has been well refuted by Blumenbach, with reſpect to the frontal ſinuſes; and his remarks are equally applicable to the others. "Loquelæ enim, eximiæ hominis prærogativæ, hos inſervire ſinus, ex eo improbabile eſt, quod tot animalia infra recenſenda ſimilibus quidem ſinibus, nullum vero, præter hominem, loquela inſtructum ſit: quia et variis in morbis, de quibus poſtea ſermo erit, ſinus frontales abſque loquelæ detrimento plane defecerint. Sed neque ad vocem, quæ humano generi cum reliquis animalibus, quæ per pulmones ſpirant, communis eſt, multum nobis conferre videntur. Infans enim, diu antequam ipſius conficti ſunt ſinus frontales, et antequam loqui didicit, voce acuta pollet: et multa animalia vocalia abſque ſinibus; et contra ſtupendis alia ſinibus, attamen debili ſaltem voce prædita, videbimus. Denique per univerſam fere Europam innotuit exemplum Jo. Beckii, qui cum magna palati tam mollis quam oſſei parte pleraque etiam naſi organa (*viz.* oſſa naſi, ſeptum cum vomeris maxima parte, ſpongioſa inferiora in totum, eorum autem quæ ad os cribroſum pertinent magnam partam) perdiderat. Is ſpongia obturatis ſinibus et frontis et reliquorum calvariæ oſſium, adeoque abſque ullo narium ſinuumque juvamine, imo abſque molli uvula, (quam magis deglutitioni quam ſermoni prodeſſe exinde concludere licet) diſtincte ſatis loqui, et ſonoras voces edere poterat: cum e contrario ſublata ſpongia et apertis adeo ex larynge ad ſinus calvariæ viis, plane non loqui et ægre vociferari potuerit." Proluſio Anatom. de Sinibus Frontalibus; 1779.

It ſeems moſt probable that the ſinuſes are connected with the buſineſs of ſmelling; for we can aſſign no other function to them, and they are largeſt in animals, which have this ſenſe in the greateſt perfection; we are at a loſs, however, to ſhew how they contribute to this proceſs. Some have conceived that the air, loaded with odoriferous effluvia, enters them and is retained, ſo as to make the odour more permanent. Blumenbach thinks that the frontal ſinuſes ſecrete a watery fluid, which is of uſe in moiſtening the pituitary membrane in the upper part of the noſe, and rendering it more ſenſible.

The ſenſe of ſmelling performs many important uſes in animals; it enables them to trace their prey, and conducts them, at conſiderable diſtances, to objects that afford them ſubſiſtence. By pointing out the diſtinction of wholeſome and noxious plants, it protects the health of the herbivorous tribes. It diſcloſes to them the approach of their friends and enemies; and aſſiſts in the gratification of their appetites by guiding them, at the ſeaſon of love, to thoſe of their own ſpecies.

The advantages which the human ſpecies derives from this ſenſe are not ſo obvious. In civilized ſociety we make little or no uſe of it in ſelecting our food; indeed we conſume very offenſive things, as rotten cheeſe, ſtinking meat, &c. and it is not clear that the latter is leſs wholeſome than what is freſh. Uncultivated people are not deterred by what we deem the moſt diſguſting effluvia, of putrefying whales, ſeals, fiſh, and rancid oil, from employing theſe matters for food, and do not ſeem to be injured by their uſe. A man is not led to his mate by the ſcent, like a bull or a ſtallion. We derive, however, pleaſure from the exerciſe of ſmelling, when it is employed on ſome kinds of odours; and this has been regarded as an object of the ſenſe. "Quod autem creator opt. max. humano naſo tam inſignibus ſinibus, tamque mira et intricata fabrica ſtuduerit, hoc vero tanto magis ejus bonitatem declarat, quanto certius homini naſus, non ut ceteris animantibus tantum neceſſitatis cauſa, ut victum nempe diſcernere poſſit, ſed magnam partem ad voluptatem quoque et jucunditatem datus eſt. Quanquam enim impreſſiones, odoratus ope in ſenſorium commune effectæ, tenues plerumque ſint et tranſitoriæ; tamen ex omnibus quinque,

quos

quos vulgo numerant ſenſus externos, nullus alius tam celeres tam efficaces in toto encephali et nervorum ſyſtemate producit effectus, quam ipſe, de quo agitur, odoratus. Ut enim momentaneas et mirandas vires fragrantium rerum in ſyncopatis, taceamus, certum eſt, omnium reliquorum ſenſuum effectus, quin omnino ſanitatem hominum, jucundis aut fœtidis odoribus mirum quantum vel augeri, vel hebeſcere, et perſuaſi ſumus, nullus alias ſenſationes adeo delicatas eſſe, quam quæ per odoratum fiunt." Blumenbach de Sinib. Front. p. 15.

Nose, *Fractures of.* See Fracture.

Nose, *Hemorrhage from.* See Epistaxis.

Nose, *Polypi of.* See Polypus.

Nose-*Band*, in the *Manege*, called in French *muſerelle*, is that part of the head-ſtall of a bridle that comes over a horſe's noſe.

Nose-*Bleed*, in *Botany*. See Achillea.

Nose-*Peak*, in *Geography*, a mountain on the eaſt coaſt of the iſland of Paraguay. N. lat. 8° 56′. E. long. 118° 25′.

Nose-*Point*, a cape on the eaſt coaſt of the iſland of Paraguay. N. lat. 8° 59′. E. long. 118° 42′.

NOSIMA, a ſmall iſland of Japan, in the ſtraits between Niphon and Xicoco.—Alſo, a town of Japan, in the iſland of Ximo; 20 miles N.N.W. of Taiſero.

NOSOCOMIUM, Νοσοκομειον, an hoſpital, or infirmary, for the reception of the diſeaſed.

NOSOLOGY, from νοσος, *diſeaſe*, and λογος, *diſcourſe*, ſignifies literally a treatiſe or doctrine of diſeaſes; in which ſenſe it might be conſidered as ſynonimous with *pathology*. The term *noſology*, however, has been appropriated excluſively to a methodical arrangement of diſeaſes, after the manner of the claſſification adopted by natural hiſtorians, of which ſeveral ingenious ſyſtems were deviſed during the laſt century.

The advantages reſulting from an arrangement of this kind, both to the learner and to the practitioner of medicine, have been long acknowledged by able and learned phyſicians. Baglivi, Sydenham, Boerhaave, Gaubius, and others, expreſſed their deſire to ſee ſuch a work accompliſhed, from a conviction, that, like the objects of natural hiſtory, diſeaſes would be more eaſily and certainly diſcriminated, by being arranged under genera and ſpecies, with characteriſtic definitions. In truth, the analogy in the method of inveſtigation, in both caſes, is very cloſe: for it conſiſts in ſtudying and comparing the *external characters*, and in ſeparating thoſe which are poſſeſſed in common with other genera, from thoſe which peculiarly belong to any individual genus. Thus, in reſpect to diſeaſes, as the condition and movements of the internal organs of the animal frame are not open to the immediate cognizance of our ſenſes, we can only obtain information concerning them, by an inveſtigation of the external ſigns or *ſymptoms*, which, as we are taught by experience, indicate certain internal operations. (See Disease.) Every intelligent and diſcriminating practitioner muſt, therefore, have formed a ſpecies of noſological ſyſtem in his own mind; *i. e.* he muſt have aſcertained the ſymptoms which are characteriſtic of the different forms of diſeaſe, and which diſtinguiſh each form from thoſe others which reſemble it. "Whoever denies this," as Dr. Cullen well obſerves, "may as well deny the exiſtence of the medical art. For if phyſicians can actually diſcriminate between one diſeaſe and another, they certainly can point out the marks of ſuch diſcrimination. Now theſe marks are, in fact, the very circumſtances which enter into the noſological definition of the genera and ſpecies of diſeaſe, and which it is the object of a rightly conſtructed noſological ſyſtem to explain." (See his Synopſ. Noſol. Method. Prolegom.) It can ſcarcely be doubted, then, that the ſtudy of noſology muſt contribute to improve the means of diſcrimination of the phyſician, and muſt facilitate the progreſs of the inexperienced in the acquiſition of his art.

Another advantage, which has been alluded to by Dr. Cullen, will alſo accrue from it; it will conduce to render the views of the practitioner more clear and determinate, and to lead him to inveſtigate and preſcribe for the actual varieties of diſeaſe, rather than to content himſelf with learning their titles, and with conſidering that every eſſential information has been acquired, when the name of a diſeaſe has been made out; a habit into which thoſe practitioners, whoſe education has been conducted without an attention to noſological accuracy, are too liable to fall.

Notwithſtanding the obvious and acknowledged importance of a ſyſtem of noſology, no actual attempt was made to accompliſh ſuch a work, before nearly the middle of the eighteenth century, when the able and learned Dr. F. Boiſſier de Sauvages, a profeſſor at Montpellier, publiſhed the rudiments of his ſyſtem in 1732. This work, however, contained but an imperfect outline of his final claſſification, which was not given to the world until it had been matured by extenſive inveſtigation, much reading, and aſſiduous application, for the ſpace of thirty years. It was publiſhed in 1762, under the title of "Noſologia Methodica, ſiſtens Morborum Claſſes, Genera, et Species, juxta Sydenhamï mentem, et Botanicorum ordinem." As this elaborate and ingenious ſyſtem has not only been generally referred to, but forms, in fact, the groundwork of all the ſyſtems of noſology that have ſubſequently appeared, we ſhall ſtate the outlines of it with as much brevity as poſſible.

Sauvages arranged all the maladies and injuries to which the human frame is liable, under *ten* claſſes. The *firſt* claſs includes a number of ſuperficial and local affections, which, however, have no very diſtinct affinity in other reſpects, and is entitled "*Vitia.*" Theſe vitia are ſubdivided into ſeven orders or groups, comprehending ſpots, efflorеſcences, inflammatory tumours, excreſcences, encyſted tumours, diſplacements (*i. e.* all the varieties of hernia, &c.), and plagæ (*i. e.* fractures, diſlocations, ulcers, and wounds). His *ſecond* claſs includes the three orders of *fevers*, continued, remittent, and intermittent, with their ſeveral ſpecies. The *third* claſs compriſes the "*Phlegmaſiæ,*" or inflammatory fevers, of which he makes three orders, *viz.* the exanthematic, or eruptive fevers; the membranous inflammations, ſuch as pleuriſy, gaſtritis, enteritis, &c.; and the parenchymatous, or inflammations of the ſubſtance of the different organs, as of the lungs, liver, heart, kidnies, &c. The *fourth* claſs comprehends the "*Spaſmi,*" or convulſive diſeaſes, which he ſubdivides into four orders; the firſt and ſecond of which include the *tonic* or rigid ſpaſms, partial and general (ſuch as locked jaw, cramp, ſquinting, &c.); and the third and fourth, the clonic or convulſive ſpaſms, partial and general (*e. g.* tremors, palpitation, yawning, epilepſy, hyſteria, &c). The *fifth* claſs conſiſts of affections of the reſpiration, entitled "*Anhelationes,*" and is ſubdivided into two orders, the ſpaſmodic affections, ſneezing, cough, hiccup, &c.; and the oppreſſive, as aſthma, dyſpnæa, ſnoring, hydrothorax, &c. The *ſixth* claſs includes thoſe maladies which are characteriſed by loſs of power, either of the whole body, or in particular organs, and is entitled "*Debilitates.*" Of this there are five orders; 1. "*Dyſæſtheſiæ,*" loſt or deficient ſenſations, ſuch as blindneſs from cataract, amauroſis, deafneſs, loſs of ſmell, taſte, &c.; 2. "*Anepithymiæ,*" loſs of appetites; 3. "*Dyſcineſiæ,*" loſt

loſt or imperfect motions, including dumbneſs, loſs of voice, ſtammering, and palſy; 4. "*Leipopſychiæ*," loſt or impaired voluntary motion, as fainting, ſuſpended animation, &c.; and 5. "*Comata*," ſoporoſe diſeaſes, apoplexy, catalepſy, lethargy, &c. The *ſeventh* claſs, which compriſes the painful maladies, "*Dolores*," is likewiſe ſubdivided into five orders, according to the parts of the body in which the pains are ſeated: 1. *Vagi*, or wandering pains, including gout, rheumatiſm, catarrh, itching, laſſitude, &c.; 2. Pains of the *head*, hemicrania, tooth-ache, ear-ache, ophthalmia; 3. Of the *breaſt*, dyſphagia, pyroſis, cardiogmus; 4. Internal *abdominal* pains, heartburn, colic, pains of the liver, kidnies, &c.; and 5. Pains of the *limbs*. The *eighth* claſs comprehends the *mental* affections, "*Veſaniæ*," and conſiſts of four orders; 1. "*Hallucinationes*," ſuch as giddineſs, double viſion, hypochondriaſis, and ſomnambuliſm; 2. "*Moroſitates*," or erroneous appetites, ſuch as pica, bulimia, polydipſia, ſatyriaſis, nymphomania, noſtalgia, hydrophobia; 3. "*Deliria*," as mania, melancholy, demonomania, &c.; and 5. *Anomalous* veſaniæ, as loſs of memory. The *ninth* claſs includes diſcharges or fluxes, of which there are four orders: 1. "*Sanguifluxus*," or hæmorrhages, as hæmoptyſis, hæmatemeſis, bloody urine, uterine hæmorrhage; 2. Diſcharges from the bowels, "*Alvifluxus*," as vomiting, dyſentery, cholera, diarrhœa, teneſmus, lientery. &c.; 3. "*Seriſluxus*," or watery diſcharges, morbid ſweating, diabetes, enureſis, ptyaliſm, coryza, leucorrhœa, gonorrhœa, dyſuria, &c.; and 4. "*Aëriſluxus*," flatulence, &c The *tenth* and laſt claſs comprehends the various morbid appearances, which are conſidered as the reſult of a depraved habit of body, and are entitled "*Cachexiæ*." It includes ſeven orders, the firſt of which is characteriſed by emaciation, "*macies*," and compriſes phthiſis, tabes, and atrophy; 2. The oppoſite ſtate of enlargement, "*Intumeſcentiæ*," ſuch as emphyſema, anaſarca, obeſity, pregnancy, &c.; 3. Partial dropſies, ſuch as hydrocephalus, hydrorachitis, aſcites, tympanites, &c.; 4. "*Tubera*," including rickets, ſcrofula, cancer, the yaws, &c.; 5. "*Impetigines*," as ſyphilis, ſcurvy, itch, ſcald head, lepra, and elephantiaſis; 6. Morbid complexions, "*Icteritiæ*," ſuch as jaundice, chloroſis, petechial diſeaſe; and 7. Anomalous cachexies, as the louſy diſeaſe, trichoma, alopecia, gangrene, necroſis.

Such is the outline of the able and learned arrangement of diſeaſes, which was accompliſhed by Sauvages. It diſplays an extenſive knowledge of the phyſiology and pathology of the human body, derived both from much perſonal obſervation, and from an indefatigable peruſal of the records of medicine; and, for practical purpoſes, it has not been equalled by thoſe ſyſtems which have been ſubſquently erected upon it, as a baſis, if we except perhaps that of Dr. Cullen. At the ſame time it muſt be obvious, even from a peruſal of the preceding outline, that the claſſification is not free from ſeveral errors and imperfections. Some of theſe it poſſeſſes in common with all other attempts to arrange into claſſes the works of nature; for anomalies occur in diſeaſes, as in the objects of natural hiſtory, which diſturb the unity of artificial arrangements, uniting diſſimilar genera, and rendering neceſſary the ſeparation of others, which a general analogy would connect. Other imperfections, however, in the claſſification of Sauvages, appear to be the reſult of a want of accurate attention or diſcrimination. Several diſeaſes, for inſtance, are found under more than one claſs, and bearing different generic appellations: thus the ſhingles, zoſter, or zona, of the ancients, is deſcribed under the title of herpes zoſter, and likewiſe under that of eryſipelas zoſter, probably from a doubt to which genus it bore the greater affinity. In like manner the petechial raſh is included under the genus Stomacace, in the order of hæmorrhages, and alſo under Phænigmus, in the order, Icteritiæ, of the cachectic claſs. Again, Dr. Cullen has juſtly blamed Sauvages for introducing among the genera of diſeaſe a great number of mere ſymptoms, which are trifling in themſelves, and ſeldom alone the objects of medical treatment; among theſe may be mentioned yawning, ſtretching of the limbs, laſſitude, picking of the bed-clothes, nictitation of the eyelids, &c. He has alſo made genera of diſeaſe of other changes in the animal body, which cannot be conſidered as actual diſeaſes; ſuch as pregnancy, for inſtance, the efforts of parturition, the cicatrix left after wounds, the ſenſations produced by ſevere cold or great heat, (*algor*, and *ardor*,) and ſeveral other trivial and ſcarcely morbid occurrences. Theſe obſervations are, beſides, equally applicable to a great number of the ſpecies, or ſubdiviſions of the genera, in his claſſification, which he has often multiplied unneceſſarily, and even inſerted repeatedly with different ſpecific epithets. But although, in a philoſophical point of view, as well as for the purpoſe of initiating the ſtudent into the various phenomena of diſeaſes, this multiplication of genera and ſpecies muſt be deemed objectionable; yet the practitioner, in the progreſs of his profeſſional reſearches, will be aided in the work of obſervation (a taſk of no ſmall difficulty) by the hints which this ſubdiviſion of the phenomena of diſeaſes will afford him. And this aid will be the more advantageous to thoſe who unite the peruſal of books with actual obſervation; inaſmuch as the majority of the *ſpecific* ſubdiviſions of Sauvages, are, as it were, ſynonimes of the varieties of the generic maladies, which different local circumſtances have occaſioned, as detailed by the beſt practical writers, to whom he regularly and correctly refers.

Encouraged by the example, and above all aided by the previous original labours of Sauvages, ſeveral authors ſoon followed his ſteps in the contrivance of noſological arrangements. The celebrated naturaliſt, Linnæus, was one of the firſt to extend his ſingular ſkill in claſſification to the ſubject of diſeaſes; and after having publiſhed the outlines of his ſcheme in a theſis, in 1759, he printed his ſyſtem complete in 1763, with the title of "Genera Morborum definita." It conſiſted, however, rather of a modification of the ſyſtem of Sauvages, with a change of names and titles, than of an original arrangement; and it wanted the ſupport of the medical learning and experience, which were ſo conſpicuous and valuable in the former.

In the year 1764, profeſſor Vogel, of Gottingen, publiſhed his ſyſtem of noſology, which was likewiſe a cloſe approximation to that of Sauvages, but diſplayed a conſiderable ſhare of perſonal obſervation of the phenomena of diſeaſes; and twelve years afterwards, profeſſor Sagar, of Vienna, followed a ſimilar method, and publiſhed another modification of the ſyſtem of Sauvages, under the title of "Syſtema Morborum Symptomaticum," Vienna, 1776. In the mean time, however, Dr. Cullen, the celebrated and able profeſſor of medicine in the univerſity of Edinburgh, had alſo publiſhed his own ſyſtem of noſology in the year 1772; which, although leaning upon that of Sauvages as a baſis, was much ſhortened and condenſed, by a judicious excluſion of a number of trivial genera, and of many affections which are merely ſymptomatic, as well as by an union of ſeveral other genera, which were conſidered as only more or leſs prominent ſymptoms of the ſame eſſential malady, under one genus. This abbreviation of the ſyſtem has certainly contributed to introduce a more ſimple and philoſophical view of diſeaſes, by merging under a ſmaller number of diviſions all the varieties of human malady, and thus of courſe reducing the number of curative indications, and render-

ing the principles of pathology and of therapeutics more clear and leſs complex. We ſhall, therefore, enter briefly into the detail of this noſological ſyſtem, more eſpecially as it is adopted, as a text-book, by many of the teachers of medicine at preſent.

Dr. Cullen arranged all the diſeaſes of the human frame under four claſſes; the *firſt* containing the "Pyrexiæ," or all thoſe affections which are called *febrile;* the *ſecond*, "Neuroſes," or affections of the nervous ſyſtem, that is, "diſorders of ſenſe and motion," independently of primary fever or local diſeaſe; the *third*, "Cachexiæ," or thoſe diſorders which are connected with "a depraved ſtate of the whole, or greater part of the body, without any primary fever or nervous affection;" and the *fourth*, including the "Locales," or diſeaſes of ſome *part* of the body only.

This appears to be a ſufficiently ſimple and natural diviſion of the ſubject, and the ſub-diviſions are entitled, on the whole, to the ſame commendation. In filling up theſe outlines, however, by the genera and ſpecies, ſome difficulties occur, and ſome anomalies preſent themſelves, as in every artificial claſſification; ſo that the uniformity of the principle is occaſionally broken, and ſome hypothetical analogy is reſorted to, for the purpoſe of reducing the irregularity to apparent order. For example, among the *local* diſeaſes, and in the order of Dyſorexiæ, (falſe or defective appetites,) moſt of which are referrible to diſeaſes of the organs with which theſe appetites are connected, ſuch as bulimia and polydipſia, we find the diſorder termed *noſtalgia*, (or a vehement deſire of returning to one's native country, when abſent,) which Vogel has more correctly arranged as a ſpecies of melancholy. In other caſes, an anomalous diſeaſe is forced into the claſſification, as being the ſequela or reſult of another; thus, the pulmonary conſumption, (phthiſis pulmonalis) is arranged by Dr. Cullen among the *hæmorrhages*, in the claſs of Pyrexiæ, immediately following hæmoptyſis, or ſpitting of blood, although that hæmorrhage is by no means an univerſal precurſor of phthiſis, and is commonly one of the early ſymptoms, and not the cauſe of the diſeaſe, when it actually occurs. Some other inaccuracies of a ſimilar kind will be obſerved, in examining the particulars of the generic and ſpecific claſſifications; but many advantages over the arrangement of Sauvages will likewiſe be manifeſt, in the ſame parts of the ſyſtem, and eſpecially in the condenſation of ſeveral genera into one, and in the conſideration of many of the ſpecies as mere varieties.

Dr. Cullen's firſt claſs, *Pyrexiæ*, is ſubdivided into five orders: the *firſt* of which contains the *fevers* properly ſo called, or idiopathic fevers; of which there are two ſections, the intermittent, and continued. Of the *intermittent* fevers, Dr. Cullen makes but three genera, the tertian, quartan, and quotidian, under which he comprehends, as varieties, all the forms of intermittent and remittent fevers deſcribed by authors, the ſemitertians, and double tertians, the miliary and petechial remittents, and an almoſt innumerable catalogue of ſynonimes, which he has collected from their works, and referred to among the ſpecies of Sauvages. The ſecond ſection, or the *continued* fevers, including three genera, ſynocha, or inflammatory fever, typhus, and ſynochus, compriſe alſo a great number of febrile affections, which have been deſcribed under various names by authors; but perhaps even Dr. Cullen's diviſion of the genera might be leſſened. The *hectic* fever he does not admit among the genera; becauſe he deems it invariably ſymptomatic of ſome other diſeaſe.

The *ſecond* order of Pyrexiæ, entitled "Phlegmaſiæ," compriſes the acute organic inflammations, of all the viſcera, membranes, and muſcles; as of the eye, brain, throat, lungs, heart, peritoneum, ſtomach, liver, and other viſcera of the abdomen and pelvis, rheumatiſm, and gout. Theſe again include their reſpective ſpecies; thus the cynanche, or inflammation of the throat, compriſes five ſpecies; the common quinſey (*tonſillaris*,) the ulcerous ſore throat, which, in fact, belongs to ſcarlet fever (*maligna*); the croup, or inflammation of the wind-pipe (*trachealis*); inflammation of the pharynx (*pharyngea*); and the mumps, in which the inflammation extends to the parotid glands (*parotidæa*). In like manner, the genus Pneumonia, inflammation of the lungs, includes the two ſpecies, peripneumony and pleuriſy.

The *third* order of Pyrexiæ, or febrile diſeaſes, comprehends the eruptive fevers, and is entitled "Exanthemata." It includes ten genera, ſmall-pox, chicken-pox, meaſles, ſcarlet fever, the plague, eryſipelas, the miliary raſh, nettle-raſh, pemphigus, and aphtha, with their ſpecies and varieties.

The *fourth* order, "Hemorrhagiæ," includes epiſtaxis (bleeding of the noſe,) ſpitting of blood, hæmorrhoids or piles, and menorrhagia, with conſumption following the ſecond. And the *fifth* compriſes but two genera, catarrh and dyſentery, being entitled "Profluvia," the diſcharges being naturally mucous, not bloody. The catarrh includes the common cold, the epidemic influenza, and the coughs connected with meaſles, and other fevers, as varieties.

Dr. Cullen's ſecond claſs comprehends the "Neuroſes," or "affections of the faculties of ſenſe and motion, unaccompanied by any idiopathic fever, or local diſeaſe." This claſs contains four orders, Comata, Adynamiæ, Spaſmi, and Veſaniæ. It muſt be admitted, however, that ſomewhat of hypothetic opinion has been engaged in the diſtribution of the genera and ſpecies of this claſs; ſeveral of which, eſpecially in the ſecond and third orders, are brought together rather upon fanciful grounds, than from obvious and intelligible analogy.

The *firſt* order of this claſs, "Comata," in which "the voluntary motions are impaired, together with ſopor, or a ſuſpenſion of the ſenſes," is ſufficiently natural, and includes two genera, cloſely allied to each other, *viz.* apoplexy, and paralyſis. Dr. Cullen conſidered the carus, catoche, catalepſy, (which, however, he believed to be always feigned,) cataphora, lethargy, aſphyxia, and ecſtaſis of medical writers, as different degrees or modifications of the ſame affection, and included them all under the genus apoplexy, as well as the acute hydrocephalus, which he termed apoplexia hydrocephalica. And, in like manner, he compriſed a number of genera and ſpecies under his genus paralyſis; ſuch as the hemiplegia, paraplegia, paraplexia, paralyſis, tremor, and aſthenia.

The *ſecond* order, "Adynamiæ," or "impaired involuntary motions," compriſes four genera, which are not very obviouſly allied; theſe are ſyncope (fainting), dyſpepſia (indigeſtion), hypochondriaſis, and chloroſis. The genus dyſpepſia is of very comprehenſive import; for it includes the various modifications of ſtomach-complaints, which Dr. Cullen deemed but ſo many ſymptoms of dyſpepſia, and not diſtinct diſeaſes, as the other noſologiſts maintained; ſuch are, for inſtance, the anorexia, cardialgia, gaſtrodynia, flatulentia, nauſea, vomitus, ſoda, and diaphora, of theſe writers.

But the *third* order, "Spaſmi," which contains ſeventeen genera, unites diſeaſes that have ſtill leſs apparent affinity with each other, and upon very hypothetical grounds. Although tetanus, locked jaw, convulſion, chorea, epilepſy, palpitation, aſthma, hooping-cough, colic, hyſteria, and hydrophobia, may be properly comprehended among ſpaſmodic affections; it is not very clear, upon what principles

cholera

cholera and pyroſis are ſo arranged; and ſtill leſs obvious, how diarrhœa and diabetes are to be deemed diſeaſes of a ſpaſmodic character.

The *fourth* order, "Veſaniæ," which compriſes "diſeaſes of the reaſoning faculty, independently of fever or of coma," contains four genera, amentia, (imbecility of mind), melancholy, mania, and oneirodynia; the laſt of which includes the ſomnambuliſm, and night-mare.

The third claſs, *cachectic* diſeaſes, in which "the habit of body, either totally, or in great part, is depraved, without any primary fever or nervous diſeaſe," is divided into three orders, characteriſed by emaciation, enlargement, and a morbid condition of the ſkin.

The *firſt* order, "Marcores," compriſes only two genera, tabes and atrophia, both which are popularly termed conſumption, or decline; but the tabes is accompanied by hectic fever, and the atrophia is not.

The *ſecond* order of cachectic diſeaſes, "Intumeſcentiæ," is characteriſed by a preternatural enlargement of the whole, or ſome part of the body; and of theſe enlargements there are four kinds, adipoſe (fatty), flatulent, watery, and ſolid. Of the *fatty* ſwellings there is only one genus, corpulence, which, whenever it becomes ſo great as to occaſion impediment to any of the functions of life, is truly a diſeaſe. (See CORPULENCE.) Of the *flatulent* enlargements, there are three genera, emphyſema (or air contained in the cellular membrane), tympanites, (diſtention of the belly by air), and phyſometra (flatulent ſwelling of the womb). The *watery* or dropſical ſwellings take place in the cellular membrane (anaſarca), in the head (hydrocephalus externus), in the canal of the ſpine (hydrorachitis), in the cheſt (hydrothorax), in the abdomen (aſcites), in the uterus (hydrometra), and in the ſcrotum (hydrocele). The *ſolid* enlargements are phyſconia, when the hard tumour is in ſome of the viſcera of the belly, and rachitis (rickets).

The *third* order of this claſs, "Impetigines," includes ſcrofula, ſyphilis, ſea-ſcurvy, elephantiaſis, lepra, the yaws, trichoma, and jaundice.

The *fourth* and laſt claſs of Dr. Cullen's ſyſtem of noſology comprehends all thoſe diſorders which are confined to a part of the body, without influencing the conſtitution at large,—the Morbi "Locales." The numerous genera compriſed in this claſs are ſubdivided into eight orders, of which a brief account will be ſufficient to explain the nature of the claſſification.

The *firſt* order, "Dyſæſtheſiæ," includes the inſtances of "depravation or total loſs of ſome ſenſe, occaſioned by a fault of the external organ;" ſuch as blindneſs from cataract, opacity of the cornea, &c.; ſhort-ſightedneſs, nyctalopia, &c.; deafneſs, loſs of the ſmell, taſte, or touch. The *ſecond* order contains the "morbid or deficient appetites, "Dyſorexiæ;" *viz.* canine appetite, polydipſia, pica, ſatyriaſis, nymphomania, noſtalgia, anorexia, adipſia, and anaphrodiſia. The *third* order, "Dyſcineſiæ," compriſes "obſtructed or depraved motions, which ariſe from a diſorder of the organs," *viz.* loſs of voice, dumbneſs, hoarſeneſs, ſtammering, ſquinting, difficult deglutition, and contractions of the limbs. The *fourth* order, "Apocenoſes," comprehends all paſſive diſcharges, *i. e.* ſuch as "are produced without fever, or any increaſed impetus." The genera of this order are paſſive hæmorrhages, colliquative ſweats, flowing of tears (epiphora), ſalivation, involuntary diſcharge of urine, gonorrhœa. The *fifth* order, "Epiſcheſes," includes the "ſuppreſſion of accuſtomed excretions;" namely, conſtipation of the bowels, ſuppreſſion of urine, dyſuria, dyſpermatiſmus, amenorrhœa. The *ſixth* compriſes "Tumours of various nature; aneuriſm and varix, affecting the arteries and veins, ecchymoſis, ſcirrhus, cancer, bubo, ſarcoma, warts, corns, ganglion, hydatids, white ſwelling, and exoſtoſis. The *ſeventh* order, "Ectopiæ," contains three genera of tumours, occaſioned by the removal of a part from its proper place; *viz.* hernia, prolapſus, and diſlocations. And the *laſt* order, "Dialyſes," includes the diſorders in which there is a manifeſt ſolution of continuity, or broken ſurface; namely, wounds, ulcers, herpes, tinea, itch, fractures, and caries of bones;—a group which, it muſt be admitted, has ſcarcely any other circumſtance in common, except the breach of continuity.

Theſe imperfections, however, ſeem to belong to the ſubject; and no ſyſtem of noſology has yet been deviſed, which has any pretenſions to be free from them. It will not be neceſſary, therefore, to enter into any detail of the ſyſtems which have been promulgated ſubſequently to the publication of Dr. Cullen's; for none of theſe ſeem to poſſeſs ſo decided a ſuperiority, as to have gained any general approbation; and the purpoſes of inſtruction are fulfilled with ſufficient accuracy by the former.

Among the noſological ſyſtems which have appeared ſince the firſt edition of Dr. Cullen's, beſides that of Sagar, of Vienna, already mentioned, was one promulgated by Dr. David Macbride, in his "Methodical Introduction to the Theory and Practice of Phyſic." He propoſed to arrange diſeaſes under four claſſes, univerſal, local, ſexual, and infantile; a claſſification which appears to be liable to numerous objections, but which the author did not live to complete, having publiſhed only the orders and genera of the firſt claſs. M. Pinel, about the year 1800, publiſhed, under the title of "Noſographie Philoſophique," the firſt three claſſes of a new arrangement of diſeaſes, *viz.* fevers, inflammations, and hæmorrhages, which, we believe, he has not yet completed; nor has he favoured us with the general outline of his ſyſtem. In filling up the genera and ſpecies, however, more eſpecially under the head of fevers, he has multiplied the ſubdiviſions to an extent, which ſound obſervation does not appear to warrant; and ſtated differences, where he is unable to point out the practical means of diſtinction.

Dr. Darwin promulgated, in 1796, a new claſſification of diſeaſes, which, however, was rather intended to illuſtrate a new ſyſtem of pathology, than as a methodical noſology. It was founded upon a very original view of the principles of animal life, which were made the baſis of the claſſification. Thus, Dr. Darwin conſidered the four animal faculties, irritability, ſenſibility, volition, and aſſociation, as being, when deranged, the cauſes of every diſeaſe; and, therefore, conſtituted four great claſſes of diſeaſes, which he called diſeaſes of irritation, of ſenſation, of volition, and of aſſociation. In the diſtribution of the genera and ſpecies, however, it was often neceſſary to reſort to the fancy, to determine under which claſs certain morbid affections ſhould be arranged; and many ſpecies, on the other hand, when aſcribed to derangement of more than one of theſe faculties, were neceſſarily introduced in different parts of the claſſification: ſo that diarrhœa, for inſtance, may be found under almoſt every claſs. Although this claſſification, therefore, bears intrinſic evidence of great ingenuity, as well as of much obſervation of diſeaſe, and contains many practical hints of great value; yet as a ſyſtem of arrangement, by which the practitioner is to be directed to the diſcrimination of diſeaſes, it is perhaps altogether uſeleſs.

Before we conclude this article, we may obſerve, that it has been the faſhion, among many profeſſional men, to decry the ſtudy of noſology, and the method of teaching medicine upon a noſological plan. But this can have ariſen only from

an imperfect acquaintance with its nature and tendency, and a conſequent inadequate eſtimate of its utility. It is neceſſary, as we have obſerved above, that every practitioner ſhould be enabled to diſtinguiſh diſeaſes by their ſigns, or ſymptoms, if he would hope to cure them by appropriate remedies. He muſt, therefore, poſſeſs, in his own mind, an arrangement of the characteriſtic ſymptoms of every diſeaſe, and eſpecially of the diagnoſtic ſymptoms, or thoſe by which it is diſtinguiſhed from other diſeaſes, which reſemble it, or with which it has ſeveral ſymptoms in common. The queſtion, therefore, appears to be, whether it is adviſeable to teach medicine according to a ſyſtem, in which the diagnoſtic ſymptoms are diſtinctly laid down, or to leave them to be learned by a vague and unmethodical courſe of reading and practice;—a queſtion which ſeems to anſwer itſelf. We are perſuaded that the great ſuperiority, which is commonly ſeen in practitioners of good education, is to be aſcribed, in a conſiderable degree, to the noſological method of ſtudying the principles of medical ſcience, in which they had been early initiated.

To thoſe who have not been accuſtomed to conſider this ſubject, a ſingle illuſtration will perhaps demonſtrate the truth of this obſervation. The pleuriſy, for inſtance, or inflammation of the lungs, though marked by many ſymptoms which are common to fevers and other inflammations, is characteriſed by the invariable preſence of theſe *four ſymptoms*, which conſtitute the noſological definition of pneumonia, given by Dr. Cullen; namely, "fever, pain in ſome part of the cheſt, difficult reſpiration, cough." Now, in the abſence of any one of theſe ſymptoms, however ſevere the others may be, pneumonia cannot be preſent; yet the immethodical practitioner is liable to commit ſerious miſtakes, in reſpect to this diſeaſe, from a defective view of the pathognomonic ſymptoms. Thus, wherever there is acute pain in the cheſt, with difficulty of breathing, pleuriſy is often ſuppoſed to exiſt, and blood-letting immediately reſorted to. But if there is neither cough nor fever, or if there ſhould be even cough, but the pulſe ſhould remain natural, inflammation certainly is not preſent, and blood-letting is unneceſſary, perhaps injurious. Under ſuch circumſtances, the pain and dyſpnæa originate probably from a rheumatic affection of the intercoſtal muſcles, or from a ſpaſmodic contraction of the ſame organs, or of the diaphragm; and, therefore, the appropriate remedy will be an opiate, or other antiſpaſmodic, aided by ſome external ſtimulant; yet if there be actual inflammation preſent, and the diſeaſe is treated with opium and ſtimulants, much ſerious miſchief will be produced. Again, cough and fever may occur together, and be accompanied even by ſome degree of oppreſſion of the reſpiration; yet, if there is no pain in the thorax, there is no active inflammation of the lungs; the cough is, in this caſe, probably a ſecondary or accidental ſymptom, and the fever may be totally independent of it, and of ſuch a type, that blood-letting, employed under the ſuppoſition of removing inflammation, might irrecoverably depreſs the ſtrength of the patient. Againſt ſuch important practical errors the mind is moſt effectually ſecured, when it is ſtored with correct noſological views: for, where theſe are abſent, the practitioner is apt to proceed upon a mere empirical aſſociation of certain remedies with certain prominent ſymptoms, without duly marking their combinations, or weighing their import, that is, without forming any clear opinion as to the actual ſeat and nature of the diſeaſe.

NOSTALGIA, in *Medicine*, from νοστειν, *to return*, and αλγος, *pain* or *grief*, is a ſpecies of melancholy, the leading circumſtance of which is a vehement and unceaſing deſire to return home, and which of courſe occurs only in perſons who are abſent from their friends and native country.

This affection is called by the French *maladie du pays*, and by the German-Swiſs *heim-weh*, or home-grief. Zwingerus, who wrote a diſſertation upon the ſubject, denominated it *noſtomania*, and *pothopatridalgia*. Sauvages, and, after him, Dr. Cullen, have, by a ſingular ſtrained analogy, placed this diſeaſe among the morbid appetites, in the claſs of *local* diſeaſes, in their reſpective ſyſtems of noſology; as if there were a particular organ in the body, in which the *amor patriæ* is ſeated, like hunger and thirſt in the ſtomach. See Sauvages, claſs viii. gen. 11. Cullen, claſs iv.

This diſeaſe has been obſerved to be particularly frequent in the inhabitants of mountainous countries, which are in a ſtate approaching to the paſtoral condition of ſociety, and with which the local aſſociations, early impreſſed on the mind, are ſtronger than thoſe excited in leſs pictureſque countries. Hence the Swiſs have always been remarkable for their tendency to fall into this ſpecies of melancholy; and great numbers have been induced to deſert from the armies of foreign ſtates, in which they have been inrolled as mercenaries. The Swiſs guards, employed by the kings of France, have been particularly remarkable from this circumſtance; and they have been obſerved to be ſeized with this malady, more eſpecially, on hearing a national air, "Ranz des vaches," which is ſung to a ballad, containing alluſions to their home, relations, and domeſtic animals; an air, however, which has nothing peculiarly pleaſing in its melody, to thoſe who connect with it no particular aſſociation of ideas.

The diſeaſe, however, is by no means peculiar to the Swiſs, or other mountaineers; but occurs among a much injured people, who have been ſuppoſed incapable of enjoying happineſs in their own way, or of feeling attachment to their country. "Noſtalgia, maladie du pays, or an ardent deſire to reviſit one's native home," Dr. Winterbottom obſerves, "is a diſeaſe which affects the *natives of Africa*, as ſtrongly as it does thoſe of Switzerland: it is even more violent in its effects on the Africans, and often impels them to dreadful acts of ſuicide. Sometimes it plunges them into a deep and incurable melancholy, which induces the unhappy ſufferers to end a miſerable exiſtence by a more tedious, though equally certain, method, that of dirt-eating. No reader of ſenſibility can peruſe, without emotion, Haller's impaſſioned regret for the calm retreat of Kaſel; but even Haller's glowing language appears cold and lifeleſs, if compared with the agonizing expreſſions of diſtreſs poured out by the poor African, when, waking from the ſleep in which deluſive fancy had wafted him back to his friends and much loved home, he finds only the cruel mockery of a dream." Account of the native Africans of Sierra Leone, vol. ii. p. 174.

The ſevere and conſuming influence of this mental affection on the body, and the train of ſymptoms, tending to fatal maraſmus, which it induces, if not interrupted, as well as the ſpeedy and not leſs remarkable corporeal amendment, which the removal of the mental depreſſion occaſions, will be beſt illuſtrated by the relation of a caſe, which occurred in this country.

"In the year 1781," ſays Dr. Hamilton of Ipſwich, "while I lay in barracks at Tynemouth, in the north of England, a recruit, who had lately joined the regiment, (named Edwards,) was returned in the ſick liſt, with a meſſage from his captain, requeſting I would take him into the hoſpital. He had only been a few months a ſoldier, was young, handſome, and well-made for the ſervice; but a melancholy hung over his countenance, and wanneſs preyed on his cheeks. He complained of univerſal weakneſs, but no fixed pain; a noiſe in his ears, and giddineſs in his head; pulſe rather ſlow than frequent, but ſmall, and eaſily compreſſible. His appetite was much impaired; his tongue was ſufficiently moiſt, and his belly regular; yet he ſlept ill, and ſtarted ſuddenly out of it, with uneaſy dreams. He had little or no thirſt.

"As there were little obvious ſymptoms of fever, I did not well know what to make of the caſe. I ſuſpected he might be under an incipient typhus, and ordered what I judged neceſſary to obviate it. Some weeks paſſed with little alteration either for better or worſe, excepting that he was evidently become more meagre. He ſcarcely took any nouriſhment, yet had hitherto ſat up out of bed ſome hours every day. At length he became indolent, ſeldom ſat up at all, was conſtantly dozing, yet his ſleep never ſo ſound but he could anſwer when ſpoken to: he ſighed deeply and frequently; nor could his attention be directed to any external object. Something, it would ſeem, hung heavy on his mind. He never had any cough; yet, ſince he came into the houſe, he had waſted away conſiderably. Exerciſe was recommended, and uſed as far as he could be rouſed to take it, which was never without reluctance. He was put on a courſe of ſtrengthening medicines, and wine was allowed him. All proved ineffectual. His pulſe had changed with his appearance, and was now ſmall and quick: an evident fever, of the hectic kind, with an evening exacerbation, took place. He had now been in the hoſpital near three months, and was quite emaciated, and like one in the laſt ſtage of a conſumption. His eyes were grown hollow, cheeks prominent, nails incurvated, adnata pellucid; and he was ſo weak in his limbs, that he could neither get in nor out of bed without help. Of late, alſo, he had night ſweats. In ſhort, I looked on him as loſt.

"On making my morning viſit, and inquiring, as uſual, reſpecting his reſt of the nurſe, ſhe happened to mention the ſtrong notions he had got in his head, ſhe ſaid, *of home, and of his friends*. What he was able to ſpeak was conſtantly on this topic. This I had never heard before. The reaſon ſhe gave for not mentioning it was, that it appeared to her to be the common ravings of ſickneſs and delirium. He had talked in the ſame ſtyle, it ſeems, more or leſs, ever ſince he came into the hoſpital.

"I went immediately up to him, and introduced the ſubject; and, from the alacrity with which he reſumed it, (yet with a deep ſigh, when he mentioned his never more being able to ſee his friends,) I found it a theme which much affected him. He aſked me, with earneſtneſs, if I would let him go home. I pointed out to him how unfit he was, from his weakneſs, to undertake ſuch a journey, (he was a Welſhman,) till once he was better; but promiſed him, aſſuredly, that as ſoon as he was able, he ſhould have ſix weeks to go home. He revived at the very thoughts of it."—"It ſeems he had requeſted leave to viſit his native place, ſoon after he joined; but being only a recruit, and but a few months from thence, he was refuſed. This had hung on his ſpirits ever ſince; and from thence I now dated the origin of his illneſs. I intreated him to take food, to ſtrengthen him for his journey; and, as ſoon as he was able, to go out into the open air a little every afternoon, when the weather would permit, that he might be the ſooner able to go home. He liſtened eagerly to every word I ſaid. In ſhort, his appetite ſoon mended; and I ſaw, in leſs than a week, evident ſigns of recovery. He was now lively, though ſo weak that he could not get in or out of bed without aſſiſtance: he ſtrove to ſit up: two men took him between them, in the heat of the day, and placed him on a ſeat they had erected for him on the beach, where he had a view of the ſhipping. In a little time he was able to walk. Every viſit I paid him, he reſumed the ſubject of *the furlow*, which I perſiſted in promiſing, ſeeing the good effects it had already produced; and, in leſs than two months from the time he had received this promiſe, he was able to leave the hoſpital and go to his barrack-room." See Edin. Med. Commentaries, vol. xi. p. 343.

Under this ſtate of debility of body, and melancholy brooding of the mind upon the recollections of *home*, it will readily be conceived how even deſpair, and ſuicide, may be the reſult of the violent emotions excited by hearing a national tune, or by any other impreſſion, which, by the aſſociated feelings and remembrances that it recals, brings to the view of the individual the ſubject of his morbid contemplations. And it will be not leſs evident, from the conſideration of the preceding caſe, that the employment of phyſical expedients to ſupport the ſtrength, and to correct the hallucinations of the mind, will be totally fruitleſs, until the cordial of hope and expectation be afforded. See Zwingerus Diſſ. Med. Harder Diſſ. de Noſtalgia, in Haller's Diſputationes, tom. i. xi.

NOSTOC, in *Botany*, a cryptogamic plant, *Tremella Noſtoc* of Linnæus and his followers, Engl. Bot. t. 461, is a roundiſh, leafy, inflated, plaited production, of an olive green colour, and gelatinous ſubſtance, found in paſtures, and on paths, after rainy weather, ſoon drying and ſhrivelling up to almoſt nothing. The name of *Noſtoc* is ſaid to have been given by Paracelſus, and he is reported, by Tournefort and Geoffroy, to have attributed wonderful properties to this vegetable, and to have expected to obtain from it that univerſal ſolvent, which was one of the great objects of the chemiſts of his ſchool. Geoffroy analized it, as he did all the plants that came in his way, to little purpoſe, except to prove that ſuch an analyſis, with a view to a detection of the medical uſes of plants, aſcertains nothing. Whether the attention of Paracelſus was called to this plant, by the vulgar opinion of its being the remains of a fallen ſtar, or of a Will-of-the-wiſp, does not appear. Dillenius juſtly complains, that the above French writers have not told us where that famous quack or his diſciples ſpeak of it. Some have thought it a gelatinous depoſition from the clouds, when they touch the hills; of which notion a curious inſtance is recorded by Linnæus in his Lapland Tour, v. 1. 262, where two divines wanted only the power, as they were plentifully ſtocked with the malice, of inquiſitors, to broil him alive for not believing this, and other ſimilar philoſophy. Sometimes this plant, ſometimes *Tremella arborea*, Engl. Bot. t. 2448, is called witches' butter. In ſhort, there have always been ſome wonderful or ſuperſtitious ideas attached to it, which might long ago have died away, had not the miſtakes of recent philoſophers tended to embroil rather than

than elucidate the ſubject. Certain chemiſts, in purſuit of this vegetable for their inveſtigation, being but indifferent naturaliſts, appear to have miſtaken for it ſubſtances of a very different kind. Dr. Withering obſerves that the remains of frozen frogs, after a hard winter, bear a great reſemblance to a *Tremella*, and may eaſily be miſtaken for the *Noſtoc*, except that ſome of their bones may frequently be detected in it. Others have aſſerted that the Heron often diſgorges a ſubſtance of the ſame nature and appearance. No wonder that chemiſts who fell upon theſe, inſtead of the real *Noſtoc*, proved them to be of an animal nature! The writer of this was aſſured by a friend and companion of the celebrated Spallanzani, that ſome of his experiments, at leaſt, upon the ſame ſubject, were made with young aquatic ſnails, that had not yet acquired ſhells, in the aqueduct at Genoa, and that he rejected with much contempt the information of their being ſuch, and not a real *Tremella*, though a little attention would have enabled him to trace the animals through their various ſtates, on the ſpot, from an apparently inert gelatinous maſs, like a plant, to their complete perfection. What we read therefore, in various places, relative to the animal nature of *Tremella Noſtoc*, ſhould be received with caution, till we aſcertain whether thoſe who inveſtigated the ſubject were competent to know what they were examining. As to the genuine *Noſtoc*, Geoffroy and Reaumur long ago determined its vegetable nature. Micheli deſcribes its ſeeds as ranged in lines, like ſtrings of minute beads; but we never heard of ſuch being obſerved in any Britiſh ſpecimens. S.

NOSTRE, or NOTRE, ANDREW LE, in *Biography*, an eminent planner of gardens, was born at Paris in the year 1613. He was the ſon of a gardener, and ſucceeded his father in that employment. He probably received little or no education, and was about 40 years of age when he was brought into notice by the ſuperintendant Fouquet, for whom he laid out the magnificent gardens of Vaux-le-Vicomte, celebrated by La Fontaine in his poems. In this work he was the creator of thoſe porticoes, covered walks, grottoes, labyrinths, &c. in which, at that period, the wonders of ornamental gardening conſiſted. Lewis XIV., charmed with the magnificence of Le Noſtre's plans, employed him in the decoration of his favourite reſidences; and his art was accordingly diſplayed at Verſailles, Trianon, Fontainbleau, &c. Le Noſtre went to Rome in 1678, and afterwards travelled through Italy; and it is ſaid he found nothing in the moſt celebrated gardens, that he had not deviſed in thoſe of his own planning. He was ſome time in England, and, probably on the invitation of Charles II., laid out St. James's and Greenwich parks. In 1675, when he was again in France, his long ſervices were rewarded by letters of nobleſſe, and the croſs of St. Michael. The king would have given him a coat of arms, but he replied that he had one already, "conſiſting of three ſnails ſurmounted by a cabbage." At the age of four-ſcore he deſired permiſſion to retire, which the king granted him, on condition that he would ſometimes come and ſee him. He died at Paris, in 1700, at the age of 87. He is ſaid to have had a fine taſte for the arts in general, eſpecially for that of painting; and ſome pieces of his execution are mentioned as exiſting in the royal cabinet. Moreri.

NOSTRILS, the openings of the noſe in a horſe. Theſe ſhould be large and extended, ſo that the red within them may be perceived, eſpecially when he ſneezes.

NOTABILIA BONA. See BONA.

NOTÆ MATERNÆ, *Mother's Spots*. See NÆVUS.

NOTARICON, the third part or ſpecies of the Jewiſh Cabala.

Rabbi Nathan, in his Great Aruch, ſays, that notaricon is when a ſingle letter is taken for the ſign of a thing, *i. e.* for a whole name. He adds, that the word comes from the Latin *notarius*, a perſon who writes in notes, or ſhort-hand; and R. Elias Levita gives the ſame account in his Theſbites; except that, in lieu of one letter for a word, he mentions two or three.

But, after all, neither the one nor the other ſeems alone ſufficient; for, as a ſingle letter frequently makes a word, ſo, in the notaricon, a whole word ſometimes ſtands for a ſingle letter.

There are, therefore, two principal kinds of notaricon: the firſt is, when, by aphæreſis, or apocope, the firſt or laſt letters of ſeveral words are joined to make a ſingle word or phraſe; which, therefore, is of two kinds, the one initial, the other final; and each is done ſeveral ways. The firſt of theſe kinds, which the rabbins call *Raſche Theboth*, appears very ancient; and is ſuppoſed, by ſome, well verſed in the Hebrew, to have taken its origin from the Pſalms, and other places of Scripture, proceeding alphabetically, *i. e.* the firſt verſe beginning with א, the firſt letter of the alphabet; the ſecond with ב, the ſecond letter, &c. See ABCEDARY.

The ſecond kind is alſo very common, and is called *Sophe Theboth*, *i. e.* the end of words. For inſtance; by telling the laſt letters of the words מהשמומהלי, *Mihi, quodnam nomen eſt? Quodnam?* They find the name of God, Jehovah. This becomes ſtill more puerile, when they take the letters backwards.

The third kind is more modern, and is more groſs and perplexed. Here a letter gives a whole word, inſtead of a word's only giving a letter; ſo that a word ſhall furniſh a whole phraſe.

Thus, for example, in the firſt word of Geneſis, בראשית, *bereſchit*, is found. He created the heaven and the earth, the ſea, the abyſs, &c.

NOTARY, NOTARIUS, primarily denotes one who takes notes, or ſhort draughts, of contracts, or other inſtruments.

From the 44th Novel of Juſtinian it appears, that contracts were firſt written in notes, or abbreviatures, by the notaries, or clerks of the tabelliones, and were not yet obligatory. Afterwards they were ingroſſed, or written at length by the tabellio himſelf, and then ſigned and ſealed.

NOTARY is more particularly uſed to denote an officer who draws and keeps notes and minutes of contracts, obligations, and other inſtruments, executed before him; and delivers out authentic copies, &c. thereof.

Ragueau diſtinguiſhes between *notarii* and *tabelliones*: notaries, he ſays, in ſeveral cities, are only to receive and paſs the minutes of contracts, and to deliver them to the parties in brief; being obliged to carry them to the tabelliones to be kept, and to have ingroſſed copies delivered out to the parties.

He adds, that the notaries were anciently clerks of the tabelliones; and that ſeparating, by degrees, from their maſters, they at length erected offices of their own; and, at laſt, took place of the tabelliones, who were ſuppreſſed.

They had their name *notarii* from *notæ*; becauſe anciently they wrote in notes, or ſhort-hand.

Notaries

Notaries are now little uſed among us, except in mercantile affairs; though in France they ſtill ſubſiſt in their legal capacity. The notaries of the chatelet are called the king's counſellors, and note-keepers.

NOTARY, *Public*, among us, is a perſon who draws, and publicly atteſts deeds or writings, between merchants, to make them authentic in another country.

Notaries have the drawing, paſſing, keeping, iſſuing, &c. of all deeds, contracts, charter-parties, &c. in the mercantile world. In their books are regiſtered proteſts, remonſtrances, &c. See NOTE and BILL.

A notary public is appointed to this office by the archbiſhop of Canterbury, and the appointment is to be regiſtered and ſubſcribed by the clerk of his majeſty for faculties in Chancery. By 41 Geo. III. cap. 7. it is enacted, that from and after Auguſt 1, 1801, no perſon ſhall be ſworn, admitted, and enrolled as a public notary, unleſs ſuch perſon has ſerved ſeven years as clerk or apprentice, &c. nor perform any notarial act, without ſuch admiſſion and enrollment, &c. under a penalty of 50*l.* The admiſſion of a notary ſhall be upon a 30*l.* ſtamp, and every notarial act ſhall be on a 5*s.* ſtamp.

NOTARIES, *Eccleſiaſtical*, were officers in the firſt ages of the church, whoſe buſineſs was to collect and preſerve the acts of the martyrs.

They are ſuppoſed to have been firſt inſtituted by St. Clement. Their number was ſeven, and they were diſpoſed in the ſeven quarters or regions of Rome.

Pope Fabian, judging the ſhort-hand of the notaries too obſcure for common uſe, added ſeven ſubdeacons to them, to tranſcribe at length what the notaries drew in ſhort.

At length theſe notaries were laid aſide, and two other kinds were eſtabliſhed in their ſtead, *viz. apoſtolical* notaries, and *epiſcopal* notaries; whoſe buſineſs lies in ſpiritual and beneficiary inſtruments.

NOTATION, in a general ſenſe, implies the repreſenting of any number, quantity, dimenſion, or operation by means of certain ſymbols or characters.

NOTATION, in *Arithmetic*, is the method of expreſſing, by means of certain ſymbols or numeral characters, any propoſed number or quantity. In the common ſcale of notation, every number is expreſſed by means of the ten characters or digits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, which repreſentation is effected by giving to each digit a local as well as its proper numeral value, the invention of which method, ſimple as it now appears, is perhaps one of the moſt important improvements that has ever been made in the mathematics, and does its author as much honour as any diſcovery recorded in the hiſtory of theſe ſciences. To whom we are indebted for the advantages ariſing from this method is not known, nor even the nation whence it had its origin; ſome having attributed the invention of it to the Arabs, others to the Greeks, and others again to the Indians; which latter people have certainly a priority of claim to the two former; but whether they were the original inventors, or whether they borrowed their notion of it from any other nation, is at preſent, and probably ever will remain undecided.

The ſimplicity of this method, and the univerſal application of it to every ſpecies of calculation, render it ſo familiar to all our ideas of numbers, that we loſe ſight of the ingenuity and advantage of it by means of that which ought to render it more the object of our admiration; that is, the obvious and accurate principles upon which it is founded; and inſtead of conſidering it as a moſt ingenious diſcovery, we are apt to treat it as a neceſſary conſequence following immediately from the nature of number itſelf. That this, however, is a miſtake is evident, from the notation of the Greeks and Romans, to whom this method was unknown: in fact it does not appear to have been introduced into Europe before the latter end of the tenth century, when it was firſt taught by the Arabs to the Spaniards, with whom they had a communication, and hence it ſoon after became generally known amongſt the other European nations, though it does not appear to have been brought into uſe in England before the year 1150.

It is evident from ſeveral manuſcripts of the Arabs which are ſtill preſerved, that they derived their knowledge of it, either directly or indirectly, from the Indians, it being entitled, in ſome of their works, the "Indian Arithmetic." With regard to the characters or digits by which numbers are now almoſt univerſally expreſſed, they ſeem to be the ſame, with a very ſlight alteration, as thoſe that were originally employed for that purpoſe; but their forms are not ſuch as to throw any light upon their origin, though ſome authors, who have diſcovered more ingenuity than judgment, have endeavoured to trace them to the Greek alphabet, and hence inferring, contrary to every evidence, a Grecian origin to our preſent ſyſtem of notation. Montucla has given us, in the 11th plate of the firſt volume of his "Hiſtoire des Mathematiques," a repreſentation of the ſeveral arithmetical characters, as they have been employed by different early writers; and as theſe may be intereſting to many of our readers, we have given the ſame in *Plate Notation* of the preſent work.

In the common, or denary ſcale of notation, the value of every digit increaſes from the right hand towards the left in a tenfold proportion; thus 11111 is the ſame as 10000 + 1000 + 100 + 10 + 1, and ſo on for others; the diſtance of any figure from the right indicating the power of 10, and the digit itſelf the number of thoſe powers intended to be expreſſed, on which obvious principle it is evident, that any number whatever may be repreſented with eaſe and ſimplicity. But ſince any other number or radix might have been aſſumed inſtead of 10, the curious reader will enquire how it happened that this in particular ſhould have been ſelected as the almoſt univerſal radix by nations totally unconnected and unknown to each other, even in many rude nations, particularly amongſt the inhabitants of the iſlands in the South ſea, who have ſcarcely any notions of a regular ſyſtem of arithmetic, yet have a method of dividing their numbers into periods of tens, and the ſame has been obſerved with regard to the natives of New Holland and ſome other newly diſcovered countries. This ſingular coincidence between nations totally unknown to each other has given riſe to many philoſophical ſpeculations, from the time of Ariſtotle to the preſent day, though it ſeems to be now univerſally ſuppoſed to have had its origin in the formation of man; that is, to the circumſtance of his poſſeſſing ten fingers, by the aid of which, in all probability, calculation, or at leaſt numbering, was firſt effected; as we ſee children, in making their firſt efforts in computation, have recourſe to this means of aſſiſting their memories, and hence we may infer, that the preſent diviſion of numbers into periods of tens had its origin as ſoon as numbering was firſt attempted, that is, as ſoon as men began to aſſociate with each other. But it muſt not thence be inferred, that the mode of notation in preſent uſe followed neceſſarily from this diviſion; of the contrary of which we may be convinced by attending to the arithmetic of the Greeks, who, notwithſtanding they made uſe of the ſame diviſion, had no idea of our preſent notation. Such, however, being the caſe with regard to the diviſion of numbers, the choice of the radix 10 was the moſt natural that could have been ſelected, though it was not the beſt adapted to arithmetical calculations, 12 being much better ſuited for this purpoſe: the advantages of it,

however, are not ſuch as to lead us to expect, or even to wiſh that it ſhould ever be ſubſtituted for that which long eſtabliſhed cuſtom has rendered ſo familiar to all our ideas of numbers. But though not the beſt, the preſent ſcale, with the exception of the duodenary, is the moſt eligible that could have been deviſed, and as convenient as can be deſired; it will, therefore, not be amiſs to inveſtigate the principles on which it is founded, and the advantages and diſadvantages of it, compared with other ſyſtems; in doing which we ſhall avail ourſelves of an intereſting chapter on this ſubject in Barlow's Theory of Numbers.

Prop. I.

Every number, N, may be reduced to the form $N = a r^n + b r^{n-1} + c r^{n-2} + \&c. p r^2 + q r + w$; where r may be any number whatever, and a, b, c, &c. integers leſs than r.

For let N be divided by the greateſt power of r contained in it, as r^n, and let the quotient be a, and remainder N'; ſo that

$$N = a r^n + N'.$$

Divide, again, N' by the next lower power of r, as r^{n-1}, and let the quotient be b, which will be an integer, or zero, as $N' >$ or $< r^{n-1}$, and the remainder N'', whence

$$N = a r^n + b r^{n-1} + N''.$$

Dividing, again, N'' by r^{n-2}, and ſuppoſing the quotient c, and remainder N''', we have

$$N = a r^n + b r^{n-1} + c r^{n-2} + N'''.$$

And by thus continually dividing the remainder by the next lower power of r, we ſhall be evidently brought finally to the form

$$N = a r^n + b r^{n-1} + e r^{n-2} \ldots . p r^2 + q r + w,$$

in which expreſſion, as a, b, c, &c. are the quotients ariſing from the diviſion of a number by the higheſt power of r contained in that number, it neceſſarily follows that each of thoſe co-efficients a, b, c, &c. is leſs than r.

Cor.—If $r = 10$, then a, b, c, &c. are the digits by which any number is expreſſed in our common method of notation; thus,

$$76034 = 7 . 10^4 + 6 . 10^3 + 0 . 10^2 + 3 . 10 + 4$$
$$18461 = 1 . 10^4 + 8 . 10^3 + 4 . 10^2 + 6 . 10 + 1$$

which form is always underſtood in enumerating the value of any number propoſed; that is, we give to every digit a *local*, as well as its original or natural value; thus, in the number 76034, the ſecond digit from the right is 3, but we conſider it as repreſenting 30, on account of its local ſituation, being in the ſecond place from the right; in the ſame manner the 6 repreſents 6000, and the 7, 70,000; ſo that the value of each digit is eſtimated according to its local ſituation, and its original value, the former indicating the power of 10, and the latter the number of thoſe powers that are intended to be expreſſed.

Cor. 2.—It is evident, from the foregoing propoſition, that a number may be in the ſame manner repreſented by any other value of the radix r, and hence ariſe the different ſcales of notation, which receive the following particular denominations according to the value of the radix:

If $r =$	2	it is termed the	Binary ſcale,
$r =$	3	- -	Ternary,
$r =$	4	- -	Quaternary,
$r =$	5	- -	Quinary,
$r =$	6	- -	Senary,
$r =$	10	- -	Denary or common ſcale,
$r =$	12	- -	Duodenary.

And ſince, by the foregoing propoſition, a, b, c, &c. are always leſs than r, the radix of the ſyſtem into which they enter, therefore it follows that for every ſcale we muſt have as many characters, including the cipher, as are equal to the number expreſſing the radix of the ſyſtem. Thus for the

Binary ſcale, the characters are	0, 1.
Ternary - -	0, 1, 2.
Quaternary - -	0, 1, 2, 3.
Senary - -	0, 1, 2, 3, 4, 5
Denary or common ſcale	0, 1, 2, 3, 4, 5, 6, 7, 8, 9.

And hence it follows, that in the duodenary ſcale, we muſt have two additional characters for repreſenting 10 and 11, and as theſe characters may be aſſumed at pleaſure, we ſhall, in what follows, expreſs 10 by the ſymbol ϕ, and 11 by π, whence the digits of the duodenary ſcale will be

0, 1, 2, 3, 4, 5 6, 7, 8, 9, ϕ, π.

Prop. II.

Given the equation

$$N = a r^n + b r^{n-1} + c r^{n-2} \ldots . p r^2 + q r + w,$$

in which N and r are given numbers, to find the unknown co-efficients the a, b, c, &c.; and the exponent n. Or, which is the ſame, to transform a number from the denary to any other ſcale of notation.

It is evident that this may be done by Prop. I., namely, by dividing N ſucceſſively by the higheſt power of r which is contained in it, but it is more readily performed by dividing N ſucceſſively by r; thus, if

$$N = a r^n + b r^{n-1} + c r^{n-2} \ldots . . p r^2 + q r + w$$

be divided by r, the quotient will be

$$a r^{n-1} + b r^{n-2} + c r^{n-3} \ldots . p r + q$$

and the remainder w.

This laſt quotient, being again divided by r, gives for a quotient

$$a r^{n-2} + b r^{n-3} + c r^{n-4} \ldots . p$$

and a remainder q. And this quotient, divided by r, gives a quotient

$$a r^{n-3} + b r^{n-4} + c r^{n-5}$$

and a remainder p.

Whence it is evident that the ſucceſſive remainders will be the co-efficients w, q, p, &c., or the digits that expreſs any number in the ſcale of which r is the radix.

Example 1.—Given $17486 = a . 6^n + b . 6^{n-1} + c . 6^{n-2} \ldots . w$, to find a, b, c, &c. Or, which is the ſame, convert 17486 from the common to the ſenary ſcale.

Here, by the foregoing propoſition,

6)	17486	
6)	2914	$- 2 = w$
6)	485	$- 4 = q$
6)	80	$- 5 = p$
6)	13	$- 2 = c$
6)	2	$- 1 = b$
	0	$- 2 = a$

Therefore, 17486, in the denary ſcale, is expreſſed by 212542 in the ſenary.

Example

Example 2.—Transform 1810 into both the binary and ternary ſcales.

2)	1810		3)	1810	
2)	905	— 0	3)	603	— 1
2)	452	— 1	3)	201	— 0
2)	226	— 0	3)	67	— 0
2)	113	— 0	3)	22	— 1
2)	56	— 1	3)	7	— 1
2)	28	— 0	3)	2	— 1
2)	14	— 0		0	— 2
2)	7	— 0			
2)	3	— 1			
2)	1	— 1			
	0	— 1			

Therefore, 1810 = 11100010010 in the binary ſcale; and 1810 = 2111001 in the ternary ſcale.

Example 3.—Transform the two numbers 844371, and 215855, from the denary to the duodenary ſcale.

12)844371			12)215855		
12)	70364	— 3	12)	17987	— 11 = γ
12)	5863	— 8	12)	1498	— 11 = γ
12)	488	— 7	12)	124	— 10 = φ
12)	40	— 8	12)	10	— 4 = 4
12)	3	— 4		0	— 10 = φ
	0	— 3			

Hence 844371 is expreſſed by 348783 in the duodenary ſcale, and 215855 by φ4φγγ.

And thus a number is readily transformed from the denary, to any other ſyſtem of which the radix is given, and hence we find 1000 is expreſſed in the following manner, according to the value of the radix *r*.

If *r* =	2,	1000 =	1111101000
r =	3,	1000 =	1101001
r =	4,	1000 =	33220
r =	5,	1000 =	13000
r =	6,	1000 =	4344
r =	7,	1000 =	2626
r =	8,	1000 =	1750
r =	9,	1000 =	1331
r =	10,	1000 =	1000
r =	11,	1000 =	82φ
r =	12,	1000 =	6γ4

Hence it is evident, as it is, indeed, from the nature of the ſubject under inveſtigation, that the greater the radix is, the leſs will be the number of digits neceſſary for expreſſing any given number, but the operations of multiplication, diviſion, &c. will be the more complex; and therefore, in judging of the advantages and diſadvantages of different ſyſtems, we ought to keep both theſe circumſtances in view, as alſo a third, which is the number of prime diviſions of the radix, and on a juſt eſtimate of the whole, the radix 12 will be found preferable to any of the other ſyſtems: but on this ſubject we ſhall add a few remarks at the concluſion of this article.

Prop. III.

To transform a number from any other ſcale of notation to the denary, or common ſcale.

This propoſition is the converſe of the foregoing one, and it is readily effected by the reverſe operation.

For let $a r^n + b r^{n-1} + c r^{n-2} \ldots p r^2 + q r + w$, repreſent a number in any known ſcale of notation, whoſe radix is r; then ſince a, b, c, &c. are alſo known, we have only to collect the ſucceſſive values of the different terms, and their ſum will be the number transformed as required.

Example 1.—Transform 7184 from the duodenary to the common ſcale of notation. Firſt,

$$7184 = 7 \cdot 12^3 + 1 \cdot 12^2 + 8 \cdot 12 + 4,$$

Therefore we have

	$7 \cdot 12^3$	=	12096
	$1 \cdot 12^2$	=	144
	$8 \cdot 12$	=	96
	4	=	4
Duodenary	7184	=	12340

Example 2.—Transform 1534 from the ſenary to the denary ſcale.

1534 =	$1 \cdot 6^3 + 5 \cdot 6^2 + 3 \cdot 6 + 4$		
	$1 \cdot 6^3$	=	216
	$5 \cdot 6^2$	=	180
	$3 \cdot 6$	=	18
	4	=	4
Senary	1534	=	418 in the common ſcale.

Cor.—By means of the two foregoing propoſitions, a number may be transformed from one ſcale of notation to another, neither of which is the denary, by firſt transforming it from the given ſcale to the common ſcale, and then into the particular one required.

Prop. IV.

In every ſcale of notation where radix is r, the ſum of all the digits expreſſing any number when divided by $n - 1$; will leave the ſame remainder as the whole number divided by $r - 1$. That is, if

$$N = a r^n + b r^{n-1} + c r^{n-2} \ldots p r^2 + q r + w,$$

then will $N \div (r - 1)$, leave the ſame remainder as

$$(a + b + c \ldots p + q + w) \div (r - 1).$$

For make $r - 1 = r'$, or $r = r' + 1$, then $r^n \div (r - 1) = (r' + 1)^n \div r'$ will leave a remainder 1, becauſe every term of the expanded binomial $(r' + 1)^n$, is diviſible by r, except the laſt, which is 1, and conſequently $(r' + 1)^n \div r'$, or $r^n \div (r - 1)$, will leave a remainder 1, and this property is entirely independent of the value of n; and hence it follows, that every power of r, divided by $r - 1$, will leave a remainder 1, or each of the powers r^n, r^{n-1}, r^{n-2}, &c.

is of the form $m\,(r-1)+1$; that is, $r^{\varphi} = m\,(r-1)+1$, whatever integer value is given to φ: and hence it follows, that

$$\begin{array}{lll} a\,r^{n} & = a\,m & (r-1)+a \\ b\,r^{n-1} & = b\,m' & (r-1)+b \\ c\,r^{n-2} & = c\,m'' & (r-1)+c \\ \text{\&c.} & & \text{\&c.} \\ p\,r^{2} & = p\,m''' & (r-1)+p \\ q\,r & = q\,m^{\text{IV}} & (r-1)+q \\ w & = & w \end{array}$$

and consequently

$$\mathrm{N} = m^{\text{v}}\,(r-1) + (a+b+c+\ldots p+q+w)$$

and, therefore, when divided by $r-1$, it will evidently leave the same remainder as the sum of its digits ($a+b+c$ and w).

Cor. 1.—Hence, if the sum of the digits in any system of notation be divisible by $r-1$, the number is divisible by $r-1$; therefore, in the common scale, if the digits of a number be divisible by 9, the number itself is divisible by 9; and if the sum of the digits be even, and divisible by 9, then will the number itself be divisible by 18; because if an even number be divisible by an odd number, it is divisible by double that number. And since 3 is a factor of 9, the same property that has been shewn to belong to the number 9, belongs also to 3; namely, if the sum of the digits of a number be divisible by 3, the number itself is divisible by 3; and if the sum be even also, then will the number be divisible by 6.

Cor. 2.—It is upon this obvious principle that our rule for proving the truth of operations in multiplication, division, &c. is founded, by dividing by, or casting out the 9's contained in the two factors, and the product, and what remains of this last, ought to be equal to what remains of the product of the two former remainders divided by 9, if the work be right.

For let a and b represent any two factors, and make

$$\begin{aligned} a &= 9n + a' \\ b &= 9m + b' \end{aligned}$$

then $ab = 9\,(9nm + ma' + nb) + a'b'$; and, therefore, $ab \div 9$, leaves the same remainder as $a'b'$ divided by 9: but the remainder of a by 9, is the same as the digits of a by 9, and the remainder of $b \div 9$, is the same as the digits of b by 9, and the same of the product ab; and hence the reason of the rule. The same is obviously true for any other system of notation, by taking the number next less than the radix for the divisor. Thus, for example, we have seen that $215855 = \varphi 4\varphi\gamma\gamma$ in the duodenary scale, and $215855 \div 11$, leave a remainder 2, but $\varphi + 4 + \varphi + \gamma + \gamma = 10 + 4 + 10 + 11 + 11 = 46$, which divided by 11 gives also a remainder 2. Suppose it was required to multiply $\varphi 4\varphi\gamma\gamma$ by $\varphi\varphi 4$, the operation and proof would stand thus:

Operation.

$\varphi 4\varphi\gamma\gamma$	rem. 2	
$\varphi\varphi 4$	rem. 2	Proof by 11.
$3577\gamma 8$		
$8811\gamma 2$		
$8811\gamma 2$		
95088918	rem. 4	

It is unnecessary to observe, that in this operation, as in all others in which the radix is r, we must, in multiplying, dividing, &c. divide by the radix, that is, by 12 in the above example, and set down the overplus, instead of dividing by 10, and setting down the overplus, as is done in the common scale.

Prop. V.

In any scale of notation whose radix is r, the difference of the remainder of the sum of the 1st, 3d, 5th, &c. digits divided by $r+1$, and the sum of the 2d, 4th, 6th, &c. digits, divided also by $r+1$, is equal to the remainder of the whole number divided by $r+1$.

Let $\mathrm{N} = ar^{n} + br^{n-1} + cr^{n-2} \ldots pr^{2} + qr + w$; then will the remainder of $(w + p + b, \text{\&c.}) \div r+1$, minus the remainder of $(q + c + a, \text{\&c.}) \div r+1$, be equal to the remainder of $\mathrm{N} \div r+1$.

For make $r+1 = r'$, or $r = r'-1$, then it is evident that $\dfrac{(r'-1)^{n}}{r'}$ will leave a remainder $+1$, or -1, according as n is even or odd; for all the terms in the expanded binomial $(r'-1)^{n}$ are divisible by r', except the last, which is $+1$ or 1, according as n is even or odd, independently of any other value of n; and, therefore, $\dfrac{r^{n}}{r+1}$ will also leave the same remainder in the same cases; that is, every odd power of r is of the form $m\,(r+1)$, and every even power of r is of the form $n\,(r+1)$. Therefore, in the above expression, we have

$$\begin{array}{lll} w & = & +w \\ qr & = & q\,m\,(r+1) - q \\ pr^{2} & = & p\,n\,(r+1) + p \\ cr^{n-2} & = & c\,m'\,(r+1) - c \\ br^{n-3} & = & b\,n'\,(r+1) + b \\ ar^{n} & = & a\,m''\,(r+1) - a \\ \text{\&c.} & & \text{\&c.} \end{array}$$

And consequently,

$$\mathrm{N} = m'''\,(r+1) + w - q + p - c + b - a;$$

and, therefore, when divided by $r+1$, it will leave the same remainder as $(w - q + p - c + b - a)$ divided by $r+1$, or as $(w + p + b, \text{\&c.}) \div (r+1) - (q + c + a, \text{\&c.}) \div (r+1)$.

Cor.—Hence, in the common scale, if the sum of the digits in the odd places is equal to the sum of those in the even place; or, if one exceed the other by 11, or any multiple of 11, the whole number may be divided by 11.

Cor. 2.—The above proposition furnishes us with another rule for proving the truth of the operation in multiplication, division &c. which, in the common scale of notation, the radix being 10, is as follows.

From the sum of the digits in the 1st, 3d, 5th, &c. places, subtract those in the 2d, 4th, 6th, &c. places in both factors, and in the product; also reserve the three remainders, when each of those differences is divided by 11; multiply the two former together, and cast out the 11's, which remainder ought to be equal to the remainder of the product, if the work be right. *Note*, If the sum of the 2d, 4th, &c. digits be greater than the sum of the 1st, 3d, &c. 11 must be added to the latter.

Thus,

Thus, for example, to prove the truth of the multiplication in the following example.

741746	diff. of digits	5	
3462	diff. of digits	8	
1483492		11(40	Proof.
4450476			
2966984		rem. 7	
2225238			
2567924652	diff. - -	7	

This method, though not ſo eaſily expreſſed, is as ready in practice as the rule by 9's, and being independent of it, we may conclude, with a very conſiderable degree of certainty, that any example that proves right by both rules, is really ſo in the operation. And the ſame rule is applicable to any other radix, by making that radix plus 1 the diviſor.

Cor. 3.—By means of Cor. 1. Prop. 4. and Cor. 1. Prop. 5. we are enabled to aſcertain if a number be diviſible by 3, 6, 9, 11, and 18, without attempting the operation, which is uſeful in finding the common meaſure of two numbers, reducing a fraction to its loweſt terms, &c. And to theſe rules we may add the following; *viz.* if a number terminates with 5 or 0, it is diviſible by 5 in both caſes, and by 10 in the latter caſe; and if the two laſt digits of any number is diviſible by 4, the whole number is diviſible by 4; if the three laſt digits be diviſible by 8, the number is diviſible by 8; and generally, if the n laſt digits be diviſible by 2^n, the whole number is diviſible by 2^n.

For every number ending in 5 or 0, is of one of the forms $10\,N + 5$, or $10\,N + 0$, both of which forms are evidently diviſible by 5, and the latter by 10.

Again, every number may be expreſſed by $A \times 10^n + B$, where B repreſents the n laſt digits: thus, for example, $7846144 = 784614 \times 10 + 4 = 78461 \times 10^2 + 44 = 7846 \times 10^3 + 144$, &c. And ſince 10 is diviſible by 2, 10^n is diviſible by 2^n; therefore, in the form $A \times 10^n + B$, which may repreſent any number whatever, 10^n is diviſible by 2^n, and B by 2^n by hypotheſis, therefore $A \times 10^n + B$ is diviſible by 2^n, if B be ſo; that is, if the n laſt digits be diviſible by 2^n.

Prop. VI.

To perform duodecimal operations by means of the duodenary ſcale of notation.

Rule.—Transform the number of feet, if above 12, into the duodenary ſcale, and ſet the inches and parts as decimals. Then multiply as in common arithmetic, except carrying for every 12 inſtead of for every 10, as in the common operations, and in the reſult transform again the integral part of the product into the denary ſcale.

Exam. 1.—Multiply 17 ft. 3 in. 4′ by 19 ft. 5 in. 11′

17	3	4	=	15·34	
19	5	11	=	17·5′	Proof by 11.

11·77					
9049867					
9049867					
1359′61					
1359′61					

1571·281417 = 2533 ft. 2 in. 8′ 1″ 4‴ 1ᵛ 7ᵛ anſ.

This method was firſt publiſhed by the writer of this article, in Nicholſon's Journal, vol. xxv. and it appears to poſſeſs conſiderable advantage over the common rule, both on account of the facility of operation, and the accuracy of the reſult, as likewiſe that it may thus be ſubmitted to proof, the ſame as common multiplication, which it is not poſſible to apply to the old method. In the above examples, the proof of 11 is only made uſe of; but it is obvious that it might alſo be proved by 13, according to the rule in Prop. 5.

And in the ſame manner, any other arithmetical operation, ſuch as diviſion, extracting the ſquare root, &c. is performed with as much facility as in common numbers.

Exam. 3.—Given the area of a rectangle equal to 174 feet 11 inches, and its length 15 feet 7 inches; to find its breadth in feet, inches, &c.

174 ft. 11 in. = 126·γ, and 15 ft. 7 in. = 13·7

φ48

540
524

180
137

45

The breadth is, therefore, 11 ft. 2 in. 8′ 4″ 5‴.

As the above method of proving diviſion is ſeldom or never given in books of arithmetic, it may not be amiſs to ſay how it is effected, which is this; from the ſum of the digits in the dividend, take thoſe in the remainder; then the remainder from the diviſor and quotient ought to be equal to that of the dividend thus reduced, if the work be right. The reaſon for which is evident, becauſe the dividend minus the remainder may be conſidered as the product ariſing from the multiplication of the dividend and quotient.

Exam.—Given the breadth and area of a rectangle, equal to 24 feet 9 inches, and 971 feet 10 inches, to find its length.

24 ft. 9 in. = 20·9, and 971 ft. 10 in. = 68γ·φ.

8402	20000
2	14804
8404	73γ800
	6γ4404
	473γ8

Proof.

Therefore the ſide is 4 ft. 2 in. 0′ 2″ 10‴.

And thus may any other numerical operation be performed with as much facility as in common arithmetic.

Let us now ſhew the application of the preceding principles to two or three curious problems propoſed by Euler, in his "Analyſis Infinitorum."

Prop. VII.

Every number leſs than 2^{n+1} is compounded of ſome number of terms in the ſeries

1, 2, 2^2, 2^3, 2^4, 2^5, &c. 2^n.

This is made evident by transforming the given number $N < a^{n+1}$ into the binary ſcale, which, from what has been obſerved at Cor. 2. Prop. 1, will aſſume the form

$$N = a \cdot 2^n + b \cdot 2^{n-1} + c \cdot 2^{n-2} \ldots\ldots p \cdot 2^2 + 9 \cdot 2 + w,$$

where a, b, c, &c. are each leſs than 2, and conſequently either 0 or 1; and as every number leſs than 2^{n+1} may be thrown into this form; therefore, with the above ſeries, every number whatever within the aſſigned limits may be compounded of ſome number of thoſe terms.

Cor. 1.—What is ſaid in the above demonſtration not only proves the truth of the theorem, but alſo points out the method by which it is to be effected; and at the ſame time it is evident, that there is only one way in which the ſelection can be made.

Cor. 2.—In the above theorem the greateſt power of 2 is 2^n; and, conſequently, the greateſt number that can be formed is $2^{n+1} - 1$; but if the power of 2 be unlimited, ſo alſo will the number that may be compounded of thoſe terms; that is, any number whatever may be compounded of the terms of the indefinite ſeries 1, 2, 2^2, 2^3, 2^4, &c.

Exam.—Having a ſeries of weights of 1lb. 2lb. 4lb. 8lb. 16lb. &c., it is required to aſcertain which of them muſt be ſelected to weigh 1719 lb.

Firſt, 1719, in the binary ſcale, is repreſented by 11010110111; the weights, therefore, to be employed, are 1 lb. + 2 lb. + 2^2 lb. + 2^4 lb. + 2^5 lb. + 2^7 lb. + 2^9 lb. + 2^{11} lb.

Prop. VIII.

Every number whatever may be formed by the ſums and differences of the terms of the geometrical ſeries 1, 3, 3^2, 3^3, &c.

For by transforming the given number N into the ternary ſcale of notation, it will aſſume the form

$$N = a\,3^n + b\,3^{n-1} + c\,3^{n-2} \ldots\ldots p\,3^2 + q\,3 + w,$$

where each of the co-efficients a, b, c, &c. are leſs than 3, and, conſequently, they muſt be either 2 or 1 or 0. Now, in order to prove the truth of the theorem, it will be better to ſelect a partial example, the reaſoning on which will be evidently applicable to every other caſe. Firſt, then, it is obvious, that if no one of theſe co-efficients be greater than 1, the queſtion is reſolved agreeably to the conditions of the propoſition. We need, therefore, only conſider the caſe, in which ſome one or more of the co-efficients are equal to 2. Let, then,

$$N = 3^n + 2 \cdot 3^{n-1} + 0 \cdot 3^{n-2} + 2 \cdot 3^{n-3} + 3^{n-4} + 0 \cdot 3^{n-5} + 2 \cdot 3^{n-6}, \text{ \&c.}$$

And ſince $3 \cdot 3^{n-6} = 3^{n-5}$, and $3 \cdot 3^{n-3} = 3^{n-2}$, $3 \cdot 3^{n-1} = 3^n$

The above expreſſion is the ſame as

$$(2 \cdot 3^n + 3^{n-2} + 3^{n-4} + 3^{n-5}) - (3^{n-1} + 3^{n-3} + 3^{n-6}) =$$
$$(3^{n-1} + 3^{n-2} + 3^{n-4} + 3^{n-5}) - (3^n + 3^{n-1} + 3^{n-3} + 3^{n-6}) = N$$

agreeably to the conditions of the propoſition.

Remark.—The latter part of the above demonſtration is only for a particular caſe, but it is evident that the ſame reaſoning will apply to any caſe, or even to the general form; but it would have only tended to lengthen and embarraſs the demonſtration, and at the ſame time would not have added to the certainty of the concluſion; for which reaſon, it was thought better to proceed as above. This demonſtration, like that in the foregoing propoſition, has the advantage of pointing out the method of ſolution, at the ſame time it proves the truth of the theorem, and, like that alſo, ſhews that there is only one way in which the ſolution can be effected.

Cor.—It appears from this theorem, that with a ſeries of weights, 1 lb. 3 lb. 3^2 lb. 3^3 lb. 3^4 lb. &c., any number of pounds whatever may be aſcertained, by placing ſome of thoſe weights in one ſcale, and ſome in the other, when the caſe requires it, or only in one ſcale, when the given weight is compounded of any number of thoſe terms. The ſolution of which problem is readily deduced from the foregoing demonſtration.

Exam. 1.—Required in what manner the weights muſt be

be ſelected out of the foregoing ſeries, to weigh 716 pounds.

Firſt, 716, in the ternary ſcale, is expreſſed by

	222112	
Add	1	= 1
	222120	
Add	10	= 3
	222200	
Add	100	= 3^2
	1000000	= 3^6

Therefore, 222112 = $3^6 - (3^2 + 3 + 1)$; that is, 3^6 muſt be placed in one ſcale, and the three weights $3^2 + 3 + 1$ in the other ſcale, with the body to be weighed.

Exam. 2.—What weights out of the above ſeries muſt be ſelected to aſcertain a weight of 1319 lb.

Firſt, 1319 = 1210212 in the ternary ſcale

	1210212	
Add	1	= 1
	1210220	
Add	10	= 3
	1211000	
Add	100000	= 3^5
	2011000	
Add	1000000	= 3^6
	10011000	= $3^7 + 3^4 + 3^3$

And hence we conclude, that the weights $3^7 + 3^4 + 3^3$ muſt be put in one ſcale, and the weights $3^5 + 3^5 + 3 + 1$ in the other ſcale, with the body whoſe weight is to be aſcertained.

Theſe curious numerical problems are mentioned by Euler at page 253 of his "Analyſis Infinitorum," and the poſſibility of any weight being aſcertained by ſuch a ſyſtem of weights is rigorouſly demonſtrated; but the demonſtration in the two foregoing problems is much ſimpler, and they have moreover the advantage of indicating the mode of ſolution, which is not attainable by Euler's method.

Before we conclude this article, it will not be improper to make a few general obſervations on the comparative advantages and diſadvantages of the different ſcales of notation, which have been the ſubject of our inveſtigation. On this head, ſimplicity is evidently the firſt conſideration to be attended to, for in that alone conſiſts the ſuperiority of one ſyſtem over another; but this ought to be eſtimated on two principles, *viz.* ſimplicity in arithmetical operations, and in arithmetical expreſſions. Leibnitz, by conſidering only the former, recommended the binary ſcale, which has certainly the advantage in all arithmetical operations in point of eaſe, but this is more than counterbalanced by the intricacy of expreſſion, on account of the number of figures neceſſary for repreſenting a number of any conſiderable extent; thus we have ſeen, **Prop.** 2, that 1000 in the binary ſcale would require 10 places of figures, and to expreſs 1000000, we muſt have 20 places, which would neceſſarily be very embarraſſing; at the ſame time, that all calculations would proceed very ſlowly, on account of the number of figures that muſt be made to enter therein.

The next ſcale that has been recommended is the ſenary, which certainly poſſeſſes ſome important advantages; firſt, the operation with this ſyſtem would be carried on with facility; the number of places of figures for expreſſing a number would not be very great; beſide, that thoſe quantities, equivalent to our decimals, would be more frequently finite than they are in our ſyſtem: for example, every fraction, whoſe denominator is not ſome power of one of the factors of 10, is indefinite, and thoſe only are finite, that contain the powers of thoſe factors; and it is exactly the ſame in every other ſcale of notation; *viz.* thoſe fractions only are finite, that have denominators compounded of the powers of the factors of the radix of that ſyſtem; therefore, in the decimal ſcale only fractions of the form $\frac{a}{2^n 5^m}$ are finite, and in the ſenary ſcale the finite fractions are of the form $\frac{a}{2^n 3^m}$; and as there are neceſſarily more numbers of the form $2^n 3^m$ within any finite limit, than there are of the form $2^n 5^m$, it follows, that in a ſyſtem of ſenary arithmetic, we ſhould have more finite expreſſions for fractions than we have in the denary, and conſequently, on this head, the preference muſt be given to the ſenary ſyſtem; and, indeed, the only poſſible objection that can be made to it is, that the operations would proceed a little ſlower than in the decimal ſcale, becauſe in large numbers a greater number of figures muſt be employed to expreſs them. This leads us to the conſideration of the duodenary ſyſtem of arithmetic, which, while it poſſeſſes all the advantages of the ſenary, in point of finite fractions, it is ſuperior even to the decimal ſyſtem for ſimplicity of expreſſion; and the only additional burden to the memory, is two characters for repreſenting 10 and 11; for the multiplication table in our common arithmetic is generally carried as far as 12 times 12, although its natural limit is only 9 times 9, which is a clear proof, that the mind is capable of working with the duodenary ſyſtem, without any inconvenience or embarraſſment; and hence we may conclude, that the choice of the denary arithmetic did not proceed from reflection and deliberation, but was the reſult of ſome cauſe operating, in an unſeen and unknown manner, on the inventor of this ſyſtem; and it may, therefore, be conſidered as a fortunate circumſtance, that for this unpremeditated index, that particular one ſhould have been ſelected, which holds at leaſt the ſecond place in the ſcale of general utility. This circumſtance, as we have before obſerved, is undoubtedly connected with the formation of man, which has led all nations to the diviſion of numbers into periods of 10, and which naturally ſuggeſted the idea of making this number the radix of the ſyſtem. Still, however, the peculiar method which we employ in the repreſentation of numbers, muſt not be conſidered as ariſing out of this diviſion, but as an improvement introduced a long time afterwards, as is evident from the arithmetic of the Greeks; who, notwithſtanding they made uſe of the ſame diviſion, had no idea of our preſent ſyſtem of notation, the great and important advantage of which, is the giving to every digit a local as well as its original or natural value, by means of which we are enabled to expreſs any number, however large, by the combination of only ten numerical ſymbols, whereas the Greeks, for want of this method, were under the neceſſity of uſing 36 different characters, and with which they were not for a long time able to expreſs a number greater than 10000; this was, however, afterwards indefinitely extended by the improvements of Archimedes, Apollonius, Pappus, &c. We have given, under the article CHARACTERS, a general idea

of

of the notation of the Greeks: it will, however, be intereſting to many of our readers to have a ſlight ſketch of their arithmetical operations; we ſhall, therefore, before we conclude this article, enter upon the ſubject, and ſhall explain a little more at large the nature of their notation.

The characters employed by the Greeks were principally derived from their alphabet, and conſidering the number of them, their arithmetic was managed with conſiderable facility, though it muſt be acknowledged that it fell very ſhort of that ſimplicity which is ſo ſtrongly characteriſtic of the modern method.

Inſtead of our digits	1,	2,	3,	4,	5,	6,	7,	8,	9,
the Greeks employed	α,	β,	γ,	δ,	ε,	ζ,	ζ,	η,	θ.
To repreſent they uſed	10,	20,	30,	40,	50,	60,	70,	80,	90,
	ι,	κ,	λ,	μ,	ν,	ξ,	ο,	π,	ϟ.
To expreſs they made uſe of	100,	200,	300,	400,	500,	600,	700,	800,	900,
	ρ,	σ,	τ,	υ,	φ,	χ,	ψ,	ω,	ϡ.

But for the thouſands, 1000, 2000, &c. inſtead of any diſtinct characters, they employed for this purpoſe

α, β, γ, δ, ε, ζ, ζ, η, θ;

that is, they had recourſe again to their characters for the ſimple units, with this difference only, that, in order to diſtinguiſh them from the former, they placed a ſmall iota, or daſh, below the letter.

With theſe characters it is evident that the Greeks could expreſs any number under 10,000, or a myriad; thus

991 was repreſented by ϡαϟα

9999 ——— θϡϟθ

7382 ——— ζτπβ

8036 ——— ηλζ

6420 ——— ζυκ

4001 ——— δα

And ſo on for other numbers; whence it is evident, that neither the order nor the number of characters had any effect in fixing the value of any number intended to be expreſſed; for 4001 is expreſſed by two characters, 6420 by three, and 7382 by four. Alſo, the value of each of thoſe expreſſions is the ſame, in whatever order they are placed; thus, θϡϟθ is the ſame as ϡϟθθ, or as ϟθθϡ; and ſo on for any other poſſible combination; but as regularity tended, in a great meaſure, towards ſimplicity, they always wrote the characters according to their value, as in the examples above.

In order to expreſs any number of myriads, they made uſe of the letter M, placing above it the character repreſenting the number of myriads they intended to indicate.

	α	β	γ	δ	
Thus	M,	M,	M,	M,	&c.
repreſented	10,000,	20,000,	30,000,	40,000.	

λζ δτοβ

thus alſo M expreſſed 370,000, M = 43720000, and generally, the letter M placed beneath any number, had the ſame effect as our affixing four ciphers. This is the notation employed by Eutocius in his Commentaries on Archimedes, but it is evidently not very applicable to calculations.

Diophantus and Pappus repreſented their myriads by the two letters M υ. placed after the number, and hence, according to them, the above numbers would be written thus: α . Mυ, β . Mυ, γ . Mυ, δ . Mυ, &c. 370,000 = λζ . Mυ, and 43720000 = δτοβ . Mυ.

Alſo 43728097 is expreſſed by δτοβ . Mυϟζ

and 99999999 by θϡϟθ . Mυθϡϟθ

This notation, in ſome meaſure, reſembles that which we employ for complex numbers, ſuch as feet and inches, or pounds and ſhillings.

The ſame authors, however, employed a ſtill more ſimple notation, by dropping the Mυ, and ſupplying its place with a point, thus,

inſtead of δτοβ . Mυϟζ, they wrote δτοβ . ϟζ;

and for θϡϟθ . Mυθϡϟθ, they wrote θϡϟθ . θϡϟθ;

this laſt number, with the addition of unity, becomes $10{,}000^2 = 100{,}000{,}000$, which was the greateſt extent of the Greek arithmetic, and for common purpoſes it was quite ſufficient, becauſe their units of weight and meaſure, ſuch as the talent and ſtade, were greater than our pound and foot. It was, therefore, only aſtronomers and geometers who ſometimes found an inconvenience in this limitation; thus, for example, Archimedes in his "Arenarius," in order to expreſs the number of grains of ſand that might be contained in a ſphere that had for its diameter the diſtance of the fixed ſtars from the earth, found it neceſſary to repreſent a number which, with our notation, would require 64 places of figures; and in order to do this, he aſſumed the ſquare myriad, or 100,000,000, as a new unit, and the numbers formed with theſe new units he called numbers of the ſecond order, and thus he was enabled to expreſs any number which, in our notation, requires 16 figures: aſſuming, again, $(100{,}000{,}000)^2$ for a new unit, he could repreſent any number, that requires in our ſcale 24 figures, and ſo on; ſo that by means of his numbers of the 8th order, he could expreſs the number in queſtion, which, as we have ſaid above, required 64 figures in our ſcale.

Hence, according to Archimedes, all numbers were ſeparated into periods, or orders, of eight figures, which idea, as we are informed by Pappus, was conſiderably improved by Apollonius, who, inſtead of periods of eight places, and which were named by Archimedes octades, reduced to periods of four figures, the firſt of which, on the left, were units, the ſecond period myriads, the third double myriads, or numbers of the ſecond order, and ſo on indefinitely. In this manner Apollonius was able to write any number that can be expreſſed by our ſyſtem of numeration; as for example, if he had wiſhed to repreſent the circumference of a circle, whoſe diameter was a myriad of the 9th order, he would have written it thus:

γ.	μυιε.	θσξε.	γφπθ.	ζϡλβ.	γωμς.	βχμγ.	γωλβ.
3.	1415.	9265.	3589.	7932.	3846.	2643.	3832.
			ζϡ.	βωκδ.			
			7950.	2824.			

Having thus given an idea of the Grecian notation for integer numbers, it remains to ſay a few words on their method of repreſenting fractions. A ſmall daſh ſet on the right of a number,

number, made of that number the denominator of a fraction, of which unity was the numerator: thus,

$\gamma' = \frac{1}{3}$, $\delta' = \frac{1}{4}$, $\xi\delta' = \frac{1}{64}$, $\rho\kappa\alpha' = \frac{1}{121}$ &c. but the fraction $\frac{1}{2}$ had a particular character, as C, or $<$, or C′, or $'<$.

When the numerator is not unity, the denominator is placed as we ſet our exponents.

Thus, $\iota\varepsilon^{\xi\delta}$, repreſented 15^{64}, or $\frac{15}{64}$;

and $\zeta^{\rho\kappa\alpha}$, repreſented 7^{121}, or $\frac{7}{121}$;

alſo $\sigma\xi\gamma \cdot \gamma\varphi\mu\delta^{\lambda\gamma \cdot \varkappa\psi\sigma\varsigma} = 2633544^{331776} = \frac{2633544}{331776}$;

this laſt fraction is found in Diophantus, book iv. queſtion 46.

As it was only our intention, in this place, to convey to the reader a connected and general idea of the notation of the Greeks, in order the better to eſtimate the value of the modern, or, as it is ſometimes called, the Indian arithmetic, we have not entered into an explanation of their ſexageſimals, as employed by aſtronomers in the diviſion of the circle, and of which our's is ſtill a repreſentative, as is evident from the following example.

o. $\nu\theta' \ \eta'' \ \iota\zeta''' \ \iota\gamma^{\text{iv}} \ \iota\beta \cdot \ \lambda\alpha^{\text{i}} = 0^\circ \ 59' \ 8'' \ 17''' \ 13^{\text{iv}} \ 12^{\text{v}} \ 31^{\text{vi}}$.

All, therefore, that now remains for us to do, is, by a few examples, to throw ſome light upon the method that was employed in order to perform the common rules of arithmetic with this complicated ſyſtem of notation, referring the curious reader, who wiſhes for more particular information, to an ingenious eſſay on this head by Delambre, ſubjoined to the French tranſlation of the works of Archimedes, to which eſſay we are indebted for the foregoing and following extracts

Example in Addition.—From Eutocius, theorem 4 of the meaſure of the circle.

$\omega\mu\zeta \cdot \gamma\pi\kappa\alpha$	847 3921
$\xi \cdot \ \eta\upsilon$	60 8400
$\pi\eta \cdot \ \beta\tau\kappa\alpha$	908 2321

In this example the method of proceeding is ſo obvious, that it needs no explanation, being performed exactly as we do our compound addition of feet and inches; or pounds, ſhillings, and pence; but it is more ſimple, on account of the conſtant ratio of 10 between any character and the ſucceeding one.

Example in Subtraction.—Eutocius, theorem 3 on the meaſure of the circle.

$\theta \cdot \gamma\chi\lambda\varsigma$	9 3636
$\beta \cdot \gamma\upsilon \ \theta$	2 3409
$\zeta \ \ \sigma\varkappa\zeta$	7 0227

This example alſo is ſo ſimple, that the reader will find no difficulty in following the operation, by proceeding from right to left, as in our ſubtraction, which method ſeems ſo obviouſly advantageous and ſimple, that one can hardly conceive why the Greeks ſhould ever proceed in the contrary way, though there are many inſtances which makes it evident that they did, both in addition and ſubtraction, work from left to right.

In multiplication, they moſt commonly proceeded in their operations from left to right, as we do in multiplication of algebra; and their ſucceſſive products were placed without much apparent order, as is evident from the following examples. But as each of their characters retained always their own proper value, in whatever order they ſtood, the only inconvenience of this was that it rendered the addition of them together a little more troubleſome.

As it is burdenſome to the memory, to retain in mind the value of all the Greek characters, we have, for the eaſe of the reader, in the following examples, made the ſubſtitutions as below, by which means their operations will be the more readily comprehended.

For $\alpha \ \beta \ \gamma \ \delta$, &c.	we write	$1^\circ \ 2^\circ \ 3^\circ \ 4^\circ \ 5^\circ \ 6^\circ \ 7^\circ \ 8^\circ \ 9^\circ$
$\iota \ \varkappa \ \lambda \ \mu$, &c.	—	$1' \ 2' \ 3' \ 4' \ 5' \ 6' \ 7' \ 8' \ 9'$
$\rho \ \sigma \ \tau \ \upsilon$, &c.	—	$1'' \ 2'' \ 3'' \ 4'' \ 5'' \ 6'' \ 7'' \ 8'' \ 9''$
$\varphi \ \chi \ \psi \ \omega$, &c.	—	$1''' \ 2''' \ 3''' \ 4''' \ 5''' \ 6''' \ 7''' \ 8''' \ 9'''$

And the myriads are repreſented by $^{\text{m}}$, placed above the number of them.

Thus, $1^\circ \ 2^\circ \ 3$, &c. have their proper value.
$1' \ 2' \ 3'$, &c. will repreſent 10, 20, 30, &c.
$1'' \ 2'' \ 3''$, &c. — 100. 2 0, 300, &c.
$1''' \ 2''' \ 3'''$, &c. — 1000, 2000, 3000, &c.
$1^{\text{m}} \ 2^{\text{m}} \ 3^{\text{m}}$, &c. will be ſo many myriads.

After which, it will be extremely eaſy to follow the work in all the ſucceeding examples.

$\rho \ \upsilon \ \gamma$	$1'' \ 5' \ 3$
$\rho \ \upsilon \ \gamma$	$1'' \ 5' \ 3$
$\alpha \cdot \xi \ \tau$	$1^{\text{m}} \ 5''' \ 3''$
$\xi \ \beta \ \varphi \ \ \rho \ \upsilon$	$5''' \ 2''' \ 5'' \ 1'' \ 5'$
$\tau \ \rho \ \upsilon \ \theta$	$3'' \ 1'' \ 5' \ 9^\circ$
$\beta \cdot \gamma \ \upsilon \ \theta$	$2^{\text{m}} \ 3''' \ 4'' \ \ 9^\circ$

This example may be farther illuſtrated thus: by beginning on the left hand, we have,

$\rho \times \rho = \alpha$, or $100 \times 100 = 10000 = 1^{\text{m}}$
$\rho \times \upsilon = \xi$, or $100 \times 50 = 5000 = 5'''$
$\rho \times \gamma = \tau$, or $100 \times 3 = 300 = 3'''$

Again:

$\upsilon \times \rho = \xi$, or $50 \times 100 = 5000 = 5'''$
$\upsilon \times \upsilon = \beta\varphi$, or $50 \times 500 = 2500 = 2''' \ 5''$
$\upsilon \times \gamma = \rho\upsilon$, or $50 \times 3 = 150 = 1'' \ 5'$

Alſo:

$\gamma \times \rho = \tau$, or $3 \times 100 = 3''$
$\gamma \times \upsilon = \rho\upsilon$, or $3 \times 50 = 1'' \ 5'$
$\gamma \times \gamma = \theta$, or $3 \times 3 = 9^\circ$

Whence by addition we have evidently $2^{\text{m}} \ 3''' \ 4'' \ 9^\circ$

The above example is exactly copied from Eutocius, and is ſufficient to indicate the method that the Greeks employed in their multiplication; but it will not be amiſs to preſent

preſent the reader with another example, drawn from the ſame ſource.

φ o α	5″ 7′ 1°
φ o α	5″ 7′ 1°
x ε γ ξ φ	25m 3m 5‴ 5″
M M	
γ ξ ϑ ϡ o	3m 5‴ 4‴ 9″ 7′
M	
φ o α	5″ 7′ 1°
λ β ς μ α	32m 6‴ 4′ 1°
M	

The diviſion of the Greeks was ſtill more intricate than their multiplication: for which reaſon, it ſeems they generally preferred the ſexageſimal diviſion; and no example is left at length, by any of thoſe writers, except in the latter form. But theſe are ſufficient to throw ſome light on the proceſs they followed, in the diviſion of common numbers; and Delambre has accordingly ſuppoſed the following example.

Example in Diviſion.

```
) τ λ β . γ τ x θ ( φ ω x γ
  ρ π β . γ
  ---------
        φ ω x γ
  ρ υ .     τ x θ
  ρ μ ε . η υ
  ---------
    ϑ . φ ϡ x θ
    γ . ς υ ξ
  ---------
        ξ υ ξ θ
        ξ υ ξ θ
  ---------

332m 3‴ 3″ 2′ 9^ ( 1‴ 8″ 2′ 3^
182  3              ---------
-------               1‴ 8″ 2′ 3^
150  0  3  2  9
145  8  4
-------------
  4  1  9  2  9
  3  6  4  6
  ------------
     5  4  6  9
     5  4  6  9
  ------------
```

This example will be found, on a ſlight inſpection, to reſemble our compound diviſion, or that ſort of diviſion that we muſt neceſſarily employ, if we were to divide feet, inches, and parts, by ſimilar denominations; which, together with the number of different characters that they made uſe of, muſt have rendered this rule extremely laborious: and that for the extraction of the ſquare root was of courſe equally difficult, the principle of which was the ſame as our's, except in the difference of the notation; though it appears that they frequently, inſtead of making uſe of the rule, found the root by ſucceſſive trials, and then ſquared it, in order to prove the truth of their aſſumption.

From the foregoing ſketch of the notation and arithmetic of the Greeks, the reader will be able to form ſome eſtimate of the value and importance of the preſent ſyſtem, which does perhaps more honour to its inventor than any other diſcovery in the whole circle of the ſciences, being that to which we muſt conſider ourſelves indebted for the many brilliant advances that have been ſubſequently made in the modern analyſis and aſtronomy. Let any one compare the complicated multiplications of the ancients with the logarithmic operations of the moderns, and he will ſoon be convinced, that he cannot ſet too high a value upon the diſcovery of our preſent ſyſtem of arithmetic, which laid the foundation of that of logarithms, and many other of the moſt important improvements that have been made for facilitating calculation, and thereby extending the bounds of ſcience to their utmoſt poſſible limits. He will alſo perceive how ſlow and progreſſive are the ſteps to knowledge, and by what imperceptible degrees we arrive towards perfection. From the firſt rude efforts of the Greeks, when their notation carried them no farther than to write down 10,000, or a myriad, he will be able to trace them through their ſeveral ſucceſſive improvements, until it became indefinite, like our own: firſt, by placing the character M under the number of myriads that they wiſhed to repreſent, they extended it to $10{,}000^2$, or 100,000,000; but this poſition of the character being found inconvenient, was changed for Mυ, following the number it was before placed under; and this, again, was afterwards dropped for the more eligible form of a point, ſeparating the myriads from the ſimple units. Afterwards, Archimedes invented his octades, or periods of eights, and thus gave an indefinite extent to the Grecian arithmetic; an idea that was conſiderably improved by Apollonius, by making the periods to conſiſt of only four places, inſtead of eight, and dividing all numbers into orders of myriads; in doing which, it is moſt extraordinary that he did not perceive the advantage of making the periods conſiſt of a leſs number of characters: for having by this means given a local value to his periods of four, it was only neceſſary to have done the ſame for the ſingle digits, in order to have arrived at the ſyſtem in preſent uſe: and this overſight is the more ſingular, as the cypher was not unknown to the Greeks, being always employed by them in their ſexageſimal operations, where it was neceſſary; and, conſequently, the ſtep between this improved ſtate of their notation and that of the preſent ſyſtem was extremely ſmall, although the advantages of the latter, compared with the former, were incalculably great. Barlow's Theory of Numbers.

Notation, in *Algebra*, is the repreſenting of quantities by letters of the alphabet; or calling them by thoſe names. See Quantity, Character, &c.

Notation, in *Muſic*. See Notes.

NOTCH, *The*, in *Geography*, a paſs on the weſtern part of the White mountains, in New Hampſhire, America.

Notch, *Cape*, the weſt point of Goodluck bay, in the ſtraits of Magellan. S. lat. 53° 33′. W. long. 74° 34′.

NOTCHENGONG, a town of Hindooſtan, in the country of Berar; 47 miles S.S.W. of Nagpour; 75 miles S.W. of Ellichpour. N. lat. 20° 32′. E. long. 79° 17′.

NOTE, Nota, is uſed for a character, or abbreviature, ſerving to denote or expreſs ſomething in a little compaſs.

The ancient notaries wrote all in notes, or ſhort-hand; whence they were ſometimes denominated *curſores*, *quia notis curſim verba expediebant*.

Notes, ſigns or characters uſed to expreſs the tone and time of each ſound in writing muſic. For the twenty-four letters of the Greek alphabet, uſed for muſical characters, or ſymbols of ſound, ſee Greek *Muſic*.

Dr. Pepuſch aſſerts roundly, and without the leaſt modification of doubt, or even condeſcendiug to allege a ſingle

reaſon

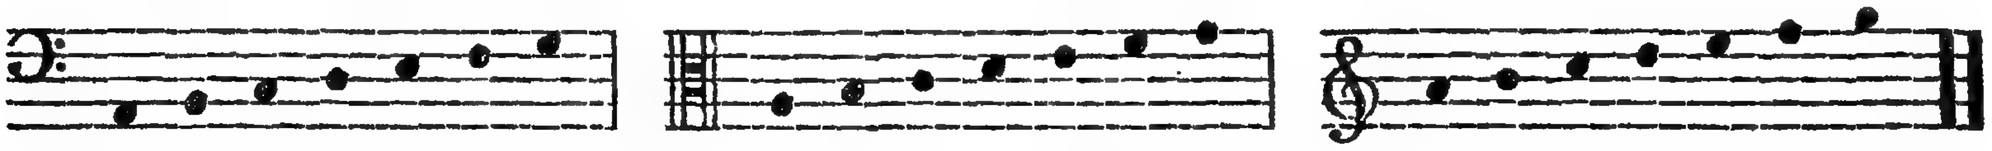
reaſon or proof in defence of his opinion, that "it was uſual among the Greeks to conſider a *deſcending* as well as an *aſcending* ſcale; the former proceeding from acute to grave, preciſely by the ſame intervals as the latter did from grave to acute. The firſt found of each was the *Proſlambanomenos*. Phil. Tranſ. Martin's Abridgment, vol. x. part i. p. 261.

No inſtances of theſe inverted ſcales are to be found, however, in Ariſtoxenus, Euclid, or any of the oldeſt and beſt writers. Boethius, Bryennius, and ſome other of the more modern compilers, have indeed puzzled the cauſe by ambiguous expreſſions, which ſeem to bear ſuch conſtruction. This perplexity concerning the ſcale, if not cleared up, would injure the few fragments left of Greek muſic, by a miſtake in this particular, as much as a poem by reading it backwards.

With reſpect to the firſt forms of modern notation, which ſucceeded points, it is not difficult to deduce them wholly from the black ſquare note, called a *breve*, the firſt and almoſt only note uſed in canto fermo; which, with a foot or tail to it, is a *long*, and if doubled in breadth, a *large*. The ſquare note alſo placed on one of its angles, differs very little from the rhombus or lozenge, and with a tail placed at its loweſt angle, when *open*, becomes a minim, and, when *full*, a crotchet.

Rouſſeau ſays, and others have ſaid before him, that the Latins had eaſed themſelves of all theſe difficulties of notation, and that Boethius eſtabliſhed the uſe of fifteen letters only, for notation; but he does not tell us where, in what book or chapter, of his treatiſe De Muſica, this reform is to be found. Boethius was only a compiler and tranſlator from the Greek, and never ſeems to propoſe a new ſyſtem or new doctrines. But it is more true, and better aſcertained, that pope Gregory, in arranging and regulating the eccleſiaſtical chants, finding that the intervals of the ſecond octave of the ſcale were, in effect, the ſame as the firſt, and that the order was the ſame in the upper and lower octave of the ſyſtem; reduced the notes to the *ſeptem diſcriminata vocum*, as the ancient Romans had done in the time of Horace and Virgil; and theſe notes, expreſſed by the firſt ſeven letters of the alphabet, were repeated in a different ſized literal character, from octave to octave, the graveſt of which he expreſſed by capitals, the mean by minuſcules, and the higheſt by double letters, thus: which in modern notes would conſtitute the following ſcale.

A B C D E F G a b c d e f g aa bb cc dd ee ff gg



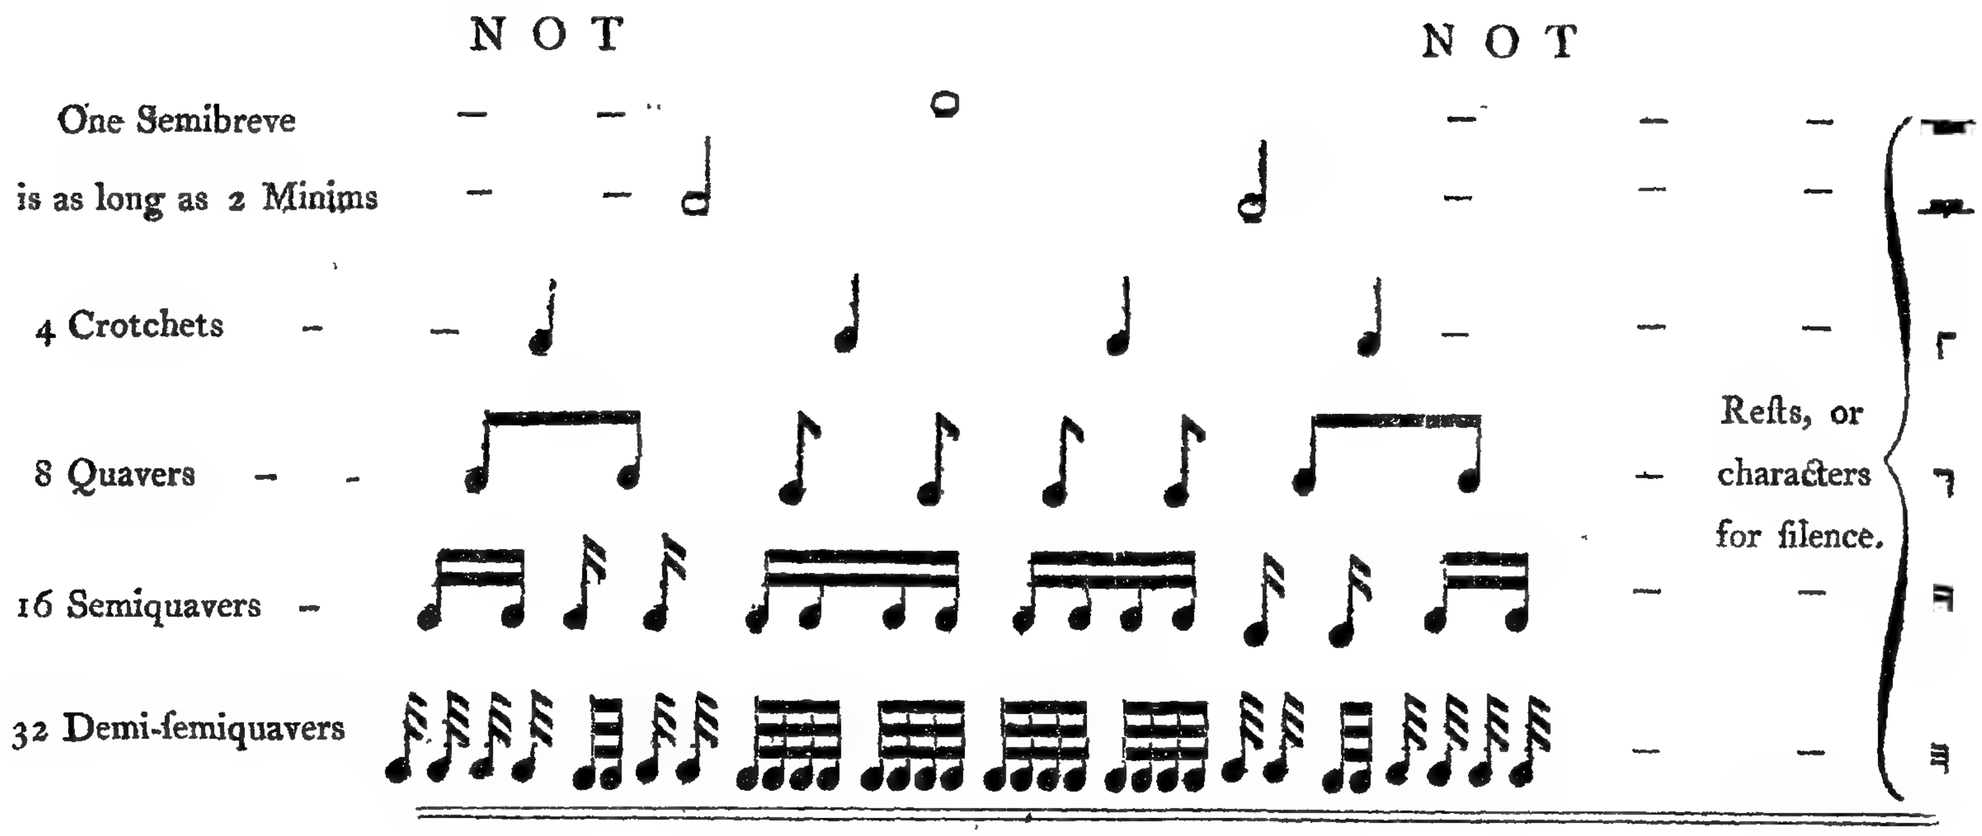
And theſe letters are ſtill retained in moſt parts of Europe, as *denominations* of muſical ſounds, though a different entablature and notation is uſed in practice. At length Guido, a Benedictine monk of Arezzo, in Tuſcany, ſubſtituted to theſe letters points, placed on different parallel lines, to each of which a letter ſerved as a clef or key. Theſe points were afterwards enlarged, and placed in the ſpaces between the lines; and, at length, theſe lines and ſpaces were multiplied as occaſion required. (See STAFF and GAMMUT.) Menage, in his "Origine de la Langue Françoiſe," gives the following derivation of the word *gammut*. "Guido Aretinus, a Benedictine monk, who had been employed to correct the eccleſiaſtical chants, about the year 1024, compoſed a ſcale, conformable to the Greek ſyſtem, adding to it a few ſounds above and below. And diſcovering afterwards that the firſt ſyllable of each hemiſtich in the hymn to St. John the Baptiſt, written by Paul Diaconus, who lived about the year 774, formed a regular ſeries of ſix ſounds aſcending,

Ut, re, mi, fa, ſol, la.

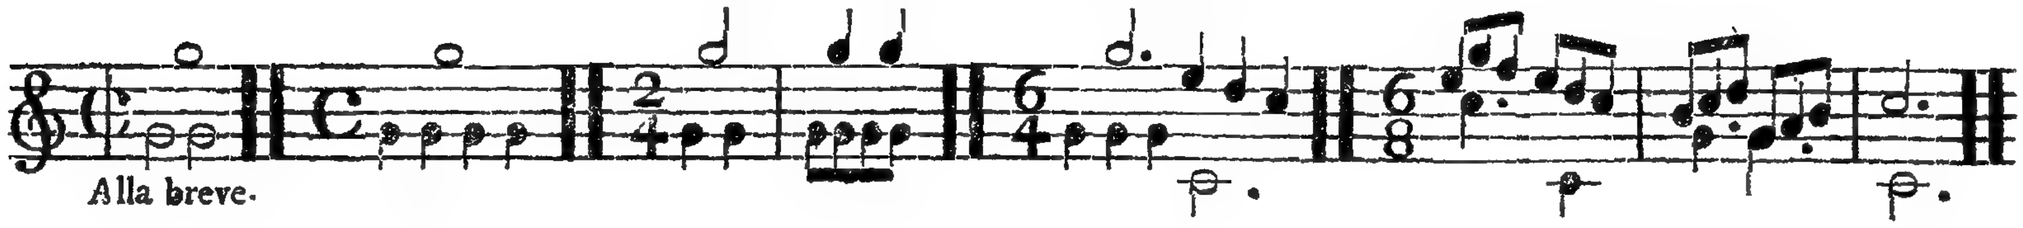
he placed at the ſide of each of theſe ſyllables one of the firſt ſeven letters of the alphabet, A, B, C, D, E, F, G, and becauſe he accompanied the note which he added below the ancient ſyſtem with the letter *gamma*, the whole ſcale was called *gammut*, a name by which it is diſtinguiſhed to this day."

For a long time the points, letters, and ſyllables which ſerved as notes, were of no other uſe than to mark the degrees of gravity and acuteneſs, and fix the intonation. As to duration, they were all equal, with no other difference, than that of long and ſhort ſyllables, uſed in chanting. Canto fermo ſtill remains nearly in the ſame ſtate to this day in the Roman Catholic churches. And the muſic of the metrical pſalms, with the Proteſtants, is ſtill more imperfect; ſince in the performance of them no diſtinction is made even in long and ſhort ſyllables, or of ſemibreves and minims, though their figure has been preſerved.

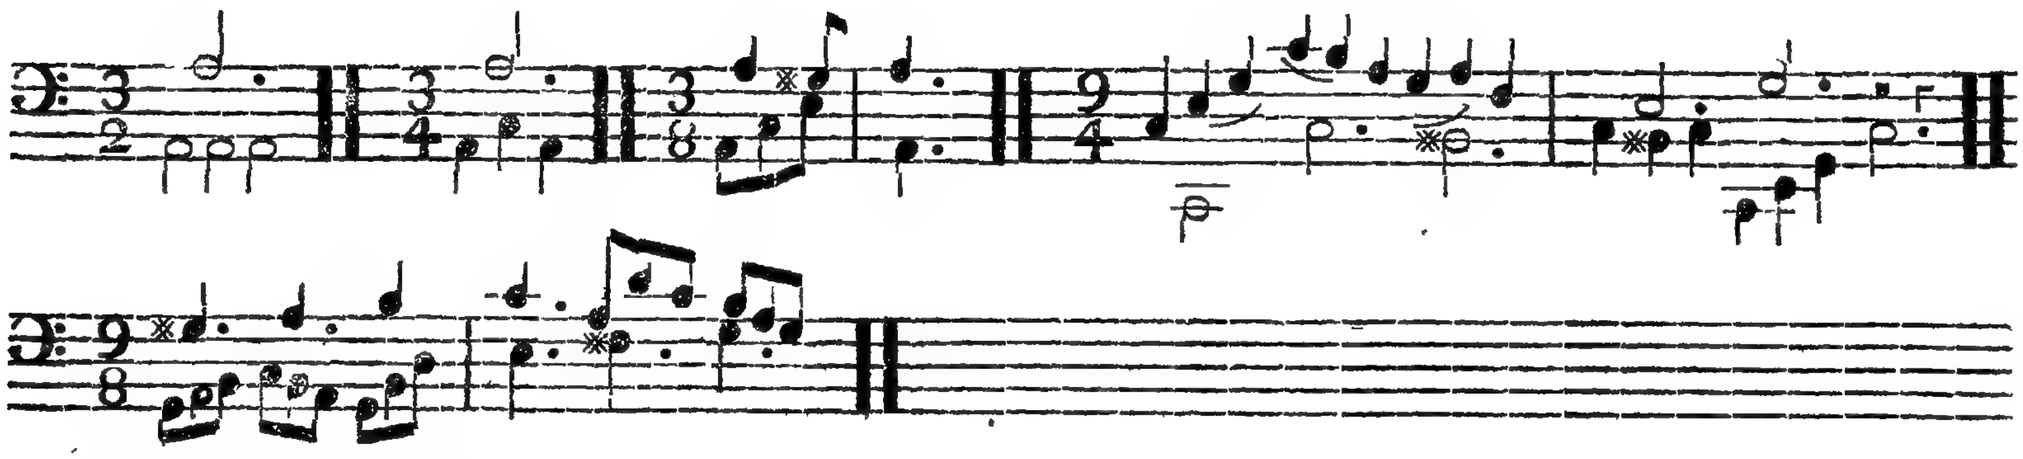
This want of diſtinction in the time of notes and their value, as to duration, is generally ſuppoſed to have continued till about the year 1338, when John de Muris is ſaid to have invented figures to expreſs different durations of ſound, and to have formed a time-table. His claim to this invention is conſidered in his biographical article. (See alſo CHARACTERS and TIME-TABLE.) In the firſt tables that were found, the notes were all black; then full and void, mixed; and laſtly, all white, as far as the minim. The complete time-table does not ſeem finiſhed till the end of the 16th century. Morley's characters in his table begin with the *maxima*, or large, and go no farther than the ſemiquaver. The modes or characters placed at the beginning of a movement, to mark the time and relative proportion of notes, are likewiſe aſcribed to John de Muris. All the notes now in uſe in ſecular muſic, are contained in the following table.



COMMON TIME, or DUAL MEASURE.



TRIPLE TIME.



NOTE, *Senſible*, Fr. is the half note below the key-note, and a ſharp third above the fifth, or dominant. There is no term in the French muſical technica ſo expreſſive as this; it deſcribes the ſenſations of every diſcriminative ear, and the eagerneſs which it excites to move to the key-note, particucularly if the fifth is accompanied with the ſeventh. Almoſt every accidental ſharp in the courſe of modulation is a *note ſenſible*, leading to a new key. B is the note ſenſible of the key of C, and G that of A.

NOTE is alſo uſed for a mark made in a book or writing, where there occurs ſomething remarkable, and worthy of particular notice.

NOTE is alſo uſed for an obſervation, or explication of ſome paſſage in an author, added in the margin, at the bottom of the page, or elſewhere, by an editor.

In this ſenſe, note ſtands contradiſtinguiſhed to text.

The notes make the principal difference in the editions of claſſic, &c. authors. We have Virgil, Horace, Terence, &c. with Ruæus's notes, the Dauphin's notes, Dacier's notes, Bentley's notes, Hare's notes, with *notis variorum*, &c.

NOTE is alſo a minute, or ſhort writing containing ſome article of buſineſs.

In which ſenſe we ſay, a *promiſſory note*, a *note under hand*, a *bank note*, &c.

Bank notes are made payable to bearer on demand; in which reſpect they differ from poſt-bills, which are payable to order at ſeven days ſight.

By 3 & 4 Ann. cap. 9, all notes ſigned by any perſons, and whereby ſuch perſons ſhall promiſe to pay to any other perſon, or order, &c. any ſum of money, the money mentioned in ſuch note ſhall be due, and payable to the perſon to whom made, and the note ſhall be aſſignable over as inland bills of exchange; whereupon the perſon to whom ſuch note is payable, or aſſigned, may maintain an action for the ſame againſt the perſon who ſigned, or any who indorſed the note, as in the caſes of inland bills, and recover damages and coſts of ſuit, &c. If the party, on whom any inland bill of exchange ſhall be drawn, refuſes to accept it by underwriting it under his hand, the perſon to whom payable is to cauſe ſuch bill to be proteſted, as foreign bills; but no acceptance ſhall charge any perſon, unleſs bills be underwritten or indorſed; and if it be not underwritten or indorſed, no drawer ſhall be obliged to pay coſts, damages, or intereſt thereon, unleſs proteſt be made for non-acceptance, and within fourteen days after the ſame be ſent, or notice thereof given to the party from whom the bill is received, or left in writing at his uſual place of reſidence. The bill being accepted, and not paid within three days after due, proteſt muſt be made, in writing, under a copy

of the bill, by ſome notary public; or, if no ſuch notary be reſident in the place, then by any other ſubſtantial inhabitant, in the preſence of two credible witneſſes, and notice given as aforeſaid, to charge the drawer, &c. Though no proteſt ſhall be neceſſary, except the value ſhall be expreſſed to be received in ſuch bill, and the bill be drawn for 20*l.* at leaſt. There is a proviſo in the act, that nothing therein ſhall diſcharge any remedy any perſon may have againſt the drawer, acceptor, or indorſer of any bill.

What has been ſaid of bills of exchange is applicable alſo to promiſſory notes, that are indorſed over and negociated from one hand to another; only that, in this caſe, as there is no drawer, there can be no proteſt for non-acceptance; or rather, the law conſiders a promiſſory note in the light of a bill drawn by a man upon himſelf, and accepted at the time of drawing: and, in caſe of non-payment by the drawer, the ſeveral indorſers of a promiſſory note have the ſame remedy, as upon bills of exchange, againſt the prior indorſers. See BILL *of Exchange*.

Stealing of notes, bills of exchange, &c. is felony, in the ſame degree as if the offender had robbed the owner of ſo much money, &c.; and the forging notes for money, bills of exchange, indorſements, &c. is felony, by ſtat. 2 Geo. II. cap. 25. See FELONY.

To NOTE *a Bill*, is when a public notary goes as a witneſs, or takes notice, that a merchant will not accept or pay it. See PROTEST.

NOTE *of a Fine*, is a brief of a fine made by the chirographer, before it be ingroſſed. Or, it is an abſtract of the writ of covenant and the concord; naming the parties, the parcels of land, and the agreement. This muſt be enrolled of record in the proper office, by 5 Hen. IV. cap. 14.

NOTEBACH, in *Geography*, a town of Sweden, in the province of Smaland; 43 miles N.W. of Calmar.

NOTELÆA, in *Botany*, ſo named by the late M. Ventenat, from νοτος, *the ſouth*, and ελαια, *an olive*, or *olive tree*, alluding to the affinity of the ſhrubs which compoſe this genus, and which are natives of the ſouthern hemiſphere, to the Olive of the ancient world. Indeed this affinity is ſo cloſe, that we much doubt whether they ought to be ſeparated. Even Mr. Brown, ſo acute in diſcerning, and ſo prone, in many caſes, to eſtabliſh generic differences, though he has adopted *Notelæa*, ſeems inclined to think it might be united with *Chionanthus* and *Olea*, as well as *Phillyrea*; which laſt he has, like Mr. Saliſbury, poſitively reduced to *Olea*. Venten. Choix de Plantes, 25. Brown. Prod. Nov. Holl. v. 1. 523. Ait. Hort. Kew. ed. 2. v. 1. 22. (Rhyſoſpermum; Gærtn. fil. t. 224.)—Claſs and order, *Diandria Monogynia*. Nat. Ord. *Sepiariæ*, Linn. *Jaſmineæ*, Juſſ. *Oleinæ*, Br.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, ſmall, tubular, four-cleft, permanent. *Cor.* of four ovate concave petals, combined in pairs by their baſe through the medium of the ſtamens, longer than the calyx. *Stam.* Filaments two, oppoſite, awl-ſhaped, ſhort, each united with the baſes of the two oppoſite pairs of petals, alternate with each petal; anthers erect, of two cells, burſting lengthwiſe. *Piſt.* Germen roundiſh, ſuperior, of two cells; ſtyle ſimple, very ſhort; ſtigma obtuſe, ſimple or cloven. *Peric.* Drupa with a ſomewhat membranous ſkin. *Seed.* Nut ſolitary, of one cell.

Eſſ. Ch. Corolla of four petals, combined in pairs by the ſtamens. Drupa oval.

1. N. *longifolia*. Long-leaved New Holland Olive. Br. n. 1. Ait. n. 1. Venten. Choix. t. 25. (Olea apetala; Andr. Repoſ. t. 216; but not of Vahl or Willdenow.)—Leaves lanceolate, reticulated with veins on both ſides; more or leſs downy, without dots, beneath. Segments of the calyx unequal. Stigma divided.—Native of Port Jackſon, New South Wales, from whence it was procured for Kew garden, by Sir J. Banks, in 1790. It is kept in the greenhouſe, and flowers from March to July. The *ſtem* is ſhrubby, with numerous, round, *branches*, downy when young. *Leaves* oppoſite, rigid, lanceolate, entire, often wavy, tapering at each end, various in breadth, from three to ſix inches long, veiny; clothed with fine ſoft down, for the moſt part, on the under ſide; roughiſh, rarely downy, above. *Footſtalks* ſhort and thick. *Cluſters* axillary, ſolitary, ſimple, about an inch long when in flower, afterwards much more; ſometimes crowded about the ends of the branches with fewer or ſmaller leaves. *Petals* yellowiſh-white. *Stigma* deeply divided and divaricated. *Fruit* about half an inch long. The true *Olea apetala*, found by Sir J. Banks in New Zealand, is a very different plant, with ſmooth elliptical *leaves*, curved at the point, and *flowers* really deſtitute of a *corolla*.

2. N. *punctata*. Dotted-leaved New Holland Olive. Br. n. 2.—"Leaves lanceolate, tapering at the baſe; veiny above; ſmooth and very thickly dotted, with obſolete veins, beneath."—Gathered by Mr. Brown in the tropical part of New Holland.

3. N. *ovata*. Ovate New Holland Olive. Br. n. 3.—"Leaves ovate, ſmooth, without dots. Segments of the calyx equal. Stigma ſeſſile, undivided."—Gathered by Mr. Brown near Port Jackſon. We obtained from Kew garden, in 1798, a ſpecimen which anſwers to this character, but no ſuch ſpecies occurs in Mr. Aiton's work. Our plant has *leaves* three or four inches long, and above one broad, entire, acute at each end, coriaceous, ſmooth, the tranſverſe veins moſt viſible beneath. *Cluſters* axillary, of but few, and rather large, white *flowers*, each cluſter about an inch long, or equal to the *footſtalks*. *Bracteas* half an inch long, ovate, concave, fringed. *Stalks* ſmooth.

4. N. *liguſtrina*. Privet-leaved New Holland Olive. Br. n. 4. Ait. n. 2. Vent. Choix, under p. 25.—"Leaves lanceolate, narrow, elongated, ſtalked, very ſmooth; ſimple in the margin; dotted beneath; veins obſolete on both ſides."—Native of Van Diemen's land. Sent to Kew by P. G. King Eſq. in 1807. It is kept in the greenhouſe, flowering in July and Auguſt.

5. N. *microcarpa*. Small-fruited New Holland Olive. Br. n. 5.—"Leaves linear-lanceolate, elongated, tapering at the baſe, nearly ſeſſile, very ſmooth; ſlightly dotted beneath; manifeſtly veiny above."—Native of the tropical part of New Holland. *Drupa* leſs than a pea; in the preceding larger.

NOTHÆ COSTÆ, in *Anatomy*, a term under which the falſe ribs are ſometimes deſcribed.

NOTHING, *Nihil, nihilum*, or *non ens*.

The ſchoolmen diſtinguiſh between nothing taken ſtrictly, which is what is impoſſible, or implies a contradiction; and nothing taken more generally, which is both applied to what is poſſible and impoſſible.

Again, they diſtinguiſh nothing into *negative*, which is the abſence of reality in any ſubject; and *privative*, which is the abſence of reality in a ſubject capable thereof, or wherein it ought to be found.

NOTHOLÆNA, in *Botany*, ſo called by Mr. R. Brown, as we preſume, from νοθος, *ſpurious*, and λαινος, *wool*; becauſe there is no involucrum, but in its ſtead the briſtly, ſcaly, or woolly covering of the frond affords a ſort of ſpurious protection to the fructification. Brown Prodr.

Nov. Holl. v. 1. 145.—Claſs and order, *Cryptogamia Filices*; ſect. *Annulatæ*. Nat. Ord. *Filices*.

Eſſ. Ch. Capſules in a marginal line, either continued or interrupted. Involucrum none; (except the briſtles, ſcales, or woollineſs of the frond, ſeparating the capſules.)

This genus is formed, by the learned writer above mentioned, out of ſome ſpecies hitherto ſuppoſed to belong either to *Acroſtichum*, *Pteris*, or Swartz's *Cheilanthes*, with which they ſeverally agree in habit.

1. N. *Marantæ*. (Acroſtichum Marantæ; Linn. Sp. Pl. 1527. Swartz. Fil. 14. Lonchitis aſpera Maranthæ; Camer. Epit. 666.)—Frond doubly pinnate, lanceolate; covered beneath with linear tawny ſcales. Branches oblong, rather cloſe. Leaflets oblong, obtuſe; the lowermoſt dilated, and ſomewhat lobed, at the baſe; uppermoſt confluent.—Native of Italy, Switzerland, and the Levant, in the clefts of rocks. This is a beautiful *fern*, about a foot high, with a long, brown, zigzag, rough and hairy *ſtalk*. The leafy part is from three to ſix inches long, and near two in breadth, ſmooth, and of a deep, ſomewhat glaucous, green, above; covered beneath with long, pointed, imbricated ſcales, of a rich golden brown. The tufted *roots* are covered with long tawny ſlender briſtles.

2. N. *diſtans*. Br. n. 1.—Frond doubly pinnate, linear-lanceolate, very rough with briſtly ſcales. Branches oppoſite, diſtant, ſomewhat deltoid. Leaflets oblong, obtuſe; the lower ones pinnatifid. Stalk briſtly throughout.—Native of Port Jackſon, New South Wales. We received it from Dr. White. The *frond* is much more linear than in the foregoing; its primary diviſions more diſtant. The colour of the *ſcales* is a rather pale brown, without any of the golden tawny hue, ſo remarkable in the firſt ſpecies.

3. N. *vellea*. Br. n. 2.—"Frond doubly pinnate, of a narrow triangular figure, hoary with entangled down. Branches nearly oppoſite. Leaflets oblong, obtuſe; the lower ones cut. Stalk woolly throughout."—Gathered by Mr. Brown in the tropical part of New Holland.

4. N. *trichomanoides*. (Pteris trichomanoides; Linn. Sp. Pl. 1532. Swartz. Fil. 102. Trichomanes argenteum, ad oras nigrum; Plum. Fil. 57. t. 75. Pet. Fil. n. 137. t. 9. f. 16. T. majus, pinnis ſinuatis ſubtùs niveis; Sloane Jam. v. 1. 80. t. 35. f. 1.)—Frond pinnate, linear. Leaflets numerous, ſomewhat ovate, obtuſe; lobed at the baſe; powdery and often hairy beneath.—Native of Jamaica and Hiſpaniola Plumier ſays it grows on all ſorts of ſoil, whether dry or moiſt, on rocks and in woods. Numerous *fronds*, from ſix to twelve inches high, ariſe from the tufted *root*, and are of a linear figure, ſcarcely an inch wide, compoſed of very numerous, moſtly alternate, ſtalked *leaflets*, one-third or one-half of an inch long, broadiſh-ovate, a little oblique, obtuſe, with more or leſs of a roundiſh ſhallow lobe at their baſe. Their margin is fringed with a denſe row of tufted, or ſtellate, brown hairs, within which, but cloſe to it, runs a nearly ſimple line of annulated *capſules*. The upper ſide of each *leaflet* is ſmooth, or very ſlightly hairy; the under covered, as if white-waſhed, with a denſe opaque white powder, occaſionally leaving the dark poliſhed midrib viſible, and moſtly beſprinkled with a few hairs. The Linnæan ſpecimen is remarkable for a denſe hairy covering on the under ſide, concealing or obliterating this whiteneſs; yet it ſeems but a caſual variation.

5. N. *Pumilio*. Br. n. 3.—"Frond pinnate, ſmooth. Leaflets from three to ſeven, oval, nearly entire, ſlightly recurved at the margin."—Gathered by Sir Joſeph Banks, in the tropical part of New Holland.

NOTHUS, νοθος, a Latin term, properly ſignifying a *baſtard*, or a perſon of ſpurious birth.

Hence it is applied figuratively, by phyſicians, &c. to ſuch diſeaſes, as, though, in reſpect of a ſimilitude of ſymptoms, &c. they have the ſame denomination as ſome others; yet are of a different origin, ſeat, or the like, from the ſame.

Nothus is ſometimes alſo uſed for the back part of the cheſt, or thorax.

NOTIOMETER. See Hygrometer.

NOTION, Notio, in *Logic*, an idea or repreſentation of any thing in the mind.

This term and the word idea are often taken in the ſame ſenſe; but an ingenious author obſerves, that we cannot ſtrictly be ſaid to have an idea of an active being, or of an action, although we may be ſaid to have a notion of them. I have ſome knowledge, or notion, of my mind, and its acts about ideas, inaſmuch as I know, or underſtand what is meant by thoſe words. What I know, that I have ſome notion of.

However, the terms idea and notion may be uſed convertibly. But yet it conduces to clearneſs and propriety, that we diſtinguiſh things very different by different names. It is alſo to be remarked, that all relations including an act of the mind, we cannot ſo properly be ſaid to have an idea, but rather a notion of the relations or habitudes between things; but, if in the modern way, the word idea is extended to ſpirits, relations, and acts, this is, after all, an affair of verbal concern.—Berkeley, Princip. of Hum. Knowl. ſect. 142. p. 160, 161. See Idea.

M. Leibnitz is very accurate in the diſtinction of notions, in the Acta Erud. Leipſ. anno 1684.

Notion, *A clear*, he defines to be ſuch an one as ſuffices us to recollect the object; *v. g.* that a given figure is reckoned in the number of triangles.

Notion, *An obſcure*, is that which doth not ſuffice to recollect the object; ſuch, *v. g.* is that of a plant, which upon ſeeing, you are in a doubt whether or no it be the ſame you had ſeen elſewhere, and which is called by this or that name.

Notion, *Diſtinct*. See Distinct.

Notion, *A confuſed*, is that wherein you are not able to aſſign the very marks or characters whereby you recollect the object, though it be reſolvable into them. Such, *v. g.* is the notion of red colour.

Notion, *Abundant*. See Abundant.

Notion, *An adequate*. See Adequate.

Notion, *An inadequate*, that wherein you have only a confuſed notion of characters that enter a diſtinct one.

Some confuſed notions are admitted into mathematics; *viz.* ſuch whoſe reſolution is of no great conſequence to any demonſtrations.

Thus, Euclid does not reſolve the notion of equality, though it enter the notion of an equilateral triangle, a rhombus, &c. inaſmuch as the propoſitions, for whoſe demonſtration it ſhould be uſed, are eaſily granted, without ſuch a detail: as *v. g.* that things equal to the ſame third are equal to one another, &c. but no notions are admitted into the number of mathematical definitions, except diſtinct ones, and thoſe too as adequate as poſſible, or as occaſion requires.

The ſchoolmen diſtinguiſh notions into *formal*, and *objective*; and each of theſe they ſubdivide into *firſt* and *ſecond*.

Notion, *A firſt formal*, is the knowledge we have of any thing according to what it is, or has in itſelf; as the knowledge of fire, *quatenus* fire; of a light body, *quatenus* light, &c.

NOTION, *A firſt objective*, is the thing itſelf known, according to what it is, or has in itſelf; as the fire known as fire, &c.

NOTION, *Second formal*, is the knowledge of a thing according to what it receives from the underſtanding: as, of fire, that it is the ſubject, and not the predicate.

NOTION, *Second objective*, is what agrees to the thing by means of the operation of the intellect, or what it receives from the intellect.

NOTIONS, *Common*, called alſo *prenotions*, προλήψεις, and κοιναὶ ἔννοιαι, are certain principles ſuppoſed by ſome writers to be innate, and which therefore are ſelf-evident, *i. e.* appear, or are known by their own light, without the intervention of any medium or proof; being impreſſed, as it were, by the finger of God, to ſerve as the foundations of all our concluſions in the ſciences, which are to be demonſtrated hereby.

Theſe *common* notions, conſidered as the foundations of ſciences, are called *axioms*.

They are called *common*, not as if ſo actually and neceſſarily perceived by every perſon, that nobody could be ignorant of, or deny them; but becauſe they are judged to be true and certain, by all perſons of ſound reaſon.

For the ſame reaſon as we ſay, ſuch a food is wholeſome; not that it is ſo to all men, but to all that are of a ſound body and conſtitution. Ariſtot. Topic. c. 4.

There are two kinds of *common* notions, *viz. theoretical*, which lay the ground-work for ſpeculation; ſuch are, every thing either is, or is not; nothing can be made by itſelf; the whole is greater than a part; equal things being added to equal, the ſums are equal: and *practical*, which lay the foundation for honeſty, and good morals; ſuch are, God is to be beloved, and worſhipped; our parents to be honoured; to give every body their due; to do as we would be done by.

Some philoſophers, however, and thoſe even of beſt note, deny the reality of any innate, or common notions; urging, that the mind does not need any actual notions, to prepare it to think, but that an innate faculty of thinking may ſuffice; as appears in an infant, from its perception of pain, taſte, colour, &c. They add, that the common organs of ſenſe, if they have but objects preſented to them, and the faculty we have of reflecting on, and variouſly combining or ordering, the ideas received thereby, are ſufficient to furniſh us with all the ſtock of knowledge we have. See IDEA and *Common* SENSE.

NOTIONAL QUANTITY. See QUANTITY.

NOTITIA, NOTICE, ſomething that has come under a perſon's knowledge or obſervation.

Hence *notification*, the action of giving notice, &c.

NOTITIA is alſo the title of certain books, compoſed for giving a particular knowledge of the places, roads, &c. of a province, kingdom, dioceſe, or the like.

Such is the Notitia Imperii, &c. M. Valois has given a Notitia Galliarum, being a collection of the ſeveral names which the cities and provinces of that kingdom bore at different times.

The Notitiæ Dignitatum Imperii, both eaſtern and weſtern, are of the utmoſt uſe both in the Roman and in eccleſiaſtical hiſtory; yet they are of little ſervice, at leaſt to young people, without good notes; ſuch are thoſe of Pancirollus, &c. and unleſs the text, which is ſtrangely corrupted and mutilated, be ſupplied.

NOTKER, or NOTGER, in *Biography*, ſurnamed the *Stammerer*, a celebrated monk of the abbey of St. Gall, who flouriſhed in the ninth and tenth centuries, was deſcended from a noble family, and born within a ſhort diſtance of that abbey, towards the cloſe of the reign of Lewis le Debonnaire. He received his education at the monaſtery of St. Gall, and took the religious habit among the Benedictines on that foundation; he became diſtinguiſhed by the progreſs which he made in ſacred and profane literature, and acquired an extraordinary fame for ſanctity. During the courſe of ſeveral years he had the conduct of the ſchools dependent on the abbey, and occupied his hours of leiſure in the compoſition of literary works, and the tranſcription of books of merit. He died at an advanced age, in the year 912. He was beatified by pope Julius II. There are ſtill extant by him "A Martyrology," in Baſnage's "Theſaurus Monumentorum Eccleſiaſticorum et Hiſtoricorum:" ſome other of his productions may be ſeen in the "Novus Theſaurus Monumentorum" of D. Pez. Moreri.

NOTKER, or NOTGER, a celebrated biſhop of Liege in the tenth and eleventh centuries, a native of Suabia, was ſaid to be the ſon of a duke of that country, though others affirm that he was nephew of Otho I. He became a monk of the abbey of St. Gall, and was entruſted with the ſuperintendance of the ſchools belonging to that religious foundation. After this he was elected provoſt or prior of the abbey, and frequently attended at the imperial court, where he became a favourite of Otho I., who, in 971, appointed him to the high dignity of biſhop of Liege. Scarcely was he ſettled in his ſee, when he deviſed meaſures for improving the city, by ſurrounding it with a wall, rebuilding the cathedral and ſeveral of the other churches, and erecting various magnificent ſtructures, ſo that he obtained the title of "founder of the city." He was alſo a great encourager of the learning and ſcience of thoſe times, and ſuſtained a conſiderable part in the management of public affairs. He was preſent at the council of Mouſſon in the year 995, and at that of Frankfort in 1007. He died in the year 1008. To him has been attributed "A Hiſtory of the Biſhops of Liege," which is inſerted in Chapeauville's Collection of Pieces relating to the Hiſtory of the City. Moreri.

NOTO, in *Geography*, a town of Sweden, in the province of Smaland; 39 miles S.W. of Wexio.

NOTO, *Valley of*, a diviſion of Sicily, in the S.E. part of the iſland.

NOTO, or *Noto Nuova*, a town of Sicily, in the above mentioned valley, built after the deſtruction of Noto Antico by an earthquake in the year 1693; 20 miles S.W. of Syracuſe. N lat. 36 48'. E. long. 15°.

NOTO, a lake of Ruſſia, in the government of Archangel, about 36 miles in length, and 8 in breadth; 36 miles S.W. of Kola.—Alſo, a ſmall iſland in the Baltic, E. of Aland. N. lat. 59° 58'. E. long. 20° 17'.—Alſo, a town of Japan, in the iſland of Niphon; 200 miles N.W. of Jedo.

NOTONECTA, the Boat-fly, in *Entomology*, a genus of inſects of the order Hemiptera: the generic character is as follows; ſnout inflected; antennæ ſhorter than the thorax; it has four wings, folded croſſwiſe; on the upper half it is coriaceous; the hind legs are hairy and formed for ſwimming.

The inſects of this genus, like thoſe of the *Nepa* (which ſee), live in ſtagnant waters, and prey on aquatic animalcula: the larvæ and pupæ are ſix-footed and active; the former have the rudiments of wings, the others have none. There are ſeventeen ſpecies, arranged in two ſections, *viz.* A, the inſects of which have the lip elongated, conic; and B, of which the inſects are diſtinguiſhed by a conic ſheath, ſpinous at the ſides. In the former diviſion there are thirteen ſpecies,

ſpecies, in the latter only four, which comprize the Sigara of Fabricius.

A. *Lip elongated, conic.*

Species.

GLAUCA. Upper wings yellow-brown, the anterior margin bright brown dotted with black, the tip bifid. It is found in this country and ſome other parts of Europe. It is particularly deſcribed in Donovan's Inſects. It is very common upon ſtagnant water; the head is round, and for the greateſt part occupied by two brown eyes; the antennæ are very ſmall, of a yellow colour, and inſerted in the under part of the head; the elytra or ſheaths are of a ruſty clouded colour, large, and croſſed one over the other.

FURCATA. Upper wings brown, with two teſtaceous ſpots at the baſe. It is very like the laſt, and is found in France.

MACULATA. Upper wings brown, with ferruginous ſpecks; they are bifid at the tip; it is leſs than the others, and is alſo found in France.

AMERICANA. This is of a greyiſh colour, but black behind; the ſcutel is of a deep black, with a yellow dot each ſide at the baſe. It is, as its name imports, an American inſect.

NIVEA. Upper wings whitiſh, immaculate, rounded at the tip. Inhabits India, and is four times as ſmall as the Glauca.

* MINUTISSIMA, or ſmall Boat-fly. This ſpecies is characteriſed by its greyiſh colour, but the head is brown; the upper wings truncate. It is found in this country and other parts of Europe. It is, as its name ſignifies, an exceedingly minute inſect, ſcarcely perceptible without the uſe of glaſſes. It is tranſverſely ſtriated.

MINUTA. Head yellow; thorax and upper wings green, with tranſverſe brown lines. It is an European inſect.

NOVEBORACENSIS. Yellowiſh; upper wings with three clouded, brown, longitudinal ſpots. It is found in New York.

OCTO-PUNCTATA. The head of this ſpecies is yellow; the thorax is browniſh; ſcutel black, with five white dots; the upper wings are brown, edged with white, and marked with four black dots. It inhabits Germany.

INDICA. This is of a glaucous hue; the upper wings are tipt with black. It inhabits India.

ATOMARIA. White; above and upper wings pale grey; under wings milky. It inhabits Ruſſia.

LUTEA. Upper wings whitiſh, with a marginal black ſtreak. It is found in Denmark; and is particularly deſcribed by Müller among the Daniſh inſects.

MARGINATA. Upper wings black, the edge and future yellow. This is alſo a Daniſh inſect.

B. *Sheath conic, ſpinous at the Sides.*

Species.

LINEATA. Upper wings brown, with two abbreviated yellow lines. It inhabits Cayenne, and is ſomething larger than the next.

* STRIATA. Upper wings pale brown, with numerous dots and ſtreaks of dark brown. It inhabits this country and ſome other parts of Europe: varies much in ſize; the head and legs are yellow. It frequents the water, and emits a diſagreeable ſmell. The elytra are pale, ſtriated with a number of undulating tranſverſe lines. Its ſhape is oblong; the forehead and feet are of a golden colour.

COLEOPTRATA. The upper wings are entirely coriaceous, brown, the outer margin yellow. It inhabits Sweden, and is very like the Striata.

MINOR. Upper wings greeniſh-aſh; it is immaculate. It is found in France, and is the Sigara minuta of Fabricius.

The inſects of this genus obtained the name of Notonectæ from the ſingular manner in which they ſwim on the back, preſenting the belly part uppermoſt. This ſituation ſeems admirably adapted to the manner which the creature adopts in feeding, which is on the under ſides of plants that grow on the ſurface of the water; for the animal, by having its mouth thus turned upwards, is capable of taking its food with great convenience; its motions are very nimble, diving down at the inſtant of alarm, and riſing again to the ſurface when the danger is paſt; the two hind legs ſerving for paddles.

NOTOPEDA, in *Zoology*. See ELATER.

NOTORIA, ARS. See ART.

NOTORIOUS, ſomething known, manifeſt, and public.

NOTOXUS, in *Entomology*, a genus of inſects of the order Coleoptera, of which the generic character is as follows: antennæ filiform; feelers four, hatchet-ſhaped; the jaw is one-toothed; the thorax is a little narrowed behind. Of this genus there are thirteen

Species.

PORCATUS. This ſpecies is black, and the ſhells have raiſed longitudinal lines. It is found in Van Diemen's land. The head is black; the antennæ are piceous; thorax cylindrical, pubeſcent; the ſhells are flat and obtuſe; the legs are piceous.

VIOLACEUS. This is pubeſcent, black, with a violet gloſs: the ſhells are ſmooth, with three yellow dots. It inhabits New Zealand.

BIFASCIATUS. Thorax rounded; body ferruginous; head black; ſhells with a black dot, band, and tip. This is a ſmall cylindrical-ſhaped inſect, and inhabits Lapland.

DUBIUS. Thorax brown; ſhell ferruginous, with a black line at the baſe, band in the middle, and dot at the tip. Found in many parts of Germany.

* MOLLIS. Downy; ſhells black, with three pale bands. It inhabits many parts of Europe, as well as our own country.

INDICUS. Head and thorax duſky; ſhells pale, ſtriate, punctured. It inhabits India.

CHINENSIS. Downy, brown; ſhells punctured, pale, with unequal black bands. It inhabits China, and is deſcribed particularly by Fabricius.

MONOCEROS. Thorax projecting like a horn over the head; ſhells pale, with a black band and dot. This is an Engliſh inſect, is deſcribed by Mr. Donovan as the Meloe monoceros, and is found on umbelliferous plants.

CORNUTUS. Thorax projecting like a horn over the head; ſhells with three black bands. It inhabits Italy.

BIPUNCTATUS. Thorax ferruginous; ſhell teſtaceous, with a black dot. It is ſmall, and an inhabitant of Germany.

* ANTHERINUS. Black; ſhells with two ferruginous bands. It inhabits this and other countries in Europe; is found on flowers, and is very nimble in its motions.

* FLORALIS. Black; thorax ferruginous. Like the laſt, it inhabits European countries, and is about the ſize of the laſt.

MINUTUS. Black, poliſhed; antennæ and legs paliſh. It is an European inſect, and is alſo ſmall.

NOTRE DAME, *our Lady*, a term frequently uſed for the Holy Virgin. Hence, feaſts of Notre Dame; the office of

of Notre Dame; congregations, nunneries, and orders of Notre Dame.

NOTRE *Dame Bay*, in *Geography*, a bay on the E. coaſt of Newfoundland. N. lat. 49° 55′. W. long. 55° 40′.

NOTRE *Dame de Neves*, a town of Braſil, in the juriſdiction of Fernambuco.

NOT's ISLAND, a ſmall iſland near the coaſt of Virginia. N. lat. 38° 38′. W. long. 76° 5′.

NOTT, in *Agriculture*, a provincial term applied to hornleſs ſheep and cattle. It is often written *knot* and *natt*.

NOTTAWAY, in *Geography*, a county of Virginia, in America, bounded N. and N.W. by Amelia, from which it was taken in the year 1788; containing 3418 white, and 5983 black people.

NOTTALEN, a town of Germany, in the biſhopric of Munſter; 7 miles W. of Munſter.

NOTTINGHAM, a borough and market-town, and a county of itſelf, is ſituated on the river Leen, near its confluence with the Trent, in the county of Nottingham, England. It is diſtant 124 miles N.N.W. from London, and contains three pariſhes, St. Mary's, St. Nicholas's, and St. Peter's, beſides an extra-parochial diſtrict attached to the caſtle. This place, according to the parliamentary returns of 1811, compriſes 6842 houſes, and a population of 34,253 perſons, of whom 6815 families are engaged in trade and manufactures. In 1801 the inhabitants were only eſtimated at 28,861 in number.

The origin of Nottingham is not leſs involved in obſcurity than that of any other town in Great Britain, and few have been the ſubjects of more ſpeculation on this point among hiſtorians and antiquaries. John Rowſe, a monk of Warwick, quoted by Thoroton, in his "Hiſtory of Nottinghamſhire," places its foundation 980 years before the Chriſtian era; and ſome other old authors tell us that a Britiſh king, named Coilus, was interred here about the ſame period. Stukeley ſays, "one may eaſily gueſs Nottingham to have been an ancient town of the Britons;" and his conjecture is fortified with the opinion of Dr. Deering, who conſiders the caves in this neighbourhood, (to be afterwards noticed,) as decided evidence of a Britiſh colony. All theſe notions concerning the antiquity of the place, however, are merely hypothetical, or reſt upon the teſtimony of authors of more than doubtful veracity. Nor does the idea of Gale, that Nottingham was the Roman ſtation Cauſennis, deſerve much greater credit. In truth, no incident in its early hiſtory can be relied on as correct till the ſeventh or eighth century, when it ſeems to have been a conſiderable town of the Mercian monarchy. In the reign of Alfred it was of ſuch conſequence as to give name to the ſhire. It appears, however, to have much decreaſed before the Norman conqueſt, as Domeſday Book aſſigns to it only one hundred and twenty dwelling-houſes. This diminution of extent may have probably been the reſult of the Daniſh ravages, and of the ſtate of confuſion into which the whole country was thrown by the ſucceſsful invaſion of William. At this time, the dominion of Nottingham, and of the foreſt adjoining, was conferred on William Peverell, the king's baſtard ſon, who is ſaid to have given great encouragement to ſuch perſons as ſettled within the town. The court eſtabliſhed by this ſuperior lord, and from him called Peverell court, continued to be held till the 9th year of Edward II., when it was aboliſhed, or at leaſt limited in its juriſdiction. Whether Nottingham was an incorporated town previous to the Conqueſt, is almoſt equally uncertain as any other part of its early hiſtory; for though Deering ſays it "was doubtleſs a borough by preſcription before that event," he does not furniſh any evidence to authenticate his aſſertion. The firſt charter, now extant, was granted in the reign of Henry II.; but as that deed merely confirms privileges enjoyed by the burgeſſes in the time of his grandfather, Henry I., it ſeems not unlikely that this prince was the perſon who originally conſtituted Nottingham a corporate town. King John confirmed the charter of his predeceſſor, as did likewiſe Henry III. and Edward I., which laſt empowered the burgeſſes to elect a mayor and two bailiffs, and granted that the mayor ſhould be eſcheator within the borough. Henry VI. made the town of Nottingham a county of itſelf, and changed the bailiffs into ſheriffs. He likewiſe gave power to the corporation to chooſe from among themſelves ſeven aldermen, who ſhould act as juſtices of the peace within the town and county of the town. In this ſtate matters remained till the reign of James II., who deprived the burgeſſes of their charters; but theſe were reſtored, and ſome additional privileges granted, by king William, ſoon after his acceſſion to the throne: and under the charter of this monarch the town is now governed. The corporation conſiſts of a mayor, ſix aldermen, a recorder, two ſheriffs, two chamberlains, and a common-council, compoſed of twenty-four burgeſſes, eighteen of whom are choſen by the freemen at large, but muſt have ſerved the office of ſheriff, and are the ſenior council, whilſt the remaining ſix are choſen in the ſame way from the body at large, and form the junior council. Theſe, however, have equal votes and equal rights with the others, except that the magiſtracy muſt be filled up from the ſenior body. Beſides theſe officers, there are a town-clerk and a ſteward attached to the corporation; and an officer called a ſcavenger, who ſuperintends the paving of the ſtreets. There are likewiſe two pinders of the town: one of the field and another of the meadows. He that is of the fields is alſo woodward, and attends and anſwers for the town at the foreſt-courts. The mayor holds a particular court of pleas of land; and he and the ſheriffs hold an ordinary court of record every alternate Wedneſday. This town ſends two members to parliament. The right of election is veſted in the mayor and corporation, together with the freeholders of 40*s. per annum*, the eldeſt ſons of freemen by birth, younger ſons of freemen, if they have ſerved ſeven years' apprenticeſhip any where, and the freemens' apprentices, as was ſettled by a deciſion of the houſe of commons in 1701. The number of voters has been eſtimated at 1700.

Nottingham has been the ſcene of many events of hiſtorical importance in almoſt every era of the Engliſh hiſtory. In the year 852, the Danes, having taken poſſeſſion of this place, were beſieged in it by Buthred, king of Mercia, but with ſo little proſpect of ſucceſs, that he was obliged to requeſt the aſſiſtance of Ethelred, king of Weſſex, and Alured his brother, who accordingly collected an army, and ſet out to join the forces of the Mercian monarch. This aid, however, did not prove ſo immediately effective as might have been ſuppoſed, for the Danes fought with ſuch deſperation, that the Saxons found it prudent to conclude a treaty with them, after a ſiege of ſeveral months, in which it was ſtipulated that they ſhould immediately quit the Mercian dominions, and leave them in future unmoleſted. But the invaders did not long adhere to theſe terms; for, returning the next year, they laid waſte a great part of that kingdom; in conſequence of which, king Buthred retired to Rome. In 942, the Danes again took poſſeſſion of this town, and held it for two years, when it was beſieged and retaken by king Edmund, and remained in the poſſeſſion of the Saxons till Canute, the Dane, made himſelf maſter of all England.

During the troubleſome reign of king Stephen, Nottingham, having been taken by the earl of Gloceſter in 1140,

was

was plundered, and nearly burnt to the ground. It was ſoon, however, rebuilt, and in 1153 once more met with the ſame misfortune, in the conteſts between Henry II. and his ſon, prince Henry, whom he had injudiciouſly cauſed to be crowned during his own life-time. From this period, the town lay in aſhes till the reſtoration of peace, at which time great exertions were made for its re-eſtabliſhment; and the king granted to the inhabitants the charter above-mentioned, as the reward of their loyalty. In the reign of Richard I., when his brother John raiſed the ſtandard of rebellion againſt him, Nottingham changed maſters ſeveral times; and a parliament was called here by Richard, in which John's eſtates were declared forfeited to the crown. Edward III. alſo held ſeveral parliaments at this town, in one of which were enacted thoſe laws relative to the ſettlement of the Flemiſh manufacturers, that may juſtly be regarded as having laid the foundation of England's greatneſs, as a trading and commercial country. The ſame parliament alſo paſſed that patriotic law, forbidding all perſons, except the royal family, to wear any foreign made cloths; and likewiſe prohibited the exportation of Engliſh wool.

A curious attempt to infringe on the liberty of election took place at Nottingham in the reign of Richard II. This monarch, having been forced by the parliament to diſmiſs his favourite, the marquis of Dublin, reſolved to concert meaſures for his reſtoration at court, and for the aſſumption of arbitrary power. He accordingly proceeded to Nottingham, and commanded all the ſheriffs and judges of the different counties to meet him there on important buſineſs. To theſe, when aſſembled, he communicated his deſign of levying an army to chaſtiſe thoſe noblemen who had been moſt active in reſtraining his prerogatives, and demanded to know from the ſheriffs what number of troops they could raiſe immediately. He further ordered them not to permit any repreſentative to be choſen for the enſuing parliament, whoſe names were not in the liſt furniſhed by himſelf; but the ſheriffs firmly told him it was not poſſible to execute his commands, for the people were in general ſo partial to the barons, that it would be difficult to raiſe an army againſt them; and ſtill more ſo to deprive his ſubjects of their parliamentary rights. The judges, however, were not ſo ſcrupulous, for, when aſked their concurrence to the propoſed meaſures, they declared their acquieſcence in them, and acknowledged the king to be ſuperior to all law; but notwithſtanding this ſubſerviency of the judges, Richard found it impoſſible to effect his purpoſes at Nottingham, and therefore returned to London.

This town ſubſequently became remarkable for having been the place of rendezvous for the troops of Edward IV., who cauſed himſelf to be proclaimed king here ſhortly after his arrival in England, in the year 1461; and in 1485, Richard III. marched hence towards Boſworth field, where he was defeated and ſlain. In 1487, his ſucceſsful rival, Henry VII., held his council of war here previous to the battle of Stoke. From this time, till 1642, nothing of importance occurs in the annals of Nottingham; but in that year it was diſtinguiſhed as the place whence king Charles firſt formally raiſed his ſtandard againſt the parliament. The inhabitants, however, being chiefly attached to the republican cauſe, his majeſty was ſoon obliged to abandon the town, to the parliamentary forces. Many intereſting and curious particulars reſpecting this town, its caſtle, and the cuſtoms of the people, during the civil wars, are detailed in "Memoirs of the Life of Colonel Hutchinſon," 2 vols. 8vo. 1810.

It was at Nottingham that the meeting took place between the earl of Devonſhire and a number of other noblemen, in order to promote the glorious revolution of 1688, from which period the hiſtory of this town is little more than the hiſtory of its trade and manufactures, except that in 1795 ſome diſturbances happened here in conſequence of the overweening loyalty of one party, who choſe to puniſh with ducking ſome ridiculous effuſions of democratical zeal in the other. They were quelled, however, with little or no bloodſhed; and Nottingham continued in quiet and proſperity till the commencement of the year 1811, when the ſtate of our continental relations having thrown many of the manufacturers out of employment, they erroneouſly attributed that effect to the adoption of machinery, inſtead of referring it to its true ſource; and hence were induced to form combinations for the purpoſe of frame-breaking, ſo dangerous in their tendency, as to call for the vigorous interference of the legiſlature.

Nottingham, with reſpect to ſituation, has many advantages. It ſtands on a conſiderable eminence, called the Dolorous-Hill, from a tradition that king Humber made a great ſlaughter of the Britons here, in the reign of Albanact. On three ſides riſe gentle hills, which ſerve to ſhield it from the more hurtful blaſts, whilſt its ſouthern aſpect is fully expoſed to the enlivening rays of the ſun at all ſeaſons of the year. From this ſide it overlooks the fertile and extenſive vale of Belvoir, the Nottinghamſhire wolds, and the hills of Leiceſterſhire; and exhibits to the traveller, as he approaches it, the novel proſpect of three tiers of ſtreets, riſing regularly one above the other, and apparently emboſomed in rock. Should he enter from the eaſt, the whole maſs of building is ſeen foreſhortened; the tower of St. Mary's church and the caſtle then appear nearly in one group; and with the long line of the Trent and Leen bridges raiſe ideas of its ſize and importance, which its ſeemingly circumſcribed limits would not otherwiſe have juſtified. In approaching from the north, the view is of a very oppoſite character. Not a building of any deſcription can be diſcovered, except the church tower, till the traveller reaches the ſummit of a ſmall hill above the race ground, when the town burſts inſtantaneouſly upon the view, as if by enchantment; and ſeems to lie in the centre of an expanded level below. The rivers Leen and Trent appear as on a map; and the fertile vale, ſtretching itſelf beyond them, forms a ſtriking contraſt to the bleak and open country through which he has paſſed. It looks like a new world ſtarting into exiſtence, and impreſſes upon the mind of taſte and feeling ſenſations of peculiar delight. On the weſtern road the character of the ſcenery is yet different from any of the others. Arriving at the village of Wollaton, the town is juſt ſeen; and all that is deſcried is then in a commanding ſituation. The caſtle and its bold cliffs riſe abruptly from the verdant ſwells in the park; in the centre the barracks ſeem to form a town of themſelves; and to the left are a number of windmills, which immediately excite the idea of a Dutch or of a Flemiſh town.

Nottingham was anciently ſurrounded by a maſſive wall and a ditch, though but few traces of either now remain. In Leland's time, however, much of the wall was ſtanding, and ſeveral of the gates. One of the latter, indeed, ſtill remains, and as it has been excavated from the ſolid rock, may continue permanent for many ages. Edward the Elder was the firſt who fortified this town, about the year 910; but the wall being greatly damaged during the Daniſh wars, it was almoſt entirely renewed by the Conqueror and his ſucceſſors to Henry III. The extent of the town at that period is uncertain, as that circumſtance is not mentioned by any author before Deering, who ſays that it meaſured two ſtatute miles in circumference, about the commencement of the

the laſt century. Its boundaries now probably include a ſpace of ſomewhat more than four miles, excluſive of many detached houſes, which conſtitute partial ſuburbs. The county of the town extends about ten miles in circuit, and till the year 1802 was free from the juriſdiction of the magiſtrates of the ſhire. Theſe limits are perambulated twice a year by a jury choſen for the purpoſe, who are likewiſe bound to walk occaſionally through the ſtreets to prevent encroachments and nuiſances. In this part of their duty, however, they are not ſo effective as might be wiſhed; for it is believed that there are few towns more irregularly built than Nottingham. The ſtreets, with the exception of Caſtle-gate, and the High Pavement, are very narrow; and far from being kept in a proper ſtate with reſpect to cleanlineſs, though much improvement, it muſt be admitted, has lately taken place in this particular. Moſt of the houſes are built of ſtone or of brick, in the modern ſtyle, but a ſmall proportion of them are of ancient erection. The whole town is divided into three pariſhes, and ſeven wards. Chapel-ward, on the weſtern ſide of the town; Caſtle-ward, in the vicinity of the caſtle; Market-ward, including the market-place, and the Long Row and lanes leading to the north of it; North-ward, which embraces the north-eaſt diviſion of the town; Bridge-ward, between St. Mary's and the Leen, and the lanes and ſtreets to the eaſtward; Middle-ward, to the eaſt of Market-ward; and Monthall-ward, containing the Low and part of the High Pavements. Each alderman, though poſſeſſing a peculiar juriſdiction over his own ward, is not obliged to reſide in it; for, indeed, his juriſdiction as a juſtice of the peace properly extends over the whole town.

Nottingham contains ſeveral buildings appropriated to public purpoſes. The town-hall, ſituated on the High Pavement, is a large building, three ſtories high, with the town-priſon on the ground floor. Behind this edifice is the county-priſon, which is ſaid to be managed under very excellent regulations. The town and county-gaol is alſo as commodious as circumſtances will admit of. It would ſtill, however, require much amelioration to render it complete; and the ſame thing may be remarked of the town-bridewell, which ſtands in St. John's-ſtreet, and was till lately a diſgrace to the town. The workhouſes are three in number, and are all laid out upon a convenient plan, and kept exceedingly clean. But the chief glory of Nottingham is its eſtabliſhments for the relief of the diſeaſed. The infirmary may vie, in point of architectural elegance, and internal arrangement, with any building in the country ſet apart for ſimilar purpoſes. It conſiſts of a centre, two advancing wings, and two ends; and is ſituated in a fine, airy ſcite, ſurrounded with pleaſant walks and gardens. The firſt ſtone of this ſtructure was laid in 1781, cloſe to the ſpot on which king Charles erected his ſtandard in 1642, whence the place is ſtill diſtinguiſhed by the name of Standard-hill The total number of patients to whom aſſiſtance had been afforded from this inſtitution, ſince its opening, up to March 1811, amounted to 33,926 perſons. The lunatic aſylum is likewiſe an elegant building, and in every reſpect admirably adapted to its object. It was opened for admiſſion in February 1812. According to the preſent regulations, the patients form three claſſes; perſons who can pay for their care and maintenance in proportion to their ability; perſons admitted on the payment of very ſmall ſums; and paupers, for whom a certain rate muſt be paid by the county Beſides theſe inſtitutions for the relief of the poor, there are perhaps a greater number of hoſpitals here than in any other town in the iſland; Plumptre's hoſpital, founded in the reign of Richard II., has been lately repaired and augmented by a deſcendant of the founder; and now ſupports thirteen poor old women, under the management of a chaplain and maſter. Collin's hoſpital, built in 1704, affords an aſylum to twenty-four poor men and women, each having two comfortable apartments, and two ſhillings *per* week, with a ton and a half of coals *per annum*. The other hoſpitals are Willoughby's hoſpital in the Fiſhergate; Gregory's hoſpital in Houndſgate; Woolley's hoſpital in Beck-lane; Handley's hoſpital in Storey-ſtreet; Labourer's hoſpital on Tollhouſe-hill; Warſargate hoſpital, &c.; the whole of which afford relief to upwards of 70 poor and infirm individuals; and independent of them are ſeveral alms-houſes, and charity eſtabliſhments in the town, of which laſt the moſt important are known by the appellation of the Peckham and Coventry charities.

The churches of Nottingham belonging to the eſtabliſhment are four in number; St. Mary's, St. Peter's, and St. Nicholas's pariſh churches, and the extra-parochial chapel of St. James, lately built in conſequence of the increaſed population of the town. St. Mary's church, ſtanding on a bold eminence, is built in the form of a croſs, and is apparently of the ſtyle prevalent in the reign of Henry VII., though ſome authors aſſert it to be of a much older date. It has lately undergone a thorough repair, and in the execution of his taſk the architect has diſplayed conſiderable taſte and diſcrimination. In this church are ſeveral monuments of the earls of Clare, and of the Plumptre family. St. Peter's church is reckoned a handſome edifice, and is adorned with a lofty ſpire, but, upon examination, great incongruity appears in the ſtyle of its architecture, ariſing from the alterations and repairs it has undergone at different eras. St. Nicholas's church was erected in 1678, on the ſcite of one more ancient, pulled down during the civil wars, on account of its proximity to the caſtle, a circumſtance which might have rendered it beneficial to a beſieging army. This ſtructure is of brick, ornamented with ſtone corners. It conſiſts of a ſpacious nave, and two ſide aiſles, both of which have been greatly enlarged within theſe few years. The church of St. James's, ſtanding near that of St. Nicholas's, is built in imitation of the early pointed ſtyle. Theſe being the only places of worſhip connected with the eſtabliſhment in Nottingham, they are, as may be ſuppoſed, wholly inadequate to the accommodation of its numerous inhabitants. Hence diſſenting and ſectarian meeting-houſes are frequent, and uſually well attended, not merely by the inferior orders, but by the more reſpectable claſſes of the community. The Preſbyterians have two meeting-houſes, one on the High Pavement and the other near Caſtle-gate; and the general Baptiſts, the baptizing Calviniſts, Quakers, and Weſleyan Methodiſts, have each one. The latter ſect, however, far exceed any of the others in point of number. A few Roman Catholics have a chapel in Storey-ſtreet.

The market-place of Nottingham has been long admired, Leland ſays "it is the moſt faireſt without exception of all England," and it is certainly one of the moſt ſpacious in the kingdom. At the upper end of it formerly ſtood the Malt croſs, but that, with all the other croſſes in the town, were deſtroyed during the great rebellion. The market days are Wedneſday and Saturday; and there are three large fairs during the year. All of theſe are for cattle and horſes, and the laſt alſo particularly for cheeſe. The new exchange is ſituated at the eaſtern corner of the market area. It was erected by the corporation in the early part of the laſt century, and is a handſome brick building, four ſtories high, and 123 feet in length. In front it is ſupported by a range of

ſtone pillars, forming a ſpacious, open façade, under which a part of the ſhambles are fixed.

The chief manufacture carried on in Nottingham is that of ſtockings, but we do not know that any correct eſtimate of the number of frames employed in this trade has been made lately. Deering ſays they exceeded 1200, in the middle of the laſt century. The bone-lace manufacture was likewiſe a ſource of great profit to the town, previous to the recent unhappy diſturbances, and the improvements made by many of the manufacturers ſeemed to authorize the concluſion that we ſhould ſoon have been enabled to rival the French in that, their much boaſted branch of manufacture. Here are alſo ſeveral mills for ſpinning ſilk and cotton, as well as for twiſting, ſome dyeing and bleach works, and a variety of breweries, malt-houſes, and tanneries. The public ſchools in this town are fully ſufficient in number for its ſize, and, from the recent regulations which have been made reſpecting them, are likely in future to anſwer every benevolent purpoſe for which they were founded. The free grammar-ſchool was erected and endowed, in 1513, by Agnes Mellors, the widow of a wealthy bell-founder in Nottingham. This ſchool had almoſt fallen into diſuſe, but in 1807 its importance was revived by the exertions of the corporation, and now ſixty boys are taught in it, not only Greek and Latin, but Engliſh, writing, and arithmetic, *gratis*. An excellent charity-ſchool is likewiſe eſtabliſhed on the High Pavement; which is entirely ſupported by voluntary contribution, and maintains fifty poor children of both ſexes, who are inſtructed in religion and in Engliſh reading. There are alſo ſeveral ſmaller ſchools, ſupported on the ſame liberal principles; one, in St. Mary's pariſh, educates thirty poor children, and another ſixteen. The Proteſtant Diſſenters ſupport one for the poor children of their own perſuaſion, who are clothed, and plainly educated. A church of England Sunday ſchool has been for ſome time in exiſtence, whoſe receipts, in 1811, amounted to 127*l.*; and many others have been lately eſtabliſhed by private individuals, either alone or collectively. The total number of children educated at theſe ſchools, and at private ſeminaries in this town, is eſtimated to exceed three thouſand.

The public amuſements of Nottingham are ſimilar to thoſe of moſt other large provincial towns: *viz.* aſſemblies, balls, concerts, theatrical repreſentations, and horſe races. The aſſemblies, balls, and concerts, are held in a large and ſpacious building in the Low Pavement. This edifice is ſtill called the "Ladies' Aſſembly Rooms," though the reaſon of the diſtinction, (the exiſtence of another, named "The Tradeſman's Aſſembly,") has long ſince ceaſed to trench upon the harmony of ſociety, by ſeparating the middle claſſes from what was termed the polite circle. The theatre is a plain ſtructure, without any external decorations, but very judiciouſly fitted up and arranged within. The races take place annually in July, on a courſe on the north ſide of the town. It was formerly four miles, though now only two miles round; and is ſaid to be one of the beſt race tracks in England, ſo far at leaſt as regards the nature of the ground. The race-ſtand, built by Mr. John Carr, of York, is a very elegant modern edifice, two ſtories high, the lower ſtory projecting ſome diſtance beyond the upper, and having a balluſtrade on the top, and a terrace, to which opens the upper room of ſeven windows in front. Equeſtrian and other itinerant exhibitions are occaſionally brought forward at the riding ſchool, which is ſituated at the Caſtle-gate.

Nottingham formerly contained ſeveral religious inſtitutions. Leland ſays "there hath been three houſe of freres, as I remember, whereof two ſtoode toward the weſte of the town, and not far from the caſtelle." The Franciſcans, or Grey friars, had a houſe in the weſt part of the town, in a place called the Broad Marſh, not far from the caſtle. The wall which encircled the garden reached as far ſouth as the river Leen. This houſe was founded by Henry III. A.D. 1250, and was granted at the diſſolution to Thomas Heneage. Between Moot-hall gate and James's lane ſtood a houſe of Carmelite, or White friars. It was founded by Reginald, lord Grey de Wilton, and ſir John Shirley, knt. in the year 1276. The ſcite was granted by Henry VIII. to James Sturley. The houſe of the Hoſpitallers was ſituated at the northern extremity of the town, near the north road. The period of its foundation is unknown, but it was in exiſtence as early as the reign of king John, and was valued at 5*l.* 6*s.* 8*d.* *per annum* in the time of Henry VIII. St. Leonard's hoſpital for lepers ſtood ſomewhere on the eaſtern ſide of the town. The inhabitants of this houſe had the privilege of cutting the dead wood in the foreſt of Nottingham. St. Sepulchre's was a brotherhood in the reign of Henry III., but the date of its foundation is not mentioned. In the church of St. Mary was a guild, or fraternity dedicated to the Holy Trinity. Their houſe on the High Pavement is ſtill ſtanding, and retains its original name. Beſides this guild there were three chantries in St. Mary's church. In St. Peter's church was a guild of St. George, and a chantry dedicated to St. Mary; and in the church of St. Nicholas was a fraternity alſo dedicated to the bleſſed Virgin.

In ſurveying the vicinity of Nottingham, the moſt prominent object which demands attention is the caſtle. This edifice is ſituated on a bold rock on the weſtern ſide of the town; and was built, in 1680, upon the ſcite of a more ancient fortreſs, originally erected by William the Conqueror, and afterwards much enlarged and beautified by Edward IV. and Richard III. At an early period it ſeems to have been eſteemed a very ſtrong poſt; for in the reign of Edw. III. we find it taken poſſeſſion of by Mortimer, earl of March, and the queen mother, as a place of ſecure reſidence againſt any efforts of the young monarch to bring the hated paramour to condign puniſhment. The king was therefore obliged to employ ſtratagem to effect his object of ſeizing Mortimer's perſon. He gained the governor, and entered the caſtle by a ſecret paſſage, which led to the ſtate apartments, and ſucceeded, after ſome ſtruggle, in apprehending the earl. Much diſpute has prevailed among antiquaries reſpecting the paſſage here alluded to. Camden deſcribes it as the ſubterraneous cavern now called Mortimer's hole; but Deering and Thoroton evidently ſhew that the great antiquary is erroneous in ſo doing; though neither of theſe authors were enabled to determine its proper ſituation. Mr. Stretton, however, a gentleman of Nottingham, has lately cleared up the point, by the actual diſcovery of the paſſage, which, with much labour and expence, he has been enabled to trace through all its windings to its termination at the ſcite of the ancient keep, where the royal apartments are recorded to have been ſituated.

The old caſtle is thus deſcribed by Leland. "The baſe court is large and meetly ſtrong, being beſtes and giantes over the ditch into the ſecond warde; the frontier of the which warde in the entering is exceedinge ſtronge with toures and portecoleces; much part of the weſt ſide of this inner warde as the haul and other things be in ruins. The eſt ſide is ſtrong and well toured; and ſo is the ſouth ſide. But the moſt beautiffulleſt and gallant building for lodging is on the north ſide, where Edward the Fourth began a right ſumpteous pece of ſtone work, of the which he clerely finiſhed an excellent goodlie toure of three heightes in building; and

brought

brought up the other part likewiſe from the foundation with ſtone and marvelus fair cumpaced windows to lay yng of the firſt ſoyle for chambers." In this caſtle were ſeveral chapels. Tanner informs us that here was a college for ſecular prieſts and a cell dedicated to St. Mary, in the chapel of St. Mary under the rock.

The preſent caſtle is altogether different from the ancient one, having been deſigned only for the reſidence of the family of the duke of Newcaſtle, by whom it was erected. It is a large edifice on a ruſtic baſement, which ſupports an ornamented front of the Corinthian order, with a grand, double flight of ſteps leading to the principal range of apartments. Over the door on the north-eaſt front here alluded to, is an equeſtrian ſtatue of the founder, ſculptured from one ſolid block of ſtone. The other ſides of the building are handſome, but leſs ornamented than this, and ſurrounding the whole is a noble terrace, which has long been a favourite promenade of the faſhionables of Nottingham, and is certainly one of the fineſt to be found in the vicinity of any town, as it commands ſeveral extenſive and varied views. The interior of the caſtle was once elegantly fitted up, and diſplayed much magnificence, but all the apartments having been neglected for many years, now contain nothing worthy the attention of the ſtranger or the touriſt.

Mortimer's hole, above-mentioned, is a moſt extraordinary work of the labour of our anceſtors; but the preciſe purpoſe for which it was formed and uſed is unknown. The entrance to it has been provided with no leſs than ſix gates, beſides the ſide one on the left hand, ſince diſcovered to be the ſecret paſſage by which king Edward was admitted into the fortreſs, as already noticed. The diſtance between the firſt and ſecond gate was about 48 feet, from this to the third 42 feet, and from the third to the fourth 45 feet; 159 feet below this ſtood the fifth gate; and 27 feet ſtill lower was the ſixth and laſt gate, which opened into the rock yard, but is now filled up; ſo that the whole length of this, once well ſecured, paſſage was 107 yards, or 321 feet. It is ſeven feet high, and ſix feet wide, and had all the way down broad ſteps cut in the rock; and likewiſe openings in the ſame to admit light, and alſo to ſerve the ſoldiers to ſhoot their arrows through. In the upper part theſe holes have been much enlarged, and regularly conſtructed as port holes for cannon, which were placed here during the civil wars. There are beſides in this part of the vault many excavations, about a foot in height, breadth, and depth. Theſe are conjectured to have been made to lodge cannon balls, to prevent their rolling to the bottom.

The park ſurrounding the caſtle is but ſmall, containing only 130 acres, and is at preſent in a very neglected ſtate. It has no deer, and but very few trees; and indeed is only peculiarly deſerving of notice on account of its Caves, or Papiſt-Holes, as they are vulgarly called, which ſtand weſt from the caſtle, in the face of a cliff almoſt cloſe to the river Leen. Concerning theſe curious monuments antiquaries are much divided in opinion, ſome conſidering them as Druidical temples, others as places of ſafety excavated by the Britons, and not a few as works of Roman conſtruction. The truth probably is, that nature herſelf has done more towards their formation than art, and that ſuch parts of them as bear evident marks of human contrivance, were not the work of one age or people, but of different ages and different nations. Some of theſe caves are, no doubt, extremely ancient, while others of them have not probably exiſted above three or four centuries. Stukeley, who viſited this place in the early part of the laſt century, obſerves, on the ſubject of the caves, that "what is viſible at preſent is not of ſo old a date as the time of the Britons, yet I ſee no doubt that it is founded upon their's. This is a ledge of perpendicular rock hewn out into a church, houſes, chambers, dove-houſe, &c. The church is like thoſe in the rocks at Bethlehem, and other places in the Holy Land. The altar is a natural rock, and there has been painting upon the wall; a ſteeple, I ſuppoſe where a bell hung, and regular pillars. The river, here winding about, makes a fortification to it, for it comes to both ends of the cliff, leaving a plain before the middle. The way to it was by gates cut out of the rock, having an oblique entrance for greater ſafety. Without is a plain with three niches, which I fancy their place of judicature or the like; between this and the caſtle is a hermitage of like workmanſhip." To this deſcription it is ſcarcely poſſible to add any thing that will convey a more correct idea of the place, even as it remains at the preſent day, except that the outer parts have fallen down at ſeveral points, evidently from the effect of damp and froſt, but the church and altar, and ſome few veſtiges of ancient paintings, may be clearly traced. Many of the pillars are ornamented with capitals, &c. and the ſpandrilled pointed arch is very well imitated in various places; a fact which militates moſt forcibly againſt their very early antiquity. It is much to be regretted that no care is taken to preſerve this venerable and curious ſpecimen; the floor of it is broken into holes where the water lodges, and much of it is disfigured with the groſſeſt filthineſs. In ſummer theſe caves are the haunts of the very loweſt of ſociety, who there take up their nocturnal abode.

At the upper end of the caſtle park, adjoining to the Derby road, is an extenſive range of barracks erected by government in 1792-3. The buildings are of brick, and command a view over the whole town.

Beſides the caverns above-mentioned, many other caves are ſituated in the neighbourhood of Nottingham, and ſome of them even within the boundaries of the town. Of theſe the moſt remarkable cluſter is at the village of Sneinton, which is ſuppoſed by ſeveral authors, and not without conſiderable ſhow of probability, to have been the ſcite of ancient Northampton, previous to the Norman conqueſt. It is now, however, a diſtinct lordſhip and pariſh of itſelf; and the ancient chapel dedicated to St. Stephen ſtands upon the ſummit of the excavated rock, but has nothing particular to recommend it to notice, except the very beautiful and extenſive proſpect which it commands over the vale of Belvoir. The village here is truly romantic, as many of the habitations are built within the rock, and have ſtaircaſes that lead up to gardens on the top. To a ſtranger it is extremely curious to ſee the perpendicular face of the rock with doors and windows in tiers, and the inhabitants peeping out of their dens, like the inmates of another world; in fact, if it had not been at home, and therefore little regarded, this place would, without doubt, have been novelized and melo-dramatized, until all the faſhionable world had been mad for getting under ground. Thoroton's Hiſtory of Nottinghamſhire, republiſhed by John Throſby, three vols. 4to. London 1799.—Nottinghamia Vetus et Nova, or the ancient and preſent State of the Town of Nottingham, by Charles Deering, M.D. 4to. edit. 1751. Beauties of England and Wales, vol. xii. by Mr. Laird.

NOTTINGHAM, a poſt-town of America, in Rockingham county, New Hampſhire; 12 miles N. of Exeter, incorporated in 1722, and containing 964 inhabitants.—Alſo, the moſt northern town of Burlington county, New Jerſey, on the E. bank of Delaware river, between Berdentown and Trenton.—Alſo, a town in Prince George's county, Maryland, on Patuxent river; 16 miles N.E. of Piſcataway.

NOTTINGHAM, *Weſt*, a poſt-town in Hillſborough county,

New Hampſhire, ſituated on the W. ſide of Merrimack river; incorporated in 1746, and containing 1267 inhabitants; about 45 miles N.N.W of Boſton.

NOTTINGHAM, *Eaſt* and *Weſt*, two townſhips in Cheſter county, Pennſylvania; the former having 889, and the latter 454 inhabitants.

NOTTINGHAM *Iſland*, an iſland in Hudſon's Bay. N. lat. 63° 30′. W. long. 78° 30′.

NOTTINGHAMSHIRE, one of the central counties of England, is bounded on the weſt by Derbyſhire; on the north by Yorkſhire; on the eaſt by Lincolnſhire; and on the ſouth by the county of Leiceſter. Its figure approaches to the elliptical; its tranſverſe diameter extending from Alkley or Fenningly in the north, to Stanford-upon-Soar on the Leiceſterſhire border, being a length of fifty miles; whilſt its conjugate, or ſhorteſt diameter, from Teverſhall on the Derbyſhire border, to Collingham, which joins to Lincolnſhire, may be eſtimated at twenty-ſix or twenty-ſeven miles. It is ſituated between fifty-two degrees fifty minutes, and fifty-three degrees thirty-four minutes, north latitude; and its circumference is computed to exceed one hundred and forty miles, and to contain a ſuperficial area of 480,000 acres. According to the parliamentary returns of 1811, the houſes in this ſhire amounted to 32,462, and the inhabitants to 162,900 in number; whereas in 1801 the houſes were only reckoned at 26,153, and the population at 140,350 perſons.

Hiſtory.—Previous to the coming of the Romans, as little is known reſpecting this county as of any other portion of our iſland. At that event it formed a part of the territories of the Coritani, who are ſaid by Camden to have poſſeſſed the counties of Nottingham, Lincoln, Leiceſter, Derby, Rutland, and Northampton. Theſe made a powerful reſiſtance againſt the progreſs of the Roman arms; but being ultimately obliged to ſubmit, their dominions were included in the province of Maxima Cæſarienſis, which extended from the river Thames to the Humber. When the Saxons obtained poſſeſſion of Britain, Nottinghamſhire became part of the Mercian monarchy, and was doubtleſs during that period the ſcene of many conflicts between that kingdom and the other nations of the heptarchy. Nottingham, Newark, Southwell, and other towns in this county, frequently ſuffered from the incurſions of the Danes, as the reader will find mentioned under the names of the reſpective places at which their depredations were committed. After the overthrow of the Saxon heptarchy, and the union of its ſeveral kingdoms under the ſuperior ſway of Alfred, Nottinghamſhire was governed by the earls of Mercia, during whoſe domination no incident worthy of hiſtorical notice ſeems to have occurred within its boundaries. At the Conqueſt, the ſame changes took place here as in other counties; the lands being parcelled out among thoſe who contributed by their talents or valour to place the crown on the brow of William. In his reign, and that of his three immediate ſucceſſors, many caſtles were erected to ſecure the ſubjection of the country. Of theſe, the principal were the caſtles of Newark and Nottingham, at both which places ſeveral events of hiſtorical importance have taken place at different eras. King John died in the caſtle of Newark; and Nottingham has been rendered remarkable as the place of refuge choſen by Mortimer and queen Iſabella, where they wiſhed to ſecure themſelves from falling into the hands of Edward. At Stoke, not far from Newark, Henry VII. engaged and defeated the earl of Lincoln, who had raiſed a formidable army to ſupport the pretenſions of the impoſtor Lambert Simnel in 1487. During the time of the civil war of Charles I. Newark was remarkable for the loyalty of its inhabitants; and Nottingham no leſs ſo for its ſteady adherence to the parliament. For ſome particulars of the tranſactions of that period, ſee NEWARK and NOTTINGHAM.

General Aſpect, Soil, and Climate.—The ſurface of this county, with the exception of the level along the banks of the river Trent, is uneven, and perhaps may be termed a hilly diſtrict, though none of the hills riſe to any conſiderable elevation. The Nottinghamſhire wolds conſtitute a range of high, open country, reſembling the wolds of Yorkſhire, and the downs of Wiltſhire, and form a ſtriking contraſt to the cloſe and fertile vale of Belvoir, and the well wooded tract of Sherwood foreſt, which occupies a great part of the weſtern diviſion of the county. The uſual diſtribution of the ſoil is into ſand or gravel, clay, lime-ſtone, and coal land; and the firſt of theſe is again ſubdivided into foreſt country and borders, the Trent Bank diſtrict, and the tongue of land beyond or eaſt from that river. The Trent bank diſtrict accompanies the river through its whole courſe within the county, and varies in breadth from one to five miles. Here the ſoil is in general a mellow or vegetable mould, lying on ſand or gravel, which ſometimes appear on the ſurface. The ſame ſoil prevails alſo on the banks of the Soar, from its junction with the Trent up to Rempſton, and is for the moſt part equally fit for tillage or for paſture. The ſandy diſtrict, eaſt of Trent, on the other hand, is extremely poor, and taken up with low moors, which are much flooded by rains. In the clay diſtrict there are two diviſions, uſually called "the north and ſouth clays." The firſt of theſe, having a conſiderable mixture of ſand in its compoſition, is more eaſily ſuſceptible of agricultural labour than cold clay lands in general. In the more northern portions, it is agreeably diverſified with hill and dale; whilſt its bold promontories, riſing abruptly from the dead level of Miſſon-Car, and their continuation in Lincolnſhire, appear evidently to have been at ſome remote period the boundaries to an ocean, which muſt once have flowed over what is now a ſcene of rich cultivation. It is indeed impoſſible for any one to contemplate the view from Gringley-on-the-Hill without drawing this concluſion, and it ſeems ſtill more evident if the hills are viewed from below, when they have all the ſemblance of iſlands riſing from the boſom of the deep; for their northern aſpect preſents a ſeries of abrupt cliffs, but on the other ſide they ſink gradually into the general line of the country. The ſouth clay diſtrict is leſs extenſive than the north. It is, however, by far the moſt valuable diviſion of the county, as it includes a great part of the vale of Belvoir, which offers a ſcene of cultivation not ſurpaſſed by any other in the kingdom. The wolds, ſkirting the vale, partake of the nature of its ſoil, but from their lofty and expoſed ſituation are deſtitute of its fertility, though certainly well adapted for plantations. The lime-ſtone and coal lands are ſituated on the weſtern verge of the county, and have in ſome places a ſurface of vegetable mould, but chiefly a cold blue or yellow clay. In point of climate, it may be obſerved, that Nottinghamſhire is conſidered by all writers as much drier than moſt of the neighbouring counties; and this opinion has lately been confirmed by accurate and repeated experiments. The fact is explained by Mr. Lowe, in his agricultural ſurvey, upon the very rational principle, that the clouds from the weſtern ocean break on the hills of Derbyſhire and Yorkſhire, and diſcharge themſelves before they reach the comparatively level diſtrict of Nottinghamſhire; while thoſe from the German ocean, being powerfully attracted by the ſame mountains, paſs over the county too quickly to depoſit much of their moiſture. This general dryneſs, as may be ſuppoſed, is favourable to the temperature of the air; which, except in the marſhy grounds

and in the wolds, is almoſt equally warm as the more ſouthern counties.

Agriculture.—The kinds of grain uſually cultivated in the county of Nottingham are the common ones of wheat, rye, barley, oats, beans, and peaſe; the rotation of crops, and the amount of their produce, differing according to the quality of the grounds upon which they are raiſed. The wheat commonly ſown is the red Lammas, and the white chaffed or Kentiſh ſort, which in common fields yield from two to three quarters, and in incloſures from two and a half to four quarters. A ſpecies of oats, called ſkegs, is much cultivated in this county, and ſuppoſed to be peculiar to it. Theſe afford a crop double that of any other kind of the ſame grain in quantity, but not more than equal in weight. They will grow in the pooreſt land, where indeed nothing elſe can be raiſed, and are reckoned very ſweet food for cattle of all kinds. In the Agricultural Survey, this ſort of oats is called the "Arena ſtipiformis" of Linnæus, and defined ſcientifically as "panicled, calyxes two-flowered, awn twice as long as the ſeed, culm branchy, ſtipeform." Their produce on bad land is ſeldom leſs than four quarters, and on good land they will yield fourteen or fifteen. Hops are cultivated to a conſiderable extent in the central parts of the county, about Ollerton, and indeed in moſt places of the "north clay," by which diſtinctive appellation they are generally known among traders. Mr. Lowe informs us, that theſe hops are much ſtronger than the Kentiſh, "going almoſt as far again in uſe;" but thoſe who are accuſtomed to the latter, object to their flavour as rank; a circumſtance which of courſe operates againſt them in the market. At Scrooby, and a few ſpots in the northern diſtrict, weld, ſometimes called the dyers' weed, has likewiſe been long an object of culture. It is commonly ſown with the barley and clover, at half a peck to an acre; and is pulled up from among the clover the year following, about the time when the latter is coming into bloom.

Few cattle are bred in this county, except on the banks of the Soar, where a number of cows are reared for the dairy. Sheep, however, are bred in great numbers, in almoſt every diſtrict. They are chiefly the old foreſt kind, or croſſes of that breed with the Lincolnſhire and new Leiceſterſhire breeds. The old foreſt ſheep, when without mixture, are deſcribed as a ſmall polled race, with grey faces and legs, the fleeces of which may run from 13 to 18 to the tod of 28 pounds. The carcaſes, when fat, weigh from ſeven to nine pounds a quarter; but as the croſſes have been found to be great improvements both on the wool and carcaſe, few farmers now rear this ſpecies of ſheep unmixed.

State of Property, &c.—Tenures here, as in moſt other counties, are in all the variety of freehold, copyhold, and leaſehold; and there is alſo a very conſiderable portion of church and collegiate lands. The freeholds are more extenſive than numerous; and with reſpect to the copyholds, a great part of the ſmall ones are "Borough Engliſh," and deſcend to the youngeſt ſon. The immediate occupants of the ſoil are moſtly tenants at will; and as their farms, in many inſtances, have continued in one family for ſeveral generations, they feel a ſort of hereditary ſecurity, that prompts them to the ſame courſe of improvement as if they were ſecured by leaſes.

Generally ſpeaking, the farms may be characteriſed as ſmall, few of them exceeding 300*l.* *per annum*, and more being under 100*l.* than above that ſum; many, indeed, eſpecially in the clay diſtrict, being as low as 20*l.* The largeſt farms are on the poor foreſt lands, which have been lately brought into a ſtate of cultivation. Rents are univerſally paid in money; reſerving only ſome few boons, as they are provincially called, *i. e.* obligations to perform ſome carriage work (chiefly of coals) for the landlord. Tithes are in ſome places taken in kind, but are more frequently compounded for, at a much lower rate than they would be valued at by any ſurveyor. In the new incloſures, land has univerſally been given in lieu of tithes; and all the lands which are either now, or have been formerly church lands, are entirely tithe free. Eſtates vary in extent from 12,000*l.* a-year downwards to the ſmalleſt amount. The largeſt, as is uſual in moſt counties, are left to the care of ſtewards; but many conſiderable as well as inferior yeomen occupy and farm their own properties.

Mineralogy.—In a mineralogical eſtimate, Nottinghamſhire has nothing particularly worthy of attention. No metals of any deſcription have hitherto been diſcovered within its boundaries. Coal and lime-ſtone, however, are tolerably abundant, as well as marle and free-ſtone. Both the coal and lime-ſtone ſtrata lie on the weſtern ſide of the county. The former occupy a line of conſiderable extent, but not more than a mile in breadth. The ſeams, however, are very prolific, and the coal being of a good quality, is conſequently wrought with great advantage to the proprietors. But the ſame remark cannot be applied to the lime-ſtone, which is for the moſt part of an inferior kind, and only fit for the purpoſes of manure. At Mansfield are ſome excellent quarries of a yellowiſh free-ſtone, well adapted for building and paving; and there is alſo at this place a red kind, capable of being formed into ciſterns and troughs. At Maplebeck is a blueiſh ſtone for building, which has the property of becoming white upon expoſure for a ſhort time to the action of the air. Beacon-hill, near Newark, is remarkable for a kind of blueiſh ſtone, for hearths, which takes ſo fine a poliſh, as frequently to be miſtaken for marble; and at Linley is a coarſe paving ſtone, much uſed in paving the ſtreets of Nottingham. The quarries on this hill alſo produce vaſt quantities of gypſum, alabaſter, or plaſter, as it is commonly called by the inhabitants. The ſame material is likewiſe abundant in many other places, and in greater variety, and of a ſuperior quality to that found in almoſt any other county of England. Marle is diſcovered throughout the whole extent of the clay diſtrict, but being no where uſed as a manure, except in one or two farms near the banks of the Trent, it is very little dug up. Mr. Lowe indeed ſays, that he is ignorant of any marle-pit opened within the county, but that at Bank-wood in the Trent Bank diſtrict.

Rivers.—The rivers which either take their riſe in Nottinghamſhire, or flow through it, are numerous, and a few of them are very conſiderable ſtreams. The Trent, which has its ſource near Biddulph, in Staffordſhire, enters this county in the vicinity of Thrumpton with a bold and rapid current, and croſſing it in a north-eaſterly direction by Nottingham and Newark, where its ſtream ſweeps decidedly to the north, reaches Clifton, and becomes the boundary between this county and that of Lincoln, for a diſtance of more than twenty miles. This river is navigable for large veſſels as high as Gainſborough, eight miles above Weſt-Stockwich, at which village it leaves Nottinghamſhire; and flat-bottomed ſmall craft of thirty or forty tons burden may navigate its whole courſe through the county. The Erwaſh forms the boundary between the ſhires of Nottingham and Derby, and falls into the Trent near Barton; as does likewiſe the Soar, which flowing from the ſouth divides this county from that of Leiceſter. The Mann and the Meaden, uniting their currents near Elkeſley, after receiving ſeveral ſmaller ſtreams, form the Idle, which runs in a northerly direction

direction by Retford and Matterſey to Bawtry, where it turns to the eaſt, and traverſing Miſſon-Car joins the Trent in the northern angle of the county. The other rivers in Nottinghamſhire are the Wollen, the Workſop, the Dover, the Greet, and the Leen, but none of them poſſeſs any features ſufficiently intereſting to claim particular deſcription.

Canals.—In this county are four principal canals, beſides a number of collateral branches to different ſmall towns and works. Theſe are the Cheſterfield canal, the Nottingham canal, the Idle River canal, and the Grantham canal. The Cheſterfield canal derives its name from the town of Cheſterfield, where it commences, and after a circuitous courſe within Derbyſhire, enters this county near Shire-oaks, and continues by Workſop through the northern limits of Sherwood-foreſt to Retford. It paſſes through the townſhips of Welham, Clarborough, Hayton, Clayworth, Everton, and Drakelow, at which place it runs under a tunnel of two hundred and fifty yards, and thence round Gringley-on-the-Hill to Miſterton, acroſs Walkeringham-moor, and thence into the Trent at Stockwich. The whole line of this canal is upwards of forty miles in length. Its riſe from Cheſterfield to Norwood is about forty-five feet; and thence to the Trent it has a regular fall of three hundred and thirty-five feet. The Nottingham canal extends about fifteen miles through the county in a north-weſt direction, but not exactly in a right line. It commences in the river Trent, and proceeds to the Cromford canal, near Langley-bridge, cloſe to the termination of the Erwaſh canal; and it is alſo connected with the Grand Trunk canal. A reſervoir has been formed at Arnſwirch with a ſelf-regulating ſluice, which lets off 3000 cubic feet of water in an hour. This canal was firſt opened for navigation in 1802; and the principal object for which it was conſtructed, was the export of agricultural produce, and of coals from the various mines in its vicinity. The Idle River canal is more properly a river navigation than a cut. It commences at Bawtry, and runs nearly due eaſt for ten miles along the northern verge of the county. In one part of its courſe it is denominated the Bycar Dyke canal; and half a mile from its junction with the Trent is Miſterton-ſluice. The Grantham canal, ſo called from its commencing at that town, in Lincolnſhire, after paſſing through Leiceſterſhire enters this county about a mile from Hicking, and croſſing the Wolds flows in a very circuitous line by Owthorpe and Cropwell-Biſhop, till its junction with the Trent. The proprietors of the Grand Trunk canal, having been at conſiderable expence in deepening the river near the entrance of this canal, are entitled to take certain tolls on all goods paſſing from it to the Nottingham canal. At Cropwell-Biſhop a branch leads off from the Grantham canal to the town of Bingham.

Foreſts.—In this county is the foreſt of Sherwood, which in ancient times was of conſiderable celebrity, particularly as the ſcene of the exploits of Robin Hood, &c. See SHERWOOD.

Commerce and Manufactures.—The malting buſineſs is carried on here to a great extent, eſpecially at Nottingham, Newark, and Mansfield. A great deal of malt is ſent by the Trent and by the canals into Derbyſhire, Cheſhire, and Lancaſhire. At Newark are great breweries, which rival thoſe of Burton-upon-Trent. The ſtocking trade may be regarded, however, as the ſtaple of the county. The firſt frame for making ſtockings is ſaid to have been invented by one Lee, a native of Calverton. This buſineſs occupies a vaſt number of hands at Nottingham, and at the ſurrounding villages, and alſo at Southwell. Many cotton-mills, worked by water, to prepare the thread for the Mancheſter goods, and for ſtockings, have been eſtabliſhed at Garnſton, Lowdham, Papplewick, Southwell, Newark, Fiſkerton, Mansfield, and Basford. At Cuckney is a mill for combing wool, another for ſpinning worſted, and a third for poliſhing marble. At Arnold is a large woollen-mill; and at Retford is another for the ſame purpoſe, both of which are worked by ſteam. At Nottingham are ſeveral ſilk-mills, alſo an extenſive manufacture of thread lace and Britiſh lace; though, unfortunately, this laſt branch of trade, as well as the ſtocking manufacture, has ſuffered much by the late commotions in this county. Mansfield is remarkable for its trade in ſtone; and at Sutton-in-Aſhfield are conſiderable potteries of coarſe red ware. A ſtarch manufactory is now carried on at Upton, near Southwell; a ſail-cloth manufactory has been long in a flouriſhing condition at Retford; and the dyeing and bleaching trade has been attempted, with conſiderable ſucceſs, at Nottingham and at Newark. The exports of the county conſiſt of moſt articles of its produce or manufacture; and its chief imports are timber, flax, hemp, iron, cotton, wool, and yarn, with, in general, all ſuch articles as are not found or manufactured within its boundaries.

Civil and eccleſiaſtical Diviſions and Government.—Nottinghamſhire is politically divided into ſix hundreds, or wapentakes, which include eleven market-towns, and 160 pariſhes. The towns are Nottingham, Newark, Mansfield, Bingham, Workſop, Tuxford, Ollerton, Eaſt-Retford, Bawtry, Blythe, and Southwell, accounts of which will be found under their reſpective names.

The eccleſiaſtical government of this county is now under the ſee of York; but it had formerly, even ſo late as the reign of Elizabeth, a biſhop of its own. At preſent it conſiſts of an archdeaconry, and four deaneries: Nottingham, Bingham, Newark, and Retford. Of the pariſhes and chapelries, 182 are within the juriſdiction of the archdeacon, 28 belong to the church of Southwell, and ſeven are under the patronage of the dean and chapter of York.

The *antiquities* of Nottinghamſhire are neither ſo numerous nor ſo important as in moſt of the central counties of England. The only Britiſh camp is that at Barton, about four miles ſouth-weſt of Nottingham; but at Oxton there are three large tumuli, one of which was opened by the late major Rooke, and found to contain an iron urn, filled with aſhes and burnt bones, a large ſword with a wooden ſcabbard, two daggers, and a great variety of glaſs beads. On the ſummit of the hills, called Robin Hood's hills, is a ſeat cut out of the ſolid rock, which is ſaid by ſome to have been the work of Robin; but others regard it as of much higher antiquity. Roman remains are more frequent than Britiſh; and no doubt that people had many ſtations within this county, of which the principal were Verometum near Willoughby, Margidunum near Bingham, and Segelocum at Littleborough. Crocolana was ſituated on the verge of the county, partly within it and partly in Lincolnſhire. The two firſt mentioned ſtations were ſituated on the Foſſe-way, which, entering the county from Leiceſterſhire, croſſes the Ermin-ſtreet from London to York. This road may be eaſily traced for many miles along the wolds, and is literally a foſſe. In the foreſts are many veſtiges of military roads, which run invariably in a north-weſt direction, and have exploratory camps ſituated, at intervals, cloſe to them. On Holly-hill, near Arnold, in Sherwood foreſt, may be ſeen a very large encampment, ſuppoſed to have been the central depôt of the Roman forces in this diſtrict, as, from its height, it commands a view over all the exploratory camps around. Gale conjectured that Nottingham was the Cauſennis of Antoninus, but without ſufficient authority. Some notices of the caves in the vicinity of that town will be found under

under the article NOTTINGHAM. General View of the Agriculture of the county of Nottingham, &c. by Robert Lowe, eſq. of Oxton, 8vo. London edit. 1798. The Antiquities of Nottinghamſhire, with Maps, Proſpects, and Portraitures, London, 1677, folio, by Dr. Thoroton.

NOTTURNO, Ital. a night-piece. About the middle of the laſt century, the notturni à 4, of Martini, of Milan, were deſervedly in high favour.

NOTZENDORF, in *Geography*, a town of Pruſſia, in Pomerelia; 7 miles E. of Marienburg.

NOÜ, a town of Hindooſtan, in the ſubah of Delhi; 20 miles W.N.W. of Coel.

NOVA, or AD NOVAS, in *Ancient Geography*, a town of Mauritania Tingitana, upon the route from Tocoloſida to Tingis, according to the Itinerary of Antonine, between Oppidum Novum and Ad Mercurii; 32 miles from the firſt, and 12 miles from the ſecond.

NOVA, in *Geography*, a ſmall iſland in the Atlantic, near the coaſt of Braſil. S. lat. 0° 4′. W. long. 50° 30′.

NOVA *Zembla*. See ZEMBLA.

NOUA, an iſland near the W. coaſt of Eaſt Greenland. N. lat. 60° 45′. W. long. 47°.

NOVAC, a town of Iſtria; 15 miles N.E. of Rovigno.

NOVACULA PISCIS, the *Razor-fiſh*, in *Ichthyology*, the name of a ſea-fiſh caught in the Mediterranean, and ſome other ſeas, and much eſteemed at the tables of the great.

It is a ſmall fiſh, ſeldom exceeding three or four inches in length, and, in its flat ſhape, ſomewhat reſembles the faber. It keeps about the ſhores, particularly ſuch as are ſtony, and ſeems never to go into deep water; and is caught on the ſhores of Majorca, Minorca, the iſland of Malta, and elſewhere, and lives on ſmall fiſh. Salvian. de Aquat. See CORYPHÆNA *Novacula*.

NOVACULARUM LAPIS, in *Natural Hiſtory*, the name given by De Laet to a ſtone which he deſcribes from Ximenes, who has it under the American name *ixtli*.

It is the ſtone out of which the natives of America made their weapons of war, and tools for other uſes of life, before they knew the uſe of iron.

There are three ſpecies of this ſtone, the one blue, the other white, and the other black: they are all capable of a very high poliſh, and, when ſet in gold or ſilver, are very highly eſteemed by the natives: they reflect the images of things, in the manner of all other highly poliſhed bodies, and the two firſt are conſiderably tranſparent.

There are ſeveral quarries of theſe ſtones in the neighbourhood of Mexico, whence the Indians uſed to get them; they naturally ſplit, in the getting out, into angular and edged figures, and theſe they afterwards faſhioned to the purpoſes they wanted them for, and poliſhed with the powder of a harder ſtone.

They ſtill make knives of them, in a very expeditious and very remarkable manner. They hold the maſs of ſtone between their feet, and, with an inſtrument prepared on purpoſe, they cut off pieces of four or five inches long, and about an inch broad, riſing to a prominence on each ſide in the middle, and growing very thin toward the edges: it is wonderful to ſee with what expedition they finiſh this odd workmanſhip. The knives, when made, are ſharper than any other inſtrument in the world; but they are very tender, eaſily broken, and more eaſily battered, and notched at the edges. They make alſo longer weapons of the ſame ſhape out of this ſtone, which they fix into wooden handles, with a ſort of gum; and theſe ſerve them as ſwords. They are very terrible weapons for one blow, but they ſeldom hold together ſo as to bear a ſecond. They make alſo the heads of their arrows with them; and, when theſe were firſt found by our travellers, they were not ſuppoſed to be of human workmanſhip, but to have fallen from heaven in thunder, and were called by many authors *ceraunia*. Ximenes, Hiſt. Ind. Occid. lib. x. cap. 13.

NOVÆ, in *Ancient Geography*, a town of Lower Mœſia, upon the route from Viminiacum to Nicomedia, according to the Itin. Anton., between Dimon and Scaidava; 17 miles from the former, and 18 from the latter.—Alſo, a town of Upper Mœſia, upon the route from Viminiacum to Nicomedia, between Cuppæ and Talia; 24 miles from the former, and 32 from the latter.—Alſo, a town of the ſecond Pannonia. It is placed by Antonine, in his Itinerary, along the coaſt of Gaul, on the route from Tauranum between Murſa and Antianæ; 24 miles from the former, and 23 from the latter.

NOVÆ, or *Ad Novas*, a town of Macedonia, upon the route from Hydrus to Aulon, between Apollonia and Claudianæ; 24 miles from the firſt, and 25 from the ſecond.

NOVAIA, in *Geography*, a town of Ruſſia, in the government of Tobolſk, on the Irtiſch; 100 miles E.S.E. of Tobolſk.

NOVALE, a town of Italy, in the Treviſan, on the Muſone; containing ſeveral churches, a convent, palaces, and about 1200 inhabitants; 10 miles S. of Trevigio.

NOVALE, in our ancient cuſtoms, denotes land newly ploughed, and converted into tillage; and which had not been tilled within the memory of man before.

"Quod novale ſemel fuit, ſemper erit novale quoad decimarum retentionem vel ſolutionem." What was once novale, will ever remain ſo, as to the paying or non-paying of tythes. "Excepta decima novalium cujuſdam terræ, quam de novo excoluerunt." Pat. 6. Edw. III.

NOVALE is ſometimes alſo uſed for fallow land, *i. e.* land which has been ploughed for two years, and reſts, or lies fallow, one more; or that lies fallow every other year.

NOVALESE, in *Geography*, a town of France, in the department of Mont Blanc; 6 miles W.N.W. of Chambery.—Alſo, a town of France, in the department of the Po, ſituated on the river Doria; 5 miles N. of Suſa.

NOVALLERA, a town of Italy, in the department of the Panaro, and capital of a ſmall principality, held as a fief of the empire by the duke of Modena; 9 miles N. of Reggio.

NOVANAGUR, a town of Hindooſtan, in Guzerat; 30 miles S.S.E. of Puttan Sumnaut.

NOVANTÆ, in *Ancient Geography*, one of the 22 Britiſh nations which, according to Ptolemy, occupied the territory S. of the wall of Antoninus, between the friths of Forth and Clyde, ſtationed near the peninſula called Novantum, now the Mull of Galloway. They poſſeſſed, according to Camden, the countries of Galloway, Carrict, Kyle, and Cunningham. Baxter ſuppoſes they were called Novantæ, from the Britiſh word "Now heat," new inhabitant, and that they had come originally from the neighbouring coaſts of Ireland. He farther obſerves, that their more modern name of Gallowadians alſo implies, that they were ſtrangers. Their towns were Lucopibia, or Lukoikidion, ſignifying the ſame with Candida Caſa in Latin, and Whithern in Saxon, and deriving its name from a cuſtom of the ancient Celts, of white-waſhing their chief buildings; and Religionum, Retigonium, or, as Camden and Baxter imagine it was written, Beregonium, being Bargeny in Carrict.

NOVARA, in *Geography*, a town of France, in the department of Marengo, and capital of a country, called "Novareſe," in the duchy of Milan, the ſee of a biſhop, ſuffragan

ſuffragan of Milan. It contains, beſides the cathedral, 17 pariſh churches, and 18 convents. This town was taken in 1797 by the French; 8 miles N.E. of Vercelli.

NOVARIA, Novarre, in *Ancient Geography*, a town of Italy, in Gallia Tranſpadana, towards the north. Tacitus ranks it among the municipal cities of Gallia Tranſpadana; and ſome have given it to the Inſubrians.

NOVARINI, Lewis, in *Biography*, a learned Italian Theatin monk, who flouriſhed in the 17th century, was a native of Verona, where he was born in the year 1594. He entered among the Theatins when he was about eighteen years of age, and was ſent to paſs his noviciate at Venice, and took the vows in 1614. He afterwards ſtudied philoſophy and divinity, and was ordained prieſt in 1621. Among other departments which he occupied, was that of counſellor of the Inquiſition. He was deeply learned in the Oriental languages, and enjoyed the eſteem of the princes and learned men of his time. He died at Verona in the year 1650, at the age of 56. He was author of a vaſt number of works, of which a long liſt is given in the 40th volume of father Niceron's Memoires. The principal of theſe works are; "Comment. in quatuor Evangel. et Acta Apoſtol." in 4 vols. fol.; "Adagia Sanctorum Patrum," in 2 vols. fol.; "Electra Sacra, in quibus quà ex Latino, Græco, Hebraico, et Chaldaico fonte, quà ex antiquis Hebræorum, Perſarum, Græcorum, Romanorum, aliarumque Gentium ritibus, quædam divinæ Scripturæ loca noviter explicantur et illuſtrantur," in 3 vols. folio. Moreri.

NOVA SCOTIA, in *Geography*. See *Nova* Scotia.

NOVATIANS, Novatiani, in *Eccleſiaſtical Hiſtory*, a ſect of ancient heretics, that aroſe towards the cloſe of the third century, ſo called from Novatus, an African biſhop; or from Novatianus, a prieſt of Rome.

They were called alſo Cathari, from καθαρὸς, *pure*, q: d. Puritans.

Novatian firſt ſeparated from the communion of pope Cornelius, on pretence of his being too eaſy in admitting to repentance thoſe who had fallen off in times of perſecution.

Novatus coming to Rome, joined himſelf to the faction of Novatian; and both maintained, that there was no other admiſſion into the church but by the repentance in baptiſm; grounding their opinion on that of St. Paul: "It is impoſſible for thoſe once enlightened, and who have taſted the heavenly gift, if they fall away, to renew themſelves by repentance."

Not that they denied but a perſon fallen into any ſin, how grievous ſoever, might obtain pardon by repentance; for they themſelves recommend repentance in the ſtrongeſt terms: but their doctrine was, that the church had it not in its power to receive ſinners into its communion; as having no way of remitting ſins but by baptiſm; which, once received, could not be repeated.

In proceſs of time the Novatians ſoftened and moderated the rigour of their maſter's doctrine, and only refuſed abſolution to very great ſinners.

The two leaders were proſcribed, and declared heretics, not for excluding penitents from communion, but for denying that the church had a power of remitting ſins.

NOVATION, Innovation, in the *Civil Law*, denotes a change or alteration of an obligation, whereby it becomes extinguiſhed or annihilated.

Thus, when an obligation is diſcharged without receiving any money, but a ſimple promiſe is accepted in its ſtead, this occaſions a novation.

There are two notations; the one *voluntary*, the other *neceſſary* and conſtrained.

Novation, *Neceſſary*, is that made in conſequence of a ſentence or decree of juſtice.

Novation, *Voluntary*, is made three ways; *viz.* by changing the cauſe of the obligation, without the intervention of any other perſon; by changing the nature of the obligation; and by delegation, as when the debtor makes over a debt to the creditor for his ſatisfaction.

In all theſe caſes there is a will to innovate. Accordingly, Juſtinian ſays, "Voluntate, non lege, novandum."

NOVAVOL, in *Geography*, a town of Samogitia; 40 miles S. of Roſienne.

NOUCONGUE, a mountain of Thibet. N. lat. 30° 54′. E. long. 94° 54′.

NOUDJER, a town of Hindooſtan, in the circar of Ellore; 20 miles W. of Ellore.

NOUE, Francis de la, in *Biography*, ſurnamed *Bras-de-Fer*, an eminent warrior and ſtateſman, was born in 1531, of an eminent family in Brittany. He was brought up to the profeſſion of arms, and became diſtinguiſhed in Italy. On his return to France, he embraced the Calviniſtic religion and party, of which he became a principal ſupporter. In 1567 he reduced Orleans, commanded the rear guard at the battle of Jarnac in 1569, and afterwards took Fontenoi, and ſeveral other places. At the capture of Fontenoi he received a wound which occaſioned the loſs of an arm, and he ſupplied its place with one of ſteel; with this he was ſoon able to manage his bridle, and hence he obtained his ſurname. He was in the Low Countries in 1571, and ſurprized Valenciennes; and returning after the maſſacre of St. Bartholemew, he was appointed by the king to the command of the troops ſent againſt Rochelle. "On this occaſion," ſays his biographer, "his attachment to his party, enforced by the juſt reſentment he might feel for the late execrable maſſacre, overcame his ſenſe of fidelity to his ſovereign, and he carried into Rochelle for its defence the forces deſigned for its reduction." We much doubt whether this can be admitted as a juſtification of his conduct as a ſoldier and man of honour. It is however more to his credit, that he uſed all his intereſt during the ſiege to promote an accommodation upon honourable terms. In 1678 he followed the duke of Alençon into the Low Countries, and rendered great ſervices to the States-General. He took Ninove, with count Egmont, who commanded it, but was himſelf made priſoner in 1680. The Spaniards thought this capture of ſo much importance, that they detained him in captivity five years, which he employed in literary purſuits. At the commencement of the wars of the League he retired to Geneva; when Senlis was beſieged by the leaguers in 1589, he was with the army of Royaliſts which attempted to throw proviſions and ammunition into the place, and when the merchants refuſed to deliver their goods without an advance of money, La Noue immediately mortgaged his eſtate for the required ſecurity. He continued to ſerve with glory under Henry IV., and in 1691 was killed by a muſket-ſhot at the ſiege of Lamballe, as he was reconnoitering. He was ſincerely regretted by both parties, and it is believed that few purer characters are to be met with in the hiſtory of thoſe times. He openly and courageouſly declared againſt the practice of duelling, at that time exceedingly prevalent, and held it as a crime to hazard in perſonal quarrels that life which ought to be devoted to the public ſervice. He was the author of "Diſcours Politiques et Militaires," compoſed in priſon, and printed in 1587. His ſon was a writer and a brave ſoldier. He died in 1618, leaving behind him ſome religious poems, which were afterwards printed at Geneva. Moreri.

Noue, Stanislaus-Louis de la, count de Vair, was of

of the ſame family as the preceding, and born in 1729. He greatly diſtinguiſhed himſelf as a gallant officer in the war of 1741, and alſo in that of 1756. He was ſlain in the action of Saxenhouſen in 1760. Lewis XV. being told of his death, ſaid that "he had loſt the Loudon of France." The count wrote "New Military Conſtitutions," printed at Frankfort in 1760.

Noue, John-Sauve de la, a French actor and dramatic writer, was born at Meaux in the year 1701. The duke of Orleans aſſigned to him the direction of his theatre at St. Cloud, and Voltaire wrote ſome pieces purpoſely for him. He died in 1761. His tragedies and comedies were publiſhed at Paris in 1765.

NOVEL, Novella, in *Juriſprudence*, is a term uſed for the conſtitutions of ſeveral emperors; *viz.* Juſtin, Tiberius II., Leo, and particularly Juſtinian.

Moſt of Juſtinian's Novels were originally Greek, and afterwards were tranſlated into Latin. Their number is 168, compriſed in nine collections or chapters. See Civil *Law*.

They had their name novel, either from their making a great alteration in the face of the ancient law; or, as Cujas rather thinks, becauſe made on new caſes not yet conſidered; and, after the reviſal of the code, compiled by order of the emperor.

Wherever Accurſius ſpeaks of novels, he means thoſe publiſhed in Greek by Juſtinian: the Latin verſion of them, made in the time of Bulgarus, he calls *Authentics*, by reaſon of its exactneſs and fidelity.

Novel, in *Matters of Literature*, a fictitious hiſtory of a ſeries of ſurprizing and entertaining events in common life, wherein the rules of probability are, or ought to be, ſtrictly obſerved; in which it differs from a romance, where the hero and heroine are ſome prince and princeſs, and the events which lead to the cataſtrophe are, in general, highly abſurd and unnatural.

After a general change in the manners of Europe, a diſbelief in magic and enchantments, the abolition of tournaments, and the prohibition of ſingle combat, had deſtroyed or greatly weakened the fondneſs for romances of chivalry, a ſecond ſpecies of romance writing took its riſe. In this there were no longer introduced dragons, necromancers, or enchanted caſtles, but with them was not entirely baniſhed abſurdity of incident and improbability of character. This ſecond ſpecies of fictitious writing did not continue long: the age was becoming too refined, and the taſte for literature too general and extenſive, for works to pleaſe in which the characters were ſtrained, the ſtyle turgid and declamatory, and the adventures incredible. This ſort of compoſition now aſſumed a third form, and from the magnificent romance, dwindled down to the familiar novel. When the novel firſt appeared in England and France, during the reigns of Louis XIV. and Charles II., it was made the vehicle for profligate adventures, and for the diſplay and recommendation of looſe and immoral character. Since that time, imitations of life and manners have been their principal object, and though their moral or beneficial tendency may often be queſtioned, yet their profeſſed object is to inſtruct as well as to amuſe.

Mrs. Barbauld, in her obſervations on the life and writings of Richardſon, remarks, that novels may be diſtinguiſhed into three claſſes, according to the mode and form of narration adopted by the author: the firſt is the narrative or epic form, in which the whole ſtory is put into the mouth of the author, who is ſuppoſed to know every thing; the ſecond is that in which the hero relates his own adventures; and the third is that of epiſtolary correſpondence, in which all the principal characters of the novel relate the events in which they were moſt concerned. This laſt mode appears to have originated with Richardſon. With reſpect to the advantages and diſadvantages of theſe different modes, and the comparative probability of a perſon ſitting down, after his adventures were finiſhed, to give an account of them to the public, and of his diſpatching a narrative of every intereſting occurrence, immediately after it happened, to his friends by the poſt, Mrs. Barbauld enters into a minute inveſtigation. It is probably a queſtion of little moment, ſince, if the novel be intereſting and well written, the reader will not be diſturbed in the middle of the ſtory, by any curioſity or ſcruple about the means or the inducements which the narrator may have had for telling it. Perhaps the firſt of theſe modes, the author's own narrative, is the moſt eligible, as it gives him greater ſcope, and allows him to introduce greater variety in his mode of narration, and in his ſtyle. The epiſtolary ſtyle, however, is beſt adapted to that ſpecies of novel in which the characters, and not the adventures of the perſons introduced, are intended principally to rouſe, and fix the intereſt of the reader; it is, therefore, employed with great propriety and effect by Rouſſeau, in his Heloiſe.

The French undoubtedly excel all other nations in this ſpecies of writing; if its chief excellence and merit conſiſt in drawing characters with delicacy, in exquiſite refinement of thought, and in great penetration into human nature. The Engliſh novel writers are more diſtinguiſhed by their ſkill in painting manners than character, and by their humour, rather ſtrong and coarſe, than chaſte and elegant. The German novel writers, in general, diſplay force and wildneſs of genius; a deep tincture of ferocity; and a diſpoſition to carry every feeling and ſentiment to the utmoſt poſſible degree of extravagance and exceſs. Their opinions reſpecting morality are of a ſingular nature, and of a very queſtionable tendency: it might almoſt be ſuſpected that their object was to recommend vice, or crime, by exhibiting it united with great vigour of mind, ſplendour of genius, and even with ſome intereſting and attractive virtues.

The Gil Blas of Le Sage is filled with great knowledge of the world; and is evidently the work of a man who had ſtudied human nature, under certain circumſtances, with great attention and ſkill: but his turn for ſatire is ſo ſtrong and predominating, that a tinge of caricature runs through the whole work. One of the chief advantages and excellencies of Gil Blas, conſiſts in the correct and animated view which is given throughout it, of the manners and habits of life, in Spain, during that period when the action is laid; nor is it poſſible to conceive a more ſtriking and juſt picture than it exhibits, of the corruption of juſtice, of the extreme lazineſs and profligacy of the grandees, and of profeſſional pedantry, preſumption, and unſkilfulneſs. In this reſpect Le Sage may be regarded as having ſupplied a too common omiſſion of the hiſtorian, who paſſes over the changes of human manners and character, and confines his attention to thoſe events and circumſtances only, which intereſt or benefit the politician.

But the novels of Le Sage do not preſent a faithful picture of the characteriſtic qualities and excellencies of the French authors in this ſpecies of writing. In this point of view Marivaux claims our attention in a very ſuperior degree: in his Marianne, particularly, he ſeems to have penetrated into the very receſſes of the human heart, while he lays open thoſe moſt ſecret motives, which, even though they influence the conduct, are not known or recognized by the agent in all their force and bearings. Perhaps his fault conſiſts in being too minute and refined in tracing the motives and painting the feelings of his character. The novels of Florian have

more ſimplicity than thoſe of Marivaux, while they are equally intereſting from the ſkill with which the narrative is conducted, the vividneſs and animation with which the incidents are related, and the faithful portraits which they exhibit of human nature, in ſome of its moſt pleaſing and amiable forms.

Rouſſeau's novels, as well as thoſe of Le Sage, form exceptions, in ſome very important reſpects, to thoſe of the French ſchool of novel writers; but the difference is of a very different nature; and even in the moſt ſplendid and eloquent parts of Rouſſeau's novels, the characters of the French ſchool may be traced. He does not indeed paint his characters by minute and laboured features: but with the hand of genius, he ſtrikes off the portrait, by the rapid and flowing exhibition of thoſe features, on which the ſoul is moſt ſtrongly expreſſed. His novels alſo are uncommonly intereſting, from the inſight which they afford into the author's own character; though there is ſo little appearance of art in his writings, that the idea of the ſkill or talents of the writer does not croſs our mind, or break in upon our thoughts or feelings, while we are warm in the peruſal; yet we no ſooner lay down the book, than a ſtrong impreſſion of the peculiar character of the author forces itſelf on our mind. In every thing which he wrote, but eſpecially in his Heloiſe, we diſcover extreme and exquiſite ſenſibility, a romantic and viſionary turn of mind, and genius of the higheſt order and pureſt nature. In his Heloiſe, there are, no doubt, conſiderable faults; in what Rouſſeau intended for the philoſophical parts, there is much ſophiſtry, and not unfrequently a tedious and obſcure weakneſs of argument. The ſtyle of the letters, alſo, is not ſufficiently varied, in the leſs impaſſioned parts: he did not, indeed, ſucceed nearly ſo well in the diſplay of reaſoning and calm, as of feeling and impaſſioned character. But with all theſe deductions from its merit, the Heloiſe muſt be ranked among the moſt ſucceſsful and ſplendid creations of human genius; and there are paſſages in it, which for power of eloquence, for refinement and tenderneſs of ſentiment, for ardour of paſſion, and for exquiſite delineation of character, cannot be paralleled in any other writer.

The circumſtances which gave riſe to this moſt extraordinary work are detailed by Rouſſeau in his memoirs; and as they are extremely intereſting, from the diſplay which they exhibit of the workings of his imagination, and the extreme and morbid ſenſibility of his feelings, we ſhall briefly detail them. Tired of Paris, he withdrew to a ſmall country houſe near it; where he ſhut himſelf completely up from all viſitors, indulging his taſte for ſolitude and viſionary enjoyments. Here he deſcribes himſelf as having been ſeized with the moſt violent propenſity to love; but as his age and ſituation precluded him from having a real miſtreſs, he created an imaginary one, whom he adorned with every charm that a flowing and moſt creative fancy could ſupply. At length he commenced a correſpondence with his imaginary miſtreſs; and the letters, thus written, pleaſed him ſo much, that he determined to publiſh them. As, however, the ſentiment which they expreſſed, and the feelings which they diſplayed, were very oppoſite to the ſevere and ſtern maxims which he had formerly inculcated, he was, at firſt, at a loſs for a juſtification of his conduct in publiſhing them. Here, again, his imagination, and his diſpoſition to ſophiſtry, came to his aid: he perſuaded himſelf that the times were ſuch, that the Heloiſe would be more uſeful than works conducted with a ſtricter regard to morality. He did not conceal from himſelf the objections that might be made to it, nor the effects that it might produce; but he urges, that the diſorder of which it preſents an example was leſs dangerous and criminal than that which had become common in France: as, therefore, he deſpaired of freeing human nature from vice, he reſolved to content himſelf with ſubſtituting one ſpecies of crime for another. He argues too, that in the generality of fictitious writings, the ſtandard for imitation had been raiſed too high; that it thus created deſpair, not emulation; but that in his Heloiſe, human nature is exhibited only with that degree of perfection which all may attain to, while the nature of the perfection, and the circumſtances under which the characters are exhibited, will naturally inſpire a wiſh to imitate them.

The novels of Richardſon are of a very peculiar character; and as they cannot be ſtrictly claſſed with any other Engliſh novels, it will be neceſſary to conſider them by themſelves, and at ſome length. Certainly his great excellence conſiſts in the extreme minuteneſs and fulneſs of his deſcriptions; and in the pains which he takes to make his readers moſt intimately acquainted with the character and feelings of the perſonages with whom they are occupied. Inſtead of hurrying over the preparatory ſcenes, and reſerving the whole of the reader's attention for thoſe parts, when a grand diſplay of incident is to be brought forward, or the working of ſome great paſſion is to be pourtrayed, Richardſon introduces his readers into the domeſtic privacy of his characters, and every thing that is ſaid or done, is thus, as it were, heard and ſeen by them. The reſult is, that we take an intereſt in all the perſonages, and almoſt acknowledge them as our moſt intimate acquaintance. In order to effect this, Richardſon has been obliged to enter into prolix deſcriptions, and to repeat rambling and tedious converſations: in the midſt of theſe, the reader is frequently tired or diſguſted, but they nevertheleſs leave on his mind a more diſtinct idea of the character of the perſonages, and give them a ſtronger hold, not only on his curioſity, but his intereſt. When, therefore, any thing important or diſaſtrous occurs to them, we feel as for old friends and companions, and are irreſiſtibly led to as lively a conception of their ſenſations, as if we were actually preſent. By this means Richardſon has the advantage of bringing readers, already intereſted in the higheſt degree, to the peruſal of thoſe ſcenes, where his knowledge of the human heart, and his powers of pathetic deſcription, are brought forward to the greateſt advantage and effect.

With all the merits of Richardſon's novels, they have great faults: the argumentative diſcuſſions which he introduces are tedious and heavy, and diſplay no great or comprehenſive powers of mind; his wit is ſtiff and formal, evidently brought forward with much effort, and ſcarcely ever either lively or natural. His ſtyle is heavy, vulgar, and embarraſſed, devoid of eaſe, elegance, or dignity: Mrs. Barbauld has very ingeniouſly and ſatisfactorily accounted for this, from his intimacy with female ſociety and female letter-writing. With regard to the moral tendency of his works, it is probably not ſo highly rated now as it was at the time they were written: on this ſcore Pamela cannot be defended; and virtue will hardly attract in the character of ſir Charles Grandiſon, nor vice be ſo warmly and ſtrongly abhorred as it ought to be, in the character of Lovelace.

In the novels of Fielding and Smollet, the genuine character of Engliſh novel-writing appears in the moſt diſtinct and marked manner; yet theſe authors differ from each other in ſeveral important points. Fielding is remarkable, rather for humour than wit; and his humour is coarſe and ſtrong, not refined and delicate: the characters which he draws are certainly lively and natural, but they are ſuch as require rather an acquaintance with manners, and with the influence of particular

particular conditions and occupations, on the opinions, diſpoſition, and conduct, than an inſight into the more ſecret workings of the human mind and heart. This obſervation will not be deemed ſevere or unjuſt by thoſe who compare thoſe parts of his novels where his favourite characters are introduced, ſuch as oſtlers, innkeepers, waiting-maids, rogues, and female demireps, with thoſe which called for the diſplay of characters of more refined ſentiments and feelings, or acting under the influence of the more powerful emotions and paſſions of the heart. The greateſt merits of Fielding's novels, more particularly of Tom Jones, conſiſts in the exquiſite ſkill with which he conducts the fable; the ſubſerviency of every incident to the furtherance of the plot, and his art in keeping alive the curioſity of the reader. His ſtyle is languid and tame, exhibiting a good deal of pedantry and affectation; and that the digreſſions, which he introduces, are at leaſt out of place, is ſufficiently proved by the total neglect which they experience from every reader. The moral tendency of his novels is bad: benevolence, generoſity, and diſintereſtedneſs, are, no doubt, ſtrongly inculcated; but in novels, the examples which are held out have a more powerful and extenſive influence, than the leſſons which are taught, or the moral maxims which are laid down; and if his hero, in his moſt favourite novel, is diſintereſted and benevolent, it is rather from want of thought, and from the overwhelming influence of ſtrong paſſions, by no means of a virtuous deſcription, than from principle and conviction.

If we were to compare the moſt popular novels of Smollet with thoſe of Fielding, we ſhould be diſpoſed to aſcribe the higheſt degree of excellence in this ſpecies of writing to the latter. In Roderic Random, and Peregrine Pickle, manners rather than character are depicted; and in the diſplay of them, the acuteneſs of the author's obſervation is much more remarkable than its extent and variety. The humour of Smollet is ſtill coarſer than that of Fielding, and his objectionable ſcenes are brought forward with more groſsneſs; while there is none of that refined generoſity and thoſe juſt ſentiments, at leaſt of moral conduct, with which Fielding inveſts his heroes. On the other hand, the novels of Smollet, particularly Roderic Random, are more full of inſtructive knowledge of the world, and are written in a much more animated, lively, and natural ſtyle. But it is in Humphrey Clinker that Smollet appears to the beſt advantage: it is not, perhaps, going too far to aſſert, that the character of Matthew Bramble is as exquiſitely and finely drawn, as any character exhibited in fictitious writing. The idea which Smollet formed to himſelf of this character, is complete and conſiſtent in all its parts; and there is not a ſentiment uttered, not a feeling expreſſed, nor an action performed by Matthew Bramble, but what is perfectly in character. An acute and vigorous intellect, a warm and benevolent heart, are united to odd and eccentric humour, a quick irritability of temper, and a retiring ſhyneſs of diſpoſition. He is ſo afraid of being known for what he really is, that he takes as much pains to appear, and be deemed moroſe and ſelfiſh, as moſt men would do to conceal thoſe qualities. In ſhort, the character of Matthew Bramble not only diſplays an intimate acquaintance with the human heart, but alſo with thoſe peculiar manners, which ſo frequently mark out, very diſtinctly, the Britiſh philanthropiſt.

Goldſmith has written only one novel; but that, in every point of view, is an exquiſite one: while the Vicar of Wakefield diſplays almoſt unequalled humour, of the pureſt and higheſt nature, it alſo contains paſſages that are irreſiſtibly pathetic. Nothing can be conceived more perfectly drawn than his character of Doctor Primroſe; it is a truly Engliſh character, exhibited, where ſuch a character appears to the greateſt advantage, at home, by his fire-ſide, in the midſt of his family. Indeed, the great merit, and the moſt powerful and attractive intereſt of this novel, conſiſts in its diſplay of domeſtic feelings. The fable of the Vicar of Wakefield alſo deſerves much commendation; all the perſonages are conducted through their various viciſſitudes, in the moſt natural manner; the events are ſtriking, yet ſimple and probable; and the concluſion is brought about without the leaſt appearance of exaggeration or force. Of the ſtyle, it may be ſufficient to ſay, that it fully merits the praiſe which Johnſon beſtowed on Goldſmith's writings; *nihil quod tetigit, non ornavit*.

Before proceeding to the conſideration of the ſentimental claſs of novels, it may be proper, very briefly and rapidly, to characteriſe the novels of Cumberland, Moore, and Burney. Cumberland evidently imitates Fielding; but he is inferior to him in humour, in the nice delineation of manners and character, and in the ſtructure and management of his fable; while he excels him, in preſenting a more extenſive view of human life, in pathetic deſcription, and in chaſteneſs and elegance of ſtyle. It is a remarkable, unaccountable, but lamentable fact, that the "Terence of England," as Cumberland has been ſtyled, delights, in his novels, in painting ſcenes of voluptuous profligacy, equally reprehenſible with thoſe of Fielding, and much more dangerous, becauſe leſs groſs and vulgar. In the novels of Dr. Moore, great knowledge of the world, and of national character, are diſplayed; and the more difficult taſk of depicting the ſtronger paſſions, is performed with conſiderable ſkill and effect. His humour is rather dry and cauſtic, than rich and ſportive; his ſtyle is at once eaſy, natural, and animated. Perhaps his diſtinguiſhing excellence conſiſts in the almoſt total abſence of exaſperation and caricature in his perſonages; the real features of human life are drawn with ſo much diſcrimination and diſtinctneſs, that, in order to be intereſting or recogniſed, they did not require to be heightened by caricature: on this account, the novels of Dr. Moore will ſupply the place of experience more effectually, and with leſs danger of diſappointment, or being led aſtray, in actual intercourſe with the world, than the novels of any other author. Praiſe of a ſimilar nature cannot be beſtowed on the novels of Miſs Burney; caricature pervades almoſt every feature of all her perſonages, and occaſionally a ſpecies of buffoonery is indulged in, by no means conſiſtent with that purity of mind, and elegance of taſte, which ſhe generally exhibits. But with all theſe deductions from the merits of her novels, they ſtill muſt rank high; Evelina certainly in the firſt claſs; Cecilia (except in the ſerious and pathetic parts) below Evelina; and Camilla very far below both.

The general character of the German novels has been already ſketched, and when the ſentimental deſcription of novels is conſidered, it will be more particularly deſcribed. There are, however, ſome exceptions to this character among the novel writers of Germany; and Auguſtus la Fontaine deſerves in an eſpecial manner to be excepted. His Clara Dupleſſis, and his Family of Halden, deſerve great commendation; they diſplay conſiderable talents of obſervation, and an intimate acquaintance with the feelings and workings of the human heart. In his Family of Halden, he ſeems to have ſet before him as his models Sterne and Goldſmith, and he has certainly imitated them with no ſmall degree of ſucceſs; his imitation, perhaps, is in ſome reſpects improperly cloſe, as the Engliſh caſt of manners is too viſible. Many of his ſubſequent novels are of very inferior merit.

About the middle of the laſt century, a new ſpecies of

fictitious writing took its riſe, called the ſentimental; it conſiſted, principally, in the expoſure and delineation of certain minute and delicate ſenſations, which either have no exiſtence, or paſs unnoticed, in active and buſy life. The moſt celebrated writers of this ſpecies of novel, are Sterne and Goethè. Sterne poſſeſſes wit and humour, intermingled with no ſmall ſhare of diſguſting and profligate buffoonery; the ſentimental parts of his writings are of very different merit; wherever he is entirely filled with his ſubject, ſo that he forgets his affectation of feeling and ſentiment, he is moſt touchingly pathetic, and exhibits a proof of a literary maxim, which he too often neglected, that ſimple and natural incidents, if told in correſpondent language, have more command over the feelings and ſympathy of the reader, than ſcenes of extraordinary and accumulated diſtreſs, pourtrayed in figurative and ſtrained language. It may, however, juſtly be doubted, whether indolent and paſſive ſympathy, rather than active and diſcriminating benevolence, will not be generated by the peruſal, even of the fineſt paſſages in Sterne's novels.

Perhaps few novels were ever more popular than the Sorrows of Werter were, at one time; but their popularity has been long on the wane. It is a ſentimental novel of a very different claſs from the writings of Sterne; being diſtinguiſhed rather by ſtrong and boiſterous paſſion, than by delicate and ſhrinking ſenſibility; and while an indolent languor of feeling is produced by the latter author, the peruſal of the novel of Goethè is calculated to ſtimulate an ungovernable temper, impatience of reſtraint, and contempt for all the ſober and rational maxims of life. The ſenſibility pourtrayed and recommended by Sterne is juſtly cenſurable, as indulging too much in what may be termed the luxury of grief; as directed to, and expended upon improper and unworthy objects, and as totally incompatible with that enlightened and vigorous benevolence, which alone can exerciſe and improve the mind and heart, and confer a real bleſſing on mankind: but the ſelfiſhneſs which lurks in it, is by no means ſo groſs as the ſelfiſhneſs of the hero of the Sorrows of Werter. He is indeed feelingly alive to every incident and impreſſion, but only ſo far as they are connected either with his own happineſs, or with the happineſs of that being in whom he has centered his own. While, however, the Sorrows of Werter muſt be condemned on this account, they deſerve high praiſe for the diſplay of genius which they exhibit; genius indeed not regulated by ſober judgment, or a refined taſte, but partaking, in a high degree, of that impetuoſity and extravagance, which always diſtinguiſh it in a barbarous age.

From this view of ſome of the beſt authors in the higheſt claſs of novel writing, it will be abundantly evident, that the peruſal of theſe works is more calculated, and apt, to be prejudicial than advantageous, unleſs the mind is previouſly fortified with ſound principles, and the paſſions and feeling are completely under the maſtery of the judgment. Even then, their claim muſt reſt, rather on the intereſt which they excite, than on the inſtruction which they afford. Whoever draws his opinions of the world, of the manners, characters, and purſuits of mankind, from novels, will enter on real life to great diſadvantage; the perſonages of novels, eſpecially of thoſe which teem from the modern preſs, either bear no reſemblance to mankind, or that reſemblance conſiſts in ſuch a narrow peculiarity of feature, as renders it rather an individual than a general picture. But the ſtrongeſt and moſt undoubted objection to novels, ariſes from the effects which the peruſal of them produces on the mental faculties, and the literary taſte; during it the mind is nearly paſſive; a lounging, deſultory habit of reading is acquired, ſo that when works are to be peruſed which require cloſe and regular attention, and a judgment conſtantly on the alert, to follow and comprehend the author's obſervations and arguments, the mind is unequal to the taſk. The literary taſte will ſuffer equally, except the reading be confined to a very few ſelect novels: unleſs, therefore, the habits of cloſe, active, and vigorous attention are of a very powerful and predominating nature, and the taſte has been modelled to correctneſs and purity, by long and regular diſcipline, novels ought to be avoided: where theſe preparatives exiſt, their peruſal cannot do harm; it will intereſt, if it does not inſtruct; it will never be indulged in to an improper extent, and it will reſtore the mind to more ſober and uſeful ſtudies, with greater reliſh and renewed freſhneſs.

Novel *Aſſignment*, in an action of treſpaſs, is an aſſignment of time, place, or the like, in a declaration, otherwiſe or more particularly than it was in the writ.

Novel *Diſſeiſin*. See Assise *of novel diſſeiſin*.

NOVELDA, in *Geography*, a town of Spain, in the province of Valencia; 15 miles W. of Alicant.

NOVEMASTO, a town of Auſtrian Poland, in Galicia; 40 miles W.S.W. of Lemberg.

NOVEMBER, the eleventh month in the Julian year, but the ninth in the year of Romulus; whence its name.

NOVEMIASECZKO, in *Geography*, a town of Samogitia; 26 miles N.E. of Medniki.

NOVEMPOPULANIA, in *Ancient Geography*, a province of Gaul, towards the ſouth-weſt.

NOVEMSILES, or Novensiles, in *Mythology*, a ſpecies of gods worſhipped among the ancient Romans.

The dii novemſiles were the gods of the Sabines, adopted by Romulus; and had a temple built to them, in conſequence of a vow, by king Tatius.

Some antiquaries take the name to have been given to thoſe heroes who were laſt placed among the number of the gods; as Hercules, Veſta, Sanctity, Fortune, &c.

NOVEMVIRI, an order of magiſtrates at Athens, nine in number.

The novemviri were the chief magiſtrates of the city; their office only held for one year. Their chief was called *archon*, whoſe name was recorded in the Athenian feaſts; as, at Rome, that of the conſuls.

The ſecond bore the title of *baſileus*; the third, of *polemarcha, i. e.* chief of the troops; and the remaining ſix, of *theſmothetes*.

NOVENDIALE, or Novemdiale, in *Antiquity*, a ſolemn ſacrifice among the Romans, held on occaſion of any prodigies appearing to menace them with ill fortune.

It had its name from the term of its celebration: *viz. novem dies, nine days*.

NOUER L'Eguillette, in the *Manege*. See Yerking.

NOVES, in *Geography*, a town of Spain, in New Caſtile; 16 miles N.N.W. of Toledo.

NOUGARSEK, a town of Eaſt Greenland. N. lat. 61° 14′. W. long. 45° 30′.

NOVGOROD, or Novogorod, a city of Ruſſia, and capital of a government, on the river Volchova, at the N. end of the lake Ilmen; the ſee of an archbiſhop. This is one of the moſt ancient cities in Ruſſia, and was formerly called "Great" Novogorod, to diſtinguiſh it from other Ruſſian towns of a ſimilar name. According to Neſtor, the earlieſt of the Ruſſian hiſtorians, it was built at the ſame time with Kiof, in the middle of the fifth century, by a Sclavonian horde, that iſſued from the banks of the Volga. In the ninth century Ruric, the firſt great duke of Ruſſia, made this city the metropolis of his dominions; and though the

the ſeat of government was removed to Kiof in the year 879, the next year after his death, Novogorod continued for more than a century under the juriſdiction of governors, nominated by the great dukes. In 1036, Yaroſlaf, ſon of Vlodimir, who occupied the throne of Ruſſia, granted to the inhabitants conſiderable privileges, that laid the foundation of their liberty. The dukes of this city, who were at firſt ſubordinate to the great dukes, who reſided at Kiof and Volodimir, gradually uſurped, as the place advanced in wealth and population, an abſolute independency. They were, however, unable to maintain their authority over their own ſubjects; ſo that Novogorod was a republic under the juriſdiction of a nominal ſovereign. The privileges of this town proved very beneficial to its real intereſts; and it became the great mart of trade between Ruſſia and the Hanſeatic cities, and made rapid advances in opulence and population. Its territory extended as far as the frontiers of Livonia and Finland, and compriſed great part of the province of Archangel, and a large diſtrict beyond the north-weſtern limits of Siberia. So extenſive were its dominions, ſo great its powers, and ſo impregnable its ſituation, as to give riſe to a proverb, "who can reſiſt the gods, and Great Novogorod?" In the year 1471, Ivan Vaſſilievitch I. aſſerted his right to the ſovereignty of this principality, and having vanquiſhed the troops of the republic, forced the citizens to acknowledge his claims, and appointed a governor, who was permitted to reſide in the town, and exerciſe the authority formerly veſted in their own dukes. But at this time, they retained their own laws, choſe their own magiſtrates, and the governor never interfered in public affairs, except by appeal. Ivan, not ſatisfied with this limited government, proceeded to extend his authority, and in 1477 laid ſiege to the town. The ſubjugation of the citizens was ſo complete, that it was evinced by the removal of an enormous bell from Novogorod to Moſcow, denominated by the inhabitants "eternal," and revered as the palladium of their liberty, and the ſymbol of their privileges. Nevertheleſs, ſubject as it afterwards was to the deſpotiſm of Ivan, and his ſucceſſors, it ſtill continued to be the largeſt and moſt commercial city in all Ruſſia. It is deſcribed accordingly by Richard Chanceler, who paſſed through it in 1554, on his way to Moſcow. In its moſt flouriſhing condition, it contained at leaſt 400,000 ſouls. In 1570, a conſpiracy having been diſcovered againſt the government of Ivan Vaſſilievitch II., he repaired thither in perſon, and appointed a court of inquiry, juſtly denominated the "tribunal of blood." On each day, during the interval of five weeks, more than 500 inhabitants fell victims to the vengeance of incenſed deſpotiſm. According to ſome authors 25,000, and as others ſay, 30,000 perſons periſhed in this dreadful carnage. By this cataſtrophe, and ſubſequent oppreſſion, Novogorod was conſiderably impaired, both with regard to ſtrength and ſplendour; but it was not totally obſcured, until Peterſburgh was founded, and Peter the Great transferred thither all the commerce of the Baltic, which had before centered in this city. The preſent town is ſurrounded by a rampart of earth, with a range of old towers at regular diſtances, forming a circumference of about one mile and a half; within which incloſure are many uninhabited houſes, and much open ſpace. It ſtretches on both ſides of the Volkof, which is a beautiful river of conſiderable depth and rapidity, ſomewhat broader than the Thames at Windſor, and ſeparating the town into two diviſions, *viz.* the Trading part, and the Quarter of St. Sophia, which are united by a bridge, partly wood, and partly brick. The former diviſion comprehends, if we except the governor's houſe, a rude cluſter of wooden habitations, preſenting ruined remains of ancient grandeur. The latter diviſion derives its appellation from the cathedral of St. Sophia, completed in 1051, and includes the fortreſs or Kremlin, which contains the cathedral, with ſome other buildings, beſides a waſte ſpace, overſpread with weeds and nettles, and covered with ruins. The entrance into the cathedral has a pair of brazen gates, ornamented with various figures in alto relievo, repreſenting the paſſion of our Saviour, and other ſcriptural hiſtories. Withinſide are twelve maſſy piers, which, as well as the walls, are thickly covered with the repreſentation of our Saviour, the Virgin Mary, and of various ſaints. Some of theſe paintings are very ancient, and probably anterior to the revival of the art in Italy. Several princes of the ducal family of Ruſſia are interred in this cathedral. According to Heym, Novogorod, in 1783, contained 62 churches, 6 convents, and excluſively of 12 public buildings, 1512 houſes, of which only 39 were of brick. The population amounted to 3342 males, and 3784 females; 92 miles S.S.E. of Peterſburgh. N. lat. 58° 35′. E. long. 30° 44′. Coxe.

NOVGOROD, *Niznei*, a town of Ruſſia, and capital of a government, ſituated at the conflux of the Oka and Volga; built in the year 1222, and containing two cathedrals, twenty-eight pariſh churches, moſtly of ſtone, and five convents; an archbiſhopric, and having a caſtle ſurrounded with ſtone walls. The trade is conſiderable, and the ſhops, richly ſtored with home and foreign goods, make a handſome appearance; 492 miles E.S.E. of Peterſburg. N. lat. 56° 18′. E. long. 48° 54′.

NOVGOROD, *Sieverſkoe*, a government of Ruſſia, bounded on the N. by the governments of Smolenſk and Mogilev, on the N.W. by Mogilev, on the S.W. and S. by Tchernigovſkoi, and on the E. by the governments of Orlov, Kurſk, and Charkov; about 160 miles in length, and from 60 to 72 in breadth. N. lat. 50° 50′ to 53° 25′. E. long. 31° 24′ to 34° 34′.—Alſo, a town of Ruſſia, and capital of a government. N. lat. 52°. E. long. 33° 14′.

NOVGORODSKOI, a government of Ruſſia, ſo called from Novgorod, its capital, bounded N. by Olonetz, N.W. by the government of Peterſburg, on the S.W. by that of Pikov, S.E. by that of Tver, and E. by that of Vologda; its length being about 320 miles, and mean breadth about 160. N. lat. 57° 10′ to 61° 10′. E. long. 29° 39′.

NOVI, a fortified town of Croatia, on the left bank of the Unna; 45 miles S.E. of Carlſtadt.—Alſo, a town of the Ligurian republic; 24 miles N. of Genoa. N. lat. 44° 47′. E. long. 8° 48′.

NOVIA BUNDER, a town of Hindooſtan, in Guzerat; 45 miles N.W. of Puttan Sumnaut.

NOVICE, a perſon not yet ſkilled or experienced in an art or profeſſion.

In the ancient Roman militia, *novicii*, or *noviții*, were the young raw ſoldiers, diſtinguiſhed by this appellation from the veterans.

In the ancient orders of knighthood there were novices, or clerks in arms, who went through a kind of apprenticeſhip before they were admitted knights.

NOVICE is more particularly uſed in monaſteries, for a religious, yet in his, or her year of probation, and who has not made the vows.

In ſome convents the ſuperior has the direction of the novices. In nunneries the novices wear a white veil, the reſt a black one.

A novice is not eſteemed dead in law, but is capable of inheriting till the time of actual profeſſion; nor can his benefices be taken away during the year of probation, without his conſent.

The council of Trent prohibits a novice from aſſigning over

over his benefices, till two months before the expiration of his year of probation; and he may even reſume them, if the profeſſion be null.

A novice is not allowed to make any donation to his ſuperior, by reaſon of the dependence he is under.—Novices may either quit the convent during their noviciate, or may be turned off by the convent.

NOVICIATE, a year of probation, appointed for the trial of religious, whether or no they have a vocation, and the neceſſary qualities for living up to the rule; the obſervation whereof they are to bind themſelves to by vow.

The noviciate laſts a year at leaſt; in ſome houſes more. It is eſteemed the bed of the civil death of a novice, who expires to the world by profeſſion.

NOVICIATE is alſo uſed for the houſes or places where novices are inſtructed.

In this ſenſe the noviciate is frequently a cloiſter ſeparate from the grand dormitory.

NOVIGRAD, in *Geography*, a town of Hungary, with a caſtle, which gives name to a county; 14 miles E. of Gran.—Alſo, a town of Sclavonia, 45 miles N. of Kralivvavelika.—Alſo, a town of Dalmatia, ſituated on a bay to which it gives name; 16 miles N. of Scardona. N. lat. 44° 28′. E. long. 17° 32′.

NOVIGUNGE, a town of Hindooſtan, in Dooab; 30 miles W. of Canoge.

NOVIODUNUM, in *Ancient Geography*, a town of Lower Mœſia, at the place where the Danube ſeparates into various branches. According to Ptolemy it is on the route from Nicomedia to Arrubium, between Dinigullia and Ægiſon, 20 miles from the former, and 28 from the latter. —Alſo, a town of Pannonia, upon the route from Æmona to Sirmium, between Prætorium Latovicorum and Quadratum, one mile from the firſt, and 28 miles from the ſecond.

NOVIOMAGUS, Lizieux, a town of Gaul, in the ſecond Lyonnenſis. It was the capital of the Lexovii, from whom it took its name.—Alſo, the ancient name of Spire, of Nimeguen, and of Noyon.

NOVION-PORCIEN, in *Geography*, a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Rethel; ſix miles N. of Rethel. The place contains 1039, and the canton 11,243 inhabitants, on a territory of 222½ kiliometres, in 31 communes.

NOVIOREGUM, Royan, in *Ancient Geography*, a town of Gallia Aquitanica, between Tamnum and Mediolanum Santonum, 12 miles from the firſt, and 15 from the ſecond. Anton. Itin.

NOVISILLO, in *Geography*, a town of Hungary, on the Danube; four miles S.W. of Bacs.

NOVITA, or *Real el Novita*, a town of South America, capital of a diſtrict in the viceroyalty of New Grenada, annexed to the province of Choco; 160 miles N. of Popayan. N. lat. 5° 4′. W. long. 76° 16′.

NOVLENSKOI, a town of Ruſſia, in the government of Vologda, near the lake Kubenſkoe; 32 miles N.W. of Vologda.

NOUN, Nomen, in *Grammar*, a name or word which expreſſes the ſubject ſpoken of; or expreſſes a ſubject of which ſomething is, or may be affirmed; as man, food, whiteneſs, Henry, &c.

A noun, therefore, in language, anſwers to an idea in logic.

The generality of ſubjects ſpoken of have particular names; yet there are others, which, without being attached to the ſame particular ſubject, are yet real nouns.

Thus, beſides the particular name which each perſon bears, and by which others denote him, he gives himſelf another when he ſpeaks of himſelf, as *I*, or *myſelf*.

It is only the more particular names that in grammar have retained the quality of nouns; the more general ones are called *pronouns*.

Nouns, again, are to be viewed in another light, *viz.* as divided into nouns *ſubſtantive*, and nouns *adjective*.

They are called *ſubſtantives*, when the objects they deſign are conſidered ſimply in themſelves, and without any regard to their qualities.

They are called *adjectives*, when their objects are conſidered as clothed with any qualities.

But, in effect, the object is alone deſigned by the nouns ſubſtantives; which, in this view, are alone the proper nouns.

Adjectives, in reality, are only the modificatives of nouns; though in one view they may be conſidered as nouns; *viz.* as they do not ſo much repreſent a quality or circumſtance of the object, as the object itſelf, clothed with that quality or circumſtance. Nor muſt it be omitted, that a noun adjective frequently becomes a ſubſtantive: for as its nature is to expreſs the quality of an object, if that quality happen to be the object itſelf ſpoken of, then, according to our firſt definition, it becomes a ſubſtantive.

Thus, if I ſay, *a good intention*, the word *good* is here an adjective, repreſenting the intention as clothed with the quality of goodneſs; but if I ſay, *the good is to be choſen*, it is evident that *good* is here the ſubject ſpoken of, and of conſequence is a noun ſubſtantive. Nor are there caſes wanting, wherein nouns ſubſtantives become adjectives.

It is true, that in the common uſe of grammar, many nouns, that are really adjectives, are not reckoned as ſuch; none being eſteemed adjectives but thoſe which, without any, or at leaſt any conſiderable change in their inflexion and termination, are joined indifferently to nouns ſubſtantives of different genders.

Nouns are again divided into *proper* and *appellative*.

Nouns *proper* are thoſe which expreſs a particular thing or perſon, ſo as to diſtinguiſh it from all other things of the ſame kind; as Socrates.

Nouns *appellative* are thoſe common to ſeveral individuals of the ſame kind; as man, angel, &c.

Nouns *heterogeneous*, are ſuch as are of one gender in the ſingular number, and of another in the plural. See Heteroclyte.

NOVO Mirgorod, in *Geography*, a town of Ruſſia, in the government of Ekaterinoſlav; 136 miles W.N.W. of Ekaterinoſlav. N. lat. 48° 40′. E. long. 21° 44′.

NOVODVAR, a town of Hungary, four miles N. of Cſakathurn.

NOVOGRIGOREVSKOE, a town of Ruſſia, in the government of Ekaterinoſlav; 72 miles N.W. of Cherſon.

NOVOGRODEK, a town of Ruſſian Lithuania, in the palatinate of the ſame name, otherwiſe called "Black Ruſſia," ſituated on a hill, not large, but including ſeveral Ruſſian and Popiſh convents. Beſides a provincial elect, and inferior court of judicature, a high tribunal, like that of Wilna, is held alternately here and at Minſk, which continue ſitting for five months every year; 68 miles E. of Grodno. N. lat. 53° 33′. E. long. 26°.

NOVOI, a ſmall iſland in the Caſpian ſea; N. lat. 44° 50′. E. long. 51° 54′.

NOVOMIASTO, a town of Poland, in the palatinate of Rava; 20 miles S.E. of Rava.

NOVOMOSKOVSK, a town of Ruſſia, in the government of Ekaterinoſlav, on the Dnieper; 16 miles N. of Ekaterinoſlav. N. lat. 48° 30′. E. long. 35° 12′.

NOVOMST,

NOVOMST, a town of Ruſſia, in the government of Novgorod Sieverſkoe; 60 miles N.W. of Novgorod Sieverſkoe. N. lat. 52° 35′. E. long. 22°.

NOVORZEV, a town of Ruſſia, in the government of Pſkov, on the river Uda; 64 miles S.S.E. of Pſkov. N. lat. 57°. E. long. 29° 26′.

NOVOSEL, a town of European Turkey, in Romania, on the Mariza; 26 miles W. of Filipopoli.

NOVOSIL, a town of Ruſſia, in the government of Tula; 44 miles S.S.W. of Tula. N. lat. 53° 5′. E. long. 36° 54′.

NOVOSLOVO, a town of Ruſſia, in the government of Kolivan; 72 miles S.S.W. of Kraſnoiarſk.

NOVOTZURUCHETNEVSKOI, a town of Ruſſia, in the government of Irkutſk, on the Argun; 152 miles S.E. of Nertchinſk.

NOVOUSOLE, a town of Ruſſia, in the government of Perm, on the Kama; eight miles S. of Solikamſk.

NOUP Head, a cape on the W. coaſt of the iſland of Weſtra. N. lat. 59°. W. long. 2° 56′.

NOUPRA, a mountain of Thibet; 51 miles S.W. of Laſſa.

NOURDYA, a town of Perſia, in the province of Khoraſan; 108 miles S. of Meſchid.

NOUREDDIN, or Noradin, in *Biography*, ſultan of Syria, was the ſon of Zenghi, a lieutenant of the Seljukian ſultans, who had made himſelf the independent ſovereign of Aleppo and Moſul. Upon the death of his father in the year 1145, he took poſſeſſion of Aleppo, and fixed his reſidence there. Zenghi had obtained various ſucceſſes againſt the Chriſtian cruſaders ſettled at Jeruſalem and Antioch, and Noureddin continued the war with equal ſucceſs. He gained a complete victory over Bohemond, prince of Antioch, who loſt his life in the battle. He recovered ſeveral places of which the cruſaders had made themſelves maſters, and adding to his dominions the cities of Emeſſa and Damaſcus, he extended his rule from the Tigris to the borders of Egypt. In many of his expeditions he was attended by his nephew Salaheddin, ſo famous afterwards in the hiſtory of the cruſades under the name of Saladin, who, after his uncle's death, ſucceeded to the command, and in 1171 put an end to the dynaſty of the Fatimites. Noureddin may be accounted the moſt powerful and proſperous of the Mahometan princes of his time. He died in 1174, after a reign of twenty-nine years. He was illuſtrious, not only for his civil and military talents, but for all the virtues that can adorn a throne. No prince ſurpaſſed him in regard to juſtice, and to the rights of his ſubjects of all ranks, and to him is attributed the firſt inſtitution of a chamber of equity for the purpoſe of ſecuring the lower claſſes againſt the oppreſſions of the higher. The grateful feelings of his people towards him, on this account, were ſhewn after his death; thus a poor man, unable to obtain redreſs for an injury, went about the ſtreets of Damaſcus crying aloud, "O Noureddin, Noureddin, where art thou now?" His economy, with regard to his private expences, was worthy of the primitive ages, and was founded upon a ſenſe of the duty of a ſovereign to ſpare the property of his people. But in every thing relating to the public welfare, his liberality was boundleſs. He founded a number of colleges, hoſpitals and moſques, and rebuilt the walls and edifices of ſeveral of the principal cities of his dominions, which had ſuffered ſeverely from an earthquake. He was extremely religious according to the rules of his faith, yet is ſaid to have been entirely free from bigotry and intolerance. Univer. Hiſt.

NOURISHING Clysters. See Clyster.

NOURISHMENT. See Nutrition.

NOURRIR *les Sons*, to ſwell, cheriſh, and ſuſtain ſounds to the laſt moment of their value, inſtead of diſcontinuing them before their time is expired; as is often done. There are movements which require every note to be ſuſtained, and others that require the tones to be cut ſhort, detached, and only touched with the point of the bow.

NOUS Shehr, in *Geography*, a town of Aſiatic Turkey, in Caramania, anciently called "Nyſſa;" 40 miles S.E. of Kir-Shehr.

NOUSIS, a town of Sweden, in the government of Abo; 10 miles N.N.W. of Biorneborg.

NOUSKERY, a town of Hindooſtan, in Lahore; 55 miles S.S.W. of Lahore.

NOUTRA, a town of Poland, in the palatinate of Cracow, on the frontiers of Hungary, near which are ſome gold mines; 30 miles S. of Cracow.

NOUTROKOOAGAN, a river of Canada, which diſcharges itſelf into St. John's lake. N. lat. 48° 26′. W. long. 72° 38′.

NOUVION, a town of France, in the department of the Somme, and chief place of a canton, in the diſtrict of Abbeville. The place contains 623, and the canton 9856 inhabitants, on a territory of 202½ kiliometres, in 20 communes.—Alſo, a town of France, in the department of the Aiſne, and chief place of a canton, in the diſtrict of Vervins; 13 miles N.W. of Vervins. The place contains 3357, and the canton 10,106 inhabitants, on a territory of 115 kiliometres, in nine communes.

NOVUS *Auris Muſculus*, in *Anatomy*, a name given by Fabricius to the muſcle called by Albinus laxator tympani, and by others externus auris, and exterior.

Novus *Portus*, in *Ancient Geography*, a port on the ſouthern coaſt of the iſle of Albion, between the mouth of the river Triſanton and the promontory Cantrum, according to Ptolemy.

NOWA Grodla, in *Geography*, a town of Poland, in the palatinate of Braclaw; 36 miles N. of Braclaw.

NOWADA, a town of Bengal; 22 miles S. of Ghidore.—Alſo, a town of Bengal; ſix miles S. of Curruckdeagh.—Alſo, a town of Bengal; 18 miles S. of Burdwan.—Alſo, a town of Bengal; 17 miles N. of Toree.—Alſo, a town of Bengal, at which is a paſs acroſs mountains; 15 miles S.E. of Ramgur.—Alſo, a town of Hindooſtan, in Bahar; 20 miles S. of Bahar. N. lat. 24° 53′. E. long. 85° 43′.

NOWADAH, a town of Bengal; 54 miles N.E. of Ramgur.—Alſo, a town of Hindooſtan, in Bahar; 30 miles E. of Gayah.—Alſo, a town of Hindooſtan, in Dooab; 30 miles E. of Canoge.

NOWADEE, a town of Bengal; three miles S. of Koonda.—Alſo, a town of Bengal; 46 miles N.N.W. of Ramgur.

NOWADY, a town of Bengal; 16 miles W. of Doeſa. N. lat. 22° 58′. E. long. 84° 45′.

NOWAG, a town of Sileſia, in the principality of Neiſſe; eight miles N.W. of Neiſſe.

NOWAGEE, a town of Bengal; 20 miles N. of Palamow.

NOWAGONG, a town of Hindooſtan, in Oude; 22 miles N.W. of Kairabad.

NOWAGUNGE, a town of Hindooſtan, in Oude; 12 miles S.E. of Bahreitch.

NOWAGUR, a town of Bengal; 15 miles N.E. of Palamow.—Alſo, a town of Hindooſtan, in the circar of Ruttunpour; 36 miles E. of Ruttunpour.

NOWANAGUR, a town of Hindooſtan, in Bahar; 55 miles S.W. of Patna. N. lat. 25° 23′.

NOWAR, a town of Hindooſtan, in Bahar; 43 miles S.W. of Arrah.

NOWE, a town of Pruſſia, in the province of Pomerelia, on the Viſtula; 40 miles S. of Dantzic.—Alſo, a town of America, in the ſtate of Tenneſſee; 46 miles N. of Knoxville.

NOWECZEITLY, a town of Auſtrian Poland, in Galicia; 28 miles E. of Lemberg.

NOWECZELKO, a town of Poland, in Podolia; 64 miles N.W. of Kaminiecz.

NOWED, Nowe, *i. e. knotted*, in *Heraldry*, is applied to the tails of ſuch creatures as are very long, and ſometimes repreſented in coat-armour, as if tied up in a knot.

NOWELL, Alexander, in *Biography*, a learned divine of the church of England, was born at Read, in Lancaſhire, in the year 1511. When only thirteen years of age, his progreſs in learning was ſo great, that he was entered of Brazen-noſe college in the univerſity of Oxford, where he proſecuted his ſtudies with much ſucceſs, and was admitted to the degree of B. A. in 1536, and to that of M. A. in 1540. Before he took the laſt-mentioned degree, he was elected fellow of his college. Having acquired a high reputation for learning and piety, and diſtinguiſhed himſelf by his zeal in promoting the reformation, he opened a ſchool in the city of Weſtminſter, where he educated his pupils in Proteſtant principles. About the year 1550, king Edward VI. granted him a licence for preaching, and in the following year he was inſtalled prebendary of Weſtminſter. In the firſt parliament of queen Mary's reign, he was returned one of the burgeſſes for Weſtlow in Cornwall; but his election was declared void, it being determined that having, by his prebend, a voice in the houſe of convocation, he could not ſit in the houſe of commons. He fled to the continent to avoid the perſecution of the times, but upon the acceſſion of queen Elizabeth, he was one of the firſt Proteſtant exiles who returned to England, and ſoon obtained conſiderable preferment. For thirty years together he preached the firſt and laſt ſermons in Lent before the queen, "wherein," according to Anthony Wood, "he dealt plainly and faithfully with her majeſty, without diſlike," that is, he probably pleaded ſtrongly againſt errors and practices, in which ſhe did not feel herſelf involved, for when he attacked one of her favourite doctrines, ſhe called aloud to him from her cloſet window, commanding him to retire from that ungodly digreſſion, and to return to his text. In 1562 dean Nowell was choſen prolocutor of the lower houſe of convocation. In 1594 he was inſtalled canon of Windſor; and in the following year he was elected principal of Brazen-noſe college in Oxford. In the ſame year he was created doctor of divinity, with a right of precedence over all the doctors then in the univerſity, both on account of his great age, and his high dignity in the church. He died in 1602, having reached the advanced age of ninety, and retained to the laſt the perfect uſe of his faculties. He gave an eſtate of 200*l. per ann.* for the ſupport of ſcholarſhips in Brazen-noſe college. He was author of ſeveral works, but that which is moſt known is a catechiſm, publiſhed by the unanimous approbation of the convocation. He drew up alſo a ſmaller catechiſm in Greek and Latin, which was tranſlated into Engliſh and into the Hebrew language.

Nowell, Lawrence, brother of the preceding, was alſo a clergyman of the church of England, and educated partly at Brazen-noſe college, and partly at Cambridge. Like his brother he fled to Frankfort from the perſecutions of queen Mary, and returned after her death, and was promoted to the deanery of Litchfield and the archdeaconry of Derby. He alſo obtained prebends in the cathedral churches of York and Chicheſter. He died in 1576, at the age of ſixty. He was deeply learned in antiquities, and particularly in the Saxon language and literature, being, according to Camden, the firſt who revived the ſtudy of it in this kingdom. Under his inſtructions the famous Lambarde made himſelf maſter of that tongue, and he is ſaid to have availed himſelf of the aſſiſtance and notes of his tutor, when he wrote his work "De Priſcis Anglorum Legibus." Mr. Nowell left behind him "A Saxon Engliſh Dictionary," in MS. ſtill remaining in the Bodleian library at Oxford, of which Francis Junius had a copy when he compiled his "Etymologicum Anglicanum," and Somner made much uſe, when he wrote his "Saxon Dictionary." He made "Collections" from curious ancient hiſtorical manuſcripts, which are preſerved in the Cottonian library. Biog. Brit.

NOWELZACLO, in *Geography*, a town of Aland, in Galicia; 44 miles S.S.E. of Halicz.

NOWGONG, a town of Bengal; 21 miles E S.E. of Nattore.

NOWIDWOR, a town of Lithuania, in the palatinate of Novogrodek; 68 miles S.W. from Novogrodek.

NOWLAYE', a town of Hindooſtan, in the circar of Kitchwara; 20 miles S.W. of Ougein.

NOWOGROD, a town of Poland, in the palatinate of Braclaw; 24 miles S. of Braclaw.

NOWOPOL, a town of Poland; 56 miles N.N.W. of Cracow.

NOWOSICKLI, a town of Poland, in the palatinate of Chelm; eight miles W. of Chelm.

NOWT, in *Agriculture*, a provincial word ſometimes applied to neat cattle.

Nowt-*Herd*, a provincial word ſignifying a cattle-herd, or keeper of cattle.

NOWYLARG, in *Geography*, a town of Poland, in the palatinate of Cracow; 40 miles S. of Cracow.

NOXON, Noxonton, or *Nox Town*, a town of America, in Newcaſtle county, in Delaware; 21 miles N. of Dover.

NOY, William, in *Biography*, an able and induſtrious lawyer, was born in or about the year 1577, at St. Buriens in Cornwall. At the age of ſixteen he was entered of Exeter college, Oxford, whence he removed to Lincoln's-Inn to ſtudy the law. In this profeſſion he roſe to conſiderable eminence, and was choſen repreſentative for Helſton in two parliaments towards the cloſe of king James' reign. At this period he exerted himſelf as a firm oppoſer of the arbitrary exertions of the royal prerogative. In 1625 he was elected a member of the houſe of commons for St. Ives, and in the parliament of that year under Charles I., and a ſucceeding one, he perſiſted in the ſame courſe of patriotic conduct. No man ſurpaſſed him in the diligence with which he ſought all precedents favourable to parliamentary privilege, and detected all the oblique methods employed by former kings in raiſing money. Such was his influence in the houſe, and his popularity through the country, that it was thought deſirable by the court to purchaſe him, and accordingly the place of attorney-general, conferred upon him in 1631, gave a complete turn to his mind, and brought him over to the royal party. From this moment he was among the moſt active ſervants of the crown in promoting every violent and arbitrary meaſure, and he executed his particular office with the moſt violent ferocity. He countenanced, defended, and juſtified the illegal exaction of ſhip-money: and his manners, ſo far from attempting to conciliate the people, over whom he held his ſway, aggravated the odiouſneſs of his public conduct, for he was haughty, rude, and cynical.

He at length became an object of public and univerſal hatred, and in that ſtate died in the year 1634, at the age of fifty-ſeven. His ardour in the cauſe of tyranny cauſed him to be regretted by thoſe labouring in the ſame wretched cauſe, and archbiſhop Laud thus ſpeaks of his death in his diary: "I have loſt a near friend of him, and the church the greateſt ſhe had of his condition, ſince ſhe needed any ſuch." He left behind him ſeveral works on legal ſubjects, as, "A Treatiſe of the principal Grounds and Maxims of the Laws of England:" "Perfect Conveyancer; or ſeveral ſelect and choice Precedents:" "Reports of Caſes in the Time of Queen Elizabeth, King James, and Charles I:" "Complete Lawyer, or A Treatiſe concerning Tenures or Eſtates in Lands of Inheritance for Life, and other Hereditaments and Chattels, real and perſonal:" "Arguments and Law Speeches." Noy alſo left in MS. "Collections from the Records in the Tower, in ſupport of the King's naval Prerogatives, and of the Privileges and Powers of eccleſiaſtical Courts."

NOYA, in *Geography*, a ſea-port town of Spain, in Galicia, at the mouth of the Tambro, in a bay of the Atlantic. The principal trade is the building of ſhips; 19 miles W.S.W. of Compoſtella. N. lat. 42° 50′. W. long. 8° 56′.—Alſo, a river of Spain, which runs into the Robregat, near Martorell.

NOYANT, a town of France, in the department of the Maine and Loire, and chief place of a canton, in the diſtrict of Baugé; nine miles E. of Baugé. The place contains 464, and the canton 8990 inhabitants, on a territory of 320 kiliometres, in 15 communes.

NOYEL, a river of Hindooſtan, which riſes in the mountains about ten miles W. of Coimbetore, and runs into the Cauvery; 10 miles N.W. of Carroor.

NOYER, a town of France, in the department of the Yonne, and chief place of a canton, in the diſtrict of Tonnerre; 11 miles S. of Tonnerre. The place contains 1896, and the canton 8469 inhabitants, on a territory of 317½ kiliometres, in 16 communes.

NOYERS, a town of France, in the department of the Lower Alps, and chief place of a canton, in the diſtrict of Siſteron; five miles W. of Siſteron. The place contains 931, and the canton 4289 inhabitants, on a territory of 262½ kiliometres, in eight communes.

NOYLAND Point, a cape of England, on the N. coaſt of the iſland of Thanet; one mile W. of Margate.

NOYON, a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Compiègne, ſeated on the Oiſe; before the revolution the ſee of a biſhop, the capital of an election, and the reſidence of a governor, containing ten pariſh churches. This was the native place of the famous John Calvin. The place contains 6000, and the canton 13,168 inhabitants, on a territory of 117½ kiliometres, in 17 communes. N. lat. 49° 35′. E. long. 3° 5′.

NOZA, a ſmall iſland near the W. coaſt of Madagaſcar. S. lat. 13° 30′. E. long. 40° 9′.

NOZAI, a town of France, in the department of the Lower Loire, and chief place of a canton, in the diſtrict of Chateaubriant. The place contains 2030, and the canton 7850 inhabitants, on a territory of 325 kiliometres, in ſix communes.

NOZDRICE, a town of Poland, in Volhynia; 64 miles N.E. of Zytomiers.

NOZEROY, a town of France, in the department of the Jura, and chief place of a canton, in the diſtrict of Poligny; 12 miles S. E. of Salins. The place contains 785, and the canton 8221 inhabitants, on a territory of 205 kiliometres, in 36 communes.

NOZLI, a town of Aſiatic Turkey, in Natolia; 44 miles W. of Degnizlu.

NUAPEND, a town of Hindooſtan, in the Carnatic; eight miles N.W. of Nellore.

NUAW, a town of Hindooſtan, in Bahar; 24 miles W. of Arrah.

NUAYHAS, the *Ague-tree*, a name given by the Indians to a ſort of bamboo cane, the leaves of which falling into the water, are ſaid to impregnate it with ſuch virtue, that the bathing in it afterwards will cure the ague. They uſe alſo a decoction of the leaves to diſſolve coagulated blood, giving it internally, and, at the ſame time, rubbing the bruiſed part externally with it.

There ſeems ſomething of fiction in the account of many particulars of this tree, in the Hortus Malabaricus, but it ſeems certain that the length of the ſtalks, or trunk, muſt be very great; for in the gallery of Leyden, there is preſerved a cane of it of twenty-eight feet long, and another but little ſhorter in the Aſhmolæan Muſeum at Oxford, which is more than eight inches in diameter; yet both theſe appear to be only parts of the whole trunk, they being nearly as large at one end as at the other.

NUBAS, in *Geography*, a fort of the Tyroleſe, for defending the paſſage of the Alps; ſix miles E. of Fueſſen.

NUBECULA, *Little Cloud*, in *Medicine*, a term ſometimes uſed for a diſeaſe in the eye, where objects appear as through a cloud or miſt.

The nubecula ſeems to ariſe from certain groſs particles detained in the pores of the cornea, or ſwimming in the aqueous humour, and thus intercepting the rays of light.

Nubecula, or *Nubes*, is alſo uſed for what we otherwiſe call *albugo* and *pannus*.

Nubecula is alſo uſed for a matter in form of a cloud, ſuſpended in the middle of the urine. This they ſometimes alſo called *enæorema*. See Urine.

NUBEDAM, in *Geography*, a town of Grand Bucharia; eight miles E. of Saganien.

NUBELOSA Linea, a term uſed by the Latin writers on heraldry, to expreſs a ſort of clouded line in certain coats of arms. Our heralds call it *nebule*, and the French *nuance*. It is figured ſo as to repreſent clouds at the edge, and was given to the firſt of the families who bear it, as a token of their ſkill in aſtronomy and navigation.

NUBES, in *Natural Hiſtory*, a word uſed by the ancients to expreſs that whitiſh foulneſs which we frequently ſee in the bottom of the fineſt columns of cryſtal; we expreſs this by the ſame word, *cloud*.

The columnar emeralds are ſubject to the ſame ſort of foulneſs at the bottom; and this part was called the root of the emerald properly enough, as it was that end of the column where it grew to the ſtone; but the word root of emerald has been ſince applied to ſeveral very different ſubſtances of a green colour, and ſome degree of tranſparence.

NUBIA, in *Geography*, a town of Africa, in the country of Nubia, on the Nile, ſuppoſed to be the ancient Meroe; 360 miles N.E. of Sennaar. N. lat. 18° 10′. E. long. 34° 54′.

Nubia, a country of Africa, bounded on the N. by Egypt, on the E. by the Red ſea, on the S. by Abyſſinia, and on the W. by unknown countries of Africa. Nubia is compoſed of ſeveral kingdoms, among which Sennaar and Dongola appear to be the moſt powerful, or at leaſt they are beſt known. A conſiderable part of this

country along the coaſt, and of the territory that lies between Egypt and Dongola, is ſubject to the dominion of the Turks. Sandy deſerts abound in this country, intermixed with various diſtricts, eſpecially thoſe that are adjacent to the rivers, which are uncommonly fertile.

NUBIGENUM Æs, a term uſed by ſome hiſtorians to ſignify copper generated in the clouds, and falling from thence with rains, or in ſtorms. They talk alſo of iron, and of ſtones produced the ſame way, and call them *ferrum nubigenum*, and *lapides nubigeni*.

Many of the German hiſtorians mention the falling of iron in duſt, and in large pieces; and Avicenna tells us ſuch things of Italy. Phil. Tranſ. N° 156. See *Præternatural* Rains.

NUBILES Anni. See Anni.

NUBLADA, in *Geography*, an iſland in the North Pacific ocean, with three ſmall ones lying near it, S.W. of Cape Corientes, on the coaſt of Mexico. N. lat. 16° 40′. W. long. 122° 30′.

NUBLE, a river of Chili, which runs into the Plata, 20 miles from its mouth.

NUCAIL, a town of Africa; 70 miles S.W. of Fez.

NUCAMENTACEÆ, in *Botany*, the laſt ſection of the order of *Compoſitæ*, in the Natural Orders of Linnæus. The term is taken from one of the old appellations of a catkin, or *amentum*; but it is not eaſy to perceive the leading principle of this ſection, under which are ranged ſome true compound ſyngeneſious plants, with others whoſe flowers are monoecious, the males being amentaceous, with perfectly diſtinct anthers, the females only compound or aggregate. The genera ſtand thus in the *Gen. Pl. Stoebe*, *Tarchonanthus*, *Artemiſia*, *Seriphium*, *Eriocephalus*, *Filago*, *Micropus*, *Iva*, *Parthenium*, *Ambroſia*, *Xanthium*, *Strumpfia*. To theſe are added in his manuſcript *Hippia*, *Gnaphalium*, *Xeranthemum*, and *Clibadium*.

NUCAMENTUM, the ancient Latin name for the catkin, or pendulous ſtring of flowers, for the moſt part male, as in the oak, fir, &c., for which Linnæus uſes the term *Amentum*. See Catkin.

NUCASSE, in *Geography*, a town of America, in the Tenneſſee ſtate; five miles S. of Knoxville.

NUCERIA, Nocera, in *Ancient Geography*, a town of Italy, in Campania, towards the S.E. The firſt colony that was conducted thither was in the time of Auguſtus.

NUCHA, the hinder part of the nape of the neck; called alſo *cervix*.

NUCHAN, in *Geography*, a town of Ruſſia, near the ſea, which ſeparates the continent of Aſia from America. N. lat. 66°. E. long. 189° 14′.

NUCHI, Nughi, or *Scheki*, the capital of a country near the Caſpian ſea, called Scheki, and ſituated in the elevated ridge of mountains on the Kur. Nuchi conſiſts of 300 houſes, and is defended by a ſtrong caſtle, formerly called Kara Hiſſar, at preſent Galläſin Göräſen, which reſiſted the victorious troops of Nadir Shah. The population of the city and of the village belonging to it amounts to about 2800 families. To the S. of Nuchi, on the bank of the Kur, lies a large and flouriſhing market-town, called *Akdaſch*.

NUCI, La, a town of Naples, in the province of Bari; 12 miles S.W. of Monopoli.

NUCIFEROUS, an appellation given by botaniſts to trees which bear nuts.

NUCIFRAGA, in *Ornithology*, a name given by many to the *coccothrauſtes*, or groſs-beak, from its breaking nuts and the ſtones of fruits. See Loxia *Coccothrauſtes*. See alſo Corvus *Caryocatactes*.

NUCIPERSICA, in *Botany*. See Amygdalus.

NUCK, Anthony, in *Biography*, a diſtinguiſhed Dutch phyſician and anatomiſt, flouriſhed at the Hague, and ſubſequently at Leyden, in the latter part of the ſeventeenth century. He filled the office of profeſſor of anatomy and ſurgery in the univerſity of the latter place, and was alſo preſident of the College of Surgeons. He purſued his diſſections with great ardour, cultivating both human and comparative anatomy at every opportunity. He died about the year 1692. He contributed ſome improvements alſo to the practice of ſurgery. The following is a catalogue of his publications. "De Vaſis aquoſis Oculi," Leid. 1685. "De Ductu ſalivali novo, Salivâ, ductibus aquoſis et humore aqueo oculorum," ibid. 1686. Some ſubſequent editions of this work were entitled, "Sialographia, et ductuum aquoſorum Anatome nova." "Adenographia curioſa, et Uteri fœminei Anatome nova, cum Epiſtola ad Amicum de Inventis novis." ibid. 1692, &c. "Operationes et Experimenta Chirurgica," ibid. 1692, and frequently reprinted. The three laſt mentioned works were publiſhed together, in three ſmall volumes, at Lyons, in 1722. Eloy Dict. Hiſt. de la Med.

NUCKIANÆ Glandulæ, in *Anatomy*, a number of ſmall glands, ſituate in that part of the ſkull wherein the orbits of the eyes are, between the abducent muſcle of the eye, and the upper part of the os jugale. See Gland.

They were thus denominated from their diſcoverer, Anthony Nuck, profeſſor of phyſic at Leyden.

The ſame author gave his name to a ſalival duct, *ductus Nuckianus*.

NUCLEUS, a Latin word, literally denoting the kernel of a nut, or ſtone fruit; or, more ſtrictly, the edible part contained within the ſkin of the kernel.

Nucleus is alſo uſed by *Botaniſts*, in a larger ſenſe, for any fruit or ſeed contained within a huſk or ſhell.

Nucleus is alſo uſed by Hevelius, and ſome other aſtronomers, for the body of a comet, which others call its head, in contradiſtinction to its tail, or beard. See Comet.

Nucleus is alſo applied by ſome to the central parts of the earth, and other planets, as ſuppoſing them to be looſe from the exterior part, which they conſider as a cortex or ſhell.

Nucleus, in *Architecture*, denotes the middle part of the flooring of the ancients, conſiſting of a ſtrong cement, over which they laid the pavement, bound with mortar.

NUDDEAH, in *Geography*, a town of Hindooſtan, in Bengal; 30 miles E.N.E. of Burdwan.—Alſo, a town of Hindooſtan, in Dooab; 24 miles S. of Canoge.

NUDDERE, a town of Hindooſtan, in the circar of Ellichpour; 24 miles S.W. of Akoat.

NUDDYA, a town of Bengal; 31 miles N.W. of Burdwan.

NUDE Compact, *Nudum Pactum*, a bare contract, engagement, or promiſe of a thing without any conſideration: *Ex quo*, ſay the lawyers, *non oritur actio*. See Contract.

Nude *Matter* denotes a bare allegation of a thing done.

NUDIPEDALIA, among the ancients, a feſtival in which all were obliged to walk bare-footed.

This was done on account of ſome public calamity, as the plague, famine, an intenſe drought, and the like.

It was likewiſe uſual for the Roman matrons, when any ſupplication and vows were to be made to the goddeſs Veſta, to walk in proceſſion to her temple bare-footed.

NUDITIES,

NUDITIES, in *Painting* and *Sculpture*, denote thoſe parts of a human figure not covered with any drapery; or thoſe parts where the carnations appear.

NUEL, or rather *Newel* of a ſtaircaſe. See NEWEL, and STAIR-*caſe*.

NUESTRA SENHORA, in *Geography*, a town of South America, in the province of Cordova; five miles E. of Cordova.

NUESTRA *Senhora de Ajuda*, a town of Brazil; 150 miles S.W. of Fernambuco.

NUESTRA *Senhora del Eſtero*, a town of Braſil, capital of a government, on the coaſt oppoſite to the iſland of St. Catharine. S. lat. 28° 10′.

NUESTRA *Senhora de Luz*, an iſland in the Pacific ocean, diſcovered by Quiros in 1506; the ſame with that called "Pic de l'Etoile" by Bougainville. S. lat. 14° 30′.

NUESTRA *Senhora de Pecos*, a town of New Mexico; 10 miles E. of Santa Fé.

NUESTRA *Senhora de Popa*, a town of South America, in the province of Carthagena; five miles N. of Carthagena.

NUESTRA *Senhora de la Fé*, a town of South America, in the province of Cuyos. S. lat. 21°. W. long. 56° 46′. —Alſo, a town of South America, in the province of Paraguay; 120 miles S.S.E. of Aſſumption.

NUESTRA *Senhora de Nieves*, a town of Braſil, on an iſland in the Amazon river, in which are an ancient miſſion and Spaniſh ſettlement. S. lat. 2° 30′. W. long. 49° 35′.

NUESTRA *Senhora los Santos*, a town of South America, in the province of Cordova; 42 miles E. of Cordova.

NUESTRA *Senhora de Socoro*, a town of New Mexico, on the Bravo; 115 miles S. of Santa Fé. See CHONOS.

NUESTRA *Senhora de Vittoria*, a town of Braſil, in the government of St. Salvador; eight miles N.W. of St. Jorge. See TABASCO.

NUESTRA *Senhora de Talavera*, a town of South America, in the province of Tucuman.

NUEZ, a town of Spain, in the province of Leon, on the borders of Portugal; 42 miles W. of Zamora.

NUFAR, in *Botany*. See NUPHAR.

NUGARAH, in *Geography*, a town of Hindooſtan, in Allahabad; 27 miles N.E. of Gazypour.

NUGENT, ROBERT, *Earl*, in *Biography*, an ingenious nobleman, was born of an ancient family in the county of Weſtmeath, in Ireland, in the year 1709. He was bred a Roman Catholic, which religious profeſſion he abjured, and became a member of the Britiſh parliament in 1741. He was much attached to the cauſe of the prince of Wales, with whom he was a great favourite, and was appointed comptroller of the houſhold of his royal highneſs. In 1754 he was made commiſſioner of the treaſury, and in the parliament that met in the ſame year, he was choſen repreſentative for the city of Briſtol, and continued to ſit for that place till 1774, when he was choſen for St. Mawes. In 1766 he was appointed one of the commiſſioners of trade and plantations, and at the ſame time created a peer by the title of baron Nugent and viſcount Clare. He was afterwards raiſed to the rank of earl, and died in 1788. His lordſhip is known in the literary world by "A Collection of Odes and Epiſtles," which is ſaid to poſſeſs great merit. He was author likewiſe of "An Ode to Mankind," publiſhed in 1741; "Verſes addreſſed to the Queen, with a New Year's Gift of Iriſh Manufacture;" "Verſes to the Memory of Lady Townſend," and other pieces.

NUGENT, THOMAS, an Iriſh writer, and doctor of laws, who died at London in the year 1772. He publiſhed "A Tour in Europe," in 4 vols.; "Tranſlations of the Port Royal Latin and Greek Grammars;" "A Pocket Dictionary of the French Language;" and "A Vocabulary of the Greek Primitives." Dr. Nugent, in the preface to the above named Latin grammar, ſays, that the author of that work, and of the other grammars, out of his great modeſty, choſe to conceal himſelf under the general name of the Society of Port Royal, but that his name was Claude Lancelot, who was born at Paris in 1613. Having finiſhed his introductory ſtudies he retired to Port Royal, and was employed in the education of youth. His various grammars were founded on his experience as a diligent inſtructor. He was afterwards ſelected by the princeſs of Conti to educate the young princes. Conſiderable preferment was within his reach and actually preſſed upon him, but he choſe to retire to the abbey of St. Cyran, and enter a monaſtic life. He died at the age of eighty, at the abbey of Quimperlè, in Brittany.

NUGGOORDER, in *Geography*, a town of Hindooſtan, in Lahore; 30 miles E.S.E. of Sultanpour.

NUGHZ. See NAGEZ.

NUGOAH, a town of Hindooſtan, in Bahar; 10 miles N.N.W. of Chuprah.

NUITS, a town of France, in the department of the Coté d'Or, and chief place of a canton, in the diſtrict of Beaune, celebrated for the excellent wines made in its vicinity; 12 miles S. of Dijon. The place contains 2541, and the canton 12,367 inhabitants, on a territory of 332½ kiliometres, in 28 communes.

NUIZIA, a river of Ruſſia, which runs into the Olckma. N. lat. 57° 15′. E. long. 119° 34′.

NUK, or NUKOE, an iſland of the Baltic, which occaſionally becomes a peninſula, being joined to the main land; but when the water is high, and the wind blows from the ſea, the flood ſo runs between, that it is entirely cut off from the land, though at times it is poſſible to walk dryſhod from one to the other. Nuk is about 14 verſts long and eight broad.—Alſo, a lake in the government of Olonetz, about 40 miles long and ſix broad. N. lat. 64° 20′ to 64° 40′. E. long. 31° to 32°.

NULDINGAH, a town of Bengal, capital of the circar of Mahmudſi; 65 miles N.E. of Calcutta. N. lat. 23° 27′. E. long. 89° 16′.

NULEZ, a ſmall town of Spain, in the province of Valencia; 25 miles N.N.E. of Valencia. It is of a ſquare form, ſurrounded with walls flanked with towers, and has four gates. The houſes in narrow but ſtraight ſtreets exhibit a mean appearance. Its population amounts to about 3400 inhabitants.

NULHATTY, a town of Hindooſtan, in Bengal; 25 miles W.N.W. of Moorſhedabad. N. lat. 24° 17′. E. long. 87° 38′.

NULLACONDA, a town of Hindooſtan, in Golconda; 40 miles S.E. of Hydrabad.

NULLITY, the quality of a thing null, that is void, and of no effect, by reaſon of ſomething contrary to law, cuſtom, or form.

There are two kinds of nullities to invalidate a contract, or other inſtrument, *viz.* *de facto* and *de jure*. The former where the thing commences null *ipſo facto*, as ſoon as the thing is proved: in the latter the act does not immediately become null, but a handle is given thereby to have it entirely annulled, or ſet aſide.

NULLUA, in *Geography*, a town of Bengal; 30 miles S. of Calcutta.

NULSHI, a town of Hindooſtan, in Bengal; 20 miles N.N.W. of Pucculoe.

NUMA, POMPILIUS, in *Biography*, ſecond king of Rome, a Sabine, the ſon of Pompilius Pompo, a perſon of

illuſtrious family. The Sabines at this time were diſtinguiſhed for the ſimplicity and ſtrictneſs of their manners; and Numa, whoſe mind was improved by the philoſophy which he had imbibed in his youth, became himſelf eminent for wiſdom and virtue. It has been thought by ſome writers, that he received inſtruction from Pythagoras the Samian philoſopher; but there is good evidence to prove that this ſage was poſterior to Numa by a century. Such was the reputation of Numa, that Tatius, the Sabine aſſociate of Romulus in his kingdom, beſtowed upon him his daughter. At the death of Romulus, the Romans fixed upon him as their king, and two ſenators were deputed to acquaint him of the fact. Numa at firſt refuſed their offer, but was at length prevailed upon, with much difficulty, to accept the crown. He was not, like Romulus, fond of the arts and practice of war, but applied himſelf to tame the ferocity of his ſubjects, to inculcate a reverence for the Deity, and to quell their diſſentions, by dividing all the citizens into different claſſes. He eſtabliſhed different orders of prieſts, and encouraged the report which was ſpread of his paying regular viſits to the nymph Egeria, making uſe of her name to give ſanction to the laws and inſtitutions which he had introduced. He impreſſed upon the Romans the idea that the ſafety of the empire depended on the preſervation of the ſacred ſhield, which, as was then generally believed, fell from heaven. He dedicated new temples, particularly that of Janus, which was to remain ſhut in time of peace, and to ſtand open in time of war. He made ſeveral laws for the reformation of manners; and promoted agriculture, by aſſigning portions of the conquered lands to thoſe who had no other occupation. He endeavoured to break the diſtinction which ſubſiſted, when he came to the crown, between the Romans and the Sabines, by diſtributing the citizens generally into companies, according to their ſeveral trades and occupations, thus uniting the individuals of the two nations by the ſubordinate ties of communities of intereſt and employment. Another reform he attempted, which appears not only wonderful, but almoſt beyond belief, had we not ample evidence as to the fact; this was the reformation of the calendar, the principle of which was the diviſion of the year into twelve lunar months, which he made to correſpond with the courſe of the ſun by intercalations. Numa likewiſe marked out the boundaries of the Roman territories, which Romulus had declined doing; and, therefore, ſeemed to renounce the idea of future aggrandiſement by the operation of warfare. His whole reign was wholly pacific; and had his ſucceſſors been like himſelf, Rome would have been ranked only among the petty ſtates of Italy; he may, however, be juſtly denominated one of the founders of the Roman greatneſs, from the ſtability which he conferred on the conſtitution by his civil and religious inſtitutes. He died, after a reign of forty-three years, having arrived at the age of eighty-three. Previouſly to his death, he ordered his body to be interred in a ſtone coffin, contrary to the cuſtom of the times, and his books of ceremonies, which conſiſted of twelve in Latin, and as many in Greek, to be buried by his ſide. Theſe, it was ſaid, were taken up about 400 years after; and, becauſe it was thought impious to communicate the myſteries they contained to the common people, they were burnt by order of the ſenate. He left behind him one daughter, called Pompilia, who married Numa Marcius, and became the mother of Ancus Marcius, the fourth king of Rome. See Ancus. Univer. Hiſt. Plutarch.

NUMAGA, in *Geography*, a river of Germany, which runs into the Rhine, 6 miles above Briſach.

NUMANTIA, in *Ancient Geography*, a town in the interior part of Hither Spain, at one of the ſources of the Durius. According to Strabo, it was the capital of Celtiberia. Strong both by nature and art, and by the number of its inhabitants, it was built upon a hill difficult of acceſs, and on three ſides ſurrounded by mountains; and its extent was ſuch, that within its circuit they had paſture for their cattle. Numantia is celebrated in Roman hiſtory for the long war which it ſuſtained againſt this republic, and for the ferocious bravery with which it defended itſelf at the cloſe of a ſiege of twenty years. It was deſtroyed at length by Scipio Africanus in the year of Rome 620.

NUMB-*Fiſh*, a cramp-fiſh, in *Ichthyology*. See Torpedo.

NUMBER is properly a collection or an aſſemblage of units, or of ſeveral things of the ſame ſort. Some authors, however, give a more comprehenſive definition of number, calling it that by which quantity of any kind is expreſſed, and hence include under the ſame general denomination *integers*, *fractions*, and *ſurds*.

Numbers are alſo divided into a variety of claſſes, according to the particular manner in which they are generated, or the forms under which they are included, or the properties which they poſſeſs. The principal of which diviſions may be enumerated as follows:

An unit, or *unity*, is the repreſentation of any thing conſidered individually, without regard to the parts of which it is compoſed.

An integer, or *integral number*, is an unit, or an aſſemblage of units.

An even number is that which can be divided into two equal integral parts.

An odd number is that which cannot be divided into two equal integral parts; being greater or leſs than ſome even number by unity.

A compoſite number is any number that is produced by the multiplication of two or more integral factors; or it is a number that may be divided into two or more equal integral parts, each greater than unity.

A prime number is that which cannot be produced by the multiplication of any integral factors; or it is that which cannot be divided into any number of equal integral parts greater than unity. See Prime *Number*.

Commenſurable numbers are ſuch as have each the ſame common diviſor; or that may be each exactly divided into the ſame number of equal integral parts.

Incommenſurable numbers, or *numbers prime to each other*, are ſuch as have not a common diviſor.

Square numbers are thoſe which ariſe from the product of two equal integral factors.

Cube numbers are thoſe which ariſe from the product of three equal integral factors.

A power is that which ariſes from the multiplication of any number of equal factors, and it is called the 2d, 3d, 4th, &c. power, according as it conſiſts of two, three, four, &c. factors. See Power.

A perfect number is that which is equal to the ſum of all its diviſors, or aliquot parts; thus $6 = 1 + 2 + 3$; or $6 = \frac{6}{2} + \frac{6}{3} + \frac{6}{6}$; therefore 6 is a Perfect *Number*; which ſee.

Abundant number is that which exceeds the ſum of all its diviſors, or aliquot parts.

Deficient number is that which is leſs than the ſum of all its diviſors, or aliquot parts.

Amicable numbers are thoſe pairs of integers, each of which is equal to all the aliquot parts of the other: thus 284 and 220 are a pair of amicable numbers, for

$$\frac{284}{2} + \frac{284}{4} + \frac{284}{71} + \frac{284}{142} + \frac{284}{284} = 220;$$

$$\text{and } \frac{220}{2} + \frac{220}{5} + \frac{220}{10} + \frac{220}{11} + \frac{220}{22} + \frac{220}{20} + \frac{220}{44} + \frac{220}{55} + \frac{220}{110} + \frac{220}{220} = 284.$$

Figurate numbers are all thoſe that fall under the general expreſſion

$$\frac{n\,(n+1)\,(n+2)\,(n+3),\ \&c.\ \ldots\ (n+m)}{1\ .\ 2\ .\ 3\ .\ 4,\quad \&c.\ \ldots\ (m+1)}$$

and they are ſaid to be of the 1ſt, 2d, 3d, &c. order, according as $m = 1, 2, 3$, &c.: thus,

	General term.
Nat. ſeries, 1, 2, 3, 4, 5, &c. -	n
1ſt ord. 1, 3, 6, 10, 15, &c. -	$\frac{n\,(n+1)}{1\ .\ 2}$
2d ord. 1, 4, 10, 20, 35, &c. -	$\frac{n\,(n+1)\,(n+2)}{1\ .\ 2\ .\ 3}$
3d ord. 1, 5, 15, 35, 70, &c.	$\frac{n\,(n+1)\,(n+2)\,(n+3)}{1\ .\ 2\ .\ 3\ .\ 4}$
4th ord. 1, 6, 21, 56, &c. &c.	

Theſe are otherwiſe called *pyramidal numbers*.

Polygonal numbers are the ſums of different and independent arithmetical ſeries, and are termed *natural* or *lineal*, *triangular*, *quadrangular* or *ſquare*, *pentagonal*, *hexagonal*, *&c. numbers*, according to the ſeries from which they are generated.

Lineal, or *natural numbers*, are formed from the ſucceſſive ſums of a ſeries of units; thus,

Units, - 1, 1, 1, 1, 1, 1, &c.
Nat. numbers, 1, 2, 3, 4, 5, 6, &c.

General form, n.

Triangular numbers are the ſucceſſive ſums of an arithmetical ſeries, beginning with unity, the common difference of which is 1; thus,

Arith. ſeries, - 1, 2, 3, 4, 5, &c.
Triangular numbers, 1, 3, 6, 10, 15, &c.

General form, $\frac{n^2 - n}{2}$.

Quadrangular or *ſquare numbers* are the ſucceſſive ſums of an arithmetical ſeries, beginning with unity, the common difference of which is 2; thus:

Arithmetical ſeries, - 1, 3, 5, 7, 9, &c.
Quadrangular or ſquare numbers, 1, 4, 9, 16, 25, &c.

General form, $\frac{2n^2 - 0n}{2} = n^2$.

Pentagonal numbers are the ſucceſſive ſums of an arithmetical ſeries, beginning with unity, the common difference of which is 3; thus:

Arithmetical ſeries, 1, 4, 7, 10, 13, &c.
Pentagonal numbers, 1, 5, 12, 22, 35, &c.

General form, $\frac{3n^2 - n}{2}$;

and ſo on for *hexagonal*, *heptagonal*, *&c. numbers*; the general form for the *m-gonal* ſeries of numbers being

$$\frac{(m-2)\,n^2 - (m-4)\,n}{2}.$$

Theſe are called polygonal numbers, becauſe they may be always arranged in the forms of the ſeveral geometrical figures, after which they are denominated. See POLYGONAL *Numbers*.

NUMBERS are farther divided into *abſolute*, *abſtract*, *concrete*, *diſcrete*, *heterogeneal*, *homogeneal*, *rational*, *irrational*, *ſurd*, &c.; for which, ſee the reſpective adjectives.

Theory of NUMBERS is a modern and very intereſting branch of analyſis, which is directed towards the inveſtigation of the ſeveral properties, forms, diviſors, products, &c. of integral numbers. This ſubject was indeed conſidered by ſome of the ancient mathematicians, *viz.* by Ariſtotle and Pythagoras, and particularly by Euclid and Diophantus; but in conſequence of the embarraſſing notation of thoſe early times, and the total want of the algebraical analyſis, but little progreſs was made in this branch of ſcience till about the beginning of the 17th century, when Bachet, a French analyſt of conſiderable reputation, undertook the tranſlation of Diophantus into Latin, retaining alſo the Greek text, which was publiſhed by him in 1621, interſperſed with many marginal notes of his own, and which may be conſidered as containing the firſt germ of our preſent theory. Theſe were afterwards conſiderably extended by the celebrated Fermat, in his edition of the ſame work, publiſhed after his death in 1670, where we find many of the moſt elegant theorems in this branch of analyſis; but they are generally left without demonſtration, an omiſſion which the author accounted for, by ſtating that he was himſelf preparing a treatiſe on the theory of numbers, which would contain "multa varia et abſtruſiſſima numerorum myſteria:" but unfortunately this work never appeared, and moſt of his theorems remained without demonſtration for a conſiderable time.

At length the ſubject was again revived by Euler, Waring, and La Grange, three of the moſt eminent analyſts of modern times. The former, beſides what is contained in his "Elements of Algebra," and his "Analyſis Infinitorum," has ſeveral papers in the Peterſburgh Acts, in which are given the demonſtrations of many of Fermat's theorems. What has been done by Waring on this ſubject is contained in chap. v. of his "Meditationes Algebraicæ." And La Grange, who has greatly extended the theory of numbers, has ſeveral intereſting papers on this head in the Memoirs of Berlin, beſides what is contained in his Additions to Euler's Algebra. It is, however, but lately that this branch of analyſis has been reduced into a regular ſyſtem; a taſk that was firſt performed by Le Gendre, in his "Eſſai ſur la Théorie des Nombres," Paris, 1800; a ſecond edition of which was publiſhed in 1807: and nearly at the ſame time that the firſt edition appeared, Gauſs publiſhed his "Diſquiſitiones Arithmeticæ." Theſe two works eminently diſplay the talents of their reſpective authors, and contain a complete developement of this intereſting theory. The latter, in particular, has opened a new field of inquiry, by the application of the properties of numbers to the ſolution of binomial equations of the form, $x^n - 1 = 0$; on the ſolution of which depends the diviſion of the circle into n equal parts, as was before known from the Coteſian theorem. (See POLYGON.) Mr. Barlow, of the Royal Military Academy, has alſo publiſhed a conciſe treatiſe on this ſubject, entitled "An elementary Inveſtigation of the Theory of Numbers;" to which work we are indebted for many of the preceding remarks and definitions, as alſo for ſeveral of the following properties of numbers, in which we have generally omitted the demonſtrations, as theſe would have carried us beyond the limits preſcribed to the preſent article.

Properties

Properties of Numbers.

Prop. I.

On the Diviſors of Numbers.—Every number N, when reduced to the form $N = a^m b^n c^p d^q$, &c. a, b, c, &c. being prime numbers, will have the number of the diviſors expreſſed by the formula

$$(m+1)(n+1)(p+1)(q+1), \text{ \&c.};$$

the number itſelf being conſidered as one of its diviſors.

Suppoſe, for example, it were required to find how many diviſors belong to the number 360.

Here we have $360 = 2^3 \cdot 3^2 \cdot 5$; therefore $m=3$, $n=2$, $p=1$. Hence, $(3+1)(2+1)(1+1) = 4 \cdot 3 \cdot 2 = 24$, the number of its diviſors.

Again: required how many diviſors belong to the number 1000.

Firſt, $1000 = 2^3 \cdot 5^3$; therefore $m=3$, and $n=3$; whence $(3+1)(3+1) = 4 \cdot 4 = 16$, the number of diviſors required, which are as follow: 1, 2, 4, 5, 8, 10, 20, 25, 40, 50, 100, 125, 200, 250, 500, 1000.

Prop. II.

To find a number that ſhall have any required number of diviſors.

Let w repreſent the given number of diviſors: reſolve w into its factors, as $w = x \times y \times z$, &c. Then take $m = x - 1$, $n = y - 1$, $p = z - 1$, &c.; ſo ſhall $a^m b^n c^p$ &c. be the number required, where a, b, c, &c. may be taken any prime numbers at pleaſure.

Exam.—Find a number that ſhall have 30 diviſors.

Firſt, $30 = 2 \times 3 \times 5$; that is, $x=2$, $y=3$, $z=5$: therefore, $m=1$, $n=2$, $p=4$; whence $a \cdot b^2 \cdot c^4$ is a number having 30 diviſors, as required.

If $a=2$, $b=3$, $c=5$; then $2 \cdot 3^2 \cdot 5^4 = 11250$.
If $a=5$, $b=3$, $c=2$; then $5 \cdot 3^2 \cdot 2^4 = 720$.
If $a=5$, $b=2$, $c=3$; then $5 \cdot 2^2 \cdot 3^4 = 1620$.

Each of which numbers has 30 diviſors; and it is evident that various other numbers might be obtained, that would have the ſame property, by only changing the values of a, b, c, &c.

When it is required to find the leaſt number that has a given number of diviſors, we muſt reſolve the given number into the greateſt number of factors, and proceed in given values to a, b, c, &c. as follows, *viz.* to the greateſt exponent the leaſt root, the next greater exponent the next leſs root, &c.; the roots themſelves being the leaſt prime numbers that can be employed for this purpoſe, and which will of courſe depend upon the number of factors.

Suppoſe, for example, it were required to find the leaſt number having 20 diviſors.

Here the greateſt number of factors is when we make $20 = 2 \times 2 \times 5$; or when $x=2$, $y=2$, and $z=5$, and therefore $m=1$, $n=1$, and $p=4$; ſo that $a^1 b^1 c^4$ is the leaſt form; and by making $c=2$, $b=3$, $a=5$, we have $2^4 \cdot 3^1 \cdot 5^1 = 240$, which is the leaſt number that has 20 diviſors.

Prop. III.

To find the ſum of all the diviſors of any given number.

Reſolve the given number into the form $a^m \cdot b^n \cdot c^p$ &c. then the ſum of all its diviſors will be expreſſed by the formula

$$\frac{a^{m+1}-1}{a-1} \times \frac{b^{n+1}-1}{b-1} \times \frac{c^{p+1}-1}{c-1}, \text{ \&c.}$$

Suppoſe, for example, it were required to find the ſum of all the diviſors of 360, the number itſelf being included as one of them.

Here $360 = 2^3 \cdot 3^3 \cdot 5$; therefore $a=2$, $b=3$, $c=5$; $m=3$, $n=3$, $p=1$; whence,

$$\frac{2^4-1}{2-1} \times \frac{3^4-1}{3-1} \times \frac{5^2-1}{5-1} = 15 \cdot 13 \cdot 6 = 1170;$$

which is the ſum of all the diviſors of 360, the number itſelf being conſidered as one of them.

Prop. IV.

To find how many integers there are leſs than a given number N, and alſo prime to it.

Reſolve the given number into the form $N = a^m b^n c^p$ &c. then will

$$N \times \frac{a-1}{a} \times \frac{b-1}{b} \times \frac{c-1}{c}, \text{ \&c.}$$

expreſs the number of integers that are leſs than n, and alſo prime to N.

Exam.—How many numbers are there leſs than 100, which are alſo prime to it?

Firſt, $100 = 2^2 \cdot 5^2$; therefore,

$$100 \times \frac{2-1}{2} \times \frac{5-1}{5} = 40,$$

the number ſought, theſe being as follow, *viz.*

1	13	27	39	51	63	77	89
3	17	29	41	53	67	79	91
7	19	31	43	57	69	81	93
9	21	33	47	59	71	83	97
11	23	37	49	61	73	87	99

Exam. 2.—How many numbers are there leſs than 360, that are alſo prime to it?

Here $360 = 2^3 \cdot 3^2 \cdot 5$; therefore,

$$360 \times \frac{2-1}{2} \times \frac{3-1}{3} \times \frac{5-1}{5} = 96,$$

the number ſought.

Prop. V.

A number that is the ſum of two ſquares prime to each other, can only be divided by numbers that are alſo the ſums of two ſquares; or, which is the ſame, every diviſor of a number falling under the form $t^2 + u^2$, t and u being prime to each other, is itſelf alſo of the ſame form.

Thus, for example, $65 = 8^2 + 1^2$, can only be divided by 13 and 5, each of which is the ſum of two ſquares; for $13 = 3^2 + 2^2$, and $5 = 2^2 + 1^2$.

Alſo, $50 = 7^2 + 1^2$ have for diviſors,

$$2 = 1^2 + 1^2, \quad 5 = 2^2 + 1^2$$
$$10 = 3^2 + 1^2, \quad 25 = 4^2 + 3^2.$$

And the ſame for all other numbers falling under the above form, obſerving only that the two ſquares muſt be prime to each other.

Prop. VI.

A number that is the ſum of a ſquare and double a ſquare, prime to each other, can only be divided by numbers that are alſo made up of the ſum of a ſquare and double a ſquare. Or, which is the ſame, every diviſor of a number falling under the form $t^2 + 2u^2$, t and u being prime to each other, is itſelf alſo of the ſame form.

Thus

Thus for example, $99 = 1^2 + 2 \cdot 7^2$, can only be divided by the following numbers, which are all of the ſame form; *viz.*

$$3 = 1^2 + 2 \cdot 1^2$$
$$9 = 1^2 + 2 \cdot 2^2$$
$$11 = 3^2 + 2 \cdot 1^2$$
$$33 = 5^2 + 2 \cdot 2^2$$

and the ſame for all other numbers of the above form.

Prop. VII.

Every number which is equal to the difference of a ſquare and double a ſquare, prime to each other, can have for diviſors only thoſe numbers which are alſo equal to the difference of a ſquare and double a ſquare. Or, every diviſor of numbers falling under the form $t^2 - 2u^2$, t and u being prime to each other, can only have for diviſors numbers that are of the ſame form. Thus for example, $98 = 10^2 - 2 \cdot 1^2$, have the four following diviſors, each of which is of the ſame form, *viz.*

$$2 = 2^2 - 2 \cdot 1^2$$
$$7 = 3^2 - 2 \cdot 1^2$$
$$14 = 4^2 - 2 \cdot 1^2$$
$$49 = 9^2 - 2 \cdot 4^2$$

and the ſame for all other numbers of this form.

For the diviſors of the powers of numbers, ſee Powers.

Of the Product and Transformation of certain numerical Formulæ.

Prop. VIII.

The product of the ſum, and difference of two integers, is equal to the difference of their ſquares. For

$$(x + y)(x - y) = x^2 - y^2.$$

Prop. IX.

The product of the ſum of two ſquares by double a ſquare, is alſo the ſum of two ſquares. For

$$(x^2 + y^2) \times 2z^2 = (x + y)^2 \times z^2 + (x - y)^2 z^2.$$

Hence, if a number be the ſum of two ſquares, its double is alſo the ſum of two ſquares. Alſo, if a number N be the ſum of two ſquares, then 2^n N will be alſo the ſum of two ſquares.

Thus for example:

$$5 = 2^2 + 1^2;\ 5 \times 2 = 10 = 3^2 + 1^2;$$
$$10 \times 2 = 4^2 + 2^2;\ 20 \times 2 = 40 = 6^2 + 2^2;\ \&c.$$

Prop. X.

The product ariſing from the ſum of two ſquares by the ſum of two ſquares, is alſo the ſum of two ſquares. For

$$(x^2 + y^2)(x'^2 + y'^2) = \begin{cases} (xx' + yy')^2 + (xy' - x'y)^2, \text{ or} \\ (xx' - yy')^2 + (xy' + x'y)^2 \end{cases}$$

Hence alſo it appears, that the product may be divided into two ſquares two different ways. And if this product be again multiplied by another, which is the ſum of two ſquares, the reſulting product may be divided into two ſquares four different ways; and generally, if a number N be the product of n factors, each of which is the ſum of two ſquares; then will N be the ſum of two ſquares, and may be reſolved into two ſquares 2^n different ways.

For example:

$$5 = 2^2 + 1$$
$$13 = 3^2 + 2^2$$

The product $65 = 8^2 + 1^2$, or $7^2 + 4^2$

Again:

$$17 = 4^2 + 1$$

The product $\begin{cases} 1105 = 32^2 + 9^2 = 33^2 + 4^2 \\ = 31^2 + 12^2 = 24^2 + 23^2 \end{cases}$

And this reſolution of the propoſed product into ſquare parts, is readily effected by the foregoing formulæ. For,

$$(8^2 + 1)(4^2 + 1) = \begin{cases} (4 \cdot 8 + 1)^2 + (8 \cdot 1 - 4 \cdot 1)^2 \\ (4 \cdot 8 - 1)^2 + (8 \cdot 1 + 4 \cdot 1)^2 \end{cases}$$

$$(7^2 + 4^2)(4^2 + 1) = \begin{cases} (4 \cdot 7 + 1 \cdot 4)^2 + (4 \cdot 4 - 7 \cdot 1)^2 \\ (4 \cdot 7 - 1 \cdot 4)^2 + (4\ 4 + 7 \cdot 1)^2 \end{cases}$$

and in the ſame manner may any other product ariſing from factors of this form be reſolved into its ſquare parts.

Prop. XI.

The product of the ſum of three ſquares by the ſum of two ſquares, is the ſum of four ſquares. For

$$(x^2 + y^2 + z^2)(x'^2 + y^2) =$$
$$(xx' + yy')^2 + (xy' - yx')^2 + x'^2 z^2 + y'^2 z^2$$

which is evidently the ſum of four ſquares.

For example: $14 = 3^2 + 2^2 + 1^2$

$$5 = 2^2 + 1^2$$

The product $\begin{cases} 70 = (3 \cdot 2 + 2 \cdot 1)^2 + (2 \cdot 2 - 3 \cdot 1)^2 \\ + 2^2 + 1^2 = 8^2 + 1^2 + 2^2 + 1^2 \end{cases}$

Prop. XII.

The product of the ſum of four ſquares by the ſum of two ſquares, is alſo the ſum of four ſquares. For

$$(w^2 + x^2 + y^2 + z^2)(x'^2 + y'^2) =$$
$$(w^2 + x^2)(x'^2 + y'^2) + (y^2 + z^2)(x'^2 + y'^2)$$

each of which products is the ſum of two ſquares, by the 10th propoſition above, and, conſequently, the whole product is the ſum of four ſquares.

Prop. XIII.

The product of the ſum of four ſquares by the ſum of four ſquares, is alſo the ſum of four ſquares. For

$$(w^2 + x^2 + y^2 + z^2)(w'^2 + x'^2 + y'^2 + z^2)$$
$$= \begin{cases} (ww' + xx' + yy' + zz')^2 + (wx' - xw' + yz' \\ - y'z)^2 + (wy' - xz' - yw' + zx')^2 + (wz' \\ + xy' - yx' - zw')^2 \end{cases}$$

as will appear immediately from the developement of the above formulæ; and, conſequently, the product in queſtion is the ſum of four ſquares.

As in this product there are only complete ſquares enter, we may change at pleaſure the ſigns of the ſimple quantities; and, conſequently, there will reſult ſeveral different formulæ equal to the ſame product, and each equal to the ſum of four ſquares; and in ſo many ways may numbers ariſing from factors of the above form be reſolved into the ſum of four ſquares. La Grange has rendered this propoſition more general by the following enunciation.

The product of the two formulæ

$$(w^2 - bx^2 - cy^2 + bcz^2)(w'^2 - bx'^2 - cy'^2 + bcz'^2)$$
$$= \begin{cases} (ww' + bxx, \pm cyy' \pm bczz')^2 - \\ b(wx' + w'x \pm cyz' \pm cy'z)^2 - \\ c(wy' - bxz' \pm yw' \mp bzx')^2 + \\ bc(xy' - wz' \pm zw' \mp yx')^2 \end{cases}$$

which equality will appear from the developement of the formulæ.

Prop.

Prop. XIV.

The product of the two formulæ $(x^2 \pm a y^2)$, and $(x'^2 \pm a y'^2)$, is of the same form as each of them. For,

$$(x^2 \pm a y^2)(x'^2 \pm a y'^2) = \begin{cases} (x x' + a y y')^2 \pm a (x y' + y x')^2, \text{ or,} \\ (x x' - a y y')^2 \pm a (x y' - y x')^2 \end{cases}$$

and, consequently, the product of any number of factors of the form $(x^2 \pm a y^2)$ will be itself also of the same form.

Prop. XV.

The two formulæ $(x^2 + y^2 + z^2)$, and $(x^2 + y^2 + 2 z^2)$, are so related to each other, that the double of either produces the other. For

$$2 (x^2 + y^2 + z^2) = 2 x^2 + 2 y^2 + 2 z^2 = (x + y)^2 + (x - y)^2 + 2 z^2$$

which is evidently of the latter form. And,

$$2 (x^2 + y^2 + 2 z^2) = 2 x^2 + 2 y^2 + 4 z^2 = (x + y)^2 + (x - y)^2 + 4 z^2$$

which is also obviously of the same form as the first.

For example: $14 = 3^2 + 2^2 + 1^2$ (2)

The product $\begin{cases} = 28 = (3 + 2) + (3 - 2)^2 + 2 \cdot 1^2 \\ = 5^2 + 1^2 + 2 \cdot 1^2 \end{cases}$

Again: $15 = 3^2 + 2^2 + 2 \cdot 1^2$ (2)

The product $\begin{cases} = 30 = (3 + 2)^2 + (3 - 2)^2 + 2^2 \\ = 5^2 + 1^2 + 2^2 \end{cases}$

That is, each of these forms, when doubled, produces the other.

Prop. XVI.

The formula $x^2 - 2 y'^2$ may be always transformed to another of the form $2 x'^2 - y'^2$, and this last may be again converted into the former.

This is obvious, because

$$x^2 - 2 y^2 = 2 (x \pm y)^2 - (x \pm 2 y)^2, \text{ and}$$
$$2 x^2 - y^2 = (x \pm 2 y)^2 - 2 (x \pm y)^2$$

as will appear from the developement of the formulæ; and, consequently, any number that is of one of these forms is also of the other.

For example: $14 = 2 \cdot 3^2 - 2^2 = 4^2 - 2 \cdot 1^2$
Also, $28 = 6^2 - 2 \cdot 2^2 = 2 \cdot 4^2 - 2^2$

The same transformation has place with regard to numbers of the form $x^2 - 5 y^2$; for

$$x^2 - 5 y^2 = 5 (x \pm 2 y)^2 - (2 x \pm 5 y)^2, \text{ and}$$
$$5 x^2 - y^2 = (5 x \pm 2 y)^2 - 5 (2 x \pm y)^2$$

Thus, in the following numbers

$$29 = 7^2 - 5 \cdot 2^2 = 5 \cdot 11^2 - 24^2 = 5 \cdot 3^2 - 4^2$$
$$41 = 5 \cdot 3^2 - 2^2 = 19^2 - 5 \cdot 8^2 = 11^2 - 5 \cdot 4^2$$

which transformation is frequently extremely useful in the solution of Diophantine problems.

Prop. XVII.

If a be any number of the form $b^2 + 1$, then will the formula $x^2 - a y^2$ be resolvable into another of the form $a x^2 - y^2$; and, conversely, this last may be transformed into the former. For,

$$x^2 - (b^2 + 1) y^2 = (b^2 + 1) (x \pm b y)^2 - (b x \pm (b^2 + 1) y)^2$$

And

$$(b^2 + 1) x^2 - y^2 = ((b^2 + 1) x \pm b y)^2 - (b^2 + 1) (b x + y)^2$$

These general formulæ furnish us with the following particular ones:

$$\begin{cases} x^2 - 2 y^2 = 2 x'^2 - y'^2 \\ 2 x^2 - y^2 = x'^2 - 2 y^2 \end{cases}$$
$$\begin{cases} x^2 - 5 y^2 = 5 x'^2 - y'^2 \\ 5 x^2 - y^2 = x'^2 - 5 y'^2 \end{cases}$$
$$\begin{cases} x^2 - 10 y^2 = 10 x'^2 - y^2 \\ 10 x^2 - y^2 = x'^2 - 10 y^2 \end{cases}$$
$$\begin{cases} x^2 - 17 y^2 = 17 x'^2 - y'^2 \\ 17 x^2 - y^2 = x'^2 - 17 y^2 \end{cases}$$
&c. &c.

Prop. XVIII.

If m and n be the roots of the quadratic equation $\varphi^2 - a\varphi + b = 0$, then will the product of the two formulæ $(x + m y)$ and $(x + n y)$ be equal to $x^2 + 2 a x y + b y^2$.

This is evident from the actual multiplication of the factors $(x + m y)$, and $(x + n y)$. For

$$(x + m) + (x + n y) = x^2 + (n + m) x y + m n y^2$$

And since m and n are the two roots of the equation $\varphi^2 - a\varphi + b$, we have, from the nature of equations, $m + n = a$, and $m n = b$; and, consequently, the product becomes $x^2 + a x y + b y^2$.

Hence, conversely, every quantity of the form $x^2 + a x y + b y^2$, may be considered as the product arising from the multiplication of two factors $(x + m y)$ and $(x + n y)$, m and n being the roots of the quadratic equation $\varphi^2 - a\varphi + b = 0$.

Or, which is the same, m and n being such as to answer the conditions $m + n = a$, $m n = b$.

Prop. XIX.

The product arising from the multiplication of the two formulæ $x^2 + a x y + b y^2$, and $x'^2 + a x' y' + b y'^2$, is itself also of the same form.

For, by the last,

$$x^2 + a x y + b y^2 = (x + m y)(x + n y)$$
$$x'^2 + a x' y' + b y'^2 = (x' + m y')(x' + n y')$$

therefore the product in question is the same as the continued product of the four latter factors. Now,

$$(x + m y)(x' + m y') = x x' + m (x y' + x' y) + m^2 y y'$$

And since $m^2 - a m + b = 0$, we have $m^2 = a m - b$, whence the above formula becomes

$$x x' - b y y' + m (x y' + x' y + a y y')$$

Or writing $\quad X = x x' - b y y'$
$\quad Y = x y' + x' y + a y y')$

we have $\quad (x + m y)(x' + m y') = X + m Y$

so also, $\quad (x + n y)(x' + n y) = X + n Y$

Consequently, the whole of the above product is

$$= (X + m Y)(X + n Y) = X^2 + a X Y + b Y^2$$

That

That is, the product of the two formulæ

$$(x^2 + a\,x\,y + b\,y^2) \text{ and } (x'^2 + a\,x'\,y' + b\,y'^2)$$

is itſelf alſo of the ſame form; and, conſequently, when $x = x'$, and $y = y'$, we have

$$(x^2 + a\,x\,y + b\,y^2)^2 = \mathrm{X}^2 + a\,\mathrm{X}\,\mathrm{Y} + b\,\mathrm{Y}^2$$

Hence we have a ready way of making a ſquare of any ſuch formulæ as $\mathrm{X}^2 + a\,\mathrm{X}\,\mathrm{Y} + b\,\mathrm{Y}^2$, or of $r^2 + a\,r\,s + b\,s^2$; which is done by ſimply writing

$$r = x^2 - b\,y^2$$
$$s = 2\,x\,y + a\,y^2$$

in which expreſſions x and y may be aſſumed any integer numbers at pleaſure.

Exam. 1.—Find the values of x and y in the equation

$$x^2 + 3\,x\,y + 5\,y^2 = z^2$$

Here $a = 3$, and $b = 5$; therefore the general values of x and y are

$$\begin{cases} x = t^2 - 5\,u^2 \\ y = 2\,t\,u + 3\,u^2 \end{cases}$$

where, for diſtinction ſake, we write t and u, in the above formulæ, inſtead of x and y.

Whence, by aſſuming ſucceſſively

$$t = 3,\ 4,\ 5,\ 6,\ \&c.$$
$$u = 1,\ 1,\ 1,\ 1,\ \&c.$$

we ſhall have the following correſponding values of x and y:

$$x = 4,\ 11,\ 20,\ 31,\ \&c.$$
$$y = 9,\ 11,\ 13,\ 15,\ \&c.$$

Exam. 2.—Find the values of x and y in the equation

$$x^2 - 7\,x\,y + 3\,y^2 = z^2$$

Here, ſince $a = -7$, and $b = 3$; the general values of x and y are

$$\begin{cases} x = t^2 - 3\,u^2 \\ y = 2\,t\,u - 7\,u^2 \end{cases}$$

And making now

$$t = 4,\ 5,\ 6,\ 7,\ 8,\ \&c.$$
$$u = 1,\ 1,\ 1,\ 1,\ 1,\ \&c.$$

we obtain,

$$x = 13,\ 22,\ 33,\ 46,\ 61,\ \&c.$$
$$y = 1,\ 3,\ 5,\ 7,\ 9,\ \&c.$$

Each of which correſponding values of x and y anſwer the required conditions of the equation; and it is manifeſt that an infinite number of other values might be obtained by changing thoſe of t and u. Barlow's Theory of Numbers.

On the Partition of Numbers.

Prop. XX.

To find in how many different ways any propoſed number may be divided into a given number of unequal parts.

Let us propoſe the following expreſſion, *viz.*

$$(1 + x^a z) \cdot (1 + x^b z) \cdot (1 + x^c z) \cdot (1 + x^d z) \cdot (1 + x^e z) \text{ \&c.}$$

and endeavour to aſcertain the form that it takes when expanded by multiplication. And, firſt, let us ſuppoſe it to become

$$1 + \mathrm{P}\,z + \mathrm{Q}\,z^2 + \mathrm{R}\,z^3 + \mathrm{S}\,z^4, \text{ \&c.}$$

then it is evident, from the theory of equations, that P will be the ſum of the powers

$$x^a + x^b + x^c + x^d + x^e, \text{ \&c.}$$

and Q, the ſum of the products, of all the poſſible combinations of theſe powers taken two and two; or an aſſemblage of the ſeveral powers of x, of which the exponents are the ſums of two different terms of the ſeries

$$a,\ b,\ c,\ d,\ e,\ f, \text{ \&c.}$$

On the ſame principle, R will be an aſſemblage of the powers of x, of which the exponents are the ſums of three different terms of the ſame ſeries; S will be an aſſemblage of all the powers of x, of which the exponents are the ſums of four different terms of the ſame ſeries; and ſo on.

Now, it is manifeſt, that the powers of x, which are compriſed in the values of P, Q, R, S, &c. will have unity for their co-efficients; if their exponents can only be formed in one way, by the quantities a, b, c, d, e, &c.; but if the exponent can be be formed in many ways, by the ſums of two, three, or more, terms of the ſame ſeries; then will this power have a co-efficient, that contains unity as many times. For example, if $\mathrm{N}\,x^n$ be found in the value of Q, this will be a proof that n may be formed in N different ways from the ſums of two different terms of the ſeries a, b, c, d, e, f, &c.; and if we find in the developement of the propoſed factors the term $\mathrm{N}\,x^n\,z^m$, its co-efficient N, indicates, in how many different ways the number n may be the ſum of m, different terms of the ſeries

$$a,\ b,\ c,\ d,\ e,\ f, \text{ \&c,}$$

Thus, the propoſed product,

$$(1 + x^a z) \cdot (1 + x^b z) \cdot (1 + x^c z) \cdot (1 + x^d z) \cdot (1 + x^e z) \text{ \&c.}$$

being really developed by multiplication, the reſult will ſhew immediately in how many different manners a given number may be the ſum of any propoſed number of different terms of the ſeries a, b, c, d, &c.: for example, if one wiſhed to know in how many different ways the number n may be formed of m different terms of this ſeries, we muſt aſcertain the term $x^n z^m$ in the expanded expreſſion, and the co-efficient of this term will be the number required.

In order to render this the more evident, let us take this product, compoſed of an infinite number of factors,

$$(1 + x\,z) \cdot (1 + x^2 z) \cdot (1 + x^3 z) \cdot (1 + x^4 z) \cdot (1 + x^5 z) \text{ \&c.}$$

the real multiplication of which gives

$$\begin{aligned}
&1 + z\,(x + x^2 + x^3 + x^4 + x^5 + x^6 + x^7 + x^8 + x^9 + \text{\&c.}) \\
&+ z^2\,(x^3 + x^4 + 2\,x^5 + 2\,x^6 + 3\,x^7 + 3\,x^8 + 4\,x^9 + 4\,x^{10} + 5\,x^{11} + \text{\&c.}) \\
&+ z^3\,(x^6 + x^7 + 2\,x^8 + 3\,x^9 + 4\,x^{10} + 5\,x^{11} + 7\,x^{12} + 8\,x^{13} + 10\,x^{14} + \text{\&c.}) \\
&+ z^4\,(x^{10} + x^{11} + 2\,x^{12} + 3\,x^{13} + 5\,x^{14} + 6\,x^{15} + 9\,x^{16} + 11\,x^{17} + 15\,x^{18} + \text{\&c.}) \\
&+ z^5\,(x^{15} + x^{16} + 2\,x^{17} + 3\,x^{18} + 5\,x^{19} + 7\,x^{20} + 10\,x^{21} + 13\,x^{22} + 18\,x^{23} + \text{\&c.}) \\
&+ z^6\,(x^{21} + x^{22} + 2\,x^{23} + 3\,x^{24} + 5\,x^{25} + 7\,x^{26} + 11\,x^{27} + 14\,x^{28} + 20\,x^{29} + \text{\&c.}) \\
&+ z^7\,(x^{28} + x^{29} + 2\,x^{30} + 3\,x^{31} + 5\,x^{32} + 7\,x^{33} + 11\,x^{34} + 15\,x^{35} + 21\,x^{36} + \text{\&c.}) \\
&+ z^8\,(x^{36} + x^{37} + 2\,x^{38} + 3\,x^{39} + 5\,x^{40} + 7\,x^{41} + 11\,x^{42} + 15\,x^{43} + 22\,x^{44} + \text{\&c.})
\end{aligned}$$

And by means of this ſeries we may aſcertain at once in how many different ways a propoſed number may be formed of any determined number of terms of the ſeries

1, 2, 3, 4, 5, 6, 7, 8, &c.

Suppoſe, for example, it were required to find in how many different ways the number 35 may be the ſum of ſeven different terms of the ſeries

1, 2, 3, 4, 5, 6, 7, 8, &c.

Find in the ſeries, that has the multiplier z^7, the power x^{35}; and its co-efficient, 15, indicates that the number 35 may be formed fifteen different ways, by the ſums of ſeven terms of the above ſeries.

But if we take $z = 1$, and thus unite together all the equal powers of x, or, which is the ſame thing, if we develope by multiplication the following infinite product,

$(1+x).(1+x^2).(1+x^3).(1+x^4).(1+x^5).(1+x^6)$ &c.

we ſhall have the ſeries,

$$1+x+x^2+2x^3+2x^4+3x^5+4x^6+5x^7+6x^8+\text{&c.}$$

in which each co-efficient indicates in how many different ways the exponent of the correſponding power of x may reſult from the addition of different terms of the ſeries 1, 2, 3, 4, 5, 6, 7, &c. without regard to the number of them.

Thus it appears, that there are ſix different manners of forming the number 8, by the addition of different numbers; as follows:

$$\begin{aligned} 8 &= 8 \\ 8 &= 7+1 \\ 8 &= 6+2 \\ 8 &= 5+3 \\ 8 &= 5+2+1 \\ 8 &= 4+3+1 \end{aligned}$$

It ſhould be obſerved here, that we muſt include the number itſelf, as one way of forming it; becauſe, the number of terms to be ſelected in the above ſeries being indeterminate, it neceſſarily follows, that we may conſider a ſingle term as one of the ſelections.

Cor.—From what has been ſaid, we learn how many ways a number may be produced by the addition of different numbers. But this condition, which requires different numbers, will no longer have place, if we tranſpoſe theſe factors to the denominator. Let us therefore conſider this caſe.

Prop. XXI.

To find in how many different ways any given number may be divided into a propoſed number of equal or unequal integral parts.

Let there be propoſed this expreſſion,

$$\frac{1}{(1-x^a z).(1-x^b z).(1-x^c z).(1-x^d z).(1-x^e z)}$$

which, being developed by diviſion, gives the ſeries

$$1+Pz+Qz^2+Rz^3+Sz^4+\text{&c.}$$

and from the firſt principles of algebra, it is evident that P is the ſum of all the powers of x, of which the exponents are contained in the ſeries

$a, b, c, d, e, f,$ &c.

Alſo, Q will be an aſſemblage of the powers of x, of which the exponents are the ſums of two terms of the ſame ſeries, repeated or not. Likewiſe, R will be the ſums of the powers of x, of which the exponents are formed by the addition of three terms; and S the ſum of the powers, of which the exponents are formed by the addition of four terms, compriſed in this ſeries, and ſo on of the other co-efficients.

Conſequently, if we ſuppoſe that the expreſſions have been actually developed, and that we have collected together the ſimilar terms, we ſhall ſee in how many different ways a propoſed number, n, may be formed by the addition of m terms, different or not, of the ſeries $a, b, c, d, e, f,$ &c.

Let us ſeek, for example, in the developed expreſſion, the term $x^n z^m$, and its co-efficient, which we will ſuppoſe N; in ſhort that the whole term will be $= N x^n z^m$; then will the co-efficient, N, ſhew in how many different ways the number n may be formed by the addition of m terms contained in the ſeries $a, b, c, d, e, f,$ &c. And hence we ſhall have the ſolution of a queſtion, analogous to the former one which we have been conſidering, except that in this they are not neceſſarily different terms, which was a condition in the firſt problem.

Let us apply what has been ſaid to a particular caſe, taking this expreſſion,

$$\frac{1}{(1-xz).(1-x^2 z).(1-x^3 z).(1-x^4 z).(1-x^5 z)}\ \text{&c.}$$

the actual developement of which, by diviſion, gives

$$\begin{aligned} &1+z(x+x^2+x^3+x^4+x^5+x^6+x^7+x^8+x^9+\text{&c.}) \\ &+z^2(x^2+x^3+2x^4+2x^5+3x^6+3x^7+4x^8+4x^9+5x^{10}+\text{&c.}) \\ &+z^3(x^3+x^4+2x^5+3x^6+4x^7+5x^8+7x^9+8x^{10}+10x^{11}+\text{&c.}) \\ &+z^4(x^4+x^5+2x^6+3x^7+5x^8+6x^9+9x^{10}+11x^{11}+15x^{12}+\text{&c.}) \\ &+z^5(x^5+x^6+2x^7+3x^8+5x^9+7x^{10}+10x^{11}+13x^{12}+18x^{13}+\text{&c.}) \\ &+z^6(x^6+x^7+2x^8+3x^9+5x^{10}+7x^{11}+11x^{12}+14x^{13}+20x^{14}+\text{&c.}) \\ &+z^7(x^7+x^8+2x^9+3x^{10}+5x^{11}+7x^{12}+11x^{13}+15x^{14}+21x^{15}+\text{&c.}) \\ &+z^8(x^8+x^9+2x^{10}+3x^{11}+5x^{12}+7x^{13}+11x^{14}+15x^{15}+22x^{16}+\text{&c.}) \end{aligned}$$

We may, therefore, by means of this ſeries, find immediately in how many different manners a number may be formed by the addition of any propoſed number of terms of this ſeries, 1, 2, 3, 4, 5, 6, 7, &c. Suppoſe, for example, it were required to know in how many different ways the number 13 might be made the ſum of five integers. We muſt, in this caſe, look for the term $x^{13} z^5$, and the co-efficient of which, 18, ſhews us, that the number in queſtion, 13, may be eighteen different ways formed by the addition of five integer numbers.

If we ſuppoſe $z = 1$, and unite in one ſum all the ſimilar powers of x, this expreſſion is transformed into this ſeries,

$$1+x+2x^2+3x^3+5x^4+7x^5+11x^6+15x^7+22x^8+\text{&c.}$$

in which each co-efficient indicates in how many different ways the exponents of the correſponding power can be formed by the addition of integers, without regard to the number of them, or whether they be equal or unequal.

For example, the term $11x^6$ ſhews that the number 6 may

may be produced eleven different ways, by the addition of whole numbers, as follows:

$6 = 6$
$6 = 5 + 1$
$6 = 4 + 2$
$6 = 4 + 1 + 1$
$6 = 3 + 3$
$6 = 3 + 2 + 1$
$6 = 3 + 1 + 1 + 1$
$6 = 2 + 2 + 2$
$6 = 2 + 2 + 1 + 1$
$6 = 2 + 1 + 1 + 1 + 1$
$6 = 1 + 1 + 1 + 1 + 1 + 1.$

Here we may remark alſo, that the propoſed number, being contained in the ſeries of numbers 1, 2, 3, 4, 5, 6, &c. is itſelf one way of forming it.

Prop. XXII.

To find, independently of the developement by multiplication, the ſeries of the powers x, that were deduced by that method in Prop. XX.

Let there be propoſed, to this effect, the following expreſſion:

$$Z = (1 + xz) \cdot (1 + x^2 z) + (1 + x^3 z) \cdot (1 + x^4 z) \cdot (1 + x^5 z) + \&c.;$$

which being developed by multiplication, and arranged according to the powers of z, gives this ſeries:

$$Z = 1 + Pz + Qz^2 + Rz^3 + Sz^4 + Tz^5 + \&c.:$$

and it is here required to find an expeditious method of obtaining the functions P, Q, R, S, &c. of x; for we ſhall have, by this means, the ſolution of the queſtion propoſed.

Now it is evident, that if we write xz for z, we ſhall have

$$(1 + x^2 z) \cdot (1 + x^3 z) \cdot (1 + x^4 z) \cdot (1 + x^5 z) \&c. = \frac{z}{1 + xz}.$$

Therefore, in ſubſtituting xz for z, the value of the product, which was z, is changed into $\frac{z}{1 + xz}$; and, conſequently, ſince

$$Z = 1 + Pz + Qz^2 + Rz^3 + Sz^4 + \&c.;$$

we ſhall have

$$\frac{z}{1 + xz} = 1 + Pxz + Qx^2 z^2 + Rx^3 z^3 + Sx^4 z^4 + \&c.$$

Multiplying of which by $1 + xz$, we ſhall obtain

$$\begin{aligned} Z = 1 &+ Pxz + Qx^2 z^2 + Rx^3 z^3 + Sx^4 z^4 + \&c. \\ &+ \quad xz + Px^2 z^2 + Qx^3 z^3 + Rx^4 z^4 + \&c. \end{aligned}$$

And this value of z, compared with the former, will give

$$P = \frac{x}{1 - x}, \quad Q = \frac{Px^2}{1 - x^2}, \quad R = \frac{Qx^3}{1 - x^3}, \quad S = \frac{Rx^4}{1 - x^4}, \quad \&c.$$

We ſhall have, therefore, for P, Q, R, S, &c. the following values:

$$P = \frac{x}{1 - x};$$

$$Q = \frac{x^3}{(1 - x) \cdot (1 - x^2)};$$

$$R = \frac{x^6}{(1 - x) \cdot (1 - x^2) \cdot (1 - x^3)};$$

$$S = \frac{x^{10}}{(1 - x) \cdot (1 - x^2) \cdot (1 - x^3) \cdot (1 - x^4)};$$

$$T = \frac{x^{15}}{(1 - x) \cdot (1 - x^2) \cdot (1 - x^3) \cdot (1 - x^4) \cdot (1 - x^5)};$$

&c. &c. &c.

We may, therefore, obtain ſeparately each of the ſeries of the powers of x, and which will ſhew in how many different ways a propoſed number may be formed, by the addition of any given number of integers: and it is evident that theſe, when converted by diviſion, will be recurring ſeries, becauſe they reſult from a fractional function of x.

Thus, the firſt expreſſion, $P = \frac{x}{1 - x}$, gives the geometrical progreſſion

$$x + x^2 + x^3 + x^4 + x^5 + x^6 + x^7 + \&c.;$$

which indicates that every number is contained once in the ſeries of integers 1, 2, 3, 4, &c. as is otherwiſe evident from firſt principles.

The ſecond expreſſion, $\frac{x^3}{(1 - x) \cdot (1 - x^2)}$, gives the ſeries

$$x^3 + x^4 + 2x^5 + 2x^6 + 3x^7 + 3x^8 + 4x^9 + 4x^{10} + \&c.;$$

in which the co-efficient of each term ſhews in how many ways the exponent x may be parted into two unequal parts. For example, the term $4x^9$ ſhews that the number 9 may be ſeparated, in four different ways, into two unequal parts. If we divide this ſeries by x^3, we ſhall have that which is derived from the fraction $\frac{1}{(1 - x) \cdot (1 - x^2)}$, as follows:

$$1 + x + 2x^2 + 2x^3 + 3x^4 + 3x^5 + 4x^6 + 4x^7 + \&c.;$$

of which we will ſuppoſe the general term $= Nx^n$. Now, from the generation of this ſeries, we know that the co-efficient N indicates in how many different ways the exponent n may be formed by the addition of the numbers 1 and 2; and ſince the general term of the firſt ſeries is Nx^{n+3}, we may thence draw this

Theorem.

Any number, $n + 3$, may be ſeparated into two unequal parts, in as many ways as the number n may be formed by the addition of the numbers 1 and 2.

The third expreſſion, $\frac{x^6}{(1 - x) \cdot (1 - x^2) \cdot (1 - x^3)}$, being reduced into a ſeries, will give

$$x^6 + x^7 + 2x^8 + 3x^9 + 4x^{10} + 5x^{11} + 7x^{12} + 8x^{13} + \&c.$$

And the co-efficient of each term, in this ſeries, ſhews in how many different ways the exponent of the correſponding power of x may be ſeparated into three unequal parts. But the developement of the fraction,

$\frac{1}{(1 - x) \cdot (1 - x^2) \cdot (1 - x^3)}$, gives the ſeries

$$1 + x + 2x^2 + 3x^3 + 4x^4 + 5x^5 + 7x^6 + 8x^7 + \&c.;$$

of which, if we ſuppoſe $N x^n$ to repreſent the general term, the co-efficient N will indicate in how many different ways the number *n* may be formed, by the addition of the three numbers 1, 2, and 3; and the general term of the foregoing ſeries being $N x^{n+6}$, we hence draw the following theorems.

Theorem II.

Any number, n + 6, may be divided into three unequal parts, in as many ways as the number n may be formed by the addition of the three numbers 1, 2, *and* 3.

The fourth expreſſion, $\frac{x^{10}}{(1-x).(1-x^2).(1-x^3).(1-x^4)}$, when developed in a ſeries, gives

$$x^{10} + x^{11} + 2x^{12} + 3x^{13} + 5x^{14} + 6x^{15} + 9x^{16} + 11x^{17} + \&c.$$

where the co-efficient of each term indicates in how many different ways the exponent of the correſponding power may be ſeparated into four unequal parts; but the transformation of the expreſſion $\frac{1}{(1-x).(1-x^2).(1-x^3).(1-x^4)}$ into a ſeries, or the diviſion of the one above by x^{10}, produces

$$1 + x^1 + 2x^2 + 3x^3 + 5x^4 + 6x^5 + 9x^6 + 11x^7 + \&c.;$$

of which, ſuppoſing the general term to be $N x^n$, it follows, that the co-efficient N ſhews in how many different ways the number *n* may be formed by the addition of the four numbers 1, 2, 3, 4; and hence, again, we deduce the following

Theorem III.

Any number, n + 10, may be divided into four unequal parts, in as many ways as the number n may be formed by the addition of the four numbers 1, 2, 3, *and* 4.

In general, therefore, if the expreſſion $\frac{1}{(1-x).(1-x^2).(1-x^3).\ \&c.\ (1-x^m)}$ be converted into a ſeries, and of which we take $N x^n$ to repreſent the general term; the co-efficient N will always indicate in how many different ways the number *n* may be formed by the addition of the numbers 1, 2, 3, 4, &c. *m*.

But if the expreſſion $\frac{x^{\frac{m.m+1}{2}}}{(1-x).(1-x^2).(1-x^3).(1-x^4)\ \&c.\ (1-x^m)}$, be converted into a ſeries, the general term will be $N x^{n+\frac{m.m+1}{2}}$; and of which the co-efficient N ſhews in how many ways the number $n + \frac{m.m+1}{1.2}$ may be divided into *m* unequal parts; and hence we draw the following general

Theorem IV.

Any number, $n + \frac{m.m+1}{1.2}$, *may be divided into m unequal parts, in as many ways as the number n may be formed by the addition of the numbers* 1, 2, 3, 4, *&c. m.*

Having thus explained the law for the partition of numbers into unequal parts, we ſhall proceed to the inveſtigation of the propoſition, which includes both equal and unequal parts.

Prop. XXIII.

To aſcertain, independently of the developement by diviſion, the ſeries of the powers that were deduced by this method in Prop. XXII.

To this effect, let there be propoſed the expreſſion

$$Z = \frac{1}{(1-xz).(1-x^2z).(1-x^3z).(1-x^4z).(1-x^5z)}$$

and ſuppoſe that, from actual diviſion, it becomes

$$Z = 1 + Pz + Qz^2 + Rz^3 + Sz^4 + Tz^5 + \&c.$$

and here, it is evident, that if we put *x z*, inſtead of *z*, in the above fraction, we ſhall have

$$(1-xz)Z = \frac{1}{(1-x^2z).(1-x^3z).(1-x^4z).(1-x^5z)\ \&c.}$$

and the ſame ſubſtitution having been made in the foregoing ſeries, there will reſult

$$(1-xz)Z = 1 + Pxz + Qx^2z^2 + Rx^3z^3 + Sx^4z^4 + \&c.$$

Now, multiplying the firſt ſeries by $(1 - xz)$, we ſhall have

$$(1-xz)Z = 1 + Pz + Qz^2 + Rz^3 + Sz^4 + \&c.$$
$$- xz - Pxz^2 + Qxz^3 + Rxz^4 + \&c.$$

And hence by compariſon, we have

$$P = \frac{x}{1-x},\ Q = \frac{Px}{1-x^2},\ R = \frac{Qx}{1-x^3},\ S = \frac{Rx}{1-x^4},\ \&c.$$

which gives for P, Q, R, S, &c. the following independent values; *viz.*

$$P = \frac{x}{1-x};$$

$$Q = \frac{x^2}{(1-x).(1-x^2)};$$

$$R = \frac{x^3}{(1-x).(1-x^2).(1-x^3)};$$

$$S = \frac{x^4}{(1-x).(1-x^2).(1-x^3).(1-x^4)}.$$

Theſe expreſſions differ from thoſe found in the foregoing propoſition, only in this; that the numerators in theſe have leſs exponents than thoſe in the preceding caſe; and, conſequently, the ſeries that ariſe from the developement of theſe and the foregoing will perfectly agree with reſpect to their co-efficients, as is otherwiſe evident from a compariſon of the two ſets of ſeries, which we have deduced at Prop. XXI. and Prop. XXII. And hence, without a repetition of the proceſs, we may deduce the following theorems, analogous to thoſe derived from Prop. XXIII.

Theorems.

1. *Any number, n + 2, may be divided into two parts, in as many different ways as the number n may be formed by the addition of the numbers* 1 *and* 2.

2. *Any number, n + 3, may be divided into three parts, in as many different ways as the number n can be formed by the addition of the numbers* 1, 2, 3.

3. *Any number, n + 4, may be divided into four parts, in as many different ways as the number n may be formed by the addition of the numbers* 1, 2, 3, 4.

4. *And, generally, as many different ways as there are of forming the number n by the addition of the numbers* 1, 2, 3, 4, ... *m; ſo many different ways may the number* $n + m$ *be divided into m parts.*

Having, therefore, to find in how many ways a given number may be divided into *m* unequal parts; and how many ways it may be divided into parts equal, or unequal; theſe two queſtions will be reſolved, from the foregoing theorems, and thoſe deduced from Prop. XXII. if we can aſcertain in how many ways a number may be formed by the addition of the numbers 1, 2, 3, 4, &c. *m*, from a compariſon of which we eaſily deduce the following

THEOREMS.

5. *The number n may be parted into m unequal parts, in as many ways as the number* $n - \frac{m \cdot \overline{m-1}}{2}$ *may be formed by the addition of the numbers* 1, 2, 3, 4, ... *m.*

6. *The number n may be parted into m equal, or unequal parts, as many ways as the number* $n - m$ *may be formed by the addition of the numbers* 1, 2, 3, 4, ... *m.*

From theſe two theorems (which are, in effect, the two general theorems deduced from Props. XXIII. and XXIV., except being in another form) we may derive theſe other two

THEOREMS.

7. *The number n may be divided into m unequal parts, in as many ways as the number* $n - \frac{m \cdot \overline{m-1}}{1 \cdot 2}$ *may be divided into m parts equal, or unequal.*

8. *The number n may be divided into parts equal, or unequal in as many ways as the number* $n + \frac{m \cdot \overline{m-1}}{1 \cdot 2}$ *may be parted into m unequal parts.* Euler's Analyſis Infinitorum.

We ſhall now conclude this article by enumerating a few curious properties of numbers, that could not properly be introduced under any of the preceding heads; but for their inveſtigations and demonſtrations we muſt refer the reader to the works above quoted.

Miſcellaneous Numerical Properties.

1. If *a* be a prime number, and *x* any number whatever not diviſible by *a*, then will x^{a-1} be always diviſible by *a*.

2. Every integer number is the ſum of one, two, or three triangular numbers; of one, two, three, or four ſquare; of one, two, three, four, or five pentagonal numbers; and ſo on for hexagonal, heptagonal, &c. numbers. This curious property was firſt diſcovered by Fermat, and propoſed by him without demonſtration, at page 180 of his edition of Diophantus; the caſe of ſquares has been proved both by Euler and La Grange, and that of the triangular numbers by Le Gendre; beyond which it ſtill remains without demonſtration, having reſiſted the efforts of ſeveral very diſtinguiſhed analyſts.

3. If *n* be a prime number, the product

$$1 \cdot 2 \cdot 3 \cdot 4 \cdot \ldots \cdot (n-1) + 1$$

is diviſible by *n*, ſo alſo is the product

$$1^2 \cdot 2^2 \cdot 3^2 \cdot 4^2 \cdots \left(\frac{n-1}{2}\right)^2 \pm 1,$$

the ambiguous ſign being + when *n* is a prime number of the form $4a - 1$, and − when it is of the form $4a + 1$.

4. The expanded binomial $(1-1)^n$

$$= 1 - n + \frac{n(n-1)}{1 \cdot 2} - \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3} + \&c. = 0;$$

and if theſe terms be reſpectively multiplied by the ſeries 1, 2, 3, 4, &c. or any power of theſe terms except the *n*th, the whole expreſſion will be ſtill equal to zero.

5. The continued product $1 \cdot 2 \cdot 3 \cdot 4 \ldots n$ is expreſſed by the formula $n^n - n(n-1)^n + \frac{n(n-1)}{1 \cdot 2}(n-2)^n - \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3}(n-3)^n + \&c.$

6. Every ſquare number is either diviſible by 5, or will leave for a remainder plus or minus 1.

Every cube number is either diviſible by 7, or will leave alſo the ſame remainder ± 1; and generally we have

$x^2 =$	$3n$, or $3n+1$	$=$	$5n$, or $5n \pm 1$
$x^3 =$	- -	$=$	$7n$, or $7n \pm 1$
$x^4 =$	$5n$, or $5n+1$	$=$	- - -
$x^5 =$	- -	$=$	$11n$, or $11n \pm 1$
$x^6 =$	$7n$, or $7n+1$	$=$	$13n$, or $13n \pm 1$
$x^7 =$	- -	$=$	- - -
$x^8 =$	- -	$=$	$17n$, or $17n \pm 1$
$x^9 =$	- -	$=$	$19n$, or $19n \pm 1$
$x^{10} =$	$11n$, or $11n+1$	$=$	- - -
$x^{11} =$	- -	$=$	$13n$, or $23n \pm 1$
$x^{12} =$	$13n$, or $13n+1$	$=$	

which formulæ are very convenient for determining whether a propoſed number be a complete power without the trouble of extraction.

We might have added here ſeveral other curious properties of numbers; but having already extended this article to a conſiderable length, we muſt refer the reader who is deſirous of entering farther into this ſubject, to Barlow's Theory of Numbers, where he will find a great variety of ſuch properties, with their ſeveral applications to arithmetic, analyſis, geometry, trigonometry, &c.

NUMBERS, *for the Manner of characteriſing*, ſee NOTATION.

For that of expreſſing or reading thoſe already characteriſed, ſee NUMERATION.

NUMBER, *for the Meaſure of a.* See MEASURE.

NUMBER, *Golden*, in *Chronology*. M. Caſſini defines the golden number by the number of years elapſed ſince that which had the new moon on its firſt day; as that of the year 1500, whoſe golden number was 0; which he takes for his epocha.

NUMBER, *Golden*, is alſo uſed, with ſomewhat leſs propriety, for a period of 19 years, invented by Meton the Athenian; at the end whereof, the ſame lunations return in the ſame days, though not preciſely in the ſame hour and minute of the day; but within an hour and a half of the ſame time.

In which ſenſe, golden number amounts to the ſame with what we otherwiſe call *lunar cycle*, or *Metonic year*.

Hence this period, called by the Greeks *enneadecaeteris*, is not perfectly juſt; there being a proemptoſis, or leap, at the end of each 312 years; *i. e.* in that time the lunations fall out a day ſooner than the golden number expreſſes them.

This, among other things, was what engaged pope Gregory XIII. to reform the calendar, to throw out the golden number, and ſubſtitute the cycle of epacts inſtead of it, for the

the uſe of the golden number, which, in the Julian calendar, ſerves to find the new moons, only ſerves, in the Gregorian, to find the cycle of epacts.

This number is ſaid to have had its name, *golden*, from the extent of its uſe; or, otherwiſe, becauſe the Athenians received it with ſo much applauſe, that they had it written in the public market in letters of gold. See *Metonic* CYCLE, and EPACT.

NUMBER, in *Grammar*, is a modification of nouns, verbs, &c. to accommodate them to the varieties of their objects, conſidered with regard to number.

Nouns, or names, agreeing to ſeveral things, may be conſidered either as applied to one of thoſe things ſingularly, or to a number of them; and thoſe either conſidered as ſeveral, or as united. To diſtinguiſh theſe caſes, two numbers have been invented, the *ſingular* and *plural*.

When a noun indicates an object conſidered as ſingle, or alone, or a number of them conſidered as united together, it is ſaid to be of the *ſingular* number; as a tree, a troop, a temple.

When it indicates ſeveral objects, and thoſe as diſtinct, it is of the *plural* number: as trees, or temples. Thus, when I ſpeak of myſelf, as making part of ſeveral others, inſtead of I, I ſay, we, &c.

The Greeks have a third number, which they call the *dual* number, as ſignifying two. The Hebrews have ſomething like it; but then it only takes place when the words ſignify a thing double, either by nature, as the hands, the eyes, &c. or by art, as ſciſſars, tongs, &c. As to common and appellative names, they ſeem all naturally to require a plural number; yet there are ſeveral, which have none, as the name of gold, ſteel, &c.

The difference of numbers in nouns is expreſſed by a difference of termination or ending.

In Engliſh, the ſingular is uſually converted into plural, by adding *s*; as tree, trees; hand, hands; &c. Where the pronunciation requires it, as when the ſingular ends in *s* or *x*, *ſh* or *ch*, it is uſually done by the addition of *es*, inſtead of *s*.

The plurals of adjectives, though varied from the ſingulars in moſt other languages, yet in Engliſh are generally the ſame.

NUMBERS, in *Poetry*, *Oratory*, *Muſic*, &c. are certain meaſures, proportions, or cadences, which render a verſe, period, or ſong agreeable to the ear.

Poetical and *proſaic* numbers are ſomewhat different.

NUMBERS, *Poetical*, conſiſt in a certain harmony in the order, quantities, &c. of the feet and ſyllables; which make the piece muſical to the ear, and fit for ſinging; for which all the verſes of the ancients were intended. See RHYTHM.

It is of theſe numbers Virgil ſpeaks in his fourth eclogue:

——— "Numeros memini, ſi verba tenerem."

And again, in the ſixth eclogue:

"Tum vero in numerum faunoſque feraſque videres
Ludere."

The numbers are what conſtitute the air and character of a verſe; and denominate it ſmooth, or ſoft, or low, or rough, or ſonorous. The following lines of Milton furniſh an inſtance of ſoft, eaſy numbers:

"Then feed on thoughts, which voluntary move
Harmonious numbers; as the tuneful bird
Sings darkling, and, in ſhadieſt covert hid,
Tunes her nocturnal note. ——"

How different from the numbers of theſe!

"Arms meet with arms, faucheons with faucheons claſh,
And ſparks of fire, ſtruck out from armour, flaſh."

NUMBERS, *Rhetorical*, or *Proſaic*, are a ſort of ſimple unaffected harmony, leſs glaring than that of verſe, yet ſuch as is perceived, and affects the mind with pleaſure. The numbers are that, by which the ſtyle is ſaid to be eaſy, free, round, flowing, &c. See STYLE.

A fine inſtance of numbers we have in that paſſage of Tully for Marcellus: "Nulla eſt tanta vis, tantaque copia, quæ non ferro ac viribus debilitari frangique poſſit." All the beauty of which would be entirely loſt to any tolerable ear, if the numbers were a little inverted, thus: "Nulla eſt vis tanta, et copia tanta, quæ non poſſit debilitari frangique viribus et ferro."

Numbers are things abſolutely neceſſary in all writings, and even in all ſpeech. Hence Ariſtotle, Tully, Quintilian, &c. lay down abundance of rules as to the beſt manner of intermixing dactyls, ſpondees, anapeſta, iambuſes, choraic, and dichoraic moloſſuſes, &c. in order to have the numbers perfect.

The ſubſtance of what we have ſaid, is reducible to what follows: 1. The ſtyle becomes numerous, by the alternate diſpoſition and temperature of long and ſhort ſyllables; ſo as that the multitude of ſhort ones neither render it too haſty, nor that of longer ones too ſlow and languid. Thus Tully to Cæſar: "Domuiſti gentes immanitate barbaras, multitudine innumerabiles, locis infinitas, omni copiarum genere abundantes, &c."

Sometimes, indeed, long or ſhort ſyllables are deſignedly thrown together, without any ſuch mixture, to paint the celerity or ſlowneſs of a thing by that of the numbers; as,

"Quadrupedante putrem ſonitu quatit ungula campum."
Æneid. l. 8.

"Luctantes ventos, tempeſtateſque ſonoras."
Id. l. 1.

2. The ſtyle becomes numerous by the intermixing words of one, two, or more ſyllables; *e. g.* "Vivis; et vivis non ad deponendam, ſed ad confirmandam audaciam." Whereas the too frequent repetition of monoſyllables renders the ſtyle pitiful and grating: *e. gr.* "Hac in re nos hic non ferit."

3. It contributes greatly to the numerouſneſs of a period; to have it cloſed by magnificent and well-ſounding words; as, "Qui locus quietis ac tranquillitatis pleniſſimus fore videbatur, in eo maximæ moleſtiarum, et turbulentiſſimæ tempeſtates extiterunt."

4. The numbers depend not only on the nobleneſs of the words in the cloſe, but on thoſe of the whole tenor of the period; as in that fine oration of Cicero for Fonteius, a brother of one of the Veſtal maids; "Nolite pati, judices, aras deorum immortalium, Veſtæque matris, quotidianis virginum lamentationibus de veſtro judicio commoveri."

5. To have the period flow eaſily and equably, the harſh concurrence of letters and words is to be very ſtudiouſly avoided, particularly the frequent meeting of rough conſonants; as *ars ſtudiorum*, *rex Xerxes*: the beginning the firſt ſyllable of a word with the laſt of the preceding; as, *Res mihi inviſæ ſunt*: the frequent repetition of the ſame letter or ſyllable; as in that verſe of Ennius:

"Africa terribili tremit horrida terra tumultu;"

and the frequent uſe of like ending words; as *amatrices*, *ajutrices*, *præſtigiatrices*, *fuerunt*. See JUNCTURE.

Laſtly,

Laſtly, the utmoſt care is to be taken, leſt in aiming at *oratorial* numbers, you ſhould fall into *poetical* ones; and inſtead of proſe write verſe; which even Cicero himſelf is ſometimes guilty of: witneſs "Cum loquitur, tanti fletus gemituſque fiebant."

With regard to Engliſh compoſition, the following cautions ſhould be obſerved: a number of monoſyllables ſhould not be crowded together, nor ſeveral words of the ſame termination, eſpecially if the accent falls on the ſame ſyllable in each of them; nor ſhould a ſentence end with a monoſyllable: to which may be added, that very long words are not ſuited to the beginning or concluſion of a period. Ward's Orat. vol. i. p. 380, &c.

NUMBERS, *Planetary*. The numbers which are uſually underſtood by the denomination *planetary*, are thoſe which are, or may be, applied in planetary clocks, orreries, and planetaria, in the conſtruction of their wheels and pinions; for the deſired rotations and revolutions of the balls that repreſent the planets, depend on the reſpective numbers of teeth employed in ſuch wheels and pinions. Theſe numbers are, therefore, of great importance in the repreſentation of planetary motion, inaſmuch as the relative velocities are entirely regulated thereby, and the addition or omiſſion of a ſingle tooth in either a wheel or pinion may produce an error in defect or exceſs of days, weeks, or months, in the whole period, accordingly as the planet has a ſhort or long period to revolve in. In any planetary machine, the velocity of the firſt moving wheel or pinion muſt be to the velocity of the laſt in a given pair, or in a given train of wheels and pinions, in the ſame proportion, as nearly as may be, as the period aſſumed for the revolution of the firſt is to the period intended to be produced in a planet immediately connected with the laſt, which is ſometimes called the planetary wheel, though, properly ſpeaking, they are all planetary wheels, by reaſon of their teeth being made to conſiſt of planetary numbers, previouſly calculated. To aſcertain numbers ſuitable for planetary wheelwork, both as to accuracy and practical convenience, is to ſelect out of all the infinite variety of numerical figures, that permutation would produce, thoſe particular relative numbers that fulfil the conditions beſt, and that could not be changed for others without diſadvantage; and various ingenious men have deviſed methods of determining ſuch numbers, though with different degrees of ſucceſs, from the time of Huygens and Roemer down to the preſent moment. Graham, Rowley, Deſaguliers, Martin, and Ferguſon, have each laboured to procure good planetary numbers for their reſpective machines, and have left behind them models of different conſtructions, which have been copied by the Engliſh inſtrument makers, who have from time to time ſucceeded them, though it will preſently appear, that none of theſe models effect a good repreſentation of the planetary motions; for, in the firſt place, the tables of thoſe motions were not ſufficiently correct during the lives of thoſe authors; in the next place, the moſt accurate numbers were not aſcertained for producing the motions they aimed at; and thirdly, five primary planets and eight ſecondaries have been diſcovered ſince their time, for which no planetary numbers were or could be calculated on that account. Theſe diſcoveries in aſtronomy have, however, lately led to correſponding improvements in planetary mechaniſm, and a clergyman, who has made planetary numbers a ſubject of his ſtudies, and to whom we are indebted for this article, as well as for ſeveral others connected with it, has ſuperintended the conſtruction of different illuſtrative machines for himſelf or friends, which are as yet unknown to the public, but which it is our intention to deſcribe under their proper titles of ORRERY and PLANETARIUM, when we arrive at thoſe articles. In the mean time, the reader will be enabled to judge of the comparative merits of ſuch machines, by a careful peruſal of our preſent article, which naturally divides itſelf into three heads; *viz.*

1ſt. That which relates to the exact periods of the planetary revolutions;

2dly. That which regards the periods as produced by wheelwork already conſtructed; and,

3dly. That which regards the calculation of planetary numbers intended to produce an exact repreſentation of thoſe periods.

For the ſake of perſpicuity, we propoſe to confine ourſelves to this order; but each of the two laſt heads will be ſubdivided into diſtinct *caſes*, for the purpoſe of affording practical examples in each caſe, ſuch as may ſerve at once to illuſtrate the theory, and to promote the practical application of planetary numbers, in the examination and actual conſtruction of machines for illuſtrating the ſolar ſyſtem.

The firſt head that preſents itſelf to our conſideration is that which relates to the exact periods of the planetary revolutions themſelves, ſo far as the preſent ſtate of our knowledge goes; for ſhould our data be aſſumed erroneouſly, our calculations depending on them will be defective in accuracy. We are therefore unwilling to copy the accounts of our predeceſſors, which have been handed down without due attention to correctneſs, and which our contemporaries have not taken the trouble to correct, ſince the moſt perfect tables were publiſhed, out of which we collect the tropical revolutions, ſubjoined, as publiſhed in La Lande's laſt edition, which revolutions are preferable to the periodic revolutions on account of their allowing for the preceſſion (or retroceſſion) of the equinoctial points, and thereby making the motions correſpondent to the ſigns as given in the Nautical Almanac and White's Ephemeris, which regiſter the apparent places of the heavenly bodies, and phenomena ariſing out of their relative motions.

The tables of the planetary motions are ſo arranged in columns for years, months, days, hours, minutes, and ſeconds, that we may readily collect from them the mean motion in its orbit of any planet correſponding to any given amount of time; or, on the contrary, the time correſponding to any given quantity of mean motion; and if we aſſume twelve ſigns, or an entire revolution in the ecliptic, as the motion given for each planet, we ſhall have the times correſponding, as we have arranged them below, for the tropical periods of thoſe planets which have had their tables completed. We will take them in the order of their diſtances from the ſun thus:

	s	o	′	″		
MERCURY.	11	26	2	12	=	87 days.
	0	3	55	19	=	23 hours.
	0	0	2	23	=	14 minutes.
	0	0	0	6	=	35.2 ſeconds.
The amount	12	0	0	0	=	$87^d\ 23^h\ 14^m\ 35^s.2$ for the whole tropical period.
VENUS.	11	28	53	9	=	224 days.
	0	1	4	5	=	16 hours.
	0	0	2	44	=	41 minutes.
	0	0	0	2	=	30 ſeconds.
The amount	12	0	0	0	=	$224^d\ 16^h\ 41^m\ 30^s$ for the tropical period.

EARTH.

	s	o	′	″		
EARTH.	11	29	45	40.5	=	365 days.
	0	0	12	19.2	=	5 hours.
	0	0	1	58.3	=	48 minutes.
	0	0	0	2	=	48 (alſo 49) ſeconds.
The amount	12	0	0	0	=	$365^{d}\ 5^{h}\ 48^{m}\ 48^{s}$ or 49^{s} for the ſolar year.
MARS.	6	11	17	9.4	=	365 days.
	5	18	13	36.8	=	321 days.
Sum	11	29	30	46.2	=	686 days.
	0	0	28	49.4	=	22 hours.
	0	0	0	24.4	=	$18^{m}\ 37^{s}$.
The amount	12	0	0	0	=	$686^{d}\ 22^{h}\ 18^{m}\ 37^{s}$ for the tropical period.
JUPITER.	1	0	20	31.7	=	365 days.
Multiply by				11		
	11	3	45	48.7	=	$365 \times 11 = 4015$ days.
	0	25	46	12	=	310 days more.
	0	0	24	56.3	=	5 days in addition.
Sum	11	29	56	57	=	4330 entire days.
	0	0	2	54.6	=	14 hours.
	0	0	0	8.4	=	$40\frac{1}{2}$ minutes.
The amount	12	0	0	0	=	$4330^{d}\ 14^{h}\ 40^{m}\ 30^{s}$ for the tropical period.
SATURN.	0	12	13	36.8	=	365 days.
Multiply by				29		
	11	24	34	47.2	=	$365 \times 29 = 10585^{d}$
	0	5	11	32	=	155 days more.
	0	0	12	3.6	=	6 days in addition.
Sum	11	29	58	22.8	=	10746 entire days.
	0	0	1	35.5	=	19 hours.
	0	0	0	1.7	=	20 minutes.
The amount	12	0	0	0	=	$10746^{d}\ 19^{h}\ 20^{m}$ for the tropical period.
GEORGIAN OR HERSCHEL.	0	4	17	44.2	=	365 days.
Multiply by				9		
	1	8	39	37.8		
Again by				9		
	11	17	56	40.2	=	$81 \times 365 = 29565$
Add more	0	8	35	28.4	=	$2 \times 365 = 730$
Alſo	0	3	24	47	=	290
And	0	0	2	49.5	=	4
Sum	11	29	59	45.1	=	30589 days.
	0	0	0	14.1	=	8 hours.
	0	0	0	0.8	=	27 minutes.
The amount	12	0	0	0	=	$30589^{d}\ 8^{h}\ 27^{m}$ for the tropical period.

The periods thus aſcertained agree very nearly with thoſe given by profeſſor Vince, as copied from La Lande's Report without further examination, except in the inſtance of Herſchel, in which there is a difference of upwards of 222 days!

How ſo great a variation has ariſen between the tables and the period aſſigned to Georgian by ſo able and accurate an aſtronomer as La Lande, we are left to conjecture. In one part of his valuable work, this author ſays that the tropical diurnal motion of this planet is 42″.678026, which is probably the daily motion at firſt aſſigned as an approximate motion, before the true one was aſcertained, and which has not been ſubſequently corrected; and if we divide 1296000″, the number of ſeconds in the ecliptic, by this number, we ſhall have a period of 30366.91528 days, or 83 tropical years, 51 days, 19 hours, and 37.44 ſeconds; but, according to the laſt edition of the tables, the mean tropical daily motion, on an average of 365 days, comes out only 42″.36712, by which, if we divide 1296000″, as before, we ſhall gain a period of more than 30589 days, which agreement with our period juſt aſcertained from the tables, conſtitutes a check on our proceſs of collecting the period from the ſaid tables. Indeed, ſince the diſcovery was made of this error in La Lande's Report of the period of Georgian, (which was communicated to Dr. Thomas Young during the time of his lecturing at the Royal Inſtitution, and corrected in his lectures), we learn that baron Von Zach, of Saxe Gotha, has given a period of 30589.36 days to this planet, which circumſtance corroborates our former concluſion, which we here mention, not only becauſe it is connected with our preſent article, but alſo becauſe profeſſor Vince, Dr. Oliſthus Gregory, Dr. Kelly, and other modern writers on aſtronomy, have copied the error we have here pointed out, and have involuntarily lent their ſanction to its propagation.

With reſpect to the exact length of the ſolar year, the determinations of Dr. Halley, Flamſtead, and ſir Iſaac Newton, as well as of Caſſini and Mayer, have yielded, in public opinion, to thoſe of La Lande and De la Caille, the former of whom, in his "Memoire ſur la veritable Longueur de l'Année aſtronomique," which gained the prize propoſed by the Royal Society of Copenhagen for the year 1780, by comparing a great number of the moſt diſtant and authentic obſervations, determined the length of the mean ſolar year to be $365^{d}\ 5^{h}\ 48^{m}\ 48^{s}$; but De la Caille's determination of 49^{s} has been followed by Von Zach in his "Abridgment of the Solar Tables," while, as Biot informs us in his "Traité Elementaire d'Aſtronomie Phyſique," 1810, M. de Lambre in his laſt tables makes the ſolar year $365^{d}.242264$, or $365^{d}\ 5^{h}\ 48^{m}\ 51^{s}.696$, which accords very nearly with Caſſini's determination from a mean of all the authentic obſervations on the equinoxes. But if we adopt, as our ſtandard, a period coming within one ſecond of the mean of all theſe determinations, the other periods to be compared with it, and conſtituting ſo many ratios, will not be deemed inaccurate.

Of the tropical revolutions of the four diminutive planets, that have been diſcovered within the preſent century, the periods are not yet ſo accurately known, as to exclude future corrections from time to time, as obſervations may be multiplied; we therefore caution our readers againſt conſidering the periods at preſent aſſigned to them, as deſerving any other name than *approximate*, or approaching towards the truth. We have carefully examined and compared both the French and German accounts, that have hitherto been given, of the elements of theſe planets, and according to the preſent ſtate of our information (1813), the following may be conſidered as the moſt correct tropical periods;

periods; which, therefore, we adopt for the preſent till more accurate ones are deduced: *viz.*

The Sun.—The period of the ſun's rotation, as it regards a ſtar or fixed point, has been given differently by different authors; ſome making it $25^d\ 6^h$, others $25^d\ 24^h\ 8^m$, and others $25^h\ 15^m\ 16^s$. But the time moſt to be depended on, is that which La Lande determined from obſervations made in the beginning of the year 1798: at which time, the writer of this article recollects having noticed the continuance of the ſame ſolar ſpot for nearly three entire rotations of the ſun, before it changed or diſappeared. The memoir was read at the public ſitting of the French National Inſtitute, in which the ſpot is ſtated to have returned to the ſame ſituation relatively to the earth in $27^d\ 7^h\ 37^m\ 28^s$; from which was deduced the period $25^d\ 10^h$, for the exact time of a rotation, as it reſpects a fixed point in the heavens. This period was deduced in the following manner: the exact quantity of the ſun's apparent motion in the ecliptic, correſponding to $27^d\ 7^h\ 37^m\ 28^s$, was aſcertained from the ſolar tables, which may be called t; then as $360° + t : 27^d\ 7^h\ 37^m\ 28^s :: 360° : 25^d\ 10^h\ 0^m$, for the exact time of a rotation; which we will conſider as ſufficiently accurate, till ſome ſolar ſpot of longer continuance may hereafter appear.

The Moon.—As the different periods of the moon's revolution with regard to the ſun, her node, and apogee, have been given agreeably to La Lande's lateſt determination, under our article MOON, it would not be neceſſary to enter on the ſubject here, provided the years there ſtated had been tropical years of $365^d.24222$, inſtead of civil years of 365^d each; but as the tropical or ſolar year is taken in our calculation of planetary numbers, as the ſtandard by which the periods of the planets are meaſured, it is requiſite to convert the lunar numbers into terms of the ſame denomination. The tropical period of the node is taken, according to the beſt tables, at $6798^d\ 4^h\ 52^m\ 52^s$; which time, divided by 365.24222, gives $18^y\ 223^d\ 19^h\ 41^m\ 24^s$ for the ſaid period in tropical years; and $3231^d\ 8^h\ 34^m\ 57^s.6$, the tropical period of the apogee, divided by the ſame numbers, produces $8^y\ 309^d\ 10^h\ 4^m\ 45^s$ of a ſimilar denomination: from which periods, lunar wheels muſt be calculated, in order that the moon's motions may be referred to the ecliptic, and the phenomena indicated agreeably to true ſolar time.

Jupiter's Moons.—The periods of Jupiter's moons, to be repreſented by wheelwork in any machine, are the ſynodic, which being of frequent recurrence, are now aſcertained with great accuracy, agreeably to the ſubjoined table, *viz.*

Sat.	D.	H.	M.	S.
1.	1	18	28	36
2.	3	13	17	54
3.	7	3	59	36
4.	16	18	5	7

We omit giving, in this place, the periods of the other ſecondaries, which will be given in their places; becauſe their motions afford no phenomena of ſervice in navigation or geography, and are therefore omitted in planetary machines, as being calculated to enhance the expence, without being of any real ſervice in explaining the ſyſtem.

Our ſecond head of this article is that which regards the periods of the planets, as produced by wheelwork already conſtructed, and which will enable the reader to appreciate the accuracy of any numbers adopted by the mathematical inſtrument makers.

The caſes which have occurred, in our examination of different inſtruments, may be claſſed into ſeven, according to the ſubjoined arrangement, *viz.*

1. When a ſimple motion is produced by means of one wheel and a correſponding pinion.
2. When a ſimple motion is produced by a train of wheels and pinions.
3. When a ſimple motion is produced by the agency of a worm, or endleſs ſcrew, actuating a wheel.
4. When a compound motion is effected partly by the action of wheels and pinions, and partly by a moveable bar or box, which ſupports ſome portion of the mechaniſm.
5. When an *apparent* progreſſive motion is cauſed by the *difference* of two comparative motions.
6. When an *apparent* retrograde motion is cauſed by the *difference* of two comparative motions.
7. And laſtly, when by means of two equal, contrary, or counteracting motions, the paralleliſm of a wheel's axis is preſerved, as it regards a given original poſition.

Before we treat theſe ſeven caſes ſucceſſively, let it be premiſed, that the wheel or pinion, which actuates or *drives* its fellow, will be invariably called the *driver*, and the other the wheel or pinion *driven*. The different methods of computing the value of any portion of wheelwork will, it is preſumed, require no other mathematical knowledge than an acquaintance with the nature of fractions, vulgar and decimal; which we muſt ſuppoſe to be familiar to every mathematical inſtrument maker.

Caſe. 1.—When a ſimple motion is produced by means of one wheel and a correſponding pinion, let the number of teeth, which each contains, be carefully counted and noted down, and alſo which of the two is the *driver*: then, whatever be the aſſumed time of a revolution of the driver, the numbers of the wheel and pinion will conſtitute a ratio, which is a fraction of that time, proper or improper, according as the *driver* is the greater or ſmaller number; which driver muſt be, in all inſtances, the *denominator*. The value of the fraction thus conſtituted, it will be ſuperfluous to ſcientific readers to ſay, is found by multiplying the aſſumed time of a revolution of the firſt mover by the numerator, and dividing by the denominator; the remainders being reduced into their next loweſt denomination of time, after every ſucceſsful diviſion. An example will render this ſimple caſe intelligible by every reader.

Suppoſe that a wheel, conſiſting of 75 teeth, and revolving once in a tropical year, drive a pinion of 6; and that it be required to know in what time the latter revolves, the work at full length will ſtand thus:

D. H. M. S.

$365.24222 = 365\ 5\ 48\ 48$

$\times\ 6$

$75)2191.45333(29$ Days.

150

691

675

16.45333

24

6581333

32906666

Carry over $75)394.87999(5$ Hours.

75)394.87999(5 Hours.
375

19.87999
60

75)1192.79999(15 Minutes.
75

442
375

67.79999

75)4067.99999(54.24 Seconds.
375

317
300

17.9
15.0

2g
30

Hence it appears, that $\frac{6}{75}$ths of 365.2422 days is equal to $29^d\ 5^h\ 15^m\ 54^s.24$.

The computation may be ſometimes abridged, by converting the vulgar fractions into a decimal, where there is no remainder, and then by multiplying thereby, inſtead of dividing; thus:

75)6.00(.08
6.00

365.24222
.08

29.2193777 Days.
24

8775111
43875555

5.2650666 Hours.
60

15.9040000 Minutes.
60

54.2400000 Seconds.

Either of theſe methods may be uſed with a like reſult.

If, inſtead of the wheel, we make the pinion the driver, or denominator of the fraction, the motion of the ſecond mover will then be retarded; for $\frac{75}{6}$ths of 365.24222 days is equal to $4565^d\ 12^h\ 36^m$. This difference in the two revolutions, when the parts of the fraction are reverſed, points out the neceſſity of attending very accurately to the circumſtance of the *driver* being made the *denominator* of the *fraction*.

The revolutions of the primary planets in the common planetarium, where there is only one pair of wheels to each planet, are eſtimated by this caſe.

When it happens that one of the pair is immoveably fixed, and the other put in motion by being carried round it, whilſt their teeth are connected, the fixed wheel is the cauſe of motion, and is therefore to be called the driver.

But the velocity, or *meaſure* of motion, in any particular wheel, is not the only effect that is to be attended to in aſtronomical mechaniſm, the *direction* of motion is alſo to be obſerved, on which account it may be worthy of remark here, that when a wheel or pinion revolves round the *outer* edge of a fixed wheel by means of a moveable bar, it turns in the *ſame* direction in which the bar itſelf moves; but when it revolves by means of a connection with the *inner* edge of a fixed ring, it revolves in a *contrary* direction. Alſo, in a contrate wheel the motion may be either direct or retrograde, accordingly as the teeth are cut in the upper or under face of the wheel; and in bevel wheels it is requiſite to notice whether the horizontal wheel be placed above or below the vertical one.

Caſe 2.—When a ſimple motion is produced by a train of wheels and pinions, the ratio of velocity between the firſt and laſt movers is thus aſcertained: multiply all the driven pinions or wheels into one another for one numerator, and all the drivers in like manner for one denominator; for inſtance, ſuppoſe that a wheel of 40 drive a pinion of 8, on the arbor of which is a wheel of 42 driving another pinion of 6, and that on the arbor of this laſt be a third wheel of 56 driving a third pinion of 7; then the operation abridged will ſtand thus: $\frac{8}{40} \times \frac{6}{42} \times \frac{7}{56} = \frac{336}{94080} = 280$; whence it appears that the number of revolutions gained is 280, which would have been ſo many loſt, had the pinions been the drivers. By this general rule the trains of all the planets in orreries may be computed, however complex, provided the *ſupporters* of the wheelwork be fixed in a ſtationary poſition. After a train is reduced to a ſimple fraction, the *time* correſponding to it is aſcertained exactly as in Caſe 1. Thus, in the inſtance before us, if the firſt wheel of 40 revolve once in a tropical year, the laſt pinion of 7 will be carried round in $\frac{336}{94080}$ of 365.24222 days, which time is equal to $1^d\ 7^h\ 18^m\ 23^s.3$.

In any train of wheelwork, the wheels or pinions placed on the firſt, third, fifth, &c. arbors, all revolve in the ſame direction, and thoſe placed on the ſecond, fourth, ſixth, &c. revolve in the contrary direction, whence it ſometimes becomes neceſſary to add an intermediate wheel or pinion, merely to change the *direction* of motion, or otherwiſe to connect two wheels, which are neceſſarily placed too far from each other to act immediately together; now, whenever a wheel or pinion of this deſcription is met with, as it gives a tooth for every tooth which it takes, it muſt be conſidered as acting in the double capacity of a driver, and a wheel or pinion driven, and will conſequently ſtand both as numerator and denominator of the fractional portion which it repreſents; but as every fraction which has its numerator and denominator alike, is equal to *unity*, and as unity, taken as a multiplier or diviſor, does not alter the value of any multiplicand or dividend, every wheel or pinion acting in a *double capacity*, whatever be its number, may be entirely omitted in computing the value of a train.

Caſe 3.—When a ſimple motion is produced by the agency of a worm or endleſs ſcrew actuating a wheel, the ſtructure of the ſcrew muſt be carefully examined; *i. e.* whether there be one or two threads, and whether the inclination thereof be ſuch as to produce a direct or retrograde motion in the wheel which it impels; theſe things being noted, the ſcrew muſt be conſidered as performing the office of a pinion of one or two leaves, as the caſe may be, the conſtruction of which is impracticable: the manner of eſtimating the agency of

of a ſcrew, is, therefore, ſimilar to that of a pinion,—by Caſe 1, if there be only one wheel, but by Caſe 2, if there be a train.

The lunar train of Mr. Ferguſon's orrery, which we ſhall have occaſion to examine under our article ORRERY, affords an example for this caſe, where it will be ſeen that the drivers may be either wheels, pinions, or endleſs ſcrews, provided they are put down as the denominators of their reſpective fractions.

Caſe 4.—When a compound motion is effected partly by the action of wheels and pinions, and partly by a moveable bar, which ſupports ſome portion of the mechaniſm, the effect is not ſo eaſily computed as in the foregoing caſes; for beſides the revolutions produced by a train of wheelwork, according to Caſe 2, it will be neceſſary to add or ſubtract an additional calculation, according as the wheels on the moveable bar are circumſtanced with reſpect to thoſe which are not carried thereby: a few inſtances will elucidate this caſe.

In Mr. Ferguſon's orrery, the train of wheels which produce a revolution of Venus, is $\frac{25}{8} \times \frac{69}{7} \times \frac{73}{10} = 224^{d}$ 20^{h} 47^{m} 1^{s}, according to the rules laid down in Caſe 2, and Mercury's revolution is occaſioned by $\frac{18}{28}$ of this train placed on the arm of Venus, or is equal to 1.555 revolutions in one of Venus; but the arm of Venus *puſhes* Mercury's laſt wheel once round in the ſame time, by means of a connection with its teeth, as may be ſeen in the author's "Select Mechanical Exerciſes," page 83—85; conſequently $\frac{244.86606}{1 + 1.55555}$, which is equal to 87^{d} 23^{h} 47^{m} 24^{s}, is the exact length of a revolution of Mercury, as produced by the joint agency of the wheelwork and moveable arm.

For another example, let us ſuppoſe that A be a central wheel of 40, moving, by means of a train, 50 times round in a tropical year, from weſt to eaſt, and B another wheel of 20, carried round it by an arm, whilſt their teeth are connected, in a contrary direction, *viz.* from eaſt to weſt, once in the ſame time; now while the wheel A of 40 revolves 50 times, it is evident that the driven wheel B of 20 muſt revolve 100 times, provided the motion of the arm which ſupports it be out of the queſtion; but if we conſider that the arm and wheel B both revolve in the ſame direction, from eaſt to weſt, it is equally evident that this wheel will revolve *twice* in being carried *round* the wheel A, even though that wheel were at reſt; ſo that 100 + 2 or 102, is the true number of revolutions that the wheel B makes whilſt the arm revolves once.

If, however, we ſuppoſe the ſaid wheel A to revolve from eaſt to weſt, inſtead of from weſt to eaſt, the wheel B will in this predicament turn in a direction contrary to that of the arm, and whilſt it is making 100 revolutions from weſt to eaſt, will make two from eaſt to weſt, the firſt occaſioned by the wheel A only, and the ſecond by the arm carrying it in a contrary direction; ſo that 100 − 2 or 98, will be the number of revolutions effected under theſe circumſtances. In the former inſtance the value will be $\overline{\frac{1}{50} \times \frac{20}{40}} + \frac{40}{20}$ of a year, and in the latter $\overline{\frac{1}{50} \times \frac{20}{40}} - \frac{40}{20}$ of the ſame.

Let us again ſuppoſe B to be 16, and A as before 40, then one inſtance will give $\overline{\frac{1}{50} \times \frac{16}{40}} + \frac{40}{16} = 127\frac{1}{2}$, and the other $\overline{\frac{1}{50} \times \frac{16}{40}} - \frac{40}{16} = 122\frac{1}{2}$.

From theſe examples the reader will be able, it is preſumed, to compute the effect of any wheelwork that may fall under this caſe; but it muſt be recollected, that in every inſtance where a moveable arm carries any wheel round a central one, the central, even though the *driving* wheel, muſt be made the *numerator* of the additive or ſubtractive fraction, which is *annexed* to the calculation depending upon the train, as computed by Caſe 2; otherwiſe an error of conſiderable magnitude will enſue, as will appear when we come to examine, by this caſe, the diurnal motion of ſome of the modern tellurians.

Caſe 5.—When an apparent progreſſive motion is cauſed by the difference of two comparative motions, as is that of the moon's apogeal point, compared with the ſmall revolving ecliptic plate in Mr. Ferguſon's inſtruments, called the "Calculator," and the "Mechanical Paradox," ſubtract the number of the ſmaller of the two wheels from that of the greater, and ſee how often the difference is contained in the *greater*: this quotient will expreſs the number of revolutions of the driving wheel during which one apparent progreſſive revolution will be gained by the other.

Let us firſt take $\frac{62}{55}$, the numbers of the calculator, for an example; their difference is 7, and $\frac{62}{7}$ is equal to $8\frac{6}{7}$ years, or 8 tropical years and 313.06476 days: in this example the driving wheel of 55 revolves once in a year, and impels the wheel of 62, which may be called the apogeal wheel, once round in a retrograde direction, except the ſpace of *ſeven* teeth in the ſame time; the ſmall ecliptic plate alſo revolves in a retrograde direction once in a year; conſequently, as the retrogradation of the apogeal wheel is ſlower than that of the ecliptic plate, it *appears* to an obſerver to *advance progreſſively* the ſpace of ſeven ſixty-ſecond parts of a circle in every year, and by this apparent motion indicates the mean motion of the moon's apogee in the ecliptic.

As a ſecond example, let the numbers of the mechanical paradox be taken, which are $\frac{44}{36}$; here the difference is 5, and $\frac{44}{5}$, or $8\frac{4}{5}$, is equal to a period of 8 tropical years and 292.1936 days.

When a train of wheels and pinions is employed to produce the progreſſive motion of the apogeal point, as is done in the common lunarium, it muſt firſt be reduced into a ſimple fraction by Caſe 2, and then eſtimated by this caſe as though one pair of large wheels conſtituted the fraction.

Caſe 6.—When an apparent retrograde motion is cauſed by the difference of two comparative motions, as in the caſe of the moon's nodes, compared with the little ecliptic plate in the lunarium, and ſome of the larger orreries, ſubtract, as in the laſt caſe, the ſmaller of the two wheels from the larger, and ſee how often the difference is contained in the *ſmaller*: the quotient will give the number of revolutions in the driving wheel during which one *retrograde* revolution will be effected by the other. Thus, in Mr. Ferguſon's orrery, the

wheels for the moon's nodes are $\frac{56}{59}$, and $\frac{56}{3} = 18\frac{2}{3}$, gives 18 years and 243.49481 days for the period of their retrograde revolution. Alſo, in the mechanical paradox of Mr. Ferguſon, the wheels $\frac{37}{39}$ produce the ſame kind of revolution in $\frac{37}{2}$ or $18\frac{1}{2}$ half years. In this caſe the retrogradation of the driven wheel is quicker than that of the ecliptic plate, on which account the *apparent* motion of the nodes is retrograde, *viz.* the reverſe of the laſt caſe; for there the *loſs* of velocity appears to be *progreſſive motion;* but here the *gain* of velocity conſtitutes the *apparent retrograde* motion; whereas, in point of fact, in both caſes the apparent motion is only the difference of two unequal motions in the ſame direction. A movement of wheels and pinions may here alſo be reduced into a ſimple fraction, and then eſtimated by the preſent caſe.

Caſe 7.—The paralleliſm of a wheel's arbor, which is carried by a moveable arm round a central point, is preſerved by means of *one* revolution of that wheel, in a direction *contrary* to that of the arm, in the *ſame time* that the arm is carried round: for whilſt the progreſſive motion of the arm is carrying any individual point of the wheel towards one ſide of any diſtant object, the retrograde motion of the wheel carries the ſame point juſt as far towards the other ſide of the ſame object, ſo that theſe two contrary motions, like the ſigns of addition and ſubtraction, counteract each other, and there appears to be no revolution at all: thus the ſame point of the wheel, and conſequently the remote end of an arm placed on its revolving arbor, will continue to point towards the ſame diſtant point in every part of its revolution. In order, therefore, to judge of the accuracy of the paralleliſm of any wheel's arbor, or planet's axis borne by it, in every part of its revolution, it is only neceſſary to examine whether it revolves *exactly once* in each revolution of the arm which ſupports it, in a direction *contrary* to that of the arm; it is of no conſequence, in point of accuracy, by what mechaniſm this effect is produced. It is by a contrivance to effect this purpoſe, that the earth's axis and ſmall ecliptic plate in all the tellurians, lunaria, and orreries are, or ought to be, preſerved parallel to a required original ſituation: but we ſhall have occaſion hereafter to point out a defect in this reſpect in ſome of our modern inſtruments.

The third head that we propoſed to treat of, is to determine by calculation planetary numbers proper for wheelwork, which ſhall produce a given effect. The moſt ſyſtematic way of laying down the various rules for doing this, will be to reverſe the ſeven caſes of which we have ſeen the application; for the fundamental directions for determining the numbers proper for wheelwork to produce a given effect, bear the ſame relation to thoſe laid down under our laſt head, for computing the value of wheelwork already conſtructed, that analyſis does to ſyntheſis; the reader, therefore, muſt bear in mind, that in thoſe caſes where multiplication or addition were uſed there, diviſion or ſubtraction will be neceſſary here; and to prepare him gradually for entering upon the more difficult calculations where prime numbers occur, we ſhall ſelect ſuch examples only in the exemplification of theſe ſeven reverſed caſes as admit of commenſurable fractions.

Caſe 1.—When a pinion is required to revolve any given number of times for its wheel once, as ſuppoſe 10, it is only neceſſary to fix upon a ſuitable number for the pinion, and multiply the given number of revolutions thereby to aſcertain the number of teeth for the required wheel; thus, if the pinion choſen be 9, the wheel muſt be $9 \times 10 = 90$, ſo that $\frac{9}{90}$ will be the pair required to produce an increaſe of velocity in the ratio of 10 to 1; but if a decreaſe be required, then $\frac{90}{9}$ will be the proper pair.

When the number of revolutions conſiſts of an integer and a fractional part, or what is uſually called "a mixed number," as is generally the caſe, it muſt be reduced to a ſimple fraction, which will expreſs the ratio of the wheel and its proper pinion: for inſtance, if $6\frac{3}{4}$ revolutions were required to be effected in a given time, the ſimple fraction or ratio would be $\frac{27}{4}$, or rather $\frac{4}{27}$, as there is to be an increaſe of velocity, and as the denominator is to be made the driver; here, however, the 4 is too ſmall a number to conſtitute a good pinion; let, therefore, both parts of the fraction be augmented in the ſame proportion, till they are both of a convenient practical ſize; in this inſtance, for moſt common purpoſes, the numerator and denominator may be both *doubled*, by which means $\frac{8}{54}$ will be the wheel and pinion required.

This rule is not only eaſy to be underſtood by any perſon who underſtands the nature of vulgar fractions, but its application is general in all kinds of ſimple wheelwork which are placed in ſtationary poſitions. Had the tropical revolutions of the planets been given in books on aſtronomy in exact fractions of a ſolar year, or of any other definite period, theſe directions would have been ſufficient for determining the wheelwork which falls under this caſe; but the periods are generally given in days, hours, minutes, and ſeconds, on which account it is neceſſary to reduce each period into its loweſt denomination, and alſo the period, with which each is compared, into the ſame, and then reduce this large fraction into its loweſt terms, by a continual alternate diviſion, till there is no remainder, as directed in the common ſchool books of arithmetic; then the fraction in its loweſt terms will be the ratio for which the wheel and pinion are to be determined.

For the ſake of exemplification, let us ſuppoſe that the tropical period of any heavenly body revolving round the ſun, be $243^d\ 11^h\ 52^m\ 32^s$, and that a pair of wheels be required to produce this revolution, whilſt the driver revolves in $365^d\ 5^h\ 48^m\ 48^s$: theſe periods, reduced into a ſimple fraction, will be $\frac{21037952''}{31556928}$, which, in its loweſt terms, is $\frac{2}{3}$; therefore, increaſing both parts eight, nine, or ten times, we ſhall have $\frac{16}{24}$, $\frac{18}{27}$, or $\frac{20}{30}$, for the wheels required. In every inſtance where a ſolar year is the denominator, the ratio of an inferior planet will be a *proper*, and of a ſuperior one an *improper* fraction.

Caſe 2.—Whenever two periods which are compared together conſtitute a fraction, which, in its loweſt terms, is compoſed of numbers too large for ſingle wheels, a train of wheels and pinions becomes neceſſary to reduce the ſize of the ſimple wheels, which may be done thus; find, by a repetition of aſſumed diviſors, or from a table for this purpoſe, what two or more numbers, uſually called compoſite numbers or factors, multiplied into each other, will give

give a product equal to the numerator, and ſubſtitute thoſe numbers, with the ſign of multiplication between each, for the numerator itſelf; do alſo the ſame for the denominator; and theſe will be the proper numbers to be tranſpoſed, augmented, or diminiſhed, as circumſtances may require, for a train of the ſame value as the original ſimple fraction. An inſtance or two will render this caſe familiar: let us take $\frac{629}{21}$ as the ratio of a ſuperior planet compared with the earth, the numerator of which is too large for a ſingle wheel: now the two compoſite numbers for the numerator are 37 and 17, their product being equal to 629, and the two compoſite numbers for 21 are 7 and 3; hence, inſtead of $\frac{629}{21}$, we have obtained $\frac{37 \times 17}{7 \times 3}$, or, which is the ſame thing in the form of a train, $\frac{37}{7} \times \frac{17}{3}$, or otherwiſe $\frac{37}{3} \times \frac{17}{7}$, it being a matter of no conſequence how the pinions are placed with reſpect to the wheels, provided they be both drivers: let now both parts of the $\frac{17}{3}$ be doubled, ſince 3 cannot be made into a good pinion, and the requiſite train will be $\frac{37}{7} \times \frac{34}{6}$.

Again, let us take $\frac{35}{621}$ for the ratio of an inferior planet; the compoſite numbers will be reſpectively 7×5, and 27×23, conſtituting a train of $\frac{7}{27} \times \frac{5}{23}$, or $\frac{14}{54} \times \frac{10}{46}$, if they have all their parts doubled. By this contrivance two ſmall wheels with correſponding pinions anſwer the ſame purpoſe as one very large wheel and its pinion, and are not only much more eaſily made, but rendered more portable for the conſtruction of an inſtrument.

When it happens that there is a great diſparity between the numerator and denominator of a fraction, where only the larger of them admits of compoſite numbers, we muſt ſubſtitute *unity* for a compoſite number along with the other, and then increaſe both parts to get a train as before. As an example of this kind, let us take $\frac{19}{235}$, the lunar numbers of Ferguſon's calculator, which, though more accurate than thoſe of his orrery, he has not attempted to reduce into ſmaller practical numbers: the numerator is a prime number, for which we may put 19×1, and the denominator is equal to 47×5; hence $\frac{19 \times 1}{47 \times 5}$, or $\frac{19}{47} \times \frac{1}{5}$, will give us a train of $\frac{19}{47} \times \frac{10}{50}$, equal in value to $\frac{19}{235}$.

In order to produce the greateſt poſſible velocity with the feweſt teeth in a train, the ratio of each wheel to its pinion ought to be, ſays Dr. T. Young, in his Syllabus, nearly as 36 to 10.

Caſe 3.—In every inſtance where 1 or 2 ſtands in the place of a pinion, according to either Caſe 1, or Caſe 2, a ſingle or double ſcrew may be adopted inſtead of increaſing both parts of the ratio, as has juſt been directed; but it muſt be under this limitation, that the ſcrew be always the driver, otherwiſe the friction and indirect action of the teeth upon its thread will prevent the communication of motion.

Caſe 4.—This caſe is more intricate than the preceding ones, and ſeems not to have been underſtood by any contriver of an orrery, except perhaps Ferguſon and Janvier, whoſe orreries are free from both the defect and exceſs in the diurnal motion, which, one or other of them, render the tellurian and large orreries extremely imperfect.

When any given number of revolutions is to be produced in a wheel or pinion carried by a moveable arm or bar, during the time that the arm itſelf is carried once round a central driving wheel, a fraction conſiſting of the numbers of thoſe two wheels, (whereof the central one muſt be the numerator, and the one driven by it on the bar the denominator,) muſt be added to, or ſubtracted from, the required number of revolutions, accordingly as the arm and the wheel borne by it have the directions of their motions circumſtanced, and wheelwork muſt be calculated to effect the ſum or difference, as the caſe may be: if the motions of the arm and of the wheel borne by it be in the *ſame* direction, the fraction muſt be *ſubtracted*, but if they be in *contrary* directions, the ſame muſt be *added*, before the proper wheels are calculated for the number thus obtained. As an inſtance of this ſpecies of calculation, let any central wheel be ſuppoſed to have 15 teeth, and the wheel borne by an arm moveable about it to have 10, and let us ſuppoſe that this latter wheel and the arm that ſupports it move in the *ſame* direction; then, under theſe circumſtances, let two ſuch other wheels be required to be calculated to actuate the central wheel, for the former portion of the train, as, in addition to thoſe two, will produce juſt 15 revolutions of the laſt wheel 10, whilſt the arm is going once round: in the firſt place, becauſe the arm and the wheel 10 move both in the *ſame* direction, $\frac{15}{10}$, or $1\frac{1}{2}$, muſt be *ſubtracted* from 15, the number of revolutions required, which ſubtraction leaves $13\frac{1}{2}$; in the next place, becauſe the central wheel of 15 goes only twice round for the wheel of 10, which is driven by it three times, $\frac{2}{3}$ or $\frac{10}{15}$ of $13\frac{1}{2}$, which is equal 9, is the value to be expreſſed by the fraction which is to repreſent the wheel and pinion required; $\frac{12}{108}$ therefore, or any pair in a ſimilar ratio, will be the wheel and pinion required; and the whole value, eſtimated by Caſe 4 under our laſt head, will be thus expreſſed, $\overline{\frac{12}{108} \times \frac{10}{15}} + \frac{15}{10} = 15$.

Again, let two ſuch wheels be required as will produce the ſame number of revolutions while the arm and the wheel borne by it move in *contrary* directions, the numbers of the two given wheels remaining the ſame as before. Here $\frac{15}{10}$, or $1\frac{1}{2}$, muſt be *added* to 15, which ſum will be $16\frac{1}{2}$; then $\frac{10}{15}$ or $\frac{2}{3}$ of $16\frac{1}{2}$ is 11, the value to be expreſſed by the required wheels, which therefore may be $\frac{12}{132}$, producing two more revolutions of the central wheel than was produced in the other inſtance; here the computation of the whole value will be $\overline{\frac{12}{132} \times \frac{10}{15}} - \frac{15}{10} = 15$.

Hence it appears, as was intimated before, that when a negative

negative ſign is prefixed to the fractional portion, which conſiſts of the central wheel for a numerator and the wheel on the arm for a denominator, in computing the number of revolutions made by the latter in wheelwork already conſtructed, according to Caſe 4 of our laſt head, a poſitive ſign muſt be here uſed in calculating what the wheelwork ought to be, and *vice verſâ*; for as $4 + 2 = 6$, ſo $6 - 2 = 4$, the one caſe being juſt the converſe of the other. Alſo, whenever the two wheels, which compoſe the fraction juſt ſpecified, are of equal numbers, *unity* muſt invariably be added or ſubtracted, accordingly as the arm and wheel borne by it are circumſtanced with reſpect to the direction of their motions.

Caſe 5.—When an apparent progreſſive motion is to be produced by the difference of two comparative motions in wheelwork, reduce the given period into its loweſt denomination of time, and put it into a ſimple fraction in its loweſt terms, which, if the motion is to be ſlower than the period of which it is a fraction, will be an improper fraction: then let the numerator be the *driven* wheel, and the *difference* between the numerator and denominator the *driver;* for inſtance, if $9\frac{5}{6}$ years were the period in which an index is required to advance progreſſively round the little ecliptic of an orrery or tellurian, whilſt the ecliptic itſelf is moving backward once in a year to preſerve its paralleliſm; in the firſt place $9\frac{5}{6}$, reduced into a ſimple fraction, gives $\frac{59}{6}$, which would be the proper wheels, by Caſe 1, if the graduated ecliptic were not placed on a revolving arbor, but in this caſe $\frac{59}{59-6}$, or $\frac{59}{53}$, will be the wheels required.

If it ſhould ſo happen that a pair of wheels thus acquired ſhould be too large to be conveniently conſtructed, they may be converted into a train of the ſame value by the directions laid down in the ſecond caſe of this head.

Caſe 6.—When we are to exhibit an apparent retrograde motion by the difference of two unequal motions, in a given period, let this period be reduced into a ſimple improper fraction, as in the laſt caſe, and then the numerator, as before, will be the *driven* wheel; but here the *ſum* of the numerator and denominator will be the *driver*, ſo that if $9\frac{5}{6}$ were the period as before, the wheels would be equal to $\frac{59}{59+6}$, namely $\frac{59}{65}$. In this caſe alſo a train may be conſtituted of two wheels which are in themſelves too large for uſe.

Caſe 7.—When the paralleliſm of a wheel's axis is to be preſerved in every part of the revolution of the arm that bears it, nothing more is neceſſary than to make the wheel revolve by any contrivance *exactly once* in each revolution of the arm, but in a *contrary* direction, as has been already explained in Caſe 7 of our laſt head.

It may here be acceptable to the inſtrument maker to learn how, from one or other of theſe ſeven caſes, any wheel or portion of a train, which has been miſlaid or loſt, may be replaced.

As it is always known what period of time is *intended* to be repreſented by any particular train in every inſtrument, the general rule will be, to aſcertain, firſt by the proper caſe in our laſt head, what the value is, in time, of that portion of the train which remains, and then divide the whole known period by this value, and the quotient will repreſent the value of the deficient portion to be replaced by the correſponding caſe in this head.

For an example of this kind we may take the annual train of the old aſtronomical clock at Hampton Court, in the calliper of which we have ſeen that two deficient wheels are repreſented by dotted circles, which are ſaid to have been ſomehow ſupplied by a man of the name of Lang. Bradley of Fenchurch-ſtreet, but in what manner is not related: in our notice of this clock we put down the whole train thus, $\frac{*}{8} \times \frac{29}{*} \times \frac{132}{12}$, out of which we may take $\frac{29}{8} \times \frac{132}{12} = \frac{3828}{96}$, or 39.875 for the value in days of the entire portion; and if the whole year 365.24222 be divided by 39.875, the quotient 9.15943 will expreſs the value of the two deficient wheels, or wheel and pinion, which we now have to aſcertain. We find, by either of two modes of calculation, which will be preſently deſcribed and illuſtrated, that the value of the decimal portion, 15943, if expreſſed in vulgar fractions, will be, according to the accuracy we may require, ſome one of theſe, *viz.* $\frac{1}{6}$, $\frac{3}{19}$, $\frac{4}{25}$, or $\frac{11}{69}$; and the mixed numbers $9\frac{1}{6}$, $9\frac{3}{19}$, $9\frac{4}{25}$, and $9\frac{11}{69}$, when converted into ſimple ratios, will be reſpectively $\frac{55}{6}$, $\frac{174}{19}$, $\frac{229}{25}$, and $\frac{632}{11}$; the moſt accurate of theſe of courſe is the laſt, but is by no means of a practical ſize; in the calliper it appears that the wheel is a little larger than the one marked 132, which circumſtance points out that $\frac{174}{19}$ muſt be the numbers to be adopted in order to ſupply the deficiency of the train before us: the whole train, however, is by no means ſo accurate as Ferguſon's, who adopted for this conſtruction of a clock the ſame train which he calculated for his orrery: according to Caſe 2 of our ſecond head, the value of the whole train, thus ſupplied, will be $\frac{174}{8} \times \frac{29}{19} \times \frac{132}{12} = \frac{666072}{1824} = 365^{d}\ 4^{h}\ 6^{m}\ 35^{s}.184$; and if a more exact period be required to be repreſented, either one of the larger pairs muſt be uſed, or the whole train muſt be reformed.

If, however, we take 365 days for the year, which probably was the time intended, then we ſhall have as ſucceſſive fractions $\frac{55}{6}$, $\frac{64}{7}$, $\frac{119}{13}$, and $\frac{2920}{319}$, the laſt of which is the exact fraction, but too large for wheelwork, on which account, moſt likely, $\frac{119}{13}$ were the numbers, which makes the whole movement $\frac{119}{8} \times \frac{29}{13} \times \frac{132}{12} = 365^{d}\ 0^{h}\ 13^{m}\ 50^{s}.7$.

By this method alſo a ratio may be formed of the periods of any two individual planets, and wheelwork calculated to communicate motion immediately from one to the other; or indeed *any time* may be aſſumed as the period of the *firſt mover* in an inſtrument, provided the wheelwork of all the planets are proper ratios of that period: in the common planetarium the period aſſumed is one year, but if, inſtead of this, a period which is nearly a mean between the two extreme periods of Mercury and Georgian, were ſubſtituted, then eleven pair of wheels, or wheels and pinions for the eleven primary planets, would be ſufficient for the production

tion of the eleven periods, more or leſs accurate, accordingly as the ratios conſiſt of large or ſmall numbers.

We ſhall hereafter ſhew how a mean period may be aſcertained which will become a common denominator to the tropical periods of *all* the planets, uſed as numerators in *practical* numbers; and at the ſame time the moſt deſirable numbers will be determined, for the conſtruction of a ſimple planetarium, to repreſent all the mean motions accurately with the leaſt poſſible number of wheels and pinions; but in order to arrive at great accuracy in all the periods, the numbers that compoſe the fractions will neceſſarily be large; for what is gained in ſimplicity, will, in a certain degree, be loſt in accuracy.

Of incommenſurable Numbers.—We have now explained the fundamental rules for determining wheelwork which ſhall correſpond to any aſſumed *commenſurable* period, the application of which can hardly be miſapplied in the reſpective caſes which occur in the practice of inſtrument makers; but when we come to apply them to ratios conſiſting of *prime* or *incommenſurable* numbers, it becomes inevitably neceſſary to ſubſtitute other ratios of *nearly* the *ſame value*, for the true ratios themſelves, and then to apply the preceding rules to thoſe, which muſt conſequently be *commenſurable* ratios.

The readieſt method of determining all the variety of approximate *ſmall* ratios, though ſomewhat mechanical, is by means of two logarithmic lines for working proportions, which on the common ſliding rules are marked A and B; for if the three firſt figures in the numerator of any fraction, vulgar or decimal, which conſiſts of many places of figures on A, be ſet to the three firſt of its denominator on B, then every pair of coincident dividing or ſubdividing lines, examined like the index and limb of a Hadley's ſextant, will conſtitute ſo many ratios, more or leſs exact, as the coincidences are more or leſs perfect; and if the graduated lines are of a large radius, and well graduated upon metal or ſeaſoned wood, all the variety of approximate ſmall ratios will be ſeen at one poſition of the ſlider, that can poſſibly be formed; after which their reſpective values may be aſcertained, by converting them ſucceſſively into decimals, and comparing them with the large original fraction.

This ſhort method, however, ought not to be depended upon in calculations where great accuracy is required, for we can ſeldom come nearer the truth, in the fraction of a year, than as far as the ſecond figure in decimals; whereas, the value of *ſeconds* depends generally upon the *fifth* and *ſixth* decimal figures. In the fraction of a day or other ſhort period, it is very uſeful as a check upon arithmetical calculations, and will ſometimes even ſuperſede the neceſſity of them. We might now proceed to determine, by a direct method, better known to mathematicians than artiſts, a ſeries of continual fractions, which approximate to the truth the nearer the higher they run, and are alternately *above* and *below* the true ratio; but as a *new tentative* or *indirect method* occurred to the author of this article, which has its advantages, before he was acquainted with the application of the one alluded to, it may be deemed acceptable to ſome readers to ſee it exemplified in the firſt place.

Indirect Method of Approximation.—When none of the ſmall fractions or ratios indicated by the ſliding rule are ſufficiently accurate, take one of them and increaſe both parts of it, by a common multiplier, and then *add unity* to, or *ſubtract unity* from that part, whether numerator or denominator, which is too great or too ſmall for its correſpondent, and by trying the value of the new enlarged fraction in decimals, it will be readily ſeen whether the multiplier aſſumed has been too large or too ſmall; after which a ſecond, and a third multiplier may be ſucceſſively tried, and it will ſoon appear what number is the moſt accurate multiplier to be adopted. The advantages of this method are theſe two principally; that its nature is eaſy to be apprehended without algebraical demonſtration; and that it affords a great variety of ratios, differing from each other but little in value, out of which to ſelect a proper practical or commenſurable ratio; indeed inſtances have occurred, in which better practical trains have been procured by this method, than can be done by the more direct ſcientific method, which will be afterwards exemplified.

The Sun's Wheels.—As the ſun is the grand luminary which, placed in, or at leaſt near, the centre of the whole ſyſtem, gives light and heat to the ſurrounding bodies, we will begin with the calculation of wheels proper for producing a rotation on his axis, and then proceed gradually to the revolutions of the planets in their reſpective order; the period of a rotation of the ſun, as it reſpects the earth, has been given by La Lande, as we have ſeen above, at 25 days and 10 hours, or 25.41666 days, by which, if we divide 365.24222, we ſhall have 14.37008 rotations in a tropical year; here $14\frac{37}{100} = \frac{1437}{100}$ is not to be divided lower than $\frac{479 \times 3}{10 \times 10}$, on which account an approximate fraction muſt be ſubſtituted for $\frac{37}{100}$; ſet, therefore, 37 on A to 100 on B, and the neareſt ſmall ratios conſtituted by the apparently coincident lines will be $\frac{7}{19}$ and $\frac{10}{27}$, the latter of which, converted into a decimal, makes .370370, &c. in which the variation from the truth is, as it happens, in the *fourth* figure of decimals. In this inſtance, as the ſolar ſpots ſeldom continue unchanged for more than two or three rotations of the ſun, a more accurate ratio might ſeem quite unneceſſary, for $14\frac{10}{27} = \frac{388}{27}$, or rather $\frac{27}{388}$, as the motion to be produced is quick, is reducible into $\frac{27 \times 1}{97 \times 4}$, and a train equal to this is $\frac{27}{97} \times \frac{15}{60} = 25^d\ 9^h\ 59^m\ 31^s$; but to exemplify our method of approximating ſtill nearer to the truth, let us take the $\frac{7}{19}$, and multiply both its parts by 10, making $\frac{70}{190}$; now as $\frac{7}{19}$ is equal to .36842 only, the 19 is too large for its numerator; let, therefore, unity be ſubtracted from 190, and we ſhall have $\frac{70}{189} = .370370$, &c. the ſame ratio as $\frac{10}{27}$; again, try 12 for a multiplier, and there will be $\left.\frac{12 \times 7}{12 \times 19 - 1}\right\} = \frac{84}{227} = .37004$, which is extremely near the truth, but unfortunately $14\frac{84}{227}$ cannot be turned into a convenient train, by reaſon of 227 being a prime number; from theſe two trials, one of which gives more, and the other leſs than the true value, we now know, that if 11, uſed as a multiplier, will produce a commenſurable ratio, it will be proper for our train; and if not, we muſt take 13, as the next neareſt to 12, for the proper multiplier; accordingly

ingly $\frac{11 \times 7}{11 \times 19 - 1} = \frac{77}{208} = .37019$ gives us $14\frac{77}{208} = \frac{2989}{208}$, and when this is inverted, we ſhall have a train of $\frac{49}{16} \times \frac{61}{13} = 25^d\ 9^h\ 59^m\ 56^s.995$, in which time the error is little more than three ſeconds. If it had become neceſſary to uſe 13 as a multiplier inſtead of 11, the proceſs would have been $\frac{13 \times 7}{13 \times 19 - 1} = \frac{91}{246} = .36992$ nearly; and $14\frac{91}{246} = \frac{91}{3535}$, when inverted, will afford the train $\frac{6}{101} \times \frac{41}{35}$, the value of which is $25^d\ 10^h\ 0^m\ 4^s$, in which the error is only four ſeconds in the oppoſite extreme.

In determining what high numbers are commenſurable, when a table of primes is not at hand, try firſt 2 and 5 as diviſors, and then the primes 3, 7, 11, 13, 17, 19, 23, &c. ſucceſſively, if they are indiviſible by 2 or 5, until a prime number is arrived at as large as the ſquare root of the number examined, and if none of theſe will divide it without a remainder, the high number is itſelf a prime number, and therefore inapplicable to mechanical purpoſes.

Wheels for the tropical Revolution of Mercury.—After having given a detailed account of the application of our indirect method of approximation, in determining a train for the ſun's rotation, it will be unneceſſary to be ſo minute in particularizing the whole proceſs in the examples which follow.

The tropical period of Mercury, as we have ſeen, is $87^d\ 23^h\ 14^m\ 35^s.2$, or makes 4.151967, &c. revolutions in a tropical year. Now if 152 on A be put to 1000 on B, on the ſliding rule, we ſhall have the ratios $\frac{5}{33} = 1515$, $\frac{7}{46} = 1521$, &c. and $\frac{12}{79} = 1519$, as nearly as poſſible. The laſt of theſe three ratios is capable of forming a train equal to $\frac{79}{328}$, namely, $\frac{12}{96} \times \frac{79}{41}\left(= \frac{79}{8 \times 41}\right)$, which produces an error of only $2^m\ 6^s$ too much in a revolution. But exact as this train is, compared with the trains of inſtruments in general, our method of approximation will procure us a much more accurate one. Let us take the firſt ratio, $\frac{5}{33}$, for this purpoſe: the wheels compoſed of $4\frac{5}{33}$ are $\frac{33}{137}$; and as 33 is too large for the 5, unity muſt be added to the 137. After both parts are multiplied an equal number of times, this multiplier we find by a few trials to be 67; ſo that $\frac{33 \times 67}{137 \times 67 + 1} = \frac{2211}{9180} = 4.15196$ &c. gives us a very convenient train of $\frac{11}{90} \times \frac{67}{34}\left(= \frac{33 \times 67}{102 \times 90}\right)$, the value of which is $87^d\ 23^h\ 14^m\ 35^s.796$, in which the error in a whole revolution is little more than *half a ſecond.*

Wheels for the tropical Revolution of Venus.—The tropical revolution of Venus has been aſcertained to be $224^d\ 16^h\ 41^m\ 30^s$; according to which data, this planet will make 1.625498, &c. revolutions in a ſolar year. Now the neareſt ſmall fraction, which correſponds to the decimal portion, is $\frac{5}{8} = 625$ exactly, and the ratio $\frac{8}{13} = 1\frac{5}{8}$ inverted, is the ſame ratio which was uſed for Venus in Huygens' automaton, and the inſtruments copied from it. But theſe numbers are by no means ſufficiently correct for an inſtrument of great accuracy; they muſt conſequently be brought, by our approximating proceſs, into higher numbers ſuitable for a train. The numerator of this fraction being too large for its denominator, let us aſſume 312 for a multiplier, and add unity to the denominator; for the more accurate the ſmall fraction is already, the greater will the multiplier be required to be, and *vice verſâ*: thus we ſhall have $\frac{8 \times 312}{13 \times 312 + 1} = \frac{2496}{4057} = 1.6254006$. Again, this multiplier proving to be too great, let us try 305 inſtead, from which we ſhall have $\frac{8 \times 312}{13 \times 1312 + 1} = \frac{2440}{3966} = 1.625409$, &c. which is a little nearer. The former of theſe periods is equal to $224^d\ 17^h\ 1^m\ 0^s$, and the latter to $224^d\ 16^h\ 59^m\ 10\frac{1}{2}^s$: now the difference of thoſe two periods being about 2^m, and the difference of the multipliers 7, we can, from theſe two trials, aſcertain pretty nearly what number will be a proper multiplier; for as 2^m are to 7, the difference of the multipliers, ſo are 17^m, the whole remaining error, to 59, the number to be ſubtracted from 305, upon a preſumption that the decreaſing intervals of time are in direct proportion; 246, therefore, is the multiplier for our third trial, from which we gain a period, where the error is much leſs, and of an oppoſite denomination. In order now to gain a great variety, from which to ſelect an accurate practical train, we will ſubjoin a table of ratios, with their values attached, till we arrive at the truth as nearly as may be.

TABLE of Ratios for the Train of Venus.

Proceſs.	Ratios.	Values.
$\frac{8 \times 246}{13 \times 246 + 1}$	$= \frac{1968}{3199}$	$= 1.625508.$
$\frac{8 \times 247}{13 \times 247 + 1}$	$= \frac{1976}{3212}$	$= 1.625506.$
$\frac{8 \times 248}{13 \times 248 + 1}$	$= \frac{1984}{3225}$	$= 1.625504.$
$\frac{8 \times 249}{13 \times 249 + 1}$	$= \frac{1992}{3238}$	$= 1.625502.$
$\frac{8 \times 250}{13 \times 250 + 1}$	$= \frac{2000}{3251}$	$= 1.625500.$
$\frac{8 \times 251}{13 \times 251 + 1}$	$= \frac{2008}{3264}$	$= 1.625498.$
$\frac{8 \times 252}{13 \times 252 + 1}$	$= \frac{2016}{3277}$	$= 1.625496.$
$\frac{8 \times 253}{13 \times 253 + 1}$	$= \frac{2024}{3290}$	$= 1.625494.$

Proceſs.	Ratios.	Values.
$\left.\frac{8 \times 254}{13 \times 254 + 1}\right\}$	$= \frac{2032}{3303}$	$= 1.625492.$
$\left.\frac{8 \times 255}{13 \times 255 + 1}\right\}$	$= \frac{2040}{3316}$	$= 1.625490.$
$\left.\frac{8 \times 256}{13 \times 256 + 1}\right\}$	$= \frac{2048}{3329}$	$= 1.625488.$
$\left.\frac{8 \times 257}{13 \times 257 + 1}\right\}$	$= \frac{2056}{3342}$	$= 1.625486.$
$\left.\frac{8 \times 258}{13 \times 258 + 1}\right\}$	$= \frac{2064}{3355}$	$= 1.625484.$

In this table, each ratio differs in value from the next preceding, on an average, about 24″ of time, and $\frac{2008}{3264}$ is the moſt exact, the error in it being ſcarcely perceptible: it is not, however, reducible into the form of a practical train; but $\frac{2016}{3277}$, the next in accuracy, which varies from the truth only 2 in the *ſixth* place of decimals, is convertible into the train $\frac{32}{113} \times \frac{63}{29}$, the value of which is $224^d\ 16^h\ 43^m\ 1^s$.

Beſides this train, the ratio $\frac{1984}{3225}$ affords the train $\frac{32}{75} \times \frac{62}{43} = 224^d\ 16^h\ 40^m\ 25^s$; and the ratio $\frac{2064}{4355}$, which is the leaſt exact, is convertible into $\frac{48}{55} \times \frac{43}{61} = 224^d\ 16^h\ 44^m\ 18^s$, in which the error is only $2^m\ 48^s$ in the whole period. Indeed, many other ratios might be procured by this proceſs, varying only a few minutes from the truth, if the table were extended; but as the moſt accurate will always be preferred, we have carried it to a ſufficient length.

The trains, which have been aſcertained from the preceding table, are calculated upon a ſuppoſition that the wheels will all be placed on a ſtationary ſupport; but as Venus revolves next to the Earth, in the ſolar ſyſtem, the writer of this article has found it convenient, in an orrery which he has conſtructed, to place ſome of the wheels on the Earth's annual arm; in which conſtruction, Venus is carried *once* round in every tropical year, independently of the ſimple operation of the train, in the ſame way that Mercury is carried once by the arm of Venus, in Ferguſon's orrery, in every revolution of the latter. This mode of placing the wheels requires that the numerator of the ſimple fraction, $\frac{2016}{3277}$, already adopted as the moſt accurate, ſhould remain as it is; but that the difference between the numerator and denominator be made a new denominator, by which means *unity* is ejected, and $1 + \frac{2016}{1261}$, inſtead of $1\frac{2016}{1261}$, becomes the repreſentative formula, and the value of the train $=$ 0.625496; $\frac{2016}{1261}$, however, is capable of forming the train $\frac{63}{13} \times \frac{32}{97}$, and $1 + \overline{\frac{63}{13} \times \frac{32}{97}}$ is equal to $214^d\ 16^h\ 42^m\ 1^s$, as before.

The ratio $\frac{2016}{1261}$ might otherwiſe have been acquired by taking $\frac{8}{5} = 625$, inſtead of $\frac{8}{13}$, or $\frac{13}{8} = 1.625$, before the approximation; for $\left.\frac{8 \times 252}{5 \times 252 + 1}\right\} = \frac{2016}{1261}$ is the ſame reſult as by the former proceſs. For other calculations of this ſort, ſee PLANETARIUM.

Train for the Earth's annual and diurnal Motions.—The earth's diurnal rotation and annual revolution, taken jointly, conſtitute the ſtandard of our meaſure of time, and is always referred to, not only when we ſpeak of hiſtorical facts, but when we deſcribe the revolutions and rotations of all the other planets; it is therefore of the utmoſt importance, in an aſtronomical inſtrument, that the train, which conſiſts of the ratio between a day and a year, be accurate. The ſolar year, as we have ſeen, conſiſts of $365^d\ 5^h\ 48^m\ 48^s$, or, in another form, of 365 24222 days; the neareſt fraction to repreſent the decimal portion 24222 exactly, is $\frac{109}{450}$, and $365\frac{109}{450} = \frac{164359}{450}$ are diviſible into $\frac{269}{10} \times \frac{47}{9} \times \frac{13}{5}$, which numbers conſtitute a movement for the *truth itſelf*. If, however, we wiſh to ſubſtitute an approximate ratio of as nearly an equal value as we can obtain for ſmaller numbers than 269; the ſmall fraction ſuitable to approximate from is $\frac{8}{33} = 2424$, and the neareſt multiplier is 35; for 365 $\left.\frac{8 \times 35}{33 \times 35 \times 1}\right\} = \frac{1156}{422220}$ is reducible into $\frac{4}{227} \times \frac{17}{60} \times \frac{17}{31}$, the time correſponding to which is $365^d\ 5^h\ 48^m\ 47^s.3$, which will be allowed to be exact enough for the niceſt purpoſes, as the error in a year does not amount to three quarters of a ſecond.

The numerator 4, it will be obſerved, is too ſmall a number for a pinion to conſiſt of, for which reaſon let it be doubled, and alſo the 31 among the denominators or drivers, by which alteration we ſhall have a practical train of $\frac{8}{227} \times \frac{17}{62} \times \frac{17}{60}$. Here the large wheel of 227 will be ſuitable for the fixed wheel in an orrery or tellurian, where the reſt of the train is placed on the annual arm, and carried round it; or for what is called the annual wheel in any orrery where all the wheels revolve in fixed ſituations.

Wheels for the tropical Revolution of Mars.—Next in the ſyſtem beyond our earth revolves the planet Mars, finiſhing its courſe through the ecliptic in $686^d\ 22^h\ 18^m\ 37^s$, according to our calculations from La Lande's laſt tables, which time bears the ſame proportion to a ſolar year that 1.880750 does to 1. In this example the ſmall fraction will be $\frac{47}{25} = 1.88$, and 53 the neareſt multiplier, as may be ſeen from the ſubjoined table.

TABLE of the Ratios of Mars.

Proceſs.	Ratios.	Values.
$\left.\frac{47 \times 5^2 + 1}{25 \times 52}\right\}$	$= \frac{2445}{1300}$	$= 1.880769$
$\left.\frac{47 \times 53 + 1}{25 \times 52}\right\}$	$= \frac{2492}{1325}$	$= 1.880754$
$\left.\frac{47 \times 54 + 1}{25 \times 54}\right\}$	$= \frac{2539}{1350}$	$= 1.880740$

Fortunately $\frac{2492}{1325}$, the moſt accurate of theſe three ratios, admits of the practical train $\frac{89}{25} \times \frac{28}{53} = 686^d\ 22^h\ 20^m\ 41^s.19$; in this train the error is $2^m\ 41^s.19$, or a ſpace in the ecliptic of $3\frac{1}{2}''$, which may be conſidered nearly as accurate at any of the preceding; for during a revolution of Mercury it will only be about an eighth part of this quantity; an error of a few minutes in the revolutions of the ſuperior planets being leſs perceptible than in the inferior ones, both on account of the ſlowneſs of their mean motions, and the great length of their tropical periods; for one minute's motion of Mercury in the ecliptic is $10''.2$, which exactly correſponds to *two hours* motion of Saturn, and $5^h.69$ of the Georgian planet.

Wheels for the tropical Revolutions of the four little Planets lately diſcovered.—According to the beſt information we at preſent poſſeſs, the periods of the four newly diſcovered planets, as they relate to the ecliptic, are theſe; *viz.* that of Veſta in 3.655153 tropical years, that of Juno in 4.355282, that of Ceres in 4.603056, and that of Pallas in 4.603616; but thoſe of the two laſt named are ſo nearly alike, that a mean between the two may be taken at 4.603386, in order to make one pair of wheels, or one train, produce the revolutions of both planets.—By the aid of the ſliding rule we find the neareſt ſmall fraction for Veſta to be $\frac{19}{29} = .65517$; and $3\frac{19}{29} = \frac{106}{29}$ will conſtitute the wheels proper to produce a revolution in 3.65517 tropical years, or in 1335.02329 days. In like manner for Juno the ſmalleſt fraction is $\frac{11}{31} = .35484$; and $4\frac{11}{31} = \frac{135}{31}$ will be proper wheels for a revolution to be performed in 4.35484 tropical years, or in 1590.56774 days. Likewiſe for Ceres and Pallas, the fraction $\frac{3}{5} = .60$ will be the neareſt in ſmall terms, and $4\frac{3}{5} = \frac{23}{5}$, or in a more practical form, $\frac{138}{30}$ will be wheels proper for effecting a mean of the two revolutions, and two arms opening like a pair of dividers may be inſerted on a tube connected with wheel 138, when the 30 revolves in a ſolar year, in which caſe each planet will make a revolution in the ecliptic in 4.60 tropical years, or in 1680.11421 days.

We might approximate much nearer to the aſſumed periods of theſe planets by our proceſs for gaining trains, but until the periods themſelves are more nicely determined, it would anſwer no uſeful purpoſe.

Wheels for the tropical Revolution of Jupiter.—We come next to Jupiter, which planet, we have ſeen, runs through the ecliptic, according to La Lande's tables, in $4330^d\ 14^h\ 40\frac{1}{2}^m$, or in 4330.61145 days, which number divided by 365.242222 gives the ſame equal to 11.856820 tropical years; now if we take $\frac{6}{7}$ for the ſmall fraction, and 377 for the neareſt practical multiplier, we ſhall have $\left.\frac{6 \times 377}{7 \times 377 + 1}\right\} = \frac{2260}{2640} = .856818$; and $11\frac{2260}{2640}$, or $\frac{31302}{2640}$, may be reſolved into $\frac{141 \times 222}{33 \times 80}$, which, if we take two-thirds of each leading portion, and one-half of each following, in both the numerator and denominator, will afford us the convenient train $\frac{111}{22} \times \frac{94}{40}$, the value of which is $4330^d\ 14^h\ 39^m\ 5^s$, during which time the error in time is only $1^m\ 25^s$, or a correſponding ſpace in the ecliptic equal to a *quarter* of a *ſecond*.

Wheels for the tropical Revolution of Saturn.—We come now to aſcertain wheels proper for the tropical revolution of Saturn, which, by the beſt tables of La Lande, is equal to $10746^d\ 19^h\ 20^m$, or 29.423777 tropical years; the ſeveral ſmall fractions which the ſliding rule gives, nearly equal to the decimal portion .423777, are $\frac{3}{7} = .428$, &c.; $\frac{11}{26} = .4230$, &c.; $\frac{14}{33} = 424242$; and $\frac{25}{59} = .423728$: now, if we approximate from the firſt of theſe, we ſhall have the following ratios.

Proceſs.	Ratios.	Values.
$\left.\frac{3 \times 16}{7 \times 16 + 1}\right\}$	$= \frac{48}{113}$	$= .4247$
$\left.\frac{3 \times 15}{7 \times 15 + 1}\right\}$	$= \frac{45}{106}$	$= .4245$
$\left.\frac{3 \times 14}{7 \times 14 + 1}\right\}$	$= \frac{42}{99}$	$= .424242 = \frac{14}{33}$ the third fraction.
$\left.\frac{3 \times 13}{7 \times 13 + 1}\right\}$	$= \frac{39}{92}$	$= .423913$
$\left.\frac{3 \times 12}{7 \times 12 + 1}\right\}$	$= \frac{36}{85}$	$= .4235$

Theſe values are not exact enough here, and the numbers $29\frac{9}{25}$, which are the moſt accurate, have prime numbers for the factors of their denominator, when reduced into a ſimple fraction; we muſt therefore have recourſe to $\frac{11}{26}$, the ſecond ſmall fraction for conſtructing another table of ratios, thus:

Proceſs.	Ratios.	Values.
$\left.\frac{11 \times 25}{26 \times 25 - 1}\right\}$	$= \frac{275}{649}$	$= .42372$
$\left.\frac{11 \times 24}{26 \times 24 - 1}\right\}$	$= \frac{264}{623}$	$= .42375$

Proceſs.	Ratios.	Values.
$\frac{11 \times 23}{26 \times 23 - 1}$	$= \frac{253}{597}$	$= .42378$
$\frac{11 \times 22}{26 \times 22 - 1}$	$= \frac{242}{571}$	$= .42381$
$\frac{11 \times 21}{26 \times 21 - 1}$	$= \frac{231}{545}$	$= .42385$
$\frac{11 \times 20}{26 \times 20 - 1}$	$= \frac{220}{519}$	$= .42389$
$\frac{11 \times 19}{26 \times 19 - 1}$	$= \frac{209}{493}$	$= .42393$
$\frac{11 \times 18}{26 \times 18 - 1}$	$= \frac{198}{467}$	$= .42398$
$\frac{11 \times 17}{26 \times 17 - 1}$	$= \frac{187}{441}$	$= .42403$
$\frac{11 \times 16}{26 \times 16 - 1}$	$= \frac{176}{415}$	$= .42409$
$\frac{11 \times 15}{26 \times 15 - 1}$	$= \frac{165}{389}$	$= .42416$
$\frac{11 \times 14}{26 \times 14 - 1}$	$= \frac{154}{363}$	$= .424242 = \frac{14}{33}$ as before.

The moſt accurate ratio of this table is $\frac{253}{597}$, but $29\frac{253}{597}$ is incapable of becoming a practical train when reduced into a ſimple fraction, one of the factors of the numerator being the large prime 8783, the next in accuracy is $29\frac{2364}{623} = \frac{18341}{623}$, which is not reducible into numbers low enough for a train; and $29\frac{242}{571}$ is alſo incapable of reduction, by reaſon of the denominator 571 being a prime number; but $29\frac{275}{649} = \frac{19096}{649}$ is reducible into the train $\frac{124}{59} \times \frac{154}{11}$; the value of which is $10746^d\ 18^h\ 54^m\ 51^s$; this train is of the ſame value as $29\frac{25}{59}$, obtained from the ſliding-rule alone, and may otherwiſe be more conveniently expreſſed thus, $\frac{124}{7} \times \frac{98}{59}$.

Again, $29\ \frac{231}{545} = \frac{16036}{545}$ will give us the leſs accurate train $\frac{76}{109} \times \frac{211}{5}$, the value of which is $10746^d\ 20^h\ 0^m\ 17^s.26$.

Wheels for the tropical Revolution of the Georgian Planet.—We come, laſtly, to the Georgian planet, which performs its circuit through the ecliptic in $30589^d\ 8^h\ 27^m$, if we confide in the accuracy of La Lande's tables, as calculated by La Lambre; let now 30589.35208 be divided by 365.24222, and we ſhall have 83.750865 tropical years for the length of the ſame period, which happens to be ſo nearly $83\frac{1}{4}$, or $\frac{335}{4}$, that an approximation ſeems unneceſſary: the train anſwering to this fraction may be $\frac{67}{10} \times \frac{100}{8} = 30589^d\ 0^h\ 52^m\ 0^s$, which time is ſo near the period aſſigned by the tables, that the error in ſpace is only about 14″ in the whole revolution.

Theſe examples will ſuffice to ſhew the application of this mode of approximation in any calculation of wheelwork that may occur in the practical conſtruction of an inſtrument, though, it muſt be confeſſed, the following method is more conciſe, as well as more ſtrictly mathematical, and therefore will generally be preferred by thoſe who underſtand it, and who may have occaſion to make new calculations for wheelwork.

It was deemed expedient to exemplify both methods, in order that, when one will not produce a convenient train, in any inſtance, the other may ſupply its defect if poſſible.

Direct Method of Approximation.—The method, already alluded to, of determining a ſeries of ratios, alternately above and below the value of a given incommenſurable ratio, has been treated of by a great variety of writers in different languages. [Vide Deſcriptio Automati Planetarii, Huygens. The Deſcription and Uſe of an Orrery of a New Conſtruction, Martin. Complement des Elemens d'Algebre, S. F. La Croix. Introductio in Analyſin Infinitorum, Euler. Opuſcula Analytica, Euler. Elements of Algebra, vol. ii. Euler. La Reſolution des Equations Numeriques, La Grange. Theorie des Nombres, Le Gendre. Memoires de l'Academie des Sciences de Paris, 1772. Memoires de l'Academie de Berlin, 1767, 1768, 1769, and 1776. Memoires de l'Academie de Peterſbourg, 1779. Cahier du Journal de l'Ecole Polytechnique, 52. Hutton's Tracts. Vince's Aſtronomy. Biot's Aſtronomy, &c.]

This method is attributed to Cotes as the inventor; but Huygens and Martin are the only two authors, perhaps, who have applied it to the calculation of wheelwork to repreſent the periods of the planetary motions: they were not, however, in poſſeſſion of periods quite ſo accurate as the preſent tables afford for the data of their calculations, and by giving only the theory and reſult of their method, inſtead of the arithmetical proceſs at full length, have puzzled the artiſt, and left him at a loſs how to proceed in the practical application of rules which have not been ſufficiently exemplified: indeed, the fifteen theorems of Martin, which were intended to illuſtrate, by algebraical expreſſions, the theory of determining a converging ſeries of ratios, have deterred the inſtrument maker, who is unacquainted with algebra, from entering upon calculations which carry with them the appearance of intricacy.

We ſhall, therefore, diveſt the method of approximation, which is the ſubject of our preſent chapter, of algebraical characters, and ſhall endeavour to render it intelligible by a ſucceſſion of examples, ſuch as were adopted in the laſt chapter, and ſhall diſtinguiſh it from the preceding indirect method, by calling it the *direct* method of approximation.

General Rule.—1. Reduce the periods of the two heavenly bodies which have their velocities compared, into the ſame denomination, by either vulgar or decimal arithmetic, and draw a line between them for the *true ratio*, or *unreduced fraction*.

2. Divide the greater by the ſmaller part of this ratio, and note the quotient; then make the diviſor a new dividend, and the remainder a new diviſor, to procure a ſecond quotient; and continue the ſame proceſs until ſeven or eight quotients are obtained, according to the common rule of obtaining a common meaſure in vulgar fractions.

3. Put $\frac{0}{1}$ for the firſt ratio, and $\frac{1}{0}$ for the ſecond, and all the ſucceeding ones may be obtained from the ſucceſſive quotients; thus, multiply by the firſt quotient the numerator of the ratio laſt obtained, and add to the product the numerator of the next preceding ratio, and this will be the numerator of a *new* ratio to follow; do the ſame with the denominators of the laſt and next preceding ratios for the denominator of the ſame new ratio; and continue this proceſs till ratios are conſtituted of all the quotients in their

due ſucceſſion, and theſe will be a ſeries of ratios, alternately above and below the value of the original true ratio, converging towards the truth in proportion generally as the ratios are more or leſs numerous.

The praxis is extremely eaſy, and thoſe readers who wiſh for a demonſtration of the theory may conſult the authors to whom a reference has been given, who have treated the ſubject mathematically.

In the examples of the ſun's rotation, and of the primary planets which follow, a ſolar year, as before, will be taken as the ſtandard period, with which the other periods will be compared, to conſtitute the true ratios, by which means we ſhall, as we proceed, contraſt the two methods of approximation.

The Sun's Wheels.—The true ratio between a ſolar year and the revolution of the ſun on its axis, as it regards the earth, is 25.41666 : 365.24222, or $\frac{365.24222}{25.41666}$, from which we have the annexed

Proceſs for the Sun's Rotation.

Diviſors.	Dividends.	Quotients.	Formulæ.	Ratios.
				$\frac{0}{1}$
				$\frac{1}{0}$
25.41666	365.24222 2541666	14	$\frac{14 \times 1 + 0}{14 \times 0 + 1}$	$\frac{14}{1}$
	11107562 10166666			
940896	2541666 1881792	2	$\frac{2 \times 14 + 1}{2 \times 1 + 0}$	$\frac{29}{2}$
659874	940896 659874	1	$\frac{1 \times 29 + 14}{1 \times 2 + 1}$	$\frac{43}{3}$
281022	659874 562044	2	$\frac{2 \times 43 + 29}{2 \times 3 + 2}$	$\frac{115}{8}$
97830	281022 195660	2	$\frac{2 \times 115 + 43}{2 \times 8 + 3}$	$\frac{273}{19}$
85352	97830 85352	1	$\frac{1 \times 273 + 115}{1 \times 19 + 8}$	$\frac{388}{27}$
12468	85352 74808	6	$\frac{6 \times 388 + 273}{6 \times 27 + 19}$	$\frac{2601}{181}$
10554	12468 10554	1	$\frac{1 \times 2601 + 388}{1 \times 181 + 27}$	$\frac{2989}{208}$

As the laſt ratio of the ſeries is in every inſtance the moſt accurate in the ſeries, let it be examined, firſt, by a table of primes, as the ratios were in the preceding chapter, and if it is found to conſiſt of a prime number in either of its parts, or to have a high prime for one of its factors, try the preceding ratio, or otherwiſe ſubſtitute another quotient next in value to the one uſed in the formula, for inſtance, either unity above it, or unity below it, and try if the ratio ſo procured be a practical or diviſible one; but this ſubſtitution muſt only be made with the *laſt* quotient, and that when carried to eight ſucceſſive places; if, indeed, the numbers do not run too high, nine or ten quotients may be procured, and as many formulæ, but that extenſion will ſeldom be found to be neceſſary, unleſs one of the parts of the true ratio, which is the ground-work of the proceſs, conſiſt of more than eight figures; for it ſhould ſeem that there ought to be as many quotients as there are figures in the greater portion of the true ratio, in order that the value of the laſt figure may be involved. In the example before us, the laſt ratio, $\frac{2989}{208}$, is the ſame as was obtained by our indirect method of approximation, and is capable of conſtituting the train $\frac{13}{49} \times \frac{16}{61}$, the value of which has been ſhewn to be $25^d\ 9^h\ 59^m\ 56^s.995$.

The reaſon why the ratio is here inverted, is, that the ſun's rotation is the ſhorter period, and is to be conſidered as the *driven* portion of the train. The next preceding ratio, $\frac{2601}{181}$, conſiſts not of practical numbers; but $\frac{388}{27}$, the laſt but two, proves alſo to be the ſame as was procured by the ſliding rule for the train $\frac{27}{97} \times \frac{15}{60} = 25^d\ 9^h\ 59^m\ 31^s$.

It will have been obſerved, that the recurring decimal figures, beyond the fifth place, have been neglected in the tabular proceſs, it having been conſidered that the value ſo excluded is too inconſiderable to be regarded, particularly as the laſt ratio proves to be commenſurable in both its parts.

Should it ever hereafter be found, that the ſame ſolar *ſpots*, as they were formerly called, (but which Dr. Herſchel now denominates *openings* in the ſolar atmoſphere, which accompany the ſun's rotation,) have periodic re-appearances, the ſeries of ratios before us will be of ſervice for eſtabliſhing the exiſtence of ſuch re-appearances, and will afford data for the conſtruction of tables to predict their occurrence. If, for inſtance, we take the ratio $\frac{115}{8}$, it implies, that in eight years the ſun has 115 rotations; for $365\frac{1}{4} \times 8$ are equal to 2992 days, alſo 25.416×115 produce 2922.916, ſo that after a lapſe of eight civil years, in which are two biſſextiles, the ſame *ſpot* would be viſible on the *ſame* part of the ſun on the *ſame* day of the *ſame* month, provided it either continued ſo long, or re-appeared identically: in 19 years there would be more exactly as to the *hour* of the day 273 rotations; in 27 years the ſame occurrence would happen more accurately after 388 rotations; after 181 years the number of rotations would be 2601 very nearly; and laſtly, after the lapſe of 208 years, the deviation from the original ſituation both as to time and appearance, would not amount to an hour, provided the civil years are made ſolar ones by the omiſſion of two biſſextlies in the two centuries, for 365.24222×208 are equal to 75970.382 days, and alſo 25.41666×2989 are equal to 75970.416, in which periods the difference is only $48^m\ 57^s.6$.

Wheels for Mercury's tropical Revolution.—We have already ſeen that the proportion of velocity between the Earth and Mercury is as 1 to 4.151967, from which data we ſhall be enabled to determine an indefinite ſeries of ratios according to the foregoing rule, as in the annexed

Proceſs

Proceſs for Mercury's tropical Revolution.

Diviſors.	Dividends.	Quotients.	Formulæ.	Ratios.
				$\frac{0}{1}$
				$\frac{1}{0}$
1.000000	4.151967 4000000	4	$\frac{4\times1+0}{4\times0+1}$	$\frac{4}{1}$

63769	88198 63769	1	$\frac{1\times29+25}{1\times7+6}$	$\frac{54}{13}$
24429	63769 48858	2	$\frac{2\times54+29}{2\times13+7}$	$\frac{137}{33}$
14911	24429 14911	1	$\frac{1\times137+54}{1\times33+13}$	$\frac{191}{46}$
9518	14911 9518	1	$\frac{1\times191+137}{1\times46+33}$	$\frac{328}{79}$
5393	9518 5393	1	$\frac{1\times328+191}{1\times79+46}$	$\frac{519}{125}$
4125	5393 4125	1	$\frac{1\times519+328}{1\times125+79}$	$\frac{847}{204}$
1268	4125 3804	3	$\frac{3\times847+519}{3\times204+125}$	$\frac{3060}{737}$

We have here been able to advance as far as to ten quotients before the numbers became too high, and yet the laſt ratio, $\frac{3060}{737}$, or by inverſion $\frac{737}{3060}$, is the ſame as $\frac{2211}{9180}$, which was procured by our indirect method of approximation, and which affords the convenient, as well as very accurate train, $\frac{11}{90}\times\frac{67}{34}=87^{d}\ 23^{h}\ 14^{m}\ 35^{s}.726$.

If, inſtead of adopting the ratio of velocity $\frac{4.151967}{1000000}$, we had uſed the fraction conſiſting of the tropical periods reduced into minutes and decimals of a minute thus, $\frac{525948.800}{126674585}$, the ſame quotients, and, conſequently, the ſame train would have been produced as we have here obtained.

From this ſeries of ratios we ſee that, after the lapſe of 737 years, the Earth, Sun, and Mercury, will be in the ſame relative ſituation with reſpect to each other in the ecliptic, that they were at the beginning of that period, and will be nearly ſo in the years 204, 125, 79, &c. after a given time, but leſs accurately as to the *time* of the *day*, the ſmaller the number of years denominated in the ſeries.

Wheels for the tropical Revolution of Venus.—If we reduce the ſolar year and tropical period of Venus into minutes, the true large ratio conſtituted of theſe numbers will be $\frac{525948.8}{323561.5}$, from which we ſhall have the following proceſs of approximation:

Proceſs for the tropical Revolution of Venus.

Diviſors.	Dividends.	Quotients.	Formulæ.	Ratios.
				$\frac{0}{1}$
				$\frac{1}{0}$
323561.5	525948.8 3235615	1	$\frac{1\times1+0}{1\times0+1}$	$\frac{1}{1}$
2023873	3235615 2023873	1	$\frac{1\times1+1}{1\times1+0}$	$\frac{2}{1}$
1211742	2023873 1211742	1	$\frac{1\times2+1}{1\times1+1}$	$\frac{3}{2}$
812131	1211742 812131	1	$\frac{1\times3+2}{1\times2+1}$	$\frac{5}{3}$
399611	812131 799222	2	$\frac{2\times5+3}{2\times3+2}$	$\frac{13}{8}$
12909	399611 38727	30	$\frac{30\times13+5}{30\times8+3}$	$\frac{395}{243}$
12341	12909 12341	1	$\frac{1\times395+13}{1\times243+8}$	$\frac{408}{251}$
568	12341 1136	21	$\frac{21\times408+395}{21\times251+243}$	$\frac{8963}{5514}$
	981 568			
413	568 413	1	$\frac{1\times8963+408}{1\times5514+251}$	$\frac{9371}{5765}$

In the ſeries of ratios here obtained the three laſt are incapable of forming factors proper for the numbers of a train, and $\frac{395}{243}$, the value of which is $224^{d}\ 16^{h}\ 38^{m}\ 22^{s}.2$, is the ſame that Martin ſays he availed himſelf of in his "Orrery of a new Conſtruction;" the train into which it is reducible may be $\frac{81}{20}\times\frac{12}{79}$.

In this example it appears the indirect method of approximation gives us a more accurate practical train, than our preſent method. Should we, however, ſubſtitute other quotients for one of the two laſt in the table, a train of greater accuracy might be procured, but perhaps not without a ſucceſſion of trials.

In the denominators of theſe ſucceſſive ratios we have alſo the equal intervals in years, after which a conjunction of Venus with the Sun, or any other particular phenomenon

of a ſimilar nature, will happen on the ſame day of the month, and even *hour*, if we take one of the moſt accurate ratios.

Train for the Earth's annual and diurnal Motions.—The annual and diurnal motions of the earth conſtitute the fraction or ratio $\frac{365.24222}{1.00000}$, from which we thus approximate:

Proceſs for a ſolar or tropical Year.

Diviſors.	Dividends.	Quotients.	Formulæ.	Ratios.
				$\frac{0}{1}$
				$\frac{1}{0}$
1.00000	365.24222 365.00000	365	$\frac{365 \times 1 + 0}{365 \times 0 + 1}$	$\frac{365}{1}$
24222	100000 96888	4	$\frac{4 \times 365 + 1}{4 \times 1 + 0}$	$\frac{1461}{4}$
3111	24222 21777	7	$\frac{7 \times 1461 + 365}{7 \times 4 + 1}$	$\frac{10592}{29}$
2444	3111 2444	1	$\frac{1 \times 10592 + 1461}{1 \times 29 + 4}$	$\frac{12053}{33}$
666	2444 1999	3	$\frac{3 \times 12053 + 10592}{3 \times 33 + 29}$	$\frac{46751}{128}$
444	666 444	1	$\frac{1 \times 46751 + 12053}{1 \times 128 + 33}$	$\frac{58804}{161}$
222	444 444	2	$\frac{2 \times 58804 + 46751}{2 \times 161 + 128}$	$\frac{164359}{450}$

By retaining the value of the recurring decimal throughout the proceſs, we have obtained in this example a ratio equal to the truth itſelf, which is preciſely the ſame as we before aſcertained, namely, $\frac{164359}{450} = \frac{269}{10} \times \frac{47}{9} \times \frac{13}{5}$, which in a practical form will be better thus, by inverting the fraction $\frac{10}{269} \times \frac{9}{47} \times \frac{15}{39}$, or thus, $\frac{10}{269} \times \frac{10}{26} \times \frac{18}{94} = 365^d\ 5^h\ 48^m\ 48^s$.

If we take the laſt ratio but one, $\frac{58804}{161}$, we ſhall have the train $\frac{7}{241} \times \frac{23}{61} \times \frac{15}{60} = 365^d\ 5^h\ 48^m\ 49^s.192128$, &c. in which the largeſt wheel is ſomewhat more practicable, with reſpect to its number of teeth; which movement proves to be the ſame that A. Janvier has employed in his famous ſphere lately conſtructed at Paris.

A train, however, ſtill more convenient in point of ſize, and probably more accurate than the latter, may be obtained by ſubſtituting unity for the laſt quotient 2, for the ratio $\frac{105555}{298}$, which is equal to $\frac{8}{227} \times \frac{17}{62} \times \frac{17}{60}$, the value of which, as has been before obſerved, is $365^d\ 5^h\ 47^s.3$.

Here the artiſt has his choice of three different calculations, any of which will be ſufficiently accurate for any inſtrument whatever.

The laſt ratio in this ſeries, *viz.* $\frac{164359}{450}$, points out what is the proper correction for our calendar, to make the ſolar and the civil years convertible into one another exactly, on a ſuppoſition that the year conſiſts of $365^d\ 5^h\ 48^m\ 48^s$, agreeably to La Lande's determination. If we divide 164359 by 365, we ſhall have 450 civil years, and 109 days over, which circumſtance proves that in every 450 ſolar years there ought to be neither more nor leſs than 109 leap years; or, which is the ſame thing, in 900 ſolar years, there ought to be 218 leap years; if, therefore, the leap year ſhould be omitted at the end of each of *ſeven*, and retained at the end of each of *two*, out of every *nine centuries*, then the civil and ſolar years would become coincident at the termination of each ninth century, for $\overline{7 \times 24} + \overline{2 \times 25} = 218$ exactly. The ſame reſult will ariſe thus; if we take $11^m\ 12^s$, the difference between a ſolar and civil year, and multiply 900 thereby, the product will be juſt ſeven days, which ſhews that ſeven centenary leap years ſhould be rejected in 900 years.

Wheels for the tropical Revolution of Mars.—If we reduce the tropical period of Mars, $686^d\ 22^h\ 18^m$, and alſo a ſolar year into minutes, we ſhall have the ratio 989178 : 525948.8 to approximate from, thus;

Proceſs for the tropical Period of Mars.

Diviſors.	Dividends.	Quotients	Formulæ.	Ratios.
				$\frac{0}{1}$
				$\frac{1}{0}$
525948.8	989178.0 525948	1	$\frac{1 \times 1 + 0}{1 \times 0 + 1}$	$\frac{1}{1}$
4632292	525948 4632292	1	$\frac{1 \times 1 + 1}{1 \times 1 + 0}$	$\frac{2}{1}$
627196	4632292 4390372	7	$\frac{7 \times 2 + 1}{7 \times 1 + 1}$	$\frac{15}{8}$
241920	627196 483840	2	$\frac{2 \times 15 + 2}{2 \times 8 + 1}$	$\frac{32}{17}$
143356	241920 143356	1	$\frac{1 \times 32 + 15}{1 \times 17 + 8}$	$\frac{47}{25}$
98564	143356 98564	1	$\frac{1 \times 47 + 32}{1 \times 25 + 17}$	$\frac{79}{42}$
44792	98564 89584	2	$\frac{2 \times 79 + 47}{2 \times 42 + 25}$	$\frac{205}{109}$
8980	44792 35920	4	$\frac{4 \times 205 + 79}{4 \times 109 + 42}$	$\frac{899}{478}$
8872	8980 8872	1	$\frac{1 \times 899 + 205}{1 \times 478 + 109}$	$\frac{1104}{587}$
108	8872 8856	82		

If

If 82, the tenth quotient, were involved in this example, the numbers would run too high for wheelwork, from which circumſtance we may infer that the ratio 1104 : 587, procured from the ninth quotient, is very accurate; accordingly, on examination, we find it to be equal to $686^d\ 22^h\ 17^m\ 58^s.88$, in which period the error is little more than one ſecond of time in defect; the denominator 587 of the fraction proves, however, to be a prime number; the denominator, too, of the preceding ratio is not diviſible lower than 2 × 239, though the numerator forms the factors 31 × 29; ſo that a train more convenient than $\frac{31}{239} \times \frac{232}{16}$ cannot be obtained from this ratio, the value of which is $686^d\ 22^h\ 34^m\ 42^s$, in which time the error is much greater than in the train for this planet obtained by our indirect method of approximation In this ſeries of ratios, and alſo in all thoſe of the ſuperior planets that follow, the *numerators* of the reſpective fractions expreſs the ſolar years, in which the ſame phenomena, or poſition, with reſpect to the Earth and Sun, or to any particular ſtar in the heavens, will recur after a number of revolutions, expreſſed by the denominators reſpectively.

The Wheels for Veſta's tropical Revolution.—If we take the tropical revolution of this planet at 3.65515 tropical years, we ſhall have the ſubjoined reſult.

Proceſs for Veſta's tropical Revolution.

Diviſors.	Dividends.	Quotients.	Formulæ.	Ratios
				$\frac{0}{1}$
				$\frac{1}{0}$
100000	3.65515 300000	3	$\frac{3 \times 1 + 0}{3 \times 0 + 1}$	$\frac{3}{1}$
65515	100000 65515	1	$\frac{1 \times 3 + 1}{1 \times 1 + 0}$	$\frac{4}{1}$
34485	65515 34485	1	$\frac{1 \times 4 + 3}{1 \times 1 + 1}$	$\frac{7}{2}$
31030	34485 31030	1	$\frac{1 \times 7 + 4}{1 \times 2 + 1}$	$\frac{11}{3}$
3455	31030 27640	8	$\frac{8 \times 11 + 7}{8 \times 3 + 2}$	$\frac{95}{26}$
3390	3455 3390	1	$\frac{1 \times 95 + 11}{1 \times 26 + 3}$	$\frac{106}{29}$
65	3390 325	50		
	40			

In this example we have arrived at the ſame reſult as we did before by the ſliding rule only; and the 7th quotient, 50, being large, ſhews, that if it ſhould be involved, the numbers would run higher than our preſent knowledge of the length of the period warrants.

Wheels for the tropical Revolution of Juno.—Taking Juno's tropical period at 4.35528 tropical years, we ſhall have the following ratios.

Proceſs for Juno's tropical Revolution.

Diviſors.	Dividends.	Quotients.	Formulæ.	Ratios
				$\frac{0}{1}$
				$\frac{1}{0}$
1.00000	4.35528 400000	4	$\frac{4 \times 1 + 0}{4 \times 0 + 1}$	$\frac{4}{1}$
35528	100000 71056	2	$\frac{2 \times 4 + 1}{2 \times 1 + 0}$	$\frac{9}{2}$
28944	35528 28944	1	$\frac{1 \times 9 + 4}{1 \times 2 + 1}$	$\frac{13}{3}$
6584	28944 26336	4	$\frac{4 \times 13 + 9}{4 \times 3 + 2}$	$\frac{61}{14}$
2608	6584 5216	2	$\frac{2 \times 61 + 13}{2 \times 14 + 3}$	$\frac{135}{31}$
1368	2608 1368	1	$\frac{1 \times 135 + 61}{1 \times 31 + 14}$	$\frac{196}{45}$
1240	1368 1240	1	$\frac{1 \times 196 + 135}{1 \times 45 + 31}$	$\frac{331}{76}$
128	1240 1152	9		

Here, again, the fifth quotient gives the ſame ratio $\left(\frac{135}{31}\right)$ which we obtained before, and is perhaps as accurate as is neceſſary for the preſent, till the period itſelf is further rectified; if not, $\frac{196}{45}$ may be taken; but the 331 in $\frac{331}{76}$ is a prime, and the laſt quotient, 9, would increaſe the numbers too much, unleſs a train were required for an inſtrument with a compound fraction, which may be eaſily obtained by purſuing the proceſs a little further.

Wheels

Wheels for the tropical Revolution of Ceres and Pallas.—We have already propoſed to take an average of the periods of theſe two planets at 4.603386 tropical years, according to which aſſumption we may proceed, as in the annexed table, to find one ratio of a practical ſize for the motions of both.

Proceſs for the tropical Revolution of Ceres and Pallas.

Diviſors.	Dividends.	Quotients.	Formulæ.	Ratios.
				$\frac{0}{1}$
				$\frac{1}{0}$
1.00000	4.60339 400000	4	$\frac{4 \times 1 + 0}{4 \times 0 + 1}$	$\frac{4}{1}$
60339	100000 60339	1	$\frac{1 \times 4 + 1}{1 \times 1 + 0}$	$\frac{5}{1}$
39661	60339 39661	1	$\frac{1 \times 5 + 4}{1 \times 1 + 2}$	$\frac{9}{2}$
20678	39661 20678	1	$\frac{1 \times 9 + 5}{1 \times 2 + 1}$	$\frac{14}{3}$
18983	20678 18983	1	$\frac{1 \times 14 + 9}{1 \times 3 + 2}$	$\frac{23}{5}$
1695	18983 1695 1933 1695	11	$\frac{11 \times 23 + 14}{11 \times 5 + 3}$	$\frac{267}{58}$
238	1695 1666	7	$\frac{7 \times 267 + 23}{7 \times 58 + 5}$	$\frac{1892}{643}$

In this ſeries of ratios 643, the denominator of the moſt accurate fraction is a prime number, but the preceding fraction is reducible into $\frac{3 \times 87}{58} = \frac{60}{20} \times \frac{87}{58}$, or more conveniently for practice $\frac{87}{20} \times \frac{60}{58}$, the value of which is $1681^{d}\ 8^{h}\ 58^{m}\ 41^{s}$, the aſſumed mean being $1681^{d}\ 8^{h}\ 20^{m}\ 30^{s}$. The ratio $\frac{23}{5}$ is the ſame as was before determined from the ſliding rule, without further approximation.

Wheels for the tropical Revolution of Jupiter.—The ratio of Jupiter's velocity in the ecliptic to that of the earth is 11.85682 : 1.00000, therefore we muſt proceed thus:

Proceſs for Jupiter's tropical Revolution.

Diviſors.	Dividends.	Quotients.	Formulæ.	Ratios.
				$\frac{0}{1}$
				$\frac{1}{0}$
1.00000	11.85682 1100000	11	$\frac{11 \times 1 + 0}{11 \times 0 + 1}$	$\frac{11}{1}$
85682	100000 85682	1	$\frac{1 \times 11 + 1}{1 \times 1 + 0}$	$\frac{12}{1}$
14318	85682 71590	5	$\frac{5 \times 12 + 11}{5 \times 1 + 1}$	$\frac{71}{6}$
14092	14318 14092	1	$\frac{1 \times 71 + 12}{1 \times 6 + 1}$	$\frac{83}{7}$
226	14092 1356 532 452	62	$\frac{62 \times 83 + 71}{62 \times 7 + 6}$	$\frac{5217}{440}$
80	226 160	2	$\frac{2 \times 5217 + 83}{2 \times 440 + 7}$	$\frac{10517}{887}$
66	80 66	1	$\frac{1 \times 10517 + 5217}{1 \times 887 + 440}$	$\frac{10734}{1327}$
14	66 56	4		

The denominators in the two laſt ratios of this ſeries are both prime numbers, and if we were to uſe the eighth quotient, the numbers would run too high for two factors of a moderate ſize; alſo if 2 be ſubſtituted for unity in the ſeventh quotient, the denominator will be ſtill a prime number; we muſt, therefore, neceſſarily ſubſtitute unity for 2 in the ſixth quotient, by which ſubſtitution we ſhall have the ratio or fraction $\frac{5300}{447} = \frac{159}{9} \times \frac{100}{149}$ when put into a practical form, the period correſponding to which is $4330^{d}\ 14^{h}\ 41^{m}\ 17^{s}.8$, which is ſomewhat more accurate than the one we determined by our indirect method of approximation, but not ſo convenient for practical conſtruction. The numbers $\frac{83}{7}$, obtained from the fourth quotient, are thoſe uſed in the common planetarium of the ſhops.

Wheels

Wheels for the tropical Revolution of Saturn.—Saturn performs his revolution through the ecliptic, as we have seen, in 29.42377 tropical years, therefore we may proceed by the following proceſs.

Diviſors.	Dividends.	Quotients.	Formulæ.	Ratios.
				$\frac{0}{1}$
				$\frac{1}{0}$
1.00000	29.42377 2900000	29	$\frac{29 \times 1 + 0}{29 \times 0 + 1}$	$\frac{29}{1}$
42377	100000 84754	2	$\frac{2 \times 29 + 1}{2 \times 1 + 0}$	$\frac{59}{2}$
15246	42377 30492	2	$\frac{2 \times 59 + 29}{2 \times 2 + 1}$	$\frac{147}{5}$
11885	15246 11885	1	$\frac{1 \times 147 + 59}{1 \times 5 + 2}$	$\frac{206}{7}$
3361	11885 10083	3	$\frac{3 \times 206 + 147}{3 \times 7 + 5}$	$\frac{765}{26}$
1802	3361 1802	1	$\frac{1 \times 765 + 206}{1 \times 26 + 7}$	$\frac{971}{33}$
1559	1802 1559	1	$\frac{1 \times 971 + 765}{9 \times 33 + 26}$	$\frac{1736}{59}$
243	1559 1458	6	$\frac{6 \times 1736 + 971}{6 \times 59 + 33}$	$\frac{11387}{387}$

The numerator in the laſt ratio of the ſeries is not capable of affording practical factors, and the preceding ratio, $\frac{1736}{59}$, is the ſame as the one already determined both by the ſliding rule, and by our indirect method of approximation.

We come, laſtly, to the tropical revolution of the Georgian planet, which we have ſeen revolves through the ecliptic in 30589.35208 days, and its numbers may be aſcertained by the following proceſs.

Diviſors.	Dividends.	Quotients.	Formulæ.	Ratios.
				$\frac{0}{1}$
				$\frac{1}{0}$
365.24222	30589.35208 2921937777	83	$\frac{83 \times 1 + 0}{83 \times 0 + 1}$	$\frac{83}{1}$
27424764	136997431 109572666 36524222 27424764	1	$\frac{1 \times 83 + 1}{1 \times 1 + 0}$	$\frac{84}{1}$
9099457	27424764 27298373	3	$\frac{3 \times 84 + 83}{3 \times 1 + 1}$	$\frac{335}{4}$
126391	9099457 884737 252087 126391	71	$\frac{71 \times 335 + 84}{71 \times 4 + 1}$	$\frac{23869}{285}$
125696	126391 125696	1	$\frac{1 \times 23869 + 335}{1 \times 285 + 4}$	$\frac{24204}{289}$
694	125696	181		

The value of the laſt ratio of this ſeries is equal to 83.7508650 tropical years, which differs from the exact truth only unity in the ſeventh place of decimals, but unfortunately it is not reducible into lower numbers than $\frac{2017 \times 12}{17 \times 17}$; and the numerator of the next preceding ratio is a prime number, ſo that we muſt either uſe $\frac{335}{4}$, which has been before determined, or otherwiſe ſubſtitute another quotient for 71; the moſt convenient, we find from a few trials, will be 66, which gives the ratio $\frac{22194}{265}$, the value of which is a revolution in 83.750943 tropical years, or 30589^{d} 9^{h} 8^{m} $10^{s}.7$, and is capable of forming the train $\frac{162}{5} \times \frac{137}{53}$.

Theſe examples of all the primary planets given at full length, and accompanied by our remarks on them, will enable any well educated inſtrument maker to aſcertain wheelwork from any other data which he may have occaſion to employ, and will ſerve, at the ſame time, to ſhew that the two methods of approximating towards the truth, where the original numbers run too high for conſtruction in practice, ſupply the defects of each other in particular caſes, but generally come by different routes to the ſame mark.

By either of theſe methods, the periods of all the ſecondary planets may be repreſented by ratios ſuitable for

compoſing wheelwork, and any particular time may be aſſumed, that the machine moſt conveniently admits of, for the period in which the firſt driver revolves. For inſtance, the motion of the moon's apogee, or nodes, may be taken from the lunation; and the lunation from either a ſolar day, or a ſolar year. Likewiſe the ſatellites of Jupiter may have their motions given from one day, or ſeven days, or any other period conſiſting of days and fractional parts of a day, when reduced into one denomination; all which calculations will fall under our examination, when we come to treat of the machines, where they occur, under our articles ORRERY, and PLANETARIUM, but an account of which would lengthen our preſent article too much, were it given in this place.

Numbers for ſynodic Revolutions.—We muſt not, however, conclude our preſent article on planetary numbers, before we have made ſome remarks on the ſynodic revolutions of the primary planets, particularly as we ſhall have occaſion to deſcribe in another place, a very ſuperior machine conſtructed entirely from calculations founded on the ſynodic periods. If it were required to aſcertain the mean ſynodic period, or time elapſed between two ſucceſſive conjunctions or oppoſitions of any two planets, as ſeen from the ſun, or of the ſun and one of them as ſeen from the other, which is indeed the ſame thing, we muſt take the difference of the mean daily motions of thoſe planets as given in the tables, and divide 360° thereby, and the quotient will give the required number of days between two ſuch mean conjunctions; for inſtance, ſuppoſe it were required to determine the number of days between two ſucceſſive oppoſitions or conjunctions of Venus with the ſun, as ſeen from the Earth, or with the Earth, as ſeen from the Sun; the mean daily motion at Venus is 1° 36′ 7″.8, and of the Sun (or rather Earth) 0° 59′ 8″.33, the difference between which is 0° 36′ 59″.47, or 2219″.47, by which if we divide 1296000″ we ſhall have 583,923 days for the mean time between two ſucceſſive conjunctions or oppoſitions, as the caſe may be, which mean time would alſo be the *true* time, if the Earth and Venus had no equation of the centre, and conſequent acceleration and retardation in the different parts of their orbits; if we take Mercury inſtead of Venus, the ſynodic period at a mean rate would be $\frac{1296000}{11184.24} = 115{,}877$ days; but as Mercury's orbit has conſiderable excentricity, the ſynodic period in any given year may exceed or fall ſhort of this number by many days, accordingly as the ſun's place may be near the aphelion or perihelion of the planet's orbit, when the conjunction or oppoſition takes place. Again, if we take Mercury and Venus, the ſynodic period will be $\frac{1296000}{8964.77} = 144.566$ days, but ſubject to an exceſs or defect ariſing from the relative ſituations in their reſpective orbits. In the ſame manner we may uſe the difference of any two other mean daily motions, to aſcertain their ſynodic period, agreeably to the reſults contained in the ſubjoined table, which we beg leave to infert here on account of its novelty as well as utility.

A TABLE of the relative mean ſynodic Revolutions of all the primary Planets, expreſſed in Days and Parts of a Day.

Planets.	Georgian.	Saturn.	Jupiter.	Pallas and Ceres.	Juno.	Veſta.	Mars.	Earth.	Venus.
Mercury	88.290	88.694	89.792	92.825	93.118	94.174	100.888	115.877	144.566
Venus	226 358	229.493	236.993	259.355	261.654	270.169	333.917	583.923	
Earth	370.713	378.091	398.892	466.606	474.101	502.813	779.938		
Mars	702.713	733.836	816.434	1161.394	1208.955	1415.002			
Veſta	1395.950	1524.347	1930.007	6480.000	8302.370				
Juno	1678.104	1867.166	2514.552	2952.164					
Ceres and Pallas	1779.242	1993.233	2748.674						
Jupiter	5044.960	7253.595							
Saturn	16568.625								

N.B. In this table the ſynodic periods of Veſta, Juno, Ceres, and Pallas, muſt not be conſidered as perfectly accurate; their tropical periods being not yet completely aſcertained.

As an example of the uſe of this table, ſuppoſe the ſynodic revolution of Mars were required, as ſeen from Jupiter; look for Mars on the left hand column, and Jupiter at the top of the table, and at the junction of the horizontal and vertical columns, in which thoſe planets ſtand reſpectively, is the number 816.434, the number of days required. In like manner, the number of days for Venus and the Earth is 583.923.

In the courſe of our making calculations for the motions of the heavenly bodies, where ſome of the wheelwork was placed on ſtationary, and ſome on moveable bars, a diſcovery was made, relating to ſynodic revolutions, which will appear extraordinary, even to the ſcientific reader; which is this, that if the wheelwork which has been calculated to repreſent or produce the ſynodic revolutions of either of the interior planets, be placed upon the Earth's annual bar, (or radius vector,) *thoſe ſame calculations* will be proper for exhibiting the tropical revolution of that planet, as ſeen from the ſun. This circumſtance we have already glanced at, when calculating the tropical period of Venus by our indirect method of approximation, but we will now illuſtrate the obſervations we have made by an example. In a ſmall orrery, at preſent before us, the ratio between the tropical revolution of Venus and a ſolar year is calculated to be $\frac{2016}{3277}$, but becauſe the wheelwork compoſed of this ratio is carried by the Earth's annual arm, at leaſt ſuch parts of it as revolve out of the centre of the inſtrument, Venus is carried *once* round, independently of the calculations, in every year, by a puſh given to the laſt wheel in the train, moving in the centre round the ſun's ſtem, as the Earth's arm goes round it, while the teeth of all the wheels are connected; *unity* is, therefore, ejected out of the ratio before the train is compoſed, thus; the numerator 2016 is ſubtracted from the denominator 3277, and the remainder, 1261, is taken as the denominator of the reduced

reduced ratio, out of which the train is compoſed; now we ſay that $\frac{2016}{3277}$ of 365.24222 days is equal to the tropical period $224^d\ 16^h\ 42^m\ 1^s$, but that $\frac{2016}{1261}$, of the ſame ſtandard, is equal to the ſynodic revolution 583.924 days, very nearly as in our table. Hence when we have procured the exact ratio between the tropical periods of the Earth and an interior planet, we can immediately procure the length of a mean ſynodic revolution of the latter, without regard being had to the daily motions, as is uſually done by aſtronomical writers.

The ſame obſervation is equally true with reſpect to any other two of the planets in the ſyſtem, whoſe tropical ratio is known, provided the diminiſhed part be made the denominator of the fraction conſtituted by the ſaid ratio. To a want of attention to this ſort of reduction of a tropical into a ſynodic period, and *vice verſâ*, is owing the very great inaccuracy of ſome inſtruments of illuſtration at preſent to be met with in the ſhops; particularly of that common orrery, known by the name of *Ryley's*, in which the *ſynodic* revolutions of both Mercury and Venus are produced in periods which were intended, by the contriver, to be either *ſidereal* or *tropical*, and which are actually conſidered to be ſo by the inſtrument makers. Thus thoſe periods which *ought* to be 115.877 and 583.923 days reſpectively, are only about 86½ and 219½; in the latter of which inſtances the velocity of the planet, in its orbit, is conſiderably more than *double* its true velocity, and yet the error has never, that we know of, been detected by any one; a convincing proof this of the inattention, not only of thoſe who conſtructed, but alſo of thoſe who have uſed this little machine, to explain the nature of the planetary motions!

NUMBERING RODS. See NEPER'S *Bones*.

NUMBERS, in *Biblical Hiſtory*, a canonical book of the Old Teſtament, one of the five books called the Pentateuch, and aſcribed juſtly, as we conceive, to Moſes the Jewiſh lawgiver. It is ſo called becauſe it begins with the numbering of the children of Iſrael that came out of Egypt; to which are ſubjoined the laws given to them for the ſpace of 39 years, whilſt they were in the wilderneſs. See PENTATEUCH.

NUMELLA, among the Romans, an engine of wood uſed in puniſhing offenders, whoſe necks and feet were made faſt in it.

NUMELLA was likewiſe uſed to denote a rope or cord made of raw ox-hides to bind beaſts with.

NUMENIA, Νεμηνια, or νεομηνια, in *Antiquity*, a feſtival obſerved at the beginning of every lunar month, in honour of all the gods, but eſpecially Apollo, who was called Νεομενιος, becauſe the ſun is the author of all lights; for whatever diſtinction of times and ſeaſons may be taken from other planets, yet they are all owing to him, as the original and fountain of all thoſe borrowed rays, which the reſt have only by participation from him.

For the ceremonies of this ſolemnity, ſee Potter, Arch. tom. i. p. 416.

NUMENIASTÆ, Νεμηνιαϛαι, a deſignation given to thoſe who kept a feſtival on every new moon. See NUMENIA.

NUMENIUS, in *Biography*, a Greek philoſopher of the Platonic ſchool, who is ſuppoſed to have flouriſhed under the reign of the emperor Marcus Aurelius, was born at Apamea in Syria. He was regarded as an oracle for wiſdom, and is mentioned with reſpect both by Plotinus and Origen. Of the works which he wrote none are now extant, excepting ſome fragments preſerved by Euſebius, Theodoret, and Clemens Alexandrinus. He is ſaid to have maintained that Plato borrowed from Moſes what he advanced concerning God and the creation of the world. Moreri. Enfield's Hiſt. Phil.

NUMENIUS, in *Ornithology*, a name uſed by authors for the different ſpecies of the *Scolopax* and *Tantalus*; which ſee.

NUMERAL FIGURES. The antiquity of theſe in England has been ſuppoſed as high as the eleventh century, from an ancient date found at Colcheſter, at firſt thought to expreſs 1090; the figure in the place of hundreds being taken for a cypher, by not attending to the inſide ſtrokes, which were pretty nearly defaced; but upon a more accurate view that miſtake was diſcovered, and the date found to be 1490. See Phil. Tranſ. N° 439 and 475. See ARABIC *Figures*, and FIGURES.

NUMERAL *Letters*, thoſe letters of the alphabet which are generally uſed for figures; as, I, V, X, L, C, D, M.

NUMERAL *Characters*. See CHARACTERS.

NUMERALS, in *Grammar*, are thoſe words which expreſs numbers; as ſix, eight, ten, &c. See ORDINALS.

NUMERATION, in *Arithmetic*, the art of eſtimating or pronouncing any number, or ſeries of numbers.

The characters, whereby numbers are ordinarily expreſſed, are the nine following ones; 1, 2, 3, 4, 5, 6, 7, 8, 9. It being the law of the common numeration, that when you are arrived at ten, you begin again, and repeat as before; only expreſſing the number of tens.

Weigelius, indeed, ſhews how to number, without going beyond a quaternary; *i. e.* by beginning to repeat at each fourth. And Leibnitz, in what he calls his "binary arithmetic," begins to repeat at every ſecond; only uſing two characters, 1 and 0. But theſe are rather matters of curioſity than uſe.

That the nine numerical notes may expreſs not only units but alſo tens or decads, hundreds or centuries, thouſands, &c. they have a local value given them; ſo as that, when either alone, or when placed in the right-hand place, they denote units; in the ſecond place, tens; in the third, hundreds; and in the fourth, thouſands.

Now to expreſs any written number, or aſſign the proper value to each character: divide the propoſed number by commas into claſſes, allowing three characters in each claſs, beginning at the right hand. Over the right-hand figure of the third claſs, add a ſmall mark, or tranſverſe line; over the right-hand figure of the fifth claſs, add two marks, or tranſverſe lines; over that of the ſeventh, three, &c. The number of the left hand of the firſt comma, expreſs by thouſands; that which has over it the firſt tranſverſe line, expreſs by millions; that with two, by billions; that with three, by trillions, &c. Laſtly, the left-hand character of each claſs, expreſs by hundreds; the middle one by tens; and the right-hand one by units. Thus will the numeration be effected.

E. gr. The following numbers 2‴, 125,473″, 613,578′, 432,597, is thus expreſſed or read: two trillions, one hundred twenty-five thouſand four hundred ſeventy-three billions, ſix hundred thirteen thouſand five hundred ſeventy-eight millions, four hundred thirty-two thouſand five hundred and ninety-ſeven.

NUMERATOR, in ſpeaking of fractions, ſignifies the number which ſhews how many of thoſe parts, which the

integer is ſuppoſed to be divided into, are expreſſed by the fraction.

The numerator is that part of a fraction which is placed over the little bar, by which it is ſeparated from the under number called the denominator, and which ſhews into how many parts the integer is divided.

Thus, *v. gr.* $\frac{7}{10}$ expreſſes ſeven tenths; where ſeven is the numerator and ten the denominator. See FRACTION.

NUMERIANUS, M. AURELIUS, in *Biography*, an emperor of Rome, in conjunction with CARINUS, (ſee his article,) was ſecond ſon of the emperor Carus. On the death of his father in the year 283 of the Chriſtian era, Numerianus, with Carinus his elder brother, ſucceeded to the imperial dignity without oppoſition. They had been nominated Auguſti by their father, whom Numerianus had accompanied in his expedition into Perſia. This young prince was diſtinguiſhed by the promiſing qualities of his temper and underſtanding. He was mild and affable, and had from a very early period cultivated literature with ſucceſs. Being, in his youth, in a private ſtation, he had exerciſed his talents for oratory in pleading cauſes, and ſeveral of his harangues had been given to the public, in which the declamatory eloquence of the age appeared with luſtre. Gibbon, in ſpeaking of the brothers, ſays, "Carinus was unworthy to live; Numerian deſerved to reign in a happier period. His affable manners and gentle virtues ſecured him, as ſoon as they became known, the regard and affection of the public. He poſſeſſed the elegant accompliſhments of a poet and orator, which dignify, as well as adorn, the humbleſt and the moſt exalted ſtations. But the talents of Numerian were rather of the contemplative, than of the active kind." When his father's elevation reluctantly forced him from the ſhade of retirement, neither his temper nor his purſuits had qualified him for the command of armies. His conſtitution was deſtroyed by the hardſhips of the Perſian war; and he had contracted, from the heat of the climate, ſuch a weakneſs in his eyes, as obliged him, in the courſe of a long retreat, to confine himſelf to the ſolitude or darkneſs of a tent or litter. The adminiſtration of all affairs, civil as well as military, was devolved on Arrius Aper, the Prætorian prefect, who, to the power of his important office, added the honour of being father-in-law to Numerian. The army was eight months on its march from the banks of the Tigris to the Thracian Boſphorus, and during all that time the imperial authority was exerciſed in the name of the emperor, who never appeared to his ſoldiers. Suſpicions at length ſpread among them that their emperor was no longer living, and they could not be prevented from breaking into the imperial tent, where they diſcovered only the corpſe. How or what time he died was never aſcertained, but the general voice accuſed Aper of being his murderer: his concealment was interpreted as an evidence of guilt, and the meaſures which Aper had taken to ſecure his election, became the immediate occaſion of his ruin: Diocletian, commander of the body-guards, was choſen in the room of Numerianus, and conſcious that his peculiar ſituation might expoſe him to ſuſpicion, he aſcended the tribunal, and raiſing his eyes to the ſun, made a ſolemn profeſſion of his own innocence, in the preſence of that all-ſeeing Deity: then, aſſuming the tone of a ſovereign and judge, he commanded that Aper ſhould be brought in chains to the foot of the tribunal. "This man," ſaid he, "is the murderer of Numerian," and without giving him time to enter on a juſtification of his conduct, drew his ſword, and buried it in the breaſt of the unfortunate prefect. (See DIOCLESIAN.) Gibbon's Roman Hiſtory, vol. ii.

NUMERICAL, NUMEROUS, or *Numeral*, ſomething that relates to number.

NUMERICAL *Algebra* is that, which makes uſe of numbers, inſtead of letters of the alphabet.

NUMERICAL *Difference*, is the difference whereby one individual is diſtinguiſhed from another.

Hence a thing is ſaid to be numerically the ſame, *idem numero*, or *numerice*, when it is the ſame in the ſtricteſt ſenſe of the word. See UNITY and IDENTITY.

NUMERO, in *Commerce*, &c. a term prefixed to any number of things; marked or abbreviated thus, N°. See BOOK.

De NUMERO, *i. e.* by tale, is uſed in ancient authors for the payment *e. gr.* of a pound in a certain number of pieces, *viz.* twenty ſhillings.

In contradiſtinction to *libra penſa*, or a pound weighed out.

NUMEROUS ARITHMETIC. See ARITHMETIC.

NUMEROUS *Exegeſis*. See EXEGESIS.

NUMIDIA, in *Ancient Geography*, a country of Africa, comprehended, according to Strabo, the kingdoms of the Maſſyli and Maſſæſyli, the laſt of which was bounded on the W. by the river Mulucha or Molochath, as the firſt was on the E. by the Tuſca. On the N. it was limited by the Mediterranean; on the S. by Gætulia, or part of Libya interior; on the W. by the Mulucha, which ſeparated it from Mauritania, and on the E. by the Tuſca, a boundary which it had in common with Africa Propria. Its length was probably, allowing Mulucha to be the preſent Mullooïah of the Algerines, and Tuſca to be Zaine, above 500 miles; but its breadth cannot be ſo eaſily aſcertained. However, if we ſuppoſe it to be nearly the ſame with the preſent kingdom of Algiers, which we have reaſon to believe was actually the caſe, it muſt in the narroweſt part have been about 40 miles; that being the diſtance near Tlemſan from the deſert or Sahara to the ſea-coaſt, and above 100 in the broadeſt. In the times of the Carthaginians, Numidia contained the two powerful nations of the Maſſyli and the Maſſæſyli. Numidia, including Numidia Propria, or the country of the Maſſyli, and Mauritania Cæſarienſis, or that of the Maſſæſyli, extended from 34° 5′ to 37° N. lat., and from 1° 15′ W. to 9° 16′ E. of London.

Numidia Propria, or as it is ſometimes called, Terra Metagonitis, was ſeparated from the proper territory of Carthage by its eaſtern boundary, the river Tuſca, and from the kingdom of the Maſſæſyli, or Mauritania Cæſarienſis, according to Pliny, by the Ampſaga. This ſeems to correſpond with that part of the province of Conſtantina lying between the Zaine and the Wed el Kibeer, which is above 130 miles long and more than 100 broad. On the ſea-coaſt this province is, in general, mountainous and rocky, and therefore called by Abulfeda, not improperly, "El Adwah," the high or lofty. The principal places in this province were Cirta, Vaga, Azama, Collops Magnus, Tacatwa, Hippo Regius, Tabraca, Naragara, Sicca, Thirmida, Suthul, and Madaura. The mountains were the ridge that terminated the country between the parallels of Sitifi and Cirta, called by the ancients Buzara, Thambes, extending to Tabraca, the Mampſarus of Ptolemy, which ſeparated the Sahara from Mauritania Stifenſis, and the Mons Audus of Ptolemy, or the Mons Auraſius of the middle ages, known among the Turks by the name of Jibbel Aureſs. The rivers are the Ampſaga, the Armua of Pliny or modern Sei-bouſe, the Rubricatus of Ptolemy or Ma-fragg of the Algerines, and the Tuſca now called the Zaine.

The

The limits and extent of the Regio Maſſæſylorum of Strabo, or the Mauritania Cæſarienſis of Dio, being the tract lying between the Mulucha and Ampſaga, are aſcertained by the determination of thoſe of Numidia in general, and Numidia Propria, or the country of the Maſſæſyli, in particular. The length of the former province, indeed, much exceeded that of the latter; but its breadth was not conſiderable, being at a medium only about 20 leagues, except in that part which bordered upon the confines of the Maſſyli. It lay betwixt 34° 30′ and 37° N. lat., and extended from 1° 15′ W. to 6° 30′ E. long. from London. It included that part of the country of the Weſtern Moors, bounded on the W. by the Mullooïah, and on the E. by the mountains of Trara; thoſe provinces of the kingdom of Algiers, called Tlemſan and Titterie; together with the weſtern part of that known by the name of Conſtantia. The principal towns were Igilgili, Saldæ, Ruſazus, Ruſucurium, Ruſconium, Icoſium, Tipaſa, Jol, Canucius or Ganugus, Cartenna, Arſenaria, Quiza, Siga, Sitifi and Satafi, Auzia or Auzea, Tubuſuptus, &c. &c. The promontories were the Audus and Vabar of Ptolemy, the promontorium Apollinis, or cape Tennes of modern geographers, the promontorium Magnum of Ptolemy, now called by ſailors Cape Hone, being a continuation of the mountains of Trara. The remarkable mountains are part of mount Atlas, the Zalacus of Ptolemy, mount Malathubalus, the Durdus of Ptolemy, the Mons Phruræſus, and the Montes Chalcorychii. The moſt remarkable rivers were the Audus, the Siſaris, the Niſſava, or preſent Boujeiah, the Sarbatis, now the Yſſer, the Savus or modern Hameeſe, the Chinalaph of Ptolemy or Shelliff of the Algerines, the Cartennes, the Flumen Salſum, at preſent called the Wed el Mailah, and Aſſara or Iſſer of Abulfeda. The only iſlands that deſerve attention are the Acra of Scylax, forming the modern part of Harſhgoone, and the Tres Inſulæ of Antoninus, about 10 miles N.W. of the river Mulucha.

The aborigines of Numidia were the deſcendants of Put or Phut; but theſe were not the only ancient inhabitants, becauſe the Phœnicians in almoſt the earlieſt ages ſent colonies thither. Although a conſiderable part, if not the whole, of Interior Numidia was independent on the Carthaginians, the Numidians always aſſiſted the Carthaginians in their wars; and the Carthaginian form of government prevailed in every part of Numidia ſubject to the ſtate of Carthage, though in other parts abſolute monarchy was eſtabliſhed. The principal objects of worſhip among the firſt Numidians were the ſun and moon; and where the dominion of Carthage extended, divine honours were paid to the Phœnician and Greek deities. Notwithſtanding the barbarity of the Numidians, ſome of them uſed letters, not very unlike thoſe that made up the Punic alphabet, as appears from the legends of ſeveral ancient Numidian coins. The Numidians were divided into tribes, nomes, or hordes; and their circular dou-wars were compoſed of their mapalia, correſponding to the khymas or tents of the modern Bedoweens. Theſe mapalia were ſecured from the heat and inclemency of the weather by a covering of hair-cloth. They were all of the ſame oblong form, reſembling the inverted bottom of a ſhip. A whole tribe encamped together, and having conſumed the produce of one fruitful ſpot, migrated to another. Some of them lived in fixed habitations or cottages, made of hurdles daubed over with mud, or conſtructed of ſlight materials, and theſe they called magaria. The towns or villages formed of theſe huts are at preſent built upon eminences, and, as Dr. Shaw informs us, they are called daſhkras. The Numidians rode without ſaddles, and many of them without bridles, whence Virgil calls them "Numidæ Infræni;" and as their principal ſtrength conſiſted in their cavalry, they were accuſtomed to the management of horſes from their infancy. The next brother of the king, and not his eldeſt ſon, ſucceeded to the crown in Numidia. The diet of the Numidians conſiſted chiefly of herbs, grain, pulſe, and water; and they ſeldom uſed wine or fleſh. Many of the poorer claſs went almoſt naked; but thoſe of any faſhion wore their garments looſe, without ſaſh or girdle. They were eminent for their ſkill in hurling the javelin and throwing darts, which they uſed in war: and they choſe to come to a general action in the night. Amongſt them deſertion was no diſgrace.

Before the firſt arrival of the Phœnicians, Numidia was thinly peopled; and this happened above 300 years before the foundation of Carthage. Little is now known of theſe people for ſeveral of the earlieſt centuries; and it would lead us beyond our preſcribed limits, if we gave a minute detail of their conflicts with the Carthaginians and with the Romans. Towards the cloſe of the exiſtence of Numidia as an independent kingdom, Juba, the ſon of a Numidian prince, deſcended from Maſſiniſſa, was inſulted by Cæſar; and in conſequence of this, the African prince adhered cloſely to the Pompeian faction, gained ſome advantage over one of Cæſar's lieutenants, and reduced Cæſar himſelf to great extremities. At length Cæſar overthrew Scipio, Juba, and Labienus, and by a deciſive action made himſelf maſter of Numidia, which he reduced to a Roman province. See MAURITANIA.

NUMIDIA, Pintado, in *Ornithology*, a genus of birds of the order Gallinæ. The generic character is this; the bill is ſtrong and ſhort, the baſe of it covered with a carunculate cere receiving the noſtrils; the head is horned, with a compreſſed coloured callus; tail ſhort, bending down; the body is ſpeckled. There are four ſpecies comprehended in this genus, of which the moſt intereſting is the Meleagris; we ſhall, however, deſcribe them all.

Species.

MELEAGRIS; the Guinea Hen. There are three varieties of this ſpecies. In the *firſt*, the caruncles at the gape are double; in the *ſecond*, the breaſt is white; and in the *third*, the body is entirely white. It is an inhabitant of Africa, and is domeſticated in moſt parts of Europe; is about 22 inches long, and makes a harſh unpleaſant cry. The bill is of reddiſh horn colour; the head is blue; the crown conic, compreſſed, with a blueiſh-red protuberance; the upper part of the neck is of a blueiſh-aſh, almoſt naked; the lower part is feathered, verging to violet; the body is black, with round white ſpots; the legs are grey-brown; and the gular caruncle of the male blueiſh, female red. The meleagris is noiſy, reſtleſs, and turbulent, continually moving from place to place, and domineering over the whole poultry-yard. The turkey, though twice its ſize, is in continual apprehenſion from its petulance. The birds of this genus ſeem in many reſpects to reſemble the common poultry. Like them, they ſcratch the ground, and go in large flocks, feeding their young and pointing out their food. In the Cape de Verde iſlands ſeveral hundreds are ſometimes ſeen together; here the inhabitants hunt them with dogs; and, as their flight is heavy, whenever they are run down they are eaſily killed or caught. The male and female ſo nearly reſemble each other, that they can hardly be diſtinguiſhed; the only difference is, that the wattles, which are blue in the former, are inclining to red in the latter. Pintados, as has been obſerved, were originally from Africa, and were known under the name of Numidian hens.

hens. They are more commonly domeſticated in thoſe countries that border on the Mediterranean than with us. In our climate, which is evidently too cold for them, they are neither fertile, nor eaſily reared, and are kept rather for ſhow than uſe. In countries adapted to their nature, the female lays a great number of eggs, which ſhe endeavours to ſecrete, till ſhe has produced her young brood. The eggs are ſmaller than thoſe of a common hen, and of a rounder ſhape. They are reckoned very fine food. During the night, the Guinea-fowl perches on high places, and if diſturbed, alarms the neighbourhood by its unceaſing cry. In its natural ſtate of freedom it prefers marſhy places. It is eaſily tamed, but often abandons its young. An hybrid race has been produced between theſe birds and our common poultry, but, as is uſual, it ſeems incapable of reproduction.

MITRATA; the Mitred Pintado. Caruncles at the gape double; the gular fold is longitudinal. It inhabits Madagaſcar and Guinea; and is the ſize of the laſt.

CRISTATA; the Creſted Pintado. This has no caruncle; on each ſide the gape is a longitudinal fold. This is a native of Africa.

ÆGYPTIACA; the Egyptian Pintado. This is black, ſpotted with blueiſh; the crown is creſted; head and neck rufous.

NUMISMATOGRAPHIA, a Greek term uſed for the deſcription of ancient medals and coins, whether of gold, ſilver, or braſs.

Fulvius Urſinus, Ant. Auguſtinus, biſhop of Saragoſſa, Erizzo, a noble Venetian, and Sambucus, a Poliſh gentleman, have all ſucceeded in the numiſmatographia. Nor muſt the more modern authors on the ſame ſubject be omitted, *viz.* the two Mezzabarbs, Patin, Spanheim, Hardouin, Morel, Vaillant, Joubert, Baudelot, Beger, and, among ourſelves, Evelyn.

NUMISMATOLOGY, NUMISMATICS, terms uſed for the ſcience which treats on COINS and MEDALS, to which articles the reader is referred. We add, however, in this place, a ſhort account of a few of the moſt celebrated *public* collections, not touched upon in the above articles.

The *Hunterian collection*, which is now in the poſſeſſion of the univerſity of Glaſgow, to which it was bequeathed by Dr. Hunter's will, is one of the moſt celebrated in Europe. The foundation of this collection was laid in the year 1770, from thoſe of the Rev. Mr. Dawes and Thomas Sadler, eſq. The next year added much to the ſtock from various cabinets, particularly that of Iſaac Jamineau, his majeſty's conſul at Naples. Mr. Sainthill, ſurgeon, in 1772, the prince of Peralta, and Mr. Weſt in 1773, continued to enrich Dr. Hunter's cabinet. In 1776, the Egyptian coins were much increaſed from the collections of Mr. J. Bruce, and Mr. C. Lindegreene, a Swede, who had reſided in Egypt. Mr. Dorana added his collection to Dr. Hunter's in the ſame year, and it contained the accumulated treaſures of many elegant ſcholars and eminent antiquaries. At the ſame time, Mr. White ſupplied, from his muſeum, thoſe coins which were wanting in Dr. Hunter's; and, as if this year was to be diſtinguiſhed by the value of the acquiſitions, and the characters of the benefactors, Dr. Ruſſell ſupplied thoſe deficiencies which his ample collection enabled him to diſcover. The year 1777 furniſhed ſtill additional ſtores from Dr. Combe, a foreign noblemen, Mr. Swinton, Mr. J. Smith, the Rev. Dr. Eyre, and Mr. Samuel of Lincoln, and from numerous other benefactors. In the year 1782, Dr. Combe publiſhed his "Nummorum veterum Populorum et Urbium qui in Muſeo Gulielmi Hunter aſſervantur Deſcriptio;" a highly uſeful work, in which the Greek and Roman coins of the collection are arranged according to the different cities in which they were ſtruck.

Of the very rich collection of coins and medals in the *Britiſh Muſeum*, we are as yet without a deſcriptive work; part of which will, however, ſoon be preſented to the public. The following ſhort account is from the "Synopſis" of the contents of that celebrated repoſitory. This collection, the baſis of which was formed by the cabinets of ſir Hans Sloane and ſir Robert Cotton, has been from time to time enlarged by many valuable purchaſes and donations, but principally by the munificent bequeſt of the Rev. C. M. Cracherode. It is comprehended under the three following heads. 1. Ancient coins. 2. Modern coins. 3. Medals. The firſt of theſe heads conſiſts of Greek and Roman coins. The Greek coins are arranged in geographical order, and include all thoſe which are ſtruck with Greek characters, in Greece, or elſewhere, by kings, ſtates, or cities, which were independent of the Romans. With this claſs are placed, likewiſe, the coins of free ſtates and cities, which made uſe of either the Etruſcan, Roman, Punic, Spaniſh, or other characters. The Roman coins are placed, as far as it can be aſcertained, in chronological order. They conſiſt of the *As* in its diviſions; family or conſular coins; imperial coins ſtruck in Rome; imperial coins ſtruck in Egypt; imperial coins ſtruck in the Roman colonies; imperial coins ſtruck with Punic characters; contorniates.

The ſecond head, compriſing modern coins, conſiſts of Anglo-Saxon, Engliſh, Anglo-Gallic, Scotch, and Iriſh coins, and likewiſe the coins of foreign nations. This claſs is arranged according to the reſpective countries to which the coins belong, thoſe of each country being kept ſeparate.

The third head, which compriſes a claſs conſiderably more modern than either of thoſe which precede it, conſiſts of medals ſtruck in our own country, and of thoſe which have been ſtruck abroad. Theſe are arranged in the ſame manner as the modern coins.

The collection of the late king of *France*, now called the Imperial collection, preſerved in the National library of Paris, is by far the greateſt in Europe. The conſiderable treaſures formerly collected by Boze, the Marechal d'Etreés, Séguin, Patin, and in more modern times by Pellerin, are now all incorporated with that moſt valuable collection. Its baſis was formed by Louis I. at Fontainebleau: Henry II., Louis XIII., and particularly Louis XIV., have increaſed its treaſures with royal munificence; and the laſt of the juſt mentioned monarchs cauſed the large medals of this cabinet to be engraved by de la Boſſière. Beſides the above mentioned private collections, this cabinet acquired, in 1793, the *Cabinet de Ste. Geneviève*, at Paris; ſome years after it was increaſed by the antique coins of the Stadtholder, and in 1798, by the collection of the Vatican, the collection which formerly belonged to queen Chriſtina of Sweden, the medallions from the collections of cardinals Carpegna and Albani, &c. (See Hiſtoire abrégée du Cabinet des Medailles et antiques de la Bibliotheque nationale, par A. L. Cointreau, 1800.) An idea of the value of the preſent collection may be formed by the valuation made of it above forty years ago, which amounted to no leſs than ſix millions of livres. The *Cabinet de Ste. Geneviève*, which, having been threatened by robbers in 1793, was removed to the National library, and incorporated with the great collection, has been deſcribed by Claude du Molinet in 1692.

The celebrated imperial collection of coins at *Vienna*, if we except that of Paris, ſtands unrivalled among the cabinets of the continent. It was begun by the emperor Ferdinand I., and ſoon conſiderably increaſed by the acceſſion of other collections, ſuch as that formed by the archduke Albert,

under

under the direction of the Chiflets; and the moft valuable collection formed by the archduke Ferdinand at Ombras in Tyrol. It was afterwards conſiderably added to by the collections of the learned monarchs Maximilian I. and Rudolph II.; but particularly by the zeal of the emperor Charles VI., who was himſelf a great lover of numiſmatology, and who purchaſed the cabinets of the Carthuſians at Rome, together with that of count Parr. In the reign of Maria Thereſa it was farther increaſed by the purchaſe of the Granelli collection. Several years ago, the number of coins and medals of this collection amounted to upwards of 40,000, of which about 22,000 were antique. We poſſeſs a maſterly catalogue of the Vienna collection by the celebrated Joſeph Eckhel, publiſhed as early as 1779, and therefore far from giving a correct idea of the preſent ſtate of that highly valuable repoſitory.

The *Pruſſian* cabinet of medals is conſidered the greateſt in Germany, next to the Imperial collection of Vienna. The celebrated Laurent Beger publiſhed a catalogue of this collection, in three volumes folio, entitled "Theſaurus Brandenburgicus ſelectus, Coloniæ Marchicæ, 1696, 1699, and 1701." Though king Frederic William I. took out a number of large gold coins, (among which was the very large one, eight pounds, or five hundred ducats in weight, bearing the portraits of Frederic William the Great, and his queen,) which were converted into ſmall current money, yet the collection is ſtill richly furniſhed: the number of its antique treaſures has not long ſince been increaſed by 6000 coins from the cabinet of the late margrave of Anſpach; and baron Knobelſdorff, the Pruſſian ambaſſador at Conſtantinople, has tranſmitted many valuable contributions lately diſcovered in thoſe claſſic regions which have been the field of the baron's antiquarian reſearches.

Next in importance among the numiſmatological collections of Germany, is that of *Gotha*, the baſis of which was formed by Erneſt the Pious. It was materially increaſed by the excellent Arnſtadt cabinet of medals, which was formed by Antony Gunther, prince of Schwarzburg, aſſiſted by ſeveral celebrated antiquaries and hiſtorians, ſuch as Andreas Morellus, Chriſtian Schlegel, Olearius, &c. This latter collection was purchaſed, in 1713, by John Frederic, duke of Saxe-Gotha, for the ſum of 100,000 dollars. It is preſerved in ſmall cabinets, each of which is placed on a table, furniſhed below with a ſhelf for books relative to the coins above. This celebrated collection has been at different times conſiderably increaſed by others, ſuch as thoſe of Schachman and Sultzer, that of Mr. Gerning, rich in ſcarce Greek coins, that of baron Seckendorf, &c. The coins in the Gotha collection are ſtill arranged after the old way, by the ſizes and metals, and the ſame mode is adopted in the catalogue, ſeven volumes of which comprize the antique coins as follows: gold coins, kings; coins of cities and free ſtates; coins of families; imperial ſilver; coins of firſt ſize; coins of ſecond and third ſize. There are printed catalogues of the collections of Schachman and Sultzer, which are kept ſeparate. A ſyſtematic catalogue of the whole collection would be very deſirable. There is an old catalogue of the antique coins of the original collection by Liebe (Gotha numaria, ſiſtens Theſauri Fridericiani numiſmata antiqua, 1730, fol.) A hiſtory of the riſe and progreſs of this important cabinet has been publiſhed by Schlichtegroll in 1799.

NUMITOR, in *Biography*, the ſon of Procas, king of Alba, and the brother of Amulius. Procas, before his death, made him and Amulius joint heirs to the crown, on condition of their reigning annually by turns; but Amulius, on getting poſſeſſion of the throne, excluded Numitor, whoſe ſon, Lauſus, he ordered to be put to death, and obliged Rhea Sylvia, Numitor's only daughter, to become a veſtal. This princeſs having become pregnant, declared that ſhe was with child by the god Mars, and afterwards brought forth twins, named Remus and Romulus, who at length killed Amulius, and reſtored Numitor to the throne. This circumſtance occurred in the year 754 B.C.

NUMMES, in *Geography*, a town of Sweden, in the province of Nyland; 20 miles N. of Helſingborg.

NUMMULARIA, in *Botany*. See ANAGALLIS and LYSIMACHIA.

NUMMULARIUS, among the Romans, was uſed to ſignify a banker, or perſon who deals in money.

It likewiſe denoted an aſſayer, or one who eſtimated the goodneſs and value of money, as to its weight and fineneſs of metal.

NUMMUS, or NUMUS, among the Romans, a particular piece of money, otherwiſe called *ſeſtertius*, or *ſeſterce*; which ſee.

This was ſometimes called *nummus ſeſtertius*. *Decem millia numûm, & decem millia ſeſtertium*, were Roman ſums, which amounted to the ſame.

NUN, NONNA, the feminine of *Nonnus* or *Domnus*, *quaſi Dominus*, a word anciently uſed for a female religious, and ſtill retained in that ſenſe in our language and in other languages, particularly the French, but by way of ridicule and burleſque. Thoſe of the Benedictine, and certain other orders, have ſtill the abbreviation of Dom affixed to their names. The rule of St. Benedict, drawn up in the 6th century, ordains, "Juniores ſuos priores *Nonnos* vocent, quod intelligitur paterna reverentia."

The word comes from *nonna*, *nonnana*, or *nonnanis*, all Latin terms, firſt uſed for penitents, then for religious. Borel derives it from *nonno*, or *nonna*, which, in Italian, ſignifies *grandfather* or *grandmother*; and adds, that it was applied by way of honour to the woman, as that of *father* to the man, religious.

Nun, or *nonnes*, uſed to ſignify a monk, are of Hebrew extraction, from *nin*, or *nun*, *a ſon*.

Hence alſo *nunnery*, a monaſtery of female religious.

NUN, in *Geography*, a river of Africa, which runs into the Atlantic, N. lat. 4° 40'. W. long. 5° 6'.

NUN, or *Vled de Nun*. See VLED *de Nun*.

NUN, in *Ornithology*, the common Engliſh name for the *parus cæruleus*, or blue titmouſe, diſtinguiſhed from the common titmouſe by its ſmallneſs, and by its having its blue head ſurrounded by a white line.

NUN, *White*. See MERGUS *Albellus*.

NUN is alſo the name of a peculiar ſpecies of pigeon, called by Moore the *columba veſtalis*. It is but a ſmall pigeon, but ſometimes larger than the jacobine, and has a very particular plumage, from which it takes its name, its head being as it were covered with a veil.

The body of this ſpecies is all white; the head, tail, and ſix of the flight-feathers black, red, or yellow; the eyes are pear-coloured, and the hood white: this is a large tuft of feathers on the hinder part of the head, and the more numerous they are, the more the bird is eſteemed. This is a very beautiful ſpecies of pigeon, and is very much eſteemed. Some of its feathers, however, will vary ſometimes from their true colour; theſe birds are called foul-feathered: but it is a mere accidental variety, the young of ſuch being often as perfect and beautiful as of any others.

NUNCAR, in *Geography*, a town of Hindooſtan, in the circar of Mahur; 3 miles S.S.E. of Mahur.

NUNCIATION, NUNCIATIO, among the Romans, was particularly

particularly uſed to ſignify the report which the augur made concerning what he had ſeen.

This he did to the chief magiſtrate preſent, and the magiſtrate communicated the ſame to the people, and ſo diſmiſſed the aſſembly, which was called *obnunciation*.

NUNCIO, or NUNTIO, an ambaſſador from the pope to ſome Catholic prince or ſtate; or a perſon who attends, on the pope's behalf, at a congreſs, or an aſſembly of ſeveral ambaſſadors.

The word nuncio has the ſame import with ambaſſador; but is reſtrained, in its uſe, to the ambaſſadors of popes alone; as that of internuncio is to their envoys extraordinary.

The nuncio has a juriſdiction, and may delegate judges, in all the ſtates where he reſides, except in France, where he has no authority, but that of a ſimple ambaſſador.

NUNCUPATIVE, in the *Schools*, a term uſed to expreſs ſomething that is only nominal, or has no exiſtence but in name.

Felix of Urgel maintained, that Jeſus Chriſt, as man, was only God nuncupatively, *i. e.* nominally. Alcuin, in his anſwer to Felix, maintains, that it is to fall into Neſtorianiſm, to diſtinguiſh two ſons of God in Jeſus Chriſt, the one natural, the other adoptive; and two Gods, the one real, the other nuncupative.

NUNCUPATIVE *Will* denotes a laſt will or teſtament only made verbally, or *viva voce*, and not put in writing. See WILL and TESTAMENT.

NUNDAVERAM, in *Geography*, a town of Hindooſtan, in the Carnatic; 8 miles E.S.E. of Udeghery.

NUNDINAL, NUNDINALS, a name which the Romans gave to the eight firſt letters of the alphabet, uſed in their calendar.

This ſeries of eight letters, A, B, C, D, E, F, G, H, is placed and repeated ſucceſſively from the firſt to the laſt day of the year: one of theſe always expreſſed the market-days, or the aſſemblies called *nundinæ*, *quaſi novendinæ*, becauſe they returned every nine days.

The country people, after working eight days ſucceſſively, came to town the ninth, to ſell their ſeveral commodities, and to inform themſelves of what related to religion and government.

Thus, the nundinal day being under the letter A on the 1ſt, 9th, 17th, and 25th days of January, &c. the letter D will be the nundinal letter of the year following. Theſe nundinals bear a very great reſemblance to the dominical letters, which return every eight days, as the nundinals did every nine.

NUNDUNGOTCHY, in *Geography*, a town of Bengal; 10 miles E.S.E. of Bouleah.

NUNDUNGUR, a town of Hindooſtan, in Bahar; 25 miles E.N.E. of Durbungah. N. lat. 26° 12′. E. long. 86° 32′.

NUNDYDROOG, a town and fortreſs of Hindooſtan, in Myſore, the capital of a conſiderable diſtrict, built on the ſummit of a mountain, 1700 feet high, and in moſt parts of it inacceſſible; which was beſieged and taken by the Britiſh troops in 1792; 65 miles N. of Seringapatam.

NUNEATON, a market-town and pariſh in Atherſtone diviſion of the hundred of Hemlingford, county of Warwick, England, is ſituated on the river Anker, at the diſtance of 9 miles N.N.E. from Coventry, and 104 N.W. by W. from London. The river divides the town into two parts; and cloſe to it, on the weſt ſide, paſſes the canal which connects the town of Coventry with the Grand Trunk Navigation. This place was originally ſimply denominated Eaton, ſignifying the town on the rivulet, and ſeems to have been a conſiderable village previous to the Norman era. The addition Nun was derived from the monaſtery for Benedictine nuns, founded here in the reign of king Stephen by Robert Boſſu, earl of Leiceſter, whoſe counteſs, Amicia, took the veil in it, and at her death was buried in the church. Some fragments of the walls of the ancient buildings of this monaſtery are ſtill ſtanding at the north-weſt end of the town; but they are too trifling to convey any idea of the extent or grandeur of the foundation, in the time of its proſperity. No doubt, however, exiſts of its riches and magnificence; as it is recorded to have had large poſſeſſions in different counties, beſides the patronage of ſeveral churches, which were granted to it by pope Boniface and William, earl of Glouceſter. At the diſſolution, it was ſurrendered to the king, who beſtowed the ſcite on ſir Marmaduke Conſtable.

Nuneaton is a town of conſiderable extent, and has been on the increaſe ever ſince the opening of the canal. According to the population returns of 1811, it contained 1101 houſes, and 4947 inhabitants. The market was firſt eſtabliſhed here in the 7th year of the reign of Edward II., by a charter from that prince, granted at the requeſt of the nuns, who were afterwards empowered by ſpecial patent to "take toll of all vendible commodities coming thither by the ſpace of five years, towards the expence of paving" the town. The market is held on Saturday weekly, and there are three fairs during the year. A very conſiderable ribbon manufactory is carried on here. A free-ſchool, founded by the inhabitants in the time of Edward VI., is ſtill ſupported. The church is dedicated to St. Nicholas, and is a very ancient ſtructure, with a ſquare tower at the weſt end, but is not remarkable for its architecture. It contains, however, ſeveral curious monuments, and, among others, that of ſir Marmaduke Conſtable, whoſe death happened in April 1560.

About two miles from Nuneaton the Watling-ſtreet croſſes the northern diviſion of the county, and forms, for ſome miles, the boundary between it and Leiceſterſhire. On this part of its courſe was the ſtation Manduceſſedum, now called *Manceſter*, where many Roman coins of braſs and ſilver have been dug up. The church belonging to this village ſtands on an eminence, ſuppoſed by Stukely to have been the ſcite of an ancient camp, as one ſide of it is deeply entrenched; and to the left of the church are the remains of an ancient fortreſs, or encampment, called Oldbury. It is of an oblong form, and ſurrounded with large ramparts, which incloſe an area of ſeven acres. Dugdale thinks that this work was originally conſtructed and occupied by the Britons, as many ſtone-axes or celts are frequently diſcovered within its boundaries. About two miles to the north-weſt of Nuneaton is Arbury-hall, the ſeat of Francis Newdigate, eſq., who has a coal-mine here, whence a cut is made to the Coventry canal. In the pariſh of Chilvers-Cotton, on the ſame ſide of the town, are the ruins of the monaſtery of Erdburie, which was founded by Ralph de Sudley, in the reign of Henry II., for canons regular of the order of St. Auguſtine. The Antiquities of Warwickſhire, &c. by Sir William Dugdale, 1 vol. folio, London edit. 1656. Camden's Britannia, by Gough, vol. ii.

NUNEGAN, a ſmall iſland in the Frozen ocean. N. lat. 67° 40′. E. long. 193° 40′.

NUNEZ, ALONZO DE CASTRO, in *Biography*, chronicler to Philip IV. of Spain, a writer who lived in the worſt age of Spaniſh literature, and who continued the "Corona Gotica y Auſtriaca," which Diego de Saavedra Faxardo began, and wrote ſeveral other works. Gen. Biog.

NUNEZ, DUARTE DE LIAM, or LEAO, a Portugueſe hiſtorian,

hiſtorian, topographer, and grammarian born in the city of Evora, in the latter end of the 16th century. He wrote upon the origin and orthography of his mother tongue, a deſcription of Portugal, and a diſſertation of the kings of Portugal. His principal works were the "Primeira Parte das Chronicas dos Reis de Portugal, reformadas," corrected and put in order from the chronicle of Fernam Lopez, Recy de Pina, and Duarte Galvam. After the Braganzan revolution, Nunez proceeded with his labours, under the patronage of D. Rodrigo da Cunha, archbiſhop of Liſbon, and he abridged other chronicles of his countrymen. This work appeared in folio, 1643, three years after the Portugueſe had thrown off the yoke of the Spaniards; and no publication could have been better timed than this hiſtory of the glorious and ſucceſsful reſiſtance which their forefathers had made againſt the ſame enemies. In the enſuing year, our author's bookſeller, Antonio Alvarez, printed the original chronicle of Joam I.; and thus the late compilations loſt the greater part of their intereſt. The other originals remained in manuſcript till the year 1790, when the Royal Academy of Liſbon publiſhed them. Gen. Biog.

Nunez, Fernan de Gusman, was born at Valladolid, and became a knight and commendador of the order of Santiago. Notwithſtanding this deciſion with regard to a military life, his inclination led him to letters inſtead of arms. With the view of purſuing literature, he went into Italy, and there ſtudied Greek and Latin under Beroaldus, and Jovian the Greek refugee. As yet Greek learning had not found its way into Spain D. Inigo Lopez de Mendoza is ſaid to have profited greatly by the ſociety of Fernan Nunez, who acted as preceptor to his ſon. When cardinal Ximenes founded the univerſity of Alcala, he and Demetrius the Cretan were appointed Greek profeſſors; and in the famous Polyglot, which, it has been ſaid, would immortalize the name of Ximenes better than all his actions as a ſtateſman, the taſk of preparing a Latin verſion from the Septuagint was entruſted to them and to Lopez de Aſtuniga. Nunez had retired from all the common and unworthy objects of ambition, but his purſuits as a literary man had foſtered in him a love of liberty; and in the ſtruggle which the commons of Caſtile made againſt the growing tyranny, which has ſince been ſo fatal to their country, he lent what aid he could to their efforts, and endeavoured to win the people of Alcala to their cauſe. A young man, to whom he had promiſed great pecuniary rewards for his aſſiſtance, when the inſurgents were ſuppreſſed, attacked him, becauſe this money could not be paid, and wounded him in the arm. The aggreſſor was too powerful, and the cauſe of the diſpute of too ſerious a nature for Nunez to ſeek redreſs: he, therefore, left the univerſity, and removed to Salamanca. Here he was appointed Greek profeſſor, teaching Greek in the forenoon, Latin in the afternoon, and reading lectures upon rhetoric, and upon the natural hiſtory of Pliny. Thus he paſſed the remainder of his life, till the year 1553, when he died, leaving his valuable library to the univerſity of Salamanca. To him has been aſſigned the firſt place among the reſtorers of claſſical learning in Spain. He is highly celebrated by various authors, from ſome of which we ſhall make a ſhort extract or two. Lipſius beſtows on him very high commendation, remarking, at the ſame time, how little his celebrity was proportioned to his deſerts. He deſcribes him, "Non præceps, acutus tamen, et ſagacitate ac modeſtiâ pari." His life, ſays Mr. Southey, ſeems to bear inſpection, as well as his learning; and he is characterized by Nic. Antonio, "Cœlebs, caſtus, comis, feſtivè dicax ſed innocuè, vitiorumque reprehenſor accerrimus." His publiſhed works, beſides the part which he bore in the Polyglot, are, 1. "Annotationes in Senecæ Philoſophi Opera." 2. "Obſervationes in Pomponium Melam." 3. "Obſervationes in loca obſcura et depravata Hiſtoriæ Naturalis C. Plinii, cum retractationibus quorundam locorum Geographiæ Pomponii Melæ, lociſque aliis non paucis in diverſis utriuſque Linguæ auctoribus caſtigatis et expoſitis." 4. "Gloſſa ſobre las obras de Juan de Mena." 5. "Refranes y Proverbios Gloſſados." His occupations and growing infirmities, ſays his biographer, "prevented him from completing this work, as he intended: he was remarkable for the happy uſe of proverbs, and this book would doubtleſs be found of conſiderable uſe to the annotators of Don Quixotte." Gen. Biog.

Nunez, Pero. See Nonius.

Nunez, in *Geography*, a town of Spain, in the province of Cordova; 7 miles N.N.W. of Montella.—Alſo, a river of Africa, called *Nuno*, which ſeparates the Nalos from the Sierra Leone, and runs into the Atlantic, N. lat. 10° 20′. W. long. 13° 50′.

NUNNI, the Grecian lullaby, or ſong peculiar to nurſes. See Song.

NUNNORE, in *Geography*, a town of Hindooſtan, in Bahar, on the Soane; 15 miles S. of Arrah. N. lat. 25° 20′. E. long. 84° 49′.

NUNO Pereira, a ſmall iſland in the Eaſt Indian ſea, near the E. coaſt of Madagaſcar. S. lat. 13° 50′.

Nuno *Triſtao*, a river of Africa, which runs into the Atlantic, N. lat. 9° 40′.

NUNSARA, a town of Hindooſtan, in Guzerat; 16 miles S. of Surat.

NUNTIO. See Nuncio.

NUPER Obiit, in *Law*, a writ which lies for a coheireſs being deforced by her coparcener of land or tenements, whereof their common father or anceſtor died ſeiſed in fee-ſimple.

If the anceſtor died ſeiſed in fee-tail, the coheireſs deforced ſhall have a formedon.

NUPHAR, in *Botany*, νυφαρ of the Greeks, the Yellow Water Lily, or νυμφαια αλλη of Dioſcorides, from the flowers of which was anciently prepared a cooling drink called νυφαρον. The Turks, according to Dr. Sibthorp, ſtill make one of their kinds of Sherbet, or Sorbet, from theſe flowers, which give a kind of bitter almond flavour to the liquor in which they are infuſed. The modern Greeks call the plant νυφαρον, or νενυφαρον, of which its Turkiſh name, *Pufer ciceghi*, ſeems a wide corruption, and the French one, *Nenuphar*, ſcarcely an alteration.—Smith Prodr. Fl. Græc. v. 1. 361. Dryand. in Ait. Hort. Kew. ed. 2. v. 3. 295. (Nymphæa; Lamarck Illuſtr. t. 453. f. 2. Gærtn. t. 19, lutea. Saliſ. in Ann. of Bot. v. 2. 71.)—Claſs and order, *Polyandria Monogynia*. Nat. Ord. *Hydrocharides*, Juſſ. *Nymphæeæ*, Saliſ. an order intermediate between the *Ranunculaceæ* and *Papaveraceæ* of Juſſieu.

Gen. Ch. *Cal.* Perianth inferior, of five or ſix large, coloured, rounded, concave, permanent leaves. *Cor.* Petals numerous, ſmaller than the calyx, obtuſe, recurved, with nectariferous furrows at their back. *Stam.* Filaments very numerous, inſerted into the receptacle, about as long as the petals, flat, ſpreading; anthers oblong, on the upper ſide of each filament, opening by two linear fiſſures above. *Piſt.* Germen ſuperior, large, ovate; ſtyle none; ſtigma orbicular, peltate, radiated above, its margin entire or notched, permanent. *Peric.* Berry ovate, with a coriaceous coat, internally ſpongy, with numerous cells. *Seeds* very numerous, roundiſh, poliſhed.

Eſſ. Ch. Calyx of five or ſix leaves. Petals numerous, bearing

bearing honey at their backs, inſerted with the ſtamens into the receptacle. Stigma with radiating furrows, ſeſſile. Berry ſuperior, of many cells. Seeds numerous.

1. N. *lutea*. Common Yellow Pond-Lily, or Nuphar. Sm. Prodr. Fl. Græc. v. 1. 361. Ait. n. 1. (Nymphæa lutea; Linn. Sp. Pl. 729. Willd. Sp. Pl. v. 2. 1151. Engl. Bot. t. 159. Fl. Dan. t. 603. Matth. Valgr. v. 2. 246. Camer. Epit. 635. Ger. em. 819. Fuchſ. Hiſt. 536. Nenuphar prima; Brunf. Herb. v. 1. 36.)—Calyx of five leaves. Margin of the ſtigma entire. Footſtalks two-edged. Lobes of the leaves cloſe together.—Native of ponds, lakes, and gentle rivers throughout Europe. Dr. Sibthorp met with it in the lakes of Theſſaly, where it is ſaid by Dioſcorides to grow. It flowers copiouſly with us in June and July. The *roots* are perennial, deeply fixed in the mud, of a firm, almoſt woody, ſubſtance, white and farinaceous within. *Leaves* radical, numerous, floating, elliptical, entire, ſmooth, ſingle-ribbed, with a furrow above; deeply divided at the baſe into two ſlightly angular lobes, which fold over each other. *Footſtalks* various in length according to the depth of the water, two-edged, flat above, convex beneath. *Flower-ſtalks* radical, ſimple, cylindrical, each bearing one *flower*, about two inches wide, raiſed above the water, of an uniform golden yellow in every part, except ſome tints of orange on the *petals*, and of green at the back of the *calyx*. Theſe flowers are vulgarly termed in Norfolk Brandy-bottles, from their ſcent, which partakes of brandy or ratafia. Each ray of the *ſtigma* anſwers to a cell in the *berry*. The *ſeeds* are farinaceous, reſembling millet, but larger.

2. N. *minima*. Leaſt Pond-Lily, or Nuphar. Sm. Engl. Bot. t. 2292. (Nymphæa lutea β, minima; Willd. Sp. Pl. v. 2. 1151. N. parva; Matth. Valgr. v. 2. 247.)—Calyx of five leaves. Stigma toothed. Footſtalks two-edged, nearly flat. Lobes of the leaves rather diſtant.—Diſcovered by Mr. W. Borrer, in the lake of the Highland mountain of Ben Cruachan. Profeſſor Willdenow informs us it has been obſerved in the duchy of Mecklenburgh, as well as in Pruſſia aad Bohemia. This is moſt indubitably a diſtinct ſpecies from the laſt, differing not only in its much ſmaller ſize, the *flower* not being above half ſo big, but more eſſentially in its deeply-toothed green-bordered *ſtigma*, and compreſſed *footſtalks*. The *leaves* are ſomewhat ſilky beneath, and their lobes rather diſtant or divaricated.

This may be *Nymphæa lutea minor parvo flore*, Loes. Pruſſ. 178, but it is certainly not *N. lutea minor ſeptentrionalium*, Lob. Ic. 595, which is *Menyanthes nymphæoides*.

3. N. *Kalmiana*, Canadian Pond-Lily, or Nuphar. Ait. n. 2. (Nymphæa Kalmiana; Sims in Curt. Mag. t. 1243. N. lutea β, Kalmiana; Michaux Boreal-Amer. v. 1. 311. N. lutea e Canadâ; Linn. Sp. Pl. 729.)—Calyx of five leaves. Stigma toothed. Footſtalks ſemicylindrical. Lobes of the leaves rather diſtant; their veins furrowed beneath. —Kalm and Michaux have obſerved this in Canada. Meſſrs. Loddiges introduced it here in 1807. We received a ſpecimen from our worthy friend Mr. W. Anderſon, who raiſed it in Mr. Vere's garden at Knightſbridge. This ſpecies flowers from June to Auguſt; and is moſt akin to the laſt in ſize, but the *leaves* are more rounded and obtuſe, their *ſtalks* not flattened, their veins furrowed beneath, and ſomewhat prominent above. *Flowers* of a golden yellow, with a purpliſh, not green-bordered, *ſtigma*, ſimilarly toothed at the edge.

Mr. Anderſon remarks (ſee *Curt. Mag.*) that this, as well as the *lutea*, "beſides the leaves which float upon the water, bears others which never appear above its ſurface; theſe are tenderer, more undulated, and ſhorter, with lobes very much divaricated, and hence approaching to kidney-ſhaped."

4. N. *advena*. Three-coloured Pond-Lily, or Nuphar. Ait. n. 3. (Nymphæa advena; Ait. ed. 1. v. 2. 226. Willd. Sp. Pl. v. 2. 1152. Hort. Berolin. t. 38. Sims in Curt. Mag. t. 684.)—Calyx of ſix leaves, in two rows. Stigma undulated. Footſtalks nearly cylindrical. Leaves heart-ſhaped, with ſpreading lobes. Fruit furrowed.—Native of North America, introduced into England by Mr. William Young, in 1772. It is hardy, flowering in June, as we have ſeen it in ſir Joſeph Banks's pond at Spring-grove, near Hounſlow. This is the ſize of our common *Nuphar lutea*, but the *leaves* approaching towards a triangular form, with diſtant lobes, ſomewhat of a terminal point, and almoſt cylindrical *footſtalks*, diſtinguiſh it. The *flowers* too differ in the dark purple inſide of their three outer *calyx-leaves*, one of which indeed occaſionally, but not always, aſſumes ſome of the dilated form, and yellow colour, of the three inner ones. The *petals* are concealed by the very numerous, recurved, crimſon-bordered *anthers*. The *ſtigma* is yellow, with a wavy, or bluntly crenate, edge. The *berry* is ſaid to be furrowed longitudinally. If this ſpecies was more free in flowering, it would make an agreeable variety in ponds among the common kind.

5. N. *longifolia*. Long-leaved Pond-Lily, or Nuphar. (Nymphæa longifolia; Michaux Boreal-Amer. v. 1. 312. N. ſagittifolia; Walt. Carolin. 155.)—Calyx of ſix leaves in two rows. Stigma undulated. Leaves oblong, wavy, arrow-ſhaped, with abrupt approximated lobes, at the baſe. —Native of North and South Carolina, according to Michaux, whoſe deſcription however accords but ill with a ſpecimen communicated to us by Dr. Delile from that country, by which the *leaves* do not appear to be obtuſe, neither are the *petals* wanting, nor the *anthers* nearly ſeſſile. The *leaf* in ours is near a foot and a half long, and from three to four inches broad, wavy at the edge; its termination, though injured, appears evidently to have been acute; the baſe is extended into two ſmall lobes, one inch and a half long, folding over each other, oblong, angular, and obtuſe. *Flower* nearly the ſize of the laſt. Three outer leaves of the *calyx* green, elliptical; three inner much larger, rounder, almoſt entirely yellow. *Petals* wedge-ſhaped, the length of the outer *ſtamens*, and concealed by them. *Stigma* with numerous elevated rays, its margin ſlightly wavy. All the organs of impregnation are yellow, the *anthers* much paler than the reſt, and almoſt white; their length about equal to the *filaments*, their lobes or cells tumid.

NUPTIAL, ſomething that relates to marriage.

NUR, in *Geography*, a town of Grand Bucharia, ſituated on a mountain, and ſo called from *Nur*, light, becauſe it contained a number of holy places, whither devotees reſorted: it was taken by Jenghiz Khan in 1211; 100 miles N.E. of Bokhara. N. lat. 40° 15′. E. long. 63° 50′.—Alſo, a town of the duchy of Warſaw; 50 miles E.N.E. of Warſaw.

NURA, a river of Ruſſia, which runs into the Kargaldzin lake, N. lat. 51° 44′. E. long. 68° 44′.—Alſo, a river of Italy, which runs into the Po, 6 miles N.E. of Piacenza.

NURABAD, a town of Hindooſtan, in the circar of Gohud; 20 miles W. of Gohud.

NURAQUIMIRE, a town of Hindooſtan, in the province of Tatta; 48 miles S.S.E. of Tatta.

NURDIJA, a town of Perſia, in Khoraſan; 30 miles S. of Neiſapour.

NUREMBERG, an imperial city of Germany, in the circle of Franconia, anciently called "Mons Noricorum," made free by the emperor Frederic Barbaroſſa. It is large and well built, though not populous, ſituated on a ſandy ſpot, well cultivated and fertile, and rendered pleaſant by the villages and country ſpots that are adjacent; the river Pegnitz runs through the town, and it is here traverſed by a number of wooden and ſtone bridges. The town is encompaſſed by double walls, fortified by ſeveral towers, and guarded by a ditch of about a German mile in circuit. Its ſtreets are about 500, and its houſes 8000, but the number of inhabitants is very diſproportioned to the extent of the town. The magiſtrates and inhabitants are chiefly Lutherans; beſides two parochial churches, it contains 15 other places of worſhip. The town is divided into 8 parts, and 131 captainſhips; in one of the parts is ſituated the imperial fortreſs, conſtructed in an old-faſhioned ſtyle, and placed on a mountain, where the firſt counſellor, as imperial bailiff and caſtellan, was accuſtomed to reſide. The council-houſe is one of the moſt magnificent in Germany, and in its apartments are ſeveral curious paintings: and the council conſiſts of 34 noble and 8 handicraft counſellors. The military force of the town conſiſts of ſeven companies of foot, and two companies of cuiraſſiers, &c. Several of the inhabitants have acquired conſiderable reputation in the arts of painting and engraving; and many of its artiſts have diſtinguiſhed themſelves by works in ivory, wood, and metal, which are widely circulated. Nuremberg is one of the principal trading towns in Germany. The adjoining territory, called the circle of Nuremberg, is conſiderable; 78 miles E.S.E. of Mentz. N. lat. 49° 28′. E. long. 11° 1′.

NURHUA, a town of Hindooſtan, in Bahar; 28 miles N.W. of Chuprah. N. lat. 26° 0′. E. long. 84° 20′.—Alſo, a town of Hindooſtan, in Bahar, on the Dewah; 50 miles N.W. of Patna.

NURI, a town of New Mexico, in the province of Hiaqui; 40 miles S.E. of Riochico.

NURJEE, a town of Seweſtan; 25 miles N. of Schwan.

NURMIJARVI, a town of Sweden, in the province of Nyland; 20 miles N.N.W. of Helſingfors.

NURMIS, a town of Sweden, in the government of Kuopio; 58 miles N.E. of Kuopio.—Alſo, a ſmall iſland, on the E. ſide of the gulf of Bothnia. N. lat. 61° 12′. E. long. 21° 10′.

NURMO, a town of Sweden, in the government of Waſa; 36 miles E.S.E. of Waſa.

NURMS, a town of the duchy of Courland; 28 miles E. of Goldingen.

NURPUR, or NOORPOUR, a town of Hindooſtan, and capital place of a diſtrict, in the ſubah of Lahore. It is ſituated on the top of a hill, which is aſcended by ſome ſteps, and has the appearance of opulence and induſtry. The diſtrict is mountainous; its revenues amount to 40,000*l.*; and it is leſs moleſted than the contiguous principalities by the oppreſſive incurſions of the ſeiks; 70 miles N.E. of Lahore. N. lat. 32° 12′. E. long. 75° 5′.

NURRAH, a town of Hindooſtan, in the circar of Ruttunpour; 20 miles E. of Naypour.

NURSERY, in *Agriculture* and *Planting*, the name of a place appropriated for rearing and preſerving young plants of different kinds. Every gentleman who has any extent of land to be planted ſhould have a place of this ſort for raiſing his young trees and plants, as it ſaves a great deal of trouble and expence which muſt otherwiſe be incurred in providing them.

Mr. Boutcher ſtates, that it is an almoſt univerſally received opinion, that trees ought to be raiſed in the nurſery on a poorer ſoil than that to which they are afterwards to be tranſported for good, and it has been directed by many, otherwiſe the moſt reſpectable authors. He muſt acknowledge this doctrine has a very ſpecious appearance at firſt view. He adhered to it early in life, and it is ſo ſeemingly conſiſtent with nature, that he is not ſurpriſed it has been generally adopted by young planters, at the ſame time he cannot account for thoſe who have had much practice and long experience not expoſing the errors of it. And he adds, that he has given ſome examples, from frequently repeated experiments, of the ill effects he has felt by planting young and tender ſeedlings in the pooreſt ſoils, and the greater ſucceſs attending thoſe that were well-grown on the ſame, or in ſimilar ſituations. The conſequences of raiſing plants on poor hungry land are no leſs fatal than planting the ſeedlings in ſuch, and ſhould as much as poſſible be avoided. He has mentioned in the culture of many trees, the neceſſity of promoting their vigorous growth at firſt, in order to their becoming ſtately and handſome; nor can this be effected by any other means than being early nurſed in a generous ſoil; for whatever future purpoſe they are meant, or to whatever ſituations they are deſtined; and that, if they are but barely ſupported from infancy on meagre ground they will never afterwards become ſtrong, though removed to that which is rich and feeding. Farther, that he has ſown the ſeeds of foreſt trees on the pooreſt ground, planting ſeedlings, and ſtrong well-nurſed trees from ten to five feet high, on the ſame ground and at the ſame time, where the old well cultivated plants have frequently made good trees, when the ſeedlings have periſhed, and from the ſterility and coldneſs of the ſoil, the ſeeds have not ſo much as vegetated. In ſhort, the roots of ſeedlings are not ſo well fitted as larger plants to draw ſufficient nouriſhment from crude, rank, and uncultivated ſoils: and as he has truly found what is here ſaid in many inſtances to be the caſe, he is obliged to believe that the general practice of planting ſeedlings in poor, and large trees in good land, ſhould be quite reverſed.

It has alſo been ſtated by others, that almoſt all writers on agriculture adviſe the farmer to be very careful to make choice of ſuch plants only as have been raiſed in a nurſery of poor ſoil, and always to reject ſuch as have been reared in a richer ſoil than that in which he is to plant them: becauſe, a plant which has been reared in a barren ſoil has been inured, from its infancy, to live hardily, and will advance with a great degree of luxuriance, if it is planted in one that is better: whereas a plant that has been nurſed in a fertile ſoil, and has certainly ruſhed up to a great ſize, like an animal that has been pampered with high feeding, and ſwelled up with fat, will languiſh and pine away, if tranſplanted to a more indifferent ſoil. But it would be no difficult matter to ſhew the fallacy of this mode of reaſoning, and to point out many errors which have crept into almoſt all ſciences, from purſuing ſuch fanciful analogies between objects in their own natures ſo different, as in this example. But as this would be in ſome meaſure foreign to the purpoſe, it may juſt be noticed, that it could ſeldom be attended with worſe conſequences than in the preſent caſe, as it leads to a concluſion directly the reverſe of what is warranted by experience. For it has been found, from reiterated experiments, that a ſtrong and vigorous plant, that has grown up quickly and arrived at a conſiderable magnitude in a very ſhort time, never fails to grow better after tranſplanting, than another of the ſame ſize that is older and more ſtinted in its growth, whether the ſoil in which they are planted be rich or poor: ſo that, inſtead of

recommending a poor hungry ſoil for a nurſery, it would perhaps in all caſes be beſt to ſet apart for this purpoſe the richeſt and moſt fertile ſpot that could be found; and in the choice of plants, always to prefer the youngeſt and moſt healthy, to ſuch as are older, if of an equal ſize. This is given as the reſult of much experience in this buſineſs. And the practical planter ſuggeſts, that ſo much has been ſaid concerning the queſtion, whether a nurſery ſhould be on a ſoil, and in a ſituation correſponding to thoſe on which the trees are ultimately to be planted, that he ſhould deem it unpardonable to paſs the ſubject in ſilence. He briefly delivers his own opinion, ſo that the reader may apply or reject what agrees with, or ſtands oppoſed to his. But he firſt remarks, that experience has taught him that it is only for an extenſive ſcale of planting that the nurſery can be had recourſe to; in other caſes it is no ſaving for a gentleman to rear a nurſery. He confines himſelf to the nurſing of *ſeedlings only* on the ſame principle; and from indiſputable proofs, demonſtrated both by himſelf and others, who have had much experience, made impartial trials for aſcertaining how far it might be to a gentleman's advantage to rear his own nurſery from ſeed. And they have all found it unprofitable, and attended with conſiderable perplexity. A thing not at all to be wondered at, when we reflect on the multiplicity of buſineſs at that ſeaſon moſt critical, for inſuring ſucceſs in this branch. If the ſoil and ſituation whereon the trees are ultimately to be planted be good, or nearly reſemble what is deſcribed below; then, if all other circumſtances concur, he conceives the trees ought to be nurſed on the ſpot; but for no other reaſon than that it is leſs expenſive to carry to a diſtance ſeedling, than tranſplanted trees. But if the ſoil whereon the trees are to be planted be bad, or eſſentially different from that he is about to deſcribe, and if the ſituation be bleak, and expoſed to violent winds, then he ſhould conceive the attempt to rear nurſery plants clean, healthy, and well-rooted, oppoſed to common ſenſe. And after ſtating that great care and attention is requiſite in rearing young plants; that ſome are raiſed with more difficulty than others; it is aſked "are the aſh, the beech, the birch, the elm, the larch, and the oak, reared in *infancy* with equal eaſe? Do they not, if properly treated, all equally flouriſh afterwards on the mountain, in the vale, where ſoil is hardly found, and where it is found in abundance? Do we ſow ſeed in ſand, gravel, clay, the crevice of a rock, on the bleak top of a mountain, or in a fertile vale, with equal expectation of ſeeing it riſe a good plant?"

Soil proper for.—That which is ſuppoſed by Mr. Nicol as the beſt ſuited for this purpoſe, is a loam of a middling texture, rather inclining to ſand, neither rich nor poor, from eighteen to twenty-four inches in depth; lying on a free, porous ſubſtratum; as this will be found more generally congenial to the nature of the different foreſt trees than any other ſoil. But there is no general rule without exception. If there be a diverſity of ſoils, and if they do not too nearly approach the extremes of meagre ſterility and exceſſive fertility, ſo much the better, ſince all the kinds do not exactly thrive alike in the ſame ſoil; and an opportunity would thereby be afforded of placing each in that congenial to its nature. The ſcite ſhould neither be high nor low, ſheltered nor expoſed, in any extreme, for the ſame reaſon, *viz.* that it may the more generally anſwer all purpoſes. For a nurſery of this deſcription, nothing can be more eligible than the ſpot which may occaſionally be occupied as a kitchen-garden. The pulverization and mellowneſs afforded by the previous growth of various culinary crops, bring the land into the moſt ſuitable ſtate for the raiſing of young trees, and at the ſame time clear it the moſt effectually from vermin, as the grub and other inſects. And in all caſes, it will be adviſable to trench the ground to its full depth, in preparing it for a nurſery; and if neceſſary, to give it a dreſſing with lime, marle, dung, &c. *in compoſt.* Other manure ſhould never be applied to nurſery ground at the time of cropping with timber trees. But at the time of cropping with eſculents, manure, either ſimple or in compoſt, may be applied; as conveniency and the nature of the crop in queſtion ſhall determine. But that the trees ſhould immediately follow a manured culinary crop, is the beſt of all methods; as in that caſe, no manure would be required for the timber crop. He has known an inſtance, where a field was taken in for a nurſery, from an old paſture of rough ſward, and in which myriads of the grub-worm, ſlug, &c. had found an aſylum It was conceived, that by ſubtrenching, or deeply digging it, the land might be effectually cleaned; and accordingly the field was planted with nurſery plants, without any preparatory crop of grain, &c. But the reſult was, that moſt of the firs, the larches, the elms, the beeches, &c. became a prey to the vermin the enſuing ſeaſon; and their ſtems were found peeled entirely round, about an inch under the ſurface. For this reaſon, it becomes a matter of caution, that a like misfortune be avoided, to take a crop, or crops, of grain, potatoes, turnips, &c. in order to thoroughly cleanſe the ſoil of theſe noxious vermin, before venturing in it the more valuable crop of the nurſery. But, in reſpect to the proper rotation, much muſt be left to the judgment of the operator and exiſting circumſtances. The following example is given on the ſuppoſition that it may be applied, or partly rejected, according to the exigency of the caſe. 1ſt. Vegetables, with manure; winter fallow. 2d. Evergreen and reſinous trees, without manure. 3d. Subtrenched; deciduous trees, ditto, ditto. 4th. Potatoes or turnips, with manure. 5th. Evergreen and reſinous trees, as before, &c.

However, for the extenſive plantations of the duke of Portland, in Nottinghamſhire, where the ſoil is of a light ſandy kind, ſome well-ſituated valley is uſually choſen, as near the centre of the intended plantations as poſſible, for the purpoſe of a nurſery. If this valley is ſurrounded with hills on all ſides but the ſouth, ſo much the better. A piece of ground, conſiſting of as many acres as is convenient for the purpoſe, is fenced about in ſuch a manner as to keep out all noxious animals. At each end of the nurſery large boarded gates are fixed, and alſo a road made down the middle wide enough to admit carriages to go through, which is found exceedingly convenient in removing the young trees from thence to the plantations. After the fence is completed, the ground on each ſide the road is trenched about twenty inches deep, which may be done for about 3*l.* 10*s.* or 4*l.* an acre, according as the land is more or leſs gravelly. It is beſt done in the ſpring, when the planting ſeaſon is over. If after the trenching two or three chaldrons of lime be laid on an acre, the land will produce an excellent crop either of cabbages or turnips, which, being eaten off by ſheep in the autumn, will make the land in fine order for all ſorts of tree-ſeeds: but as the oak is the ſort of tree cultivated in general, this is the method purſued in raiſing and managing that moſt valuable ſpecies.

Culture of the Plants.—As ſoon as the acorns fall, after being provided with a good quantity, ſow them in the following manner: Draw drills with a hoe in the ſame manner as is practiſed for peaſe, and ſow the acorns therein ſo thick as nearly to touch each other, and leave the ſpace of one foot between row and row, and between every fifth row the ſpace of two feet for the alleys. While the acorns are in the

ground, great care muſt be taken to keep them free from vermin, which would very often make great havock amongſt the beds if not timely prevented. Let this caution ſerve for moſt other ſorts of tree-ſeeds. As ſoon as the acorns are come up, the beds require only to be kept clean from weeds till they want thinning; and as the plants frequently grow more in one wet ſeaſon where the ſoil is tolerably good, than in two dry ones, where the ſoil is indifferent; the time for doing this is beſt aſcertained by obſerving when the tops of the rows meet; which is done, when that is the caſe, by taking away one row on each ſide the middlemoſt, which leaves the remaining three rows the ſame diſtance apart as the breadth of the alleys. In taking up theſe rows, the workman ought to be careful neither to injure the plants removed, nor thoſe left on each ſide. The reſt of the young oaks being now left in rows at two feet apart, let them again ſtand till the tops meet; then take up every other row, and leave the reſt in rows four feet aſunder, till they arrive to the height of about five feet; which is full as large a ſize as is ever wiſhed to be planted. In taking up the two laſt ſizes, the method is to dig a trench at the end of each row, full two feet deep; then undermine the plants, and let them fall into the trench with their roots entire: the ſame mode is neceſſary with other ſorts of trees, very much of their future ſucceſs depending on this point, of their being well taken up.

But Mr. Nicol does not nurſe trees in general more than two ſeaſons; as they are either one or two years in the ſeminary, according to their kinds, before they come under view; and as the after-treatment for many kinds is the ſame, for the ſake of brevity, he claſſes ſuch as with propriety may be claſſed together, and whoſe culture in the nurſery is ſimilar; particulariſing thoſe only that are of the greateſt importance, and whoſe treatment is materially different. He adviſes that the alder and the birch ſhould remain two years in the ſeminary, and then be removed into nurſery rows. The richeſt and choiceſt ground in the nurſery, provided it be of ſuch ſoil, and in ſuch ſituation as is deſcribed above, ſhould be allotted for them. They are to be planted in lines twelve inches aſunder, and about four inches in line. The roots of the alders may be trimmed a little with the knife. The birches muſt not be touched. And he adds, that whether plants ſhould be put in with the ſpade or ſetting ſtick, is a queſtion frequently agitated. He is of opinion it is a matter of little importance to plants of this age, which method is practiſed, provided either be well performed. The ſize of the roots ſhould determine. But it would certainly be improper to force a large root into a ſmall hole, to the evident detriment of the plant, by its roots and fibres being bundled together in a maſs, without the intervention of mould. It is equally improper to force a plant into a ſlit or gaſh, whoſe ſides, by the operation of making it, are hardened and rendered impenetrable, in a great meaſure, by the tender fibrils for a time, until rain, and the influence of the weather, ſoften them. He, therefore, for the better performance of both methods, would adviſe, 1ſt, for dibbling; that the ground be well broke in the operation of digging or trenching; that whatever is dug be alſo planted the ſame day, that it neither be dug nor planted in too wet or too dry a ſtate; that the hole be made large and looſe by a twitch of the hand; that the plant be juſt ſufficiently faſtened to keep it in proper poſition; and that, at the end of each day's work, the whole be levelled, and the earth cloſed to the ſtems with a ſhort-headed rake: 2d, for laying in with the ſpade; that (inſtead of digging over the ground firſt, and then planting in a ſlit or gaſh, whereby the ſides of the ſlit are hardened, and the roots crowded in,) the digging and planting be both carried on together; that is, turn one furrow farther than where the row is to be placed, cut perpendicularly by the line; place in the plants; turn another furrow to their roots; turn a ſecond, or, if neceſſary, a third furrow; cut and place as before, &c.: treading none, but ſmoothing all with the rake. Farther, the aſh and mountain ſorb ſhould alſo remain two years in the ſeminary. The pooreſt ſoil in the nurſery ſhould be their portion, reſerving better for the kinds to follow. They ſhould alſo be planted in lines twelve inches aſunder, and four in line: the roots of both being moderately trimmed with the knife. The beech and the oak are alſo to remain two years in the ſeminary, and ſhould be planted in good ſoil, in lines fifteen inches apart, and five or ſix in line. Their roots on no account to be trimmed at this time; otherwiſe not one-half of the plants will ſtrike. They ſhould remain for two ſeaſons in this ſituation; at the end of the firſt, let their tap roots be cut at the depth of ſix inches below the ſurface, a perſon cutting on each ſide the row, with a ſpade ſharpened on purpoſe, ſo as to effectually cut the tap root of each plant, with as little injury to the upper part as poſſible, then pointing up the intervals of the rows, levelling all to the ſtems of the plants. It is ſuppoſed, that at the end of the ſecond ſeaſon the plants will have made fibry roots, and be fit for removal to almoſt any ſituation. But, if for any particular purpoſe it be neceſſary to nurſe them longer, in that caſe they ſhould be tranſplanted next ſeaſon into freſh nurſery rows; allowing them a little more room, and ſhortening all roots which have a tendency downwards. The common cheſnut, and the horſe-cheſnut, ſhould alſo ſtand two years in the ſeminary, and any part of the nurſery will ſuit them. They ſhould then be planted in lines fifteen inches apart, and four or five in line. Their roots may be gently pruned. They ſhould ſtand two or three ſeaſons, according to their progreſs in this ſituation. Being chiefly ornamental plants, and deſigned for the leſs untoward ſituations, they are frequently required of larger ſize. If ſo, at the end of the ſecond ſeaſon, they ſhould be moved and planted into rows eighteen or twenty inches apart, and eight or nine inches in line; previouſly ſhortening all the roots that tend downwards, and tapping as adviſed above, for beech and oaks. But the elm, the hornbeam, and the ſycamore, are ſometimes removed from the ſeminary at one, and ſometimes at two years old; he prefers the latter, planting them in lines at twelve inches apart, and four in line. The roots may be gently pruned if needful. And at the end of the ſecond ſeaſon they will be fit for removal to any ſituation, where ſoil to the depth of four inches is found; but if intended for more barren ſcites, they ſhould be removed at the end of the firſt year.

In reſpect to the larch, it ſhould never remain more than one ſeaſon in the ſeminary. Mr. Nicol is convinced of this from having made a variety of experiments for aſcertaining the quickeſt and moſt advantageous methods of rearing this uſeful tree. And the reſult of theſe experiments has proved to his entire ſatisfaction, that a healthy ſeedling of one year, alſo nurſed one year, in moderately good ſoil, having a ſufficiency of room, and kept properly clean of weeds, will, in any ſoil or ſituation wherein it may afterwards be placed, outgrow another of any age within the ſeventh year after tranſplanting. He has planted many of this deſcription, and within that period has meaſured them fifteen feet in height; while thoſe on the ſame ſpot, planted the ſame day, and which were, ſome two, ſome three years nurſed, did not meaſure above twelve feet, nor were ſo ſtraight or beautiful in their forms.

The

The progreſs of this plant, in infancy, has been found to follow in this courſe on all ſoils where he has made the experiment; and theſe have been very different in quality and depth:

One-year ſeedling.	One year nurſed.
Ditto ditto.	Ditto, removed, and nurſed a ſecond year.
Ditto ditto.	Nurſed in the ſame row two years.
Two-year ſeedling.	One year nurſed.
Ditto ditto.	Ditto, removed and nurſed a ſecond ſeaſon.
Ditto ditto.	Nurſed in the ſame row two years.
Ditto ditto.	Ditto for three years.

It is here aſked if this be the caſe, may we not alſo ſuppoſe, that ſince the firſt outgrows the others in infancy, and on good ſoil, it will continue to ſurpaſs them on bad and ſhallow ſoils; ſince, by reaſon of its ſmall ſize, it could be more effectually planted? Whether of the two would be moſt apt to ſuffer by inclement weather, and conſequently ſooneſt get ſtinted? It is, therefore, recommended that the plants be taken from the ſeminary at one year old, and nurſed one year, in rows twelve inches apart, and four in line. If plants of a greater ſize be wanted, they ſhould be moved at the end of one, and nurſed another year, in rows fifteen inches apart, and ſix in line. Beyond this, the larch ſhould never be nurſed. The infant tap roots may be ſhortened a little; but after this they ſhould not be pruned at all in any caſe.

With regard to the Scotch fir and the Weymouth pine, the former, unleſs for the purpoſe of decoration, or where it is wanted for variety, is never nurſed, but taken from the ſeminary at two years old, and then planted out for good. Mr. Nicol approves of this practice, provided the plants ſtand thin in the ſeminary; but otherwiſe they ſhould be nurſed one year in rows a foot aſunder, and an inch in line. If they are required of a larger ſize, they ſhould be removed from this into other nurſery lines, at twelve or fifteen inches apart, and four or five in line, according to the time they are to remain there, which, however, ſhould not be longer than two years for any purpoſe whatever. The Weymouth pine ſhould alſo ſtand two years in the ſeminary, and then be nurſed two or three years in rows; according to the purpoſe intended, or the quality and depth of ſoil wherein it is afterwards to be planted. In either caſe, fifteen inches between the lines will be ſufficient; and if they are to remain two years, four in line; but if three, five or ſix. The tap roots of the ſeedlings of either may be ſhortened a little; but at the ſecond, or any ſubſequent removal, their roots muſt not be touched.

But the common or Norway ſpruce ſhould be removed from the ſeminary at two years old, and nurſed in lines twelve inches apart, and three in line, for two ſeaſons: at the end of which, remove them into other lines fifteen inches apart, and four or five in line; there to remain one, or, at moſt, two years, in proportion to their progreſs, or the ſoil they are to be planted in. If they are intended for very barren ſcites, plants nurſed for two ſeaſons *only* are to be preferred. The roots of this plant ſhould not be pruned at any time, if it can be avoided; nor indeed ſhould any of the reſinous tribes, except a ſmall bit of the tap roots of ſeedling infants. The American ſpruce, and the ſilver fir, are alſo to be taken from the ſeminary at the end of the ſecond year, and planted in lines twelve inches apart, and four in line; nurſing them there for two ſeaſons, and then removing them into other lines, eighteen inches apart, and ſix in line, there to remain for one or two ſeaſons more, according to circumſtances. Longer they ſhould not be nurſed. If they are intended for bleak expoſures and barren ſoil, they ſhould be removed thereto at the end of the two firſt ſeaſons of nurſing, if poſſible.

In regard to the quick or white thorn, which is a moſt uſeful plant, it may remain either one or two ſeaſons in the ſeminary, according to the progreſs it may have made; then planting in lines twelve inches apart, and two in line: at the end of one ſeaſon, removing the plants into other lines, twelve inches apart, and four in line. The roots may be gently pruned.

It is obſerved, that "the reaſon of removing them at the end of the firſt year, is to encourage the progreſs of their fibry roots. At the end of the ſecond, they will be fit for *hedging* in any ſituation whatever; nor will plants of any age or ſize outgrow them within the third year, if they are properly kept clean afterwards, as he has proved by repeated experiments made impartially on very different ſoils, ſituations, and expoſures.

Seaſon of Planting.—For the deciduous kinds, from the middle of February to about the 20th of March is conſidered the moſt eligible ſeaſon; and for the evergreens, from the 20th of July to about the middle of Auguſt; taking advantage of wet or cloudy weather, and frequently watering in hot, dry weather, till the plants have ſtruck root perfectly.

And the plants of all deſcriptions ſhould be carefully kept clean of weeds in the ſummer months; and the interſtices of all the rows, which ſtand over year, be pointed in with a narrow ſpade, in any of the winter months, being careful not to injure the roots of the plants in the operation. And in reſpect to pruning, the evergreens muſt not be touched, unleſs they put forth rival ſtems or leaders; in which caſe, the weakeſt muſt be diſplaced. The larch is to be treated in the ſame manner. All branches of the deciduous kinds, which ſeem to rival the ſtem in ſize, or take upon them the office of leaders, are to be cut clean off by the bole with a ſharp knife. This is the general management, which is neceſſary to be noticed here. Se PLANTING.

NURSERY, in *Gardening*, a portion of ground ſet apart for the raiſing and nurſing various ſorts of trees, ſhrubs, and herbaceous plants, to proper ſtates of growth, for ſupplying the different gardens, orchards, plantations, and other departments.

In theſe ſituations are raiſed all the different ſorts of fruit-trees, and fruit-bearing ſhrubs, by nurſing and training them up to proper ſizes and growths for planting, where they are to remain to produce their fruit; as well as the vaſt train of foreſt trees, hardy ornamental trees, and deciduous evergreen ſhrubs; training them up properly for the purpoſes for which they are deſigned in plantations and pleaſure-grounds.

And various ſorts of hardy herbaceous plants, both of the fibrous, bulbous, and tuberous-rooted kinds, may be here provided in proper ſtates for being planted out.

Theſe different ſorts of plants are raiſed by ſeed, ſuckers, layers, cuttings, ſlips, offsets, parting the roots, grafting, budding, &c. as directed under their ſeveral heads.

And as ſome of the various ſorts are drawn off annually, to ſupply different ſituations, a freſh ſupply of young plants ſhould be accordingly raiſed every year in the nurſery, of moſt of the various kinds, ſo as to have it always fully ſtocked with moſt kinds in different ſtates of growth: ſome in ſeed-beds, others tranſplanted in nurſery rows; ſome one year, others two, three, or ſeveral years; all of which ſhould be

be well attended to, that there may be a ſufficiency of plants of all ſorts, for furniſhing every different department of gardening, as they may be wanted.

In public nurſery-grounds it is cuſtomary to have convenient green-houſes, glaſs-caſes, and ſtoves, with their proper appendages, for raiſing tender exotics from the warmer parts of the globe, which are always placed in the warmeſt and moſt ſunny ſituations, having their fronts directly facing the ſouth, to have all poſſible benefit from the ſun's influence; which ſerve for raiſing and nurſing the various tender plants to a proper growth, for furniſhing other larger conſervatories, green-houſes, &c.

Size, Soil, and Situation.—In reſpect to the extent or dimenſions of nurſery-grounds, they ſhould be according to the quantity of plants required, or the demand for ſale. If for private uſe, from a quarter or half an acre to five or ſix may be proper, which ſhould be regulated according to the extent of the garden-ground and plantations they are required to ſupply; and if for public or general cultivation, not leſs than three or four acres of land will be worth occupying, and from that to fifteen or twenty acres, or more, may be requiſite, in proportion to the demand.

The ſoil for nurſery-grounds ſhould be of different qualities, in order that it may ſuit different ſorts of trees and plants.

Nurſerymen generally prefer a loamy ſoil of a moderately light nature: however, they may be formed of any good moderately light land, that has fifteen or eighteen inches deep of good working ſoil; but if two or three ſpades deep, it will be the better; and where there is ſcope of ground to chooſe from, that where there is a good depth, and a naturally rich or good ſoil, ſhould be preferred, as the ſoil of a nurſery cannot be too good, notwithſtanding what has been advanced to the contrary; as where the ſoil is poor and lean, the plants are moſtly languid, weak, and ſtunted, no art being able to improve them; while thoſe raiſed in a good mellow ſoil always aſſume a free growth, and advance with ſtrength and vigour. It is not requiſite, however, that the ſoil ſhould be very rich, nor over-manured; a medium between the two extremes is the moſt proper, ſuch as mellow paſture land, having the ſward turned to the bottom, which is excellent for the growth of trees: and any ſimilar eligible ſoil of corn-fields is alſo extremely proper; any other good ſoil, of the nature of common garden-earth, is likewiſe well adapted for a nurſery-ground.

As to ſituation, where it is rather low than high, it is better, as being naturally warmer, and more out of the power of cutting boiſterous winds than a higher ſituation; though, where ſome parts of the ground are high, and others low, it may be an advantage, in better ſuiting the nature of the different plants. It is alſo of advantage to have nurſery-grounds fully expoſed to the ſun and free air, and, if poſſible, where there is the convenience of having water, for the occaſional watering of young ſeedlings, and newly removed plants.

When for private uſe, where there is room, nurſery-grounds may either be entirely detached, or contiguous to the outer boundaries of the ſhrubbery plantations of the pleaſure-ground; and ſo contrived as to lead inſenſibly into it by winding walks, ſo as to appear part of the garden or ſhrubbery.

Method of incloſing, preparing, and laying out.—In reſpect to the outſide fence, it may either be a hedge and ditch, or a paling. The former is the cheapeſt, and moſt durable; though, where hares and rabbits abound, paling fences are moſt eligible.

Paling, or other ſimilar cloſe fence, is, however, in general, for ſome part, extremely uſeful to train young wall-trees to a proper growth for garden-walls, &c.

After being thus fenced in, the ground ſhould be all regularly trenched over one or two ſpades deep, according to the natural depth of the ſoil: after which, proceed to divide it by walks into quarters, and other parts; letting a principal walk lead directly through the middle, or ſome principal part, which may be from five to eight or ten feet wide, according to circumſtances, having a broad border on each ſide. Another walk ſhould be carried all round, next the outward boundary, four or five feet wide, leaving an eight or ten feet border next the fence all the way; dividing the internal part by ſmaller croſs-walks, ſo as to form the whole into four, ſix, or eight principal diviſions.

One or more of theſe diviſions ſhould be appropriated for the reception of all ſorts of ſeeds, for raiſing plants to furniſh the other parts; ſubdividing it into four-feet wide beds, with foot-wide alleys at leaſt between bed and bed. In theſe beds ſhould be ſown ſeeds, &c. of all ſuch trees, ſhrubs, and herbaceous plants, as are raiſed from ſeed; and which ſhould contain the various ſorts of kernels and ſtones of fruit, to raiſe ſtocks for grafting and budding upon, as well as the ſeeds of foreſt trees, ornamental trees, ſhrubs, &c. and of numerous herbaceous perennials, of the fibrous and bulbous-rooted tribes.

The ſeaſon for ſowing is both ſpring and autumn, according to the nature of their different ſorts, as may be ſeen under their different heads. When the young tree and ſhrub ſeedling-plants, thus raiſed, are one or two years old, they ſhould be planted out in nurſery-rows, into the other principal diviſions; but many kinds of herbaceous plants require to be pricked out from the ſeed-beds, when only from two to three or four months old; and, on the contrary, moſt kinds of bulbous ſeedlings will not be fit for planting out in leſs than one or two years, at the ſhorteſt periods.

Another part of theſe grounds ſhould be allotted for ſtools of various trees and ſhrubs, for propagation by layers, by which vaſt numbers of plants of different kinds may be raiſed. Theſe ſhould be ſtrong plants, ſet in rows three or four feet diſtance every way: ſuch of them as naturally riſe with tall ſtems, after being planted one year, are headed down near the ground, to force out many lower ſhoots conveniently ſituated for laying them down. See STOOLS and LAYING.

The cuttings, ſuckers, ſlips, offsets, &c. of hardy trees, ſhrubs, and plants, may be planted out in any convenient part of the ground, in ſhady borders, &c.; but for the more tender kinds, ſome warm ſheltered ſituation ſhould be provided.

The other principal diviſions of theſe grounds ſhould be left for the reception of various ſorts of ſeedling plants from ſeminary quarters, as well as for thoſe that are raiſed from ſuckers, layers, cuttings, &c. to be planted in rows from one to two or three feet aſunder, according to their natures and growths; allowing the tree and ſhrub kinds treble the diſtance of the herbaceous perennial ſorts. Of the tree and ſhrub kinds, ſome are to be planted for ſtocks to graft and bud the ſelect ſorts of fruit-trees, and other choice plants upon, that are uſually propagated by ſuch methods; others ſhould be trained up entirely on their own roots, without budding and grafting, as in moſt foreſt and other hardy tree kinds, as well as almoſt all the ſorts of ſhrubs.

It is alſo proper to have ſome dry warm ſheltered ſituation in the full ſun, in theſe grounds, for occaſional hot-beds of dung or tan, for raiſing and forwarding many ſorts of tender or curious exotics by ſeed, cuttings, ſuckers, ſlips, &c. which ſhould be furniſhed with ſuitable frames

and

and lights, hand-glaſſes, garden-mats, and other requiſites for that ſort of culture.

Methods and Times of ſtocking with Plants.—The particular modes of cultivation are fully explained under the different heads of the plants, and the operations that are neceſſary in raiſing them to the beſt advantage.

As to the ſeaſons for performing the works of ſowing, planting, &c. they are different in different kinds; but the autumn and ſpring are the principal ſeaſons. For planting out, or removing, the principal ſeaſon is about October, and in April for tender kinds, eſpecially the evergreen tribe; but moſt other hardy trees and ſhrubs may be tranſplanted any time in winter, in open mild weather. The nature of the ſoil ſhould, however, be regarded in this buſineſs.

The hardy herbaceous fibrous-rooted plants may be removed almoſt any time, either in autumn or ſpring, and many ſorts even in the ſummer; but for the older or larger plants, the autumn or very early ſpring are the beſt periods, which are the only proper ſeaſons for dividing or ſlipping the roots of all theſe kinds for further increaſe.

And for the bulbous and ſuch tuberous roots, whoſe leaves, like moſt of the bulbous tribe, decay in ſummer, the proper ſeaſon for planting or removing them is the ſpring and ſummer months, when their flower-ſtalks decay, as well as to ſeparate their offsets for increaſe; which may either be planted again directly, or kept out of ground one, two, or ſeveral months; though it is proper to plant the principal part again in autumn, unleſs where retained for ſale, &c.

The ſucculent perennial ſorts may be removed almoſt any time in the ſpring, ſummer, or early autumn; but the laſt is the beſt. But moſt kinds of ſucculent cuttings ſucceed beſt when planted in the ſummer ſeaſon.

Methods of diſpoſing the Plants.—In the diſtribution of the different ſorts in theſe grounds, each ſhould be ſeparate: the fruit, foreſt trees, &c. occupying ſpaces by themſelves, nearly together; all the ſhrub kind ſhould alſo be ranged in ſeparate places, allotting ſuitable ſpots for herbaceous perennials and tender plants, defended with yew or privet hedges, or a reed fence, &c. in which may be ſet ſuch plants, in pots, as are a little tender whilſt young, and require occaſional ſhelter from froſt, but not ſo tender as to require to be houſed, as green-houſe plants, &c. And in ſuch places, frames of various ſizes may be placed, either to be covered occaſionally with glaſs-lights, or with mats, to contain ſome of thoſe more choice tender kinds in pots, to be nurſed a year or two, or longer, with occaſional ſhelter, till gradually hardened to bear the open air.

The arrangement of all the ſorts in the open grounds ſhould always be in lines or nurſery rows, as already ſuggeſted, placing the fruit-tree ſtocks, &c. for grafting and budding upon, in rows two feet aſunder, when for dwarfs; but for ſtandards two feet and a half, and a foot and a half in the lines. But as, after being grafted and budded, they become fruit-trees, &c. where they are to ſtand to grow to any large ſize, they ſhould be allowed the width of a yard between the rows. Foreſt-trees ſhould alſo be placed in rows from two to three feet aſunder, and half that diſtance in the rows; varying the diſtance both ways, according to the time they are to ſtand; the ſhrub ſhould likewiſe be arranged in rows about two feet aſunder, and fifteen or eighteen inches diſtant in each line; and as to the herbaceous plants, they may generally be diſpoſed in four-feet wide beds, or large borders, in rows, or diſtances, from ſix to twelve or eighteen inches aſunder, according to their nature of growth, and the time they are to ſtand or remain in them.

By this mode of arrangement, a great number of plants are included within a narrow compaſs, but which is ſufficient, as they are only to remain a ſhort time; and, beſides, they are more regularly kept under proper regulation.

In public grounds of this ſort many kinds of ſeedling-trees and ſhrubs are planted out often in much cloſer rows at firſt than theſe, not only in order to huſband the ground to the beſt advantage, but by ſtanding cloſer it encourages the ſtem to ſhoot more directly upward, and prevent their expanding themſelves much any where but at top, as, for inſtance, many ſorts of evergreens that are of ſlow growth the firſt year or two, ſuch as the pine trees, firs, and ſeveral others, which the nurſery gardeners often prick out from the ſeminary, firſt into four-feet wide beds, in rows lengthways, ſix inches aſunder; and after having one or two years growth here, tranſplant them in rows a foot aſunder, and in a year or two after give them another and final tranſplantation in the nurſery, in rows two or three feet aſunder, as above: theſe different tranſplantings encourage the roots to branch out into many horizontal fibres, and prepare them better for being finally planted out.

The various ſorts of nurſery plants, after being raiſed in ſome of the above methods, are ſometimes pricked out by dibble, in other caſes put in by the ſpade, either by trenches, ſlitting-in, trenching, or holing; and ſome are drilled in by a ſpade or hoe, according to the kinds.

Sometimes young ſeedling-trees and ſhrubs are pricked out from the ſeminary by dibble, ſometimes put in by the ſpade in the following methods; firſt, having ſet a line to plant by, the ſpade is ſtricken into the ground with its back cloſe to the line, and another ſtroke given at right angles with it; then a plant ſet into the crevice made at the ſecond ſtroke, bringing it cloſe up into the firſt-made crevice even with the line, preſſing the mould cloſe to it with the foot; then proceeding to plant another in the ſame way, and ſo on. A ſecond method, for plants with rather larger roots, is to ſtrike the ſpade down with its back cloſe to the line, and then cut out a narrow trench with it cloſe along the line, making the ſide next the line perfectly upright, placing the plants upright againſt the back of the trench cloſe to the line, at the proper diſtances; and as the work proceeds, trimming in the earth upon their roots; when one row is thus planted, the earth ſhould be trodden gently all along cloſe to the plants; and then proceed to plant another row in the ſame manner. Another method of planting out ſmall tree and ſhrub plants is, after having ſet the line as above, to turn the ſpade edgeways to the line caſting out the earth of that ſpit, then a perſon ready with plants, ſetting one in the cavity cloſe to the line, and directly taking another ſuch ſpit, turning the earth in upon the roots of the plant, and then placing another plant into the ſecond cut, covering its roots with the earth of a third ſpit, and ſo on to the end; but ſometimes, when the roots are much larger, holes are made along the line wide enough to receive the roots freely every way, covering them in, as above, as the work proceeds, always preſſing the earth gently with the foot cloſe to the roots, and cloſing it about the ſtems, to ſettle the plants firmly in their proper poſitions.

Fibrous-rooted herbaceous plants are moſtly planted with a dibble, except when the roots are large and ſpreading, or ſuch as are removed with balls of earth; when they are more commonly planted by holing them in with a garden trowel, or ſmall ſpade for the purpoſe.

But bulbous and tuberous-rooted plants, ſuch as lilies, tulips, anemones, ranunculuſes, &c. are commonly planted with a dibble, and many ſorts may be planted in drills drawn with a hoe.

They

They are alſo ſometimes planted by raking or trimming the earth from off the top of the beds from about three to four or five inches deep, into the alleys, then placing the roots in rows upon the ſurface, thruſting the bottoms a little into the ground, and immediately covering them with the earth which was drawn off into the alleys, ſpreading it evenly over every part, ſo as to bury all the roots at an equal depth in the ſoil.

The tender kinds of exotic plants, that require occaſional ſhelter whilſt young, ſhould many of them be potted, in order for moving to warm ſituations in winter, or ſome into frames, &c. to have occaſional ſhelter from froſt by glaſſes or mats, as they may require; hardening them, however, by degrees, to bear the open air fully in the nurſery the year round. And the moſt tender kinds that require the aid of a greenhouſe or ſtove, ſhould all be potted, and placed in their proper ſituations. See GREENHOUSE and STOVE PLANTS.

General Culture of the Plants.—In the management of the various hardy nurſery plants, thoſe intended as ſtocks or fruit-trees ſhould have their ſtems generally cleared from lateral ſhoots, ſo as to form clean ſtraight ſtems, but never to ſhorten the leading ſhoot, unleſs it is decayed, or becomes very crooked, in which caſe it may be ſometimes proper to cut it down low in ſpring, to ſhoot out again, training the main ſhoot for a ſtem, with its top entire, till grafted or budded. See GRAFTING, BUDDING, and TRAINING.

But in the culture of the fruit-tree kind, the ſorts deſigned for principal wall-trees, particularly ſuch as peaches, nectarines, apricots, &c. ſhould, when of one year's growth from grafting and budding, be planted againſt ſome cloſe fence, as a wall, paling, reed-hedge, &c. and their firſt graft or bud-ſhoot headed down in the ſpring, to promote an emiſſion of lower lateral ſhoots and branches, in order to be regularly trained to the fence in a ſpreading manner for two or three years, or till wanted to form the head in a regular ſpreading growth, which, in public grounds of this kind, ſhould always be ready in proper training, to ſupply thoſe who may wiſh to have their walls covered at once by ſuch ready trained trees. And a ſimilar training, both for wall and eſpalier fruit-trees, may be practiſed with ſome principal ſorts in the nurſery-rows in the open quarters of the ground, by directing their branches, in a ſpreading manner, to ſtakes placed for the purpoſe.

Standard fruit-trees ſhould only be trained with a clean ſingle ſtem, five or ſix feet for full ſtandards, by cutting off all laterals ariſing below; half-ſtandards ſhould be trained with three or four-feet ſtems, and dwarf ſtandards in proportion, by the ſame means.

The heads of the ſtandards in ſome may be directed by having the firſt immediate ſhoots from the graft or bud, when a year old, pruned ſhort in ſpring to procure lateral ſhoots, in order to form a fuller ſpread of branches, proceeding regularly together from near the ſummit of the ſtems, and thus give a more regular branchy growth to them.

Foreſt-trees ſhould, in general, be encouraged to form ſtraight clean ſingle ſtems, by occaſional trimming off the largeſt lateral branches, which alſo promotes the leading top-ſhoots in riſing ſtraight, and faſter in height, always ſuffering that part of each tree to ſhoot at full length; that is not to ſtop it, unleſs where the ſtem divides into forks, when the weakeſt ſhould be trimmed off, and the ſtraighteſt and ſtrongeſt ſhoots or branches left to ſhoot out at their proper length, to form the aſpiring tops.

The different ſorts of ſhrubs ſhould moſtly be ſuffered to branch out in their own natural way, except merely regulating very diſorderly growths; and ſome ſorts may be trained with ſingle clean ſtems, from about one foot to two or three high, according as may be thought proper. But ſhrubs in general appear the moſt agreeable when permitted to ſhoot out laterally all the way, ſo as to be branchy or feathered to the bottoms of the ſtems.

The fruit-trees in each ſpecies ſhould, as ſoon as grafted or budded, have all the different varieties numbered, by placing large flat-ſided ſticks at the ends of the rows, for which purpoſe the ſpokes of old coach-wheels, or any thing about that ſize, of any durable wood, anſwers very well, painting or marking upon them the numbers, and entering them in the nurſery-book, with the name of the varieties to which the number-ſticks are placed, by which, at all times, a ready recourſe may be had to the ſorts wanted.

And it is uſeful to employ the ſame means to trees, ſhrubs, and herbaceous plants, eſpecially the varieties of particular ſpecies, when they are numerous, ſuch as in many of the flowery tribes; as auriculas, carnations, tulips, anemones, ranunculuſes, &c.

Watering nurſery plants is very requiſite in dry hot weather, in ſpring and ſummer; ſuch as ſeed-beds and tender ſeedling plants, while young, and when firſt planted out, till they have taken good root; alſo occaſionally to new-laid layers and newly planted cuttings in dry warm weather; but as to hardy trees and ſhrubs of all ſorts, when planted out at the proper time, as not too late in the ſpring, no great regard need be paid in this reſpect, as they generally ſucceed very well without.

The next buſineſs is, in every winter or ſpring, to dig the ground between the rows of all ſorts of tranſplanted plants in the open nurſery quarters, a practice which is particularly neceſſary to all the tree and ſhrub kinds that ſtand wide enough in rows to admit the ſpade between them; this work is, by the nurſerymen, called turning-in; the moſt general ſeaſon for which is, any time from October or November until March, but the ſooner it is done the more advantageous it will be to the plants. The ground is to be dug only one ſpade deep in theſe caſes, proceeding row by row, turning the top of each ſpit clean to the bottom, that all weeds on the top may be buried a proper depth. It is a moſt neceſſary annual operation, both to deſtroy weeds, and to increaſe the growth of the young plants.

And in the ſummer ſeaſon, great attention is neceſſary to keep all ſorts clean from weeds; the ſeedlings growing cloſe in the beds muſt be hand-weeded; but among plants of all ſorts that grow in rows wide enough to admit the hoe, it will prove not only moſt expeditious, but, by looſening the top of the ſoil, promote the growth of all kinds of plants. It ſhould always be performed in dry weather, and before the weeds grow large. See HOE and HOEING.

As ſoon as any quarter or part of theſe grounds is cleared from plants, others muſt be introduced in their room from the ſeminary; the ground being previouſly trenched over for the purpoſe, giving it the addition of manure if neceſſary.

It is ſuppoſed by ſome to be of advantage to plant the ground with plants of a different kind from thoſe which occupied it before, but this is probably not very material.

The tender or exotic plants of all kinds that require ſhelter only from froſt whilſt young, and by degrees become hardy enough to live in the open air, ſhould, ſuch of them as are ſeedlings in the open ground, have the beds arched over with hoops or rods, at the approach of winter, in order to be ſheltered with mats in ſevere weather; and thoſe which are in pots, either ſeedlings or tranſplanted plants, ſhould be removed in October in their pots to warm ſunny ſituations ſheltered with hedges, &c. placing ſome cloſe under the

fences facing the ſun, where they may have occaſional covering of mats in froſty weather; others that are more tender being placed in frames to have the occaſional covering either of glaſs lights or mats, &c. obſerving that they are gradually to be hardened to the open ground, and need only to be covered in froſty weather; at all other times they ſhould remain fully expoſed, and, by degrees, as they acquire age and ſtrength, become inured to bear the open air fully, ſo as when they arrive at from two or three to four or five years old, they may be turned out into the open ground.

NURSINGPOUR, a town of Hindooſtan, in Gurry Mundella; 35 miles W. of Gurrah.—Alſo, a town of Bengal; 8 miles E. of Doeſa.—Alſo, a town of Bengal; 36 miles S. of Dacca.

NURTINGEN, a town of Wurtemberg, on the Neckar, where an hoſpital was founded in 1481, which is ſaid to be the richeſt foundation in the whole duchy; 14 miles S.E. of Stuttgart. N. lat. 48° 36′. E. long. 9° 25′.

NURTURE, *Guardian for*, in *Law*. See GUARDIAN.

NUS, in *Geography*, a town of France, in the department of the Dora; 6 miles S.E. of Aoſta.

NUSANCE, NOCUMENTUM, in *Law*, is uſed not only for a thing done to the hurt or annoyance of another, in his free lands or tenements, but alſo for the aſſiſe, or writ lying for the ſame.

The word is derived from the French, *nuire, to hurt*.

The word is mentioned anno 22 Hen. VIII. cap. 4. Nuſances are either *public* or *private*: a *public* or *common* nuſance is an offence againſt the public in general, either by doing what tends to the annoyance of all the king's ſubjects, or by neglecting to do what the common good requires: in which caſe annoyances and injuries to ſtreets, highways, bridges, and large rivers; as alſo diſorderly ale-houſes, bawdy-houſes, gaming-houſes, ſtages for rope-dancers, mountebanks, &c. cottages erected ſingly on the waſte, making and ſelling of ſquibs and fire-works, or throwing them about in any ſtreet, eaves-droppers, a common-field, and keeping of hogs in any city or market-town, are held to be common nuſances. A *private* nuſance is when only one perſon or family is annoyed, by the doing of any thing; as where a perſon ſtops up the light of another's houſe, or builds in ſuch a manner, that the rain falls from his houſe upon his neighbour's; as likewiſe the turning or diverting water from running to a man's houſe, mill, meadow, &c. corrupting or poiſoning a water-courſe, by erecting a dye-houſe, or a lime-pit, for the uſe of trade, in the upper part of the ſtream; ſtopping up a way that leads from houſes to lands; ſuffering a houſe to decay, to the damage of the next houſe; erecting a brew-houſe in any place not convenient; or an houſe of office, &c. ſo near another perſon's houſe as to offend him by its ſmell; or exerciſing any offenſive trade, and ſetting up a fair or market to the prejudice of another.

Indictment lies for a *public* or *common* nuſance at the king's ſuit, whereon the party offending ſhall be fined and impriſoned; but no action can be brought in this caſe, except one man ſuffers more by a common nuſance than another; as where a pit is dug in the highway, and he falls into it. Action on the caſe, or aſſiſe of nuſance, lies, for any *private* nuſance, at the ſuit of the party aggrieved, and on ſuch actions judgment is given that the nuſance ſhall be removed, and the injured party recover damages: but if a perſon has only a term of years in a houſe or lands, as he has no freehold therein, he can only have an action on the caſe, by which means the nuſance will be removed without his recovering damages. The continuation of a nuſance is by the law conſidered as a new nuſance, and therefore, where a perſon ſuffers a nuſance to be ſet up, and then alienates and lets the land, &c. without removing it, an action of the caſe lies againſt him who erected it; and alſo againſt the alienee or leſſee, for continuing it. It has been adjudged that any perſon may remove a nuſance, in which caſe, even the cutting down a gate that croſſes the highway is legal; yet if a man deſtroys the nuſance himſelf, before he commences his action, he cannot have it afterwards, nor recover damages. Neither the lord of a manor, nor the king himſelf, can licenſe any perſon to make or erect a nuſance. Manwood makes three kinds of nuſances in the foreſt; the firſt, *common* nuſance; the ſecond, *ſpecial* nuſance; the third, *general* nuſance.

The writ of nuſance, *de nocumento*, is either ſimply *de nocumento*, or *de parvo nocumento*.

Writs of nuſance are now properly termed *treſpaſſes*, and actions upon the caſe.

NUSANCE, *Abatement of*, denotes the removal of it, which the party aggrieved is allowed to do, ſo as he commits no riot in the doing of it. 5 Rep. 101. 9 Rep. 55.

If a houſe or wall is erected ſo near to mine, that it ſtops my ancient lights, which is a *private* nuſance, I may enter my neighbour's land, and peaceably pull it down. (Salk. 459.) Or if a new gate is erected acroſs the public highway, which is a *common* nuſance, any of the king's ſubjects paſſing that way may cut it down, and deſtroy it. (Cro. Car. 184.) The reaſon why the law allows this private and ſummary method of doing one's ſelf juſtice, is, becauſe injuries of this kind, which obſtruct or annoy ſuch things as are of daily convenience and uſe, require an immediate remedy; and cannot wait for the ſlow progreſs of the ordinary forms of juſtice.

NUSANCE, *Aſſiſe of*, is a writ, wherein it is ſtated that the party injured complains of ſome particular fact done, *ad nocumentum liberi tenementi ſui*, and therefore commanding the ſheriff to ſummon an aſſiſe, that is, a jury, and view the premiſes, and have them at the next commiſſion of aſſiſes, that juſtice may be done therein (F. N. B. 183.); and if the aſſiſe is found for the plaintiff, he ſhall have judgment of two things. 1. To have the nuſance abated, and 2. To recover damages. (9 Rep. 55.) This action, as well as that called *quod permittat proſternere*, are now out of uſe, and have given way to the action on the caſe; in which no judgment can be had to abate the nuſance, but only to recover damages.

NUSBERG, in *Geography*, a town of Pruſſia, in Ermeland; 10 miles S.S.W. of Heilſberg.

NUSCO, a town of Naples, in Principato Ultra, the ſee of a biſhop, ſuffragan of Salerno; 8 miles N. of Conza. N. lat. 40° 56′. E. long. 15° 1′.

NUSHAR, a town of Aſiatic Turkey, in the government of Maraſch, at which there is a paſſage over the Euphrates; 55 miles S.W. of Diarbekir.—Alſo, a town of Curdiſtan, at the foot of mount Ararat; 20 miles N.E. of Van.

NUSSERABAD, a town of Hindooſtan, in Candeiſh; 30 miles S.W. of Burhanpour.

NUSSERATPOUR, a town of Hindooſtan, in Baglana; 20 miles N.E. of Chandor.

NUSSERPOUR, a diſtrict or province of Hindooſtan, in Sindy, lying on each ſide of the Indus, between Seweſtan and Tatta.—Alſo, a town of Hindooſtan, and capital of a country of the ſame name, on the Sinde; 30 miles S.W. of Moultan. N. lat. 25° 20′. E. long. 68° 20′.

NUSTAM, a word uſed by Paraceliſus and his followers to

to expreſs the cream of milk, or the pellicle which in ſome caſes ſwims upon the ſurface of wine.

NUT, in *Botany* and *Vegetable Phyſiology*, *Nux*, a hard and bony ſeed, not opening by valves, uſually conſiſting of but one cell, ſometimes of more, each cell containing one, rarely two, kernels. See SEED.

NUT, *Barbadoes*. See PERIHONES.

NUT, *Bladder*. See STAPHYLÆA.

NUT, *Caſhew*. See ANACARDIUM.

NUT, *Cob*. See HAZEL and CORYLUS.

NUT, *Cocoa*, the name of a genus of plants, called by botaniſts *cacao*. See THEOBROMA. See alſo Cocos.

NUT, *Earth*. See ARACHIS.

NUT, *Fauſel*. See ARECA.

NUT, *Filbert*. See FILBERT and CORYLUS.

NUT, *Hazel*. See HAZEL and CORYLUS.

NUT, *Malabar*. See JUSTICIA.

NUT, *Peas*, which ſome call the *lathyrus* of botanical writers. See LATHYRUS.

NUT, *Phyſic*, a name ſometimes given to the *ricinoides* of Tournefort. See JATROPHA and TURNSOLE.

This is alſo a name ſometimes given to the caſſada, and ſometimes to the croton. See PINEI *Nuclei*, &c.

NUT, *Pig*, a name by which the bulbocaſtanum, or earth-nut is ſometimes called. See BUNIUM.

NUT, *Piſtachia*. See PISTACHIA.

NUT, *Spaniſh*, a name by which ſome call the ſiſyrinchium of botanical writers, or the iris with a double bulb of Linnæus.

NUT, *Vomic*. See NUX *Vomica*.

NUT, *Wall*, the name of a well-known genus of trees, called by Linnæus *juglans*, and by Tournefort ſimply *nux*. See JUGLANS and WALNUT.

NUT-*Cracker*, *Nut-hatch*, or *Nut-jobber*, in *Ornithology*. See SITTA *Europæa*

NUT-*Cracker*. See CORVUS *Caryocatactes*.

NUT-*Hatch*, the Engliſh name of a bird known among authors by that of *ſitta*; and from its climbing trees in the manner of the wood-pecker, called by ſome, though improperly, *picus cinereus*, the grey wood-pecker. (See SITTA *Europæa*.) This is alſo the name of other ſpecies of *Sitta*; which ſee.

NUT-*Jobber*. See SITTA *Europæa*.

NUT-*Oil*, is the oil of walnuts, preſſed out of the kernels by means of a ſcrew-preſs. This is uſed for the mixing with flake white or other pigments, where the clearneſs of the colour is of great conſequence, and would be injured by the brown hue of linſeed oil.

NUTS *of an Anchor*, in a *Ship*, are two little prominences, appearing like ſhort ſquare bars of iron, fixed acroſs the upper part of the anchor-ſhank, to ſecure the ſtock of it in its place; for which purpoſe there is a correſponding notch, or channel, cut in the oppoſite parts of the ſtock, of the ſame dimenſions with the nuts.

NUTATION, in *Aſtronomy*, a kind of trepidation, or tremulous motion of the axis of the earth; whereby its inclination to the plane of the ecliptic is not always the ſame; but varies backwards and forwards ſome ſeconds: and the period of theſe variations is nine years. This nutation was diſcovered by Dr. Bradley, who publiſhed an account of his diſcovery in the year 1737. He alſo diſcovered the cauſe of this phenomenon in the Newtonian ſyſtem of attraction.

The firſt principle of that ſyſtem is known to be, that all bodies mutually attract each other in the direct ratio of their maſſes, and in the inverſe ratio of the ſquares of their diſtances. From this mutual attraction, combined with motion in a right line, Newton deduces the figure of the orbits of the planets, and particularly that of the earth. If this orbit was a circle, and if the terreſtrial globe was a perfect ſphere, the attraction of the ſun would have no other effect than to keep it in its orbit, and would cauſe no irregularity in the poſition of its axis; but neither is the earth's orbit a circle, nor its body a ſphere; for the earth is ſenſibly protuberant towards the equator, and its orbit is an ellipſis, which has the ſun in its focus. When the poſition of the earth is ſuch, that the plane of its equator paſſes through the centre of the ſun, the attractive power of the ſun acts only ſo as to draw the earth towards it, ſtill parallel to itſelf, and without changing the poſition of its axis, and this happens at the equinoxes. In proportion as the earth recedes from thoſe points, the ſun alſo goes out of the plane of the equator, and approaches that of one or other of the tropics; the ſemidiameter of the earth, which is then expoſed to the ſun, being no longer equal, the equator is more powerfully attracted than the reſt of the globe, which cauſes ſome alteration in its poſition, and its inclination upon the plane of the ecliptic: and as that part of the orbit, which is compriſed between the autumnal and vernal equinox, is leſs than that which is compriſed between the vernal and autumnal, it follows, that the irregularity cauſed by the ſun, during his paſſage through the northern ſigns, is not entirely compenſated by that which he cauſes during his paſſage through the ſouthern ſigns; and that the parallelism of the terreſtrial axis, and its inclination with the ecliptic, will be a little changed. But though the irregularity is now accounted for, we are ſtill at a loſs for the cauſe of its happening in a period of nine years. This difficulty, however, will immediately diſappear.

The ſame effect which the ſun produces upon the earth, by its attraction, is alſo produced by the moon, which acts with greater force, in proportion as it is more diſtant from the equator; now, at the time when its nodes concur with the equinoctial points, its greateſt latitude is added to the greateſt obliquity of the ecliptic. At this time, therefore, the power which cauſes the irregularity in the poſition of the terreſtrial axis, acts with the greateſt force; and the revolution of the nodes of the moon, being performed in eighteen years, it is clear, that in eighteen years the nodes will twice concur with the equinoctial points; and, conſequently, that twice in that period, or once every nine years, the earth's axis will be more influenced than at any other time; ſo that it will have a kind of balancing backward and forward, the period of which will be nine years, as Mr. Bradley had obſerved; and this balancing he calls *the nutation of the terreſtrial axis*. See Phil. Tranſ. N° 406 and N° 485, in vol. xlv. p. 1. &c. and a fuller account of Dr. Bradley's obſervations under the article STARS.

That the moon has the like motion, is ſhewn by ſir Iſaac Newton, in the firſt book of his Principia; but he obſerves, that this motion muſt be very ſmall, and ſcarcely ſenſible.

NUTMEG, *Nux Moſchata*, a delicate kind of aromatic fruit, or ſpice, the fruit of the *Myriſtica*; brought from the Eaſt Indies, and particularly the Molucca iſlands; of which there are diſtinguiſhed two kinds, the *male* and *female*.

The female is that chiefly uſed among us; its form is round or oval, of the drupous kind, and its taſte hot and pungent.

The male is a wild nut, of a longiſh form, and without either taſte or ſmell; yet ſometimes put off, while yet in the fruit, for the female. See MYRISTICA.

The nutmeg is incloſed in a covering, which is fleſhy and

tough; and which by opening at the tip ſeparates into two valves, and diſcovers the "mace," (ſee MACE,) which has a reticulated appearance, and divides into three portions, which cloſely inveſt a ſlender ſhell, containing the ſeed or nutmeg. This is marked on the outſide with many vermicular furrows, within of a fleſhy farinaceous ſubſtance; variegated with whitiſh and bay, and having a cavity at the bottom for the embryo. The nutmeg tree yields three crops annually; the firſt in April, which is the beſt; the ſecond in Auguſt, and the third in December; yet the fruit requires nine months to ripen it. When it is gathered, the outer coriaceous covering is firſt ſtripped off, and then the inner carefully ſeparated and dried in the ſun. The nutmegs in the ſhell are expoſed to heat and ſmoke for three months, then broken, and the kernels thrown into a ſtrong mixture of lime and water, which is ſuppoſed to be neceſſary for their preſervation, after which they are cleaned and packed up; and with the ſame intention the mace is ſprinkled with ſalt water. There are ſeveral varieties of the tree; but that denominated the Queen nutmeg, which bears a ſmall round nut, is the beſt. They are imported in cheſts, which contain each from 100 to 140lbs. weight; the mace comes alſo in cheſts of different ſizes; the eſſential oil, which is obtained in Banda by diſtillation of the nuts, is brought in bottles, and the expreſſed oil in ſtone jars. Nutmegs are well known, as they have been long uſed both for culinary and medical purpoſes. By diſtillation, or expreſſion, they yield an oil of great fragrancy, and uſe in medicine.

When diſtilled with water, they yield nearly one thirty-ſecond their weight of a limpid eſſential oil, very grateful, poſſeſſing the flavour of the ſpice in perfection, and which is ſaid to have ſome degree of an antiſpaſmodic or hypnotic power: on the ſurface of the remaining decoction is found floating an unctuous concrete matter, like tallow, of a white colour, nearly inſipid, not eaſily corruptible, and hence recommended as a baſis for odoriferous balſams: the decoction, freed from this ſebaceous matter, and inſpiſſated, leaves a weakly bitter, ſubaſtringent extract.

The largeſt and heavieſt nutmegs are to be choſen; ſuch as are of the ſhape of an olive, well marbled withoutſide, reddiſh within, unctuous in ſubſtance, and of a fragrant ſmell.

Alcohol and ether extract the whole virtue of nutmegs by infuſion; and elevate very little of it in diſtillation; hence the ſpirituous extract poſſeſſes the flavour of the ſpice in an eminent degree. When the ethereal tincture, which is limpid and of a golden yellow colour, is evaporated in water, an equal portion of volatile eſſential oil unites with the water, and a white, opaque, granular, ſebaceous ſubſtance, heavier than water, which has much the appearance of the expreſſed oil, is depoſited. When alcohol is digeſted in this ſubſtance, it diſſolves very little of it, but becomes yellow, and acquires the qualities of a ſpirituous ſolution of the eſſential oil. The undiſſolved ſubſtance, if waſhed in water, is nearly inſipid, melts at a temperature of 150°, and on collecting, concretes into a tranſlucent brittle cake, which has the properties of wax. The part of the nutmeg inſoluble in ether is chiefly gum and ſtarch. In diſtillation with water, nutmegs yield $\frac{1}{32}$d of their weight of eſſential volatile oil, and by expreſſion one-third of a ſebaceous fixed oil. Hence, the components of the nutmeg ſeem to be ſtarch, gum, volatile oil, wax, and a fixed fat oil. The volatile oil poſſeſſes the colour and taſte of the nutmeg in a concentrated degree, is of a pale ſtraw colour, limpid, tranſparent, and lighter than water. The expreſſed oil, which is erroneouſly called oil of mace, when firſt drawn, is limpid and yellow, but on cooling acquires the conſiſtence of ſpermaceti, and ſomewhat of the appearance of Caſtile ſoap, being whitiſh, mottled with reddiſh-brown. Its odour is agreeable, and ſlightly aromatic, and its taſte fatty, purgent, and bitteriſh. It appears to be a vegetable cerate, or a triple compound of fixed oil, volatile oil, and wax.

Mace reſembles the nutmeg in its odour and taſte, but has a greater degree of pungency and bitterneſs. It is in laciniated, flexible, thin pieces, unctuous to the feel, and of a deep reddiſh-yellow colour. Alcohol and ether extract its active principles; and when the ethereal tincture is evaporated in water, a thick deep yellow-coloured, very pungent, and odorous oil is left in drops on the ſurface of the water, with ſome reſin; and a ſmall portion of extractive is alſo depoſited, but no waxy granular matter.

Nutmegs, when heated, yield to the preſs a conſiderable quantity of limpid yellow oil, which on cooling concretes into a ſebaceous conſiſtence. In the ſhops we meet with three ſorts of unctuous ſubſtances, called "oil of mace," though really expreſſed from the nutmeg. Beſides the two ſorts, mentioned under the article *Oil of* MACE, there is a third, which is the worſt of all, and uſually called "common oil of mace." This is an artificial compoſition of ſevum, palm oil, and the like, flavoured with a little genuine oil of nutmeg. The medicinal qualities of nutmeg are ſuppoſed to be aromatic, anodyne, ſtomachic, and reſtringent, and with a view to the laſt mentioned effects, it has been much uſed in diarrhœas and dyſenteries. To many people the aromatic flavour of nutmeg is very agreeable; they ſhould, however, be cautioned not to uſe it in large quantities, as it is apt to affect the head, and even to manifeſt an hypnotic power, in ſuch a degree as to prove extremely dangerous. Bontius ſpeaks of this as a frequent occurrence in India; and Dr. Cullen (Mat. Med. vol. ii.) relates a remarkable inſtance of this ſoporific effect of the nutmeg, which fell under his own obſervation; and hence he concludes, that in apoplectic and paralytic caſes, this ſpice may be very improper. The officinal preparations of nutmeg are a ſpirit and eſſential oil, and the nutmeg in ſubſtance roaſted, to render it more aſtringent. Both the ſpice itſelf and its eſſential oil, enter ſeveral compoſitions of the different pharmacopeias of the colleges of London, Edinburgh, and Dublin; thoſe of the nutmeg are "Spiritus myriſticæ," L. E. D. "Spiritus lavendula compoſitus," L. E. D. "Spiritus raphani compoſitus," D. "Confectio aromatica," L. D. "Electuarium catechu," E. D. "Pulvis carbonatis calcis compoſitus," D. "Trochiſci carbonatis calcis," E. D. Thoſe of the oil are "Spiritus ammoniæ aromaticus," D. "Pilulæ ſcillæ," D. "Emplaſtrum picis compoſitum," L. The doſe of the nutmeg and of the mace, is from grs. v. to ℈ j; that of the volatile oil m ij to m vj. Mace poſſeſſes qualities ſimilar to thoſe of the nutmegs, but is leſs aſtringent, and its oil is ſuppoſed to be more volatile and acrid. Lewis. Woodville. Thomſon.

NUTRITION, in *Phyſiology*, a function common to all organiſed bodies, in which their various component tiſſues convert nutritive matter into their own ſubſtance, and add it to the particles which previouſly entered into their compoſition.

The materials of nutrition are prepared by ſeveral previous proceſſes; by *digeſtion*, in which the food is altered in its qualities, and reduced to a homogeneous maſs; by *abſorption*, in which the nutritive part of the aliment is extracted and conveyed into the blood; by *circulation* and *reſpiration*, in which this nutritive matter is converted into blood. (See thoſe articles.) Nutrition is the completion of the functions of aſſimilation; the aliment, animaliſed by the ſeries of proceſſes juſt enumerated, and rendered

ſimilar

ſimilar to the ſubſtance of the being which it is to nouriſh, is applied to the organs, whoſe waſte it is to repair; and this identification of the nutritive matter to our organs, which take it up, and appropriate it to themſelves, conſtitutes nutrition, in which there is a real converſion of the aliment into our own ſubſtance.

The component particles of an animal body are in a ſtate of conſtant change; the old ones are detached and removed by the abſorbents, and their place is ſupplied by new matter laid down by the arteries. Until the body has attained its full ſize, the movement of compoſition predominates over that of decompoſition, and all the parts increaſe; when the growth is completed, and there is no apparent change of bulk, the removed and the added portions balance each other; and, as the body declines, the abſorption exceeds the addition of new matter. But, at all times, there is an interior motion of the component parts. Hence the body has been compared by a French phyſiologiſt to the veſſel of the Argonauts, ſo often repaired in the courſe of a long and perilous navigation, that on her return, no part of her former materials remained. An animal body probably contains none of the ſame molecules at two diſtant periods. The experiments performed by mixing madder with the food of animals, prove moſt unqueſtionably this inceſſant decompoſition of animated and living matter. This mixture, in conſequence of a chemical affinity between the madder and phoſphat of lime, dyes all the bones of a red colour; when the madder is left off for a ſufficient length of time, the colour diſappears. (See Bone.) It is obvious, that the calcareous phoſphat in the oſſeous ſyſtem previous to the commencement of the experiment, muſt be gradually removed, and its place ſupplied by the coloured earth; while this is again abſorbed in its turn, after the madder is diſcontinued, to make room for a new uncoloured depoſition. If the hardeſt and moſt ſolid parts, apparently the moſt calculated to reſiſt decay, are undergoing a perpetual motion of decompoſition and regeneration; there can be little doubt that this motion muſt be far more rapid in thoſe, whoſe power of coheſion is much inferior; for example, in the fluids. In the nails, hair, and cuticle, a conſtant growth is ſo regularly obſerved, that it is not neceſſary to particulariſe the phenomena. The fact is not ſo apparent in the ſoft parts, although we cannot doubt of its exiſtence. The arteries and abſorbents, which they all poſſeſs, can only be ſubſervient to theſe uſes; and we frequently ſee conſiderable enlargement or diminution of the body or a part, when either the addition or abſorption acquires an undue preponderance.

Attempts have been made to determine the period, at which the body is completely renovated; it has been ſuppoſed, that an interval of ſeven years is neceſſary for one ſet of molecules to diſappear and be replaced by others; but this is a point hardly ſuſceptible of any preciſe determination. The change goes on more rapidly in childhood and in youth; it is ſlower in mature age; and muſt require a conſiderable time at a very advanced period of life, when all the organs become firmer, and the vital powers more languid. There can be no doubt that ſex, habit, climate, mode of life, and various other circumſtances, accelerate or retard it.

Theſe conſiderations render it obvious, that the notion of perſonal identity cannot conſiſt in ſameneſs of the body; an animal does not conſiſt of the *ſame* parts in the ſame arrangement, not only at no two diſtant periods, but not in two following days or even hours.

The abſorbing veſſels are the agents of the decompoſition of our organs; they detach the old matter, and convey it into the blood, whence it is ſeparated chiefly by the kidnies, and perhaps alſo by the other ſecretory organs.

The waſte of the conſtituent particles of animal bodies is repaired by means of homogeneous particles exactly like themſelves; thus each organ is the ſame to all appearance, although its component parts have been entirely changed. Were it otherwiſe, the nature of our organs would be undergoing perpetual changes.

This function of reparation is allotted to the circulating ſyſtem, which is a common receptacle for the nutritive fluid extracted from our aliments, and for the materials taken away from all parts of the body by the abſorbing veſſels. The different ſubſtances brought into the circulating ſyſtem are there converted into a homogeneous fluid, of which the compoſition and properties are eſſentially the ſame under all circumſtances. Whether we feed on animal or vegetable matters, on one or on twenty articles, whether the body is increaſing or declining, no differences, or at leaſt none of any conſequence, are obſerved in this fluid; our organs and means of reſearch are not at preſent able to detect the variations of compoſition, which may be reaſonably ſuppoſed to ariſe from the circumſtances juſt enumerated.

From this common nutritive fluid, the blood, conveyed in tubes, which anatomy ſhews us to be every where alike, each organ draws the materials requiſite for its growth and ſupport: bone, muſcle, cartilage, tendon, brain, nerve, &c. convert ſome part of the blood, reſpectively, into thoſe different tiſſues. The proceſs ſeems very ſimilar to that of ſecretion: in the latter, various matters are formed, to anſwer particular purpoſes in the economy, and are then expelled from the body; in the former, the new products drawn from the blood are added to the body, and become identified with its ſtructure. Nutrition muſt be different in the different tiſſues; each appropriating to itſelf whatever it meets with, fitted to its nature, in the fluids conveyed to it, and leaving untouched the remaining heterogeneous particles. Probably there is not much difference in the baſis of all our organs: cellular tiſſue, arteries, veins, nerves, exhalants, and abſorbents, are the common and uniform ground-work. Theſe ſix organic ſyſtems are not found in all the organs, ſome of which have no arteries nor veins, ſome no nerves, &c.: but they meet together in moſt; and there are always ſome preſent, although others may be wanting. The exhalants and abſorbents are the moſt univerſally found: nutrition, reſulting from a double motion, of compoſition, which brings nutritive matter to the organs, and of decompoſition, which removes it, ſuppoſes their exiſtence; the exhalants are the agents in the firſt of theſe motions, the abſorbents in the ſecond. The general ſyſtems above-mentioned conſtitute the nutritive parenchyma of every organ, the mould into which the nutritive ſubſtance is depoſited. The latter, different in every inſtance, conſtitutes the difference of the various organs. It is phoſphat of lime and gelatine in the bones, gelatine only in the cartilages and tendons, fibrine in the muſcles, &c. See the article Fibre.

The nutrition of a part requires a ſupply of arterial blood, the ſource of its materials. Tying the principal artery of a limb does not interrupt this function, becauſe the blood is conveyed through other channels; but a general ligature, impeding the entrance of blood altogether, is followed by death of the part. The influence of the brain and nerves is not

not eſſential to this function. Paralyſed limbs retain their ſize at firſt; but after the lapſe of time, they become ſmaller. See NERVOUS *Syſtem*.

Like all vital proceſſes, nutrition is ſubject to conſiderable varieties. Beſides the modifications, which it exhibits from the progreſs of age, it may be generally increaſed or diminiſhed without any affection of health. In theſe changes, the effect is produced only on particular tiſſues: the bones remain of the ſame ſize, the viſcera are not altered, and probably the muſcles are nearly the ſame; the cellular tiſſue and its contained fat are the parts affected. Exerciſe has the effect of increaſing the ſize of the muſcles.

Numerous deviations from the natural courſe occur in this proceſs under diſeaſe. There may be an exceſſive depoſition of healthy matter in any organ, occaſioning ſwelling or exoſtoſis of the bones, tumours of various parts, &c.; or a morbid matter may be depoſited inſtead of the natural ſubſtance of a part, as in ſcirrhus, ſoft cancer of the teſtis, &c. The laws, which regulate nutrition in the different organs and tiſſues, will be conſidered under the reſpective articles on thoſe ſubjects.

In ſome parts of the body this proceſs does not take place. The hair and nails grow by additions made at one end; and the part, when once formed, undergoes none of the decompoſition and regeneration which have been deſcribed in this article. (See INTEGUMENTS.) The teeth are ſimilarly circumſtanced. (See CRANIUM.) We believe that nutrition goes on in all the other tiſſues.

The amount of what we know about nutrition is ſimply, that the various organic ſtructures of the body form out of the blood, by virtue of their vital properties, muſcle, bone, ligament, brain, nerve, &c. beſides the different products of diſeaſe: the newly formed matters bear no reſemblance to the blood, and are as widely different from each other. To the very natural queſtion, how are theſe changes wrought? we can only anſwer by an avowal of entire ignorance. It has been aſſerted by ſome modern chemiſts, that the proceſſes are chemical; and ſuch they muſt undoubtedly be held, if all the alterations in the component elements of matter fall under the department of chemiſtry. We cannot, however, compare the reſults of nutrition to any of the phenomena ordinarily called chemical. No chemiſt has ever ſucceeded in converting food into chyle, chyle into blood, and the latter into twenty or thirty different matters. Chemiſtry has as yet advanced but little in determining the difference of compoſition between blood and the ſubſtance of our organs: ſtill leſs has it pointed out how each part robs this fluid of its elements, to convert them into its own nature. If we examine vegetable and animal ſubſtances by deſtructive analyſis, we gain very different elements, and are puzzled to underſtand how food of the former kind can furniſh materials for the latter: vegetables may be reſolved into carbon, hydrogen, and oxygen, with ſometimes a ſmall proportion of azote, ſome ſalts, and other materials. In an animal body, azote predominates. The chemical phyſiologiſts have endeavoured to explain how this converſion is effected. But we take the liberty to ſuggeſt that that is not the true problem of nutrition: our inquiry is, how blood is changed into bone, brain, muſcle, &c.; and in proſecuting this inveſtigation, deſtructive analyſis may embarraſs the queſtion, but can hardly afford much aſſiſtance.

Perhaps we are yet hardly acquainted with the extent of the nutritive power. If an animal were ſupplied with food, from which lime and phoſphoric acid were carefully excluded, would the formation of bone go on? In other words, can the exhalant arteries form phoſphat of lime from the blood, if it contains none? Some facts have been aſcertained, which bear analogically on this point; but there is no direct proof either for or againſt it. Dr. Fordyce found, that if the canary bird was not ſupplied with lime, at the time of her laying, ſhe frequently died from her eggs not coming forward properly. He divided a number of theſe birds, at the time of their laying eggs, into two parties: to the one he gave a piece of old mortar, which the little animals ſwallowed greedily; they laid their eggs as uſual, and all of them lived; whereas many of the other party, which were ſupplied with no lime, died. Vauquelin, on the contrary, obſerved, that the oats conſumed in a given time by a hen contained 136.509 grains of phoſphat of lime, and 219.548 grains of ſilica. The ſhells of the eggs, which ſhe laid during this time, contained 98.776 grains of phoſphat, and 453.417 of carbonat of lime. The excrements voided in the ſame time contained 175.529 grains of phoſphat, 58.494 grains of carbonat of lime, and 185.266 grains of ſilica. Conſequently there were thrown out

	274.305	grains of phoſphat of lime.
	511.911	carbonat.
	185.266	ſilica.

We refer the reader to the article GLAND, for our obſervations on ſecretion; to which the proceſs of nutrition bears very great analogy.

NUTRITION *of Plants*. See VEGETATION, SAP, CIRCULATION, PLANTS, &c.

NUTRITION, in *Pharmacy*, an obſolete term which was uſed to denote a kind of preparation, conſiſting in the gradual mixture of liquors of different natures, by ſtirring them together till they have acquired a thick conſiſtence, as in making butter of Saturn, or unguentum nutritum.

NUTRITIOUS *Parts of Plants*, in *Agriculture*, ſuch parts as afford the nouriſhment and ſupport of animals. In this reſpect there is conſiderable diverſity of different ſorts of plants, as well as in the different parts of which they are conſtituted. Dr. Darwin has ſuggeſted that thoſe vegetables, which approach neareſt to the nature of animal bodies, are the moſt likely to ſupply the greateſt proportion of the nouriſhing material. Hence the eſculent muſhrooms, the gluten of wheat or other ſubſtances, and the oils of ſeeds and kernels, may be placed in the firſt rank in this intention. And that as the chyle of all ſuch animals as have red blood, is ſuppoſed to be nearly ſimilar, and to conſiſt chiefly of ſugar, mucilage, and oil; it may be concluded that thoſe vegetables which contain the largeſt proportion of ſuch materials, or of ſuch as are capable of being converted into them by the proceſs of digeſtion, may occupy the next place in reſpect to their nutritive properties, for ſuch animals; provided that no noxious ſubſtances be combined with ſuch uſeful properties, ſo that they cannot be eaſily ſeparated from them. But though this be the caſe with theſe ſubſtances, there are others that may nearly ſupply an equal proportion of nutriment, from their great facility of being changed into ſugar or mucilage, as thoſe which abound in farina, conſiſting of meal or ſtarch, which is partly converted into ſugar, and partly into mucilage, in the proceſs of melting, as well as many others. And the ſap wood or alburnum of moſt trees, it is likewiſe ſuggeſted, affords much nutritious matter in the winter months. This curious

ſubject

ſubject may be ſeen more fully handled in the Phytologia of the above author, where a number of intereſting circumſtances are brought to view on the ſubject.

NUTRITUM, in *Pharmacy*, is a denomination given to a deſiccative, cooling unguent, prepared by the agitation and nutrition of litharge of gold with oil and vinegar, or the juice of ſolanum, in a mortar.

NUTSHED, in *Agriculture*, a provincial term, applied to young animals, to ſignify their being ſtinted or ſtarved in bringing up.

NUTTER Mohr, or *Utter*, in *Geography*, a town of Eaſt Frieſland; 9 miles S.E. of Emden.

NUTUREE, a town of Hindooſtan, in Myſore; 28 miles N.N.E. of Chitteldroog.

NUTWABARA, a town of Bengal; 23 miles N.E. of Ramgur.

NUX, in *Botany*, is not only the Latin name of a particular ſort of ſeed, (ſee Nut,) but is applied by Tournefort generically, to deſignate the Walnut. See Juglans.

Nux *Americana*. See Melicocca, Quassia, and Sapindus.

Nux *Avellana*. See Corylus.

Nux *Galla*. See Gall.

Nux *Juglans*. See Juglans.

Nux *Malabarica*. See Sterculia.

Nux *Maris*, in *Natural Hiſtory*, a name given by many writers to a peculiar ſpecies of ſea-ſhell. It is one of the dolium, or concha globoſa kind, and a ſpecies of that genus called gondola.

Nux *Moluccana*, in *Botany*. See Jatropha.

Nux *Moſchata* and *Myriſtica*. See Myristica.

Nux *Regia*, the *royal nut*, a name given by ſome authors to the *walnut*.

Nux *Veſicaria*. See Hernandia and Staphylæa.

Nux *Vomica*, the fruit, or rather the ſeed of the fruit or berry of a large tree growing in ſeveral parts of Egypt, and in the iſlands of Timor and Ceylon; of a ſtrong narcotic quality, ſo as to be ranked in the number of poiſons. This is the tree, called by Plukenet *cucurbitifera Malabarienſis, anopliæ foliis rotundis, fructu orbiculari rubro cujus grana ſunt nuces vomicæ officinarum;* deſcribed and figured in the Hortus Malabaricus under the name of *Caniram*. See Strychnos.

It is round and flat, about an inch broad, and near a quarter of an inch thick, with a prominence in the middle on both ſides, of a grey colour, covered with a kind of woolly matter, but internally hard and tough like horn. The largeſt, whiteſt, neweſt, and cleaneſt are the beſt.

The kernel diſcovers to the taſte a conſiderable bitterneſs, but makes little or no impreſſion on the organs of ſmell. It conſiſts chiefly of a gummy matter, which is moderately bitter: the reſinous part is very inconſiderable in quantity, but intenſely bitter; hence rectified ſpirit has been conſidered its beſt menſtruum.

This drug is ſaid to be an aſſured poiſon for all animals except men. Inſtances are not wanting of its deleterious effects upon the human ſpecies. To dogs it proves fatal in a very ſhort time; and it has alſo poiſoned hares, foxes, wolves, cats, rabbits, and even ſome birds, as crows and ducks; and Loureiro relates that a horſe died in four hours after taking a drachm of the ſeed in an half-roaſted ſtate. Its effects, however, on different animals, and even on thoſe of the ſame ſpecies, are ſomewhat uncertain, and not always in proportion to the quantity given. With ſome animals it produces its effects almoſt inſtantaneouſly; with others, not till after ſeveral hours, when laborious reſpiration, followed by torpor, tremblings, coma, and convulſions, uſually precede the fatal ſpaſms, or tetanus, with which this drug commonly extinguiſhes life. The mortal ſymptoms in human ſubjects are ſimilar to thoſe now mentioned in brutes; and from theſe, as well as the diſſection of dogs killed by this poiſon, and manifeſting no injury done to the ſtomach or inteſtines, it has been inferred that the nux vomica acts immediately upon the nervous ſyſtem, and deſtroys life by the virulence of its narcotic influence. The quantity of ſeed neceſſary to produce this effect upon a ſtrong dog need not be more than a ſcruple; a rabbit was killed by five, and a cat by four grains; and of four perſons, who periſhed by this drug, one was a girl of ten years of age, to whom fifteen grains were exhibited at twice for the cure of an ague. Loſs, however, ſays, that he took one or two grains of it in ſubſtance, without diſcovering any bad effect; and that a friend of his ſwallowed a whole ſeed without injury. Hermannus, botanic profeſſor at Leyden, who has written expreſsly on it, ſays, that the vomic nuts of Timor and Ceylon are, for the human ſpecies, excellent ſudorifics, and are alſo to be ranked among diuretic medicines.

It has been recommended in tertian and quartan fevers, in virulent gonorrhœas, as well as an alexipharmic. Fallopius relates, that it was given with ſucceſs in the plague; that in doſes of from a ſcruple to half a drachm, it procured a plentiful ſweat; in which caſe the patient recovered. From the time of Geſner till a period of late date, it has been recommended by a ſucceſſion of authors, as an antidote to the plague, as a febrifuge, as a vermifuge, and as a remedy in mania, hypochondriaſis, hyſteria, rheumatiſm, gout, and canine madneſs. With us it is now conſidered, and not without good reaſon, as a deleterious drug, and is rarely if ever employed as a medicine. In Sweden it has been of late years ſucceſsfully uſed in dyſentery, but Bergius, who tried its effects in this diſeaſe, ſays, that though it ſuppreſſed the flux for twelve hours, it afterwards returned again. In one caſe, a woman, who took a ſcruple night and morning for two ſucceſſive days, is ſaid to have been ſeized with convulſions and vertigo, notwithſtanding which the dyſenteric ſymptoms returned, and the diſorder was cured by other medicines; but it was followed by a pain in the ſtomach, the effect of the medicine, which continued for a long time. Bergius is therefore of opinion, that it ſhould only be adminiſtered in the character of a tonic and anodyne in ſmall doſes from five to ten grains, and not till after proper laxatives have been employed. Loureiro recommended it as a valuable internal medicine in fluor albus, for which purpoſe he roaſts it till it becomes perfectly black and friable, which renders its medicinal uſe ſafe without impairing its efficacy.

The lignum colubrinum and Ignatius's bean, partake of the ſame qualities with the nux vomica. Lewis.

Nux *Zeylanica*, in *Botany*. See Sterculia.

NUXIA. See Manabea.

NUYS, or Nuesz, in *Geography*, a town of France, in the department of the Roer, ſituated on the Erfft, near its conflux with the Rhine. This town carries on a briſk trade in deal boards and coal; 22 miles N.N.W. of Cologne. N. lat. 51° 10′. E. long. 6° 35′. See Neuss.

NUZZI, Mario, in *Biography*, commonly known by the name of Mario dè Fiori, a flower-painter, was born in 1603, at Penna, in the kingdom of Naples. He was educated under his uncle Tomaſo Lalini, and being an exact obſerver of nature, he employed himſelf in copying the fineſt flowers cultivated by his father on a terrace on the roof of his houſe. So happy were his imitations, that a dealer who purchaſed his firſt pictures made an extraordinary profit

in

in ſelling them again. Mario, informed of this circumſtance, and alſo learning that his performances ſold ſtill higher at Rome, reſolved to viſit that capital. Here he quickly roſe to a high degree of reputation, and applied himſelf moſt diligently to attain perfection in his branch of the art. His repreſentations of nature were equally exact and elegant; he choſe his ſubjects with taſte, handled his pencil with wonderful lightneſs, and coloured with ſingular beauty. According to Mr. Fuſeli, "the charm which Mario ſpread over his flowers was not a permanent one: the impurity of the vehicle ſoon abſorbed the freſhneſs and the bloom of his glazings, and left a ſqualid ſurface." Hence his pictures did not long maintain the extraordinary prices at which they were purchaſed. He was elected a member of St. Luke, and received from his brethren all the reſpect that great excellence, though in an inferior department of the art, could command. He died in 1673, at the age of ſeventy. He was a moſt diligent artiſt, and always worked at his profeſſion early in the morning, ſaying, that "he who did not ſee the ſun riſe, loſt half the day."

NY, in *Geography*, a town of Sweden, in the province of Warmeland; 36 miles N.W. of Carlſtadt.—Alſo, a town of Sweden, in the ſame province; 53 miles N. of Carlſtadt.

NYAKER, a town of Sweden, in Angermanland; 85 miles N.N.E. of Hernoſand.

NYAMEE, a town of Africa, in the kingdom of Bambarra; 48 miles N.E. of Sego.

NYAMOV, a town of Africa, in the kingdom of Bambarra; 140 miles W. of Sego.

NYARA, a town of Africa, in the kingdom of Bambarra; 40 miles N.E. of Sego.

NYARPET, a town of Hindooſtan, in the Carnatic; 35 miles N.E. of Bomrauzepollam.

NYAYA, in *Philoſophy*, is the name of one of the ſchools of the Hindoos. The doctrines upheld by this ſect are divided into two parts: the firſt, Nyaya, or Nyayai, correſponds more than any other with the Peripatetic, and is aſcribed to Gautama, the Ariſtotle of Hindoo philoſophy. The ſecond, Nyayai, is ſometimes called Vaiſiſhika, and is ſomewhat analogous to the Ionic theory: its author, Kanada, thus correſponds with Thales. It is not eaſy to mark the diſtinctions between the doctrines of the two ſects of Nyayaikas, as the followers of them, more eſpecially of the firſt ſect, are called. The theory of Kanada is, indeed, little elſe than a modification of that of Gautama; the latter being the moſt ancient. The death of its author is placed about 550 years B.C. As well as philoſophy, the Nyaya doctrines embrace an extenſive ſyſtem of logics and metaphyſics. The leading parts are the following: There are two eternal ſubſtances, *ſpirit* and *matter;* the one diſtinguiſhed by life and intellect, the other is inert and lifeleſs, moving only as it is impelled by ſpirit. It is not, however, ſaid that the world in its preſent form has exiſted from eternity, but only the primary or chaotic matter, whence it ſprings when commanded by the creative power. Matter, in its primary ſtate, is an inviſible figureleſs ſubſtance. In the Sanſcrit language, matter in this ſtate is expreſſed by the word *beej*, or *bija*, which ſignifies *ſeed;* from this ſeed, or germ, the world is called forth by the Almighty fiat, and at its periodical diſſolution all things return to the ſeminal ſtate, in which they remain until again ſpread out by creative energy. Some explanation of this, or at leaſt the manner in which it is expreſſed by Hindoo metaphyſicians, may be found under the article KALPA. In the Gita, Kriſhna is made to ſay, "I am the eternal ſeed of all nature. The whole world was ſpread abroad by me in my inviſible form; at the end of the period kalpa, all things return into my primordial ſource, and at the beginning of another kalpa I create them all again." (See KRISHNA.) In the proceſs of creation the firſt form of material ſubſtance is called, by the Nyayaikas, *anù;* in this inviſible atomical condition, matter is eternal. Two anùs, or atoms, make a *dwenùk*, three a *trinùk*, and ſo forth; arriving at the bulk of the latter, matter aſſumes figure and becomes viſible, and in this ſtate it is periſhable. Hence in the Nyayai ſyſtem, the elements, water, earth, fire, &c. are divided into what is temporary, and what is eternal: the viſible ſtate of water, for example, is temporary; its primary ſtate, or eſſence, is eternal.

The combinations or aggregations which compoſe the material univerſe, are produced by the energy of an almighty and intelligent cauſe, the Supreme Being. "Matter is incapable of action; whence it is evident that the motions of material objects are cauſed by a being different from thoſe objects;" and hence is deduced the exiſtence of God. The following paſſage is tranſlated from a reſpected Sanſcrit author, on the opinion of the Nyayaikas: "Though individuals have in themſelves the conſciouſneſs that I am, I feel pleaſure, &c. yet we have no evident knowledge that ſpirit and matter are different: this is proved by the following argument: an inſtrument requires an operator; thus, without an operator no effect can reſult from cutting inſtruments, as an axe, &c.; in like manner, without an operator, no effect would reſult from the eyes, &c. which are the inſtruments of viſion, &c.; hence we infer the exiſtence of an operative being."

The Nyayaiks conceive that ſpirit is a figured ſubſtance, which means that it poſſeſſes magnitude, but this magnitude is indiviſible. According to Hindoo metaphyſics, whatever is the ſubject of active and moral qualities, muſt have magnitude, for theſe qualities imply action and change; but what is abſolutely without magnitude and figure, muſt be impoſſible and unchangeable; hence, as the Nyayaiks maintain that the Supreme Being is the immediate and active agent in the creation of the world, and that perception, deſire, and action, are in him permanent qualities, they aſcribe to him an inviſible magnitude. This magnitude is ſo ſmall that it moves in the ſmalleſt nerves, though they be only the thouſandth part of the diameter of a hair; and this notion is ſupported by, or grounded on, a paſſage in the Veda: "Spirit is more minute than the minuteſt atom, more ſubtle than the ſubtleſt thing." But it muſt not be inferred from this that they are materialiſts; for they maintain an eſſential diſtinction between the phenomena of matter and ſpirit.

They believe that the ſoul is a portion of the Supreme Being, and has a ſeparate individual exiſtence. It is diſtinguiſhed from the Creator by not poſſeſſing eſſentially and permanently the qualities of perception, deſire, and action; and it is, moreover, ſubject to ignorance and ſorrow, but the ſupreme ſpirit is perfect and eternally bleſſed. "Truth and intelligence," to uſe their own words, "are the attributes of God, and are not to be aſcribed to the ſoul, which is the ſubject both of knowledge and ignorance, pleaſure and pain; by which it is diſtinguiſhed from the ſupreme ſpirit; therefore God and the ſoul are entirely diſtinct beings. If this be denied, how can you account for the ſoul being confined to material habitations, and again releaſed from them?"

While embodied in matter, the ſoul is under the influence of evil paſſions, but having, by intenſe ſtudy and contemplation, arrived at the knowledge of the natural elements and principles, it attains the place of the eternal. In this ſtate of beatitude, its individuality does not, however, ceaſe; but on this difficult point they expreſs themſelves very obſcurely.

They

They admit that the ſoul is united to the Supreme Being, but conceive that it ſtill retains the abſtract nature of definite or viſible exiſtence.

The diſſolution of the world proceeds from the deſtruction of the viſible forms and qualities of things, but their material eſſence remains, and from it new worlds are formed by the creative energy of the Almighty; and thus the univerſe is diſſolved and renewed in endleſs ſucceſſion. This theory is not, however, confined to the ſect that is the ſubject more particularly of this article; but is common, under ſome modification or varied expreſſion, to others of their ſchools. Under the article PHILOSOPHY *of the Hindoos*, ſome general information will be found on theſe points, and ſome details under the ſeveral articles thence referred to.

What is here ſaid, taken chiefly from the Prabod'h Chandrodaya, may more than ſuffice as to the theory aſcribed to Gautama; whoſe doctrines, as far as they are compriſed in works ſaid to be his, are related in a very ſuccinct manner, and in a ſtrictly ſyllogiſtic ſtyle, but are immerſed and loſt almoſt in an endleſs maſs of expoſition and commentary. The name of this logician is variouſly pronounced in different parts of India, and his doctrines are variouſly expounded. He is ſaid to have been raiſed to divine honours, and to be the ſame with the Godama of the Birman empire. (See GODAMA.) And if ſo, but the fact may be reaſonably doubted, he is identified with the Boodh, or Budha, ſo extenſively worſhipped in Aſia. See BOODH.

NYBE, in *Geography*, a town of Sweden, in North Jutland; N. lat 56° 59'. E. long. 9° 39'.

NYBELLED, a town of Sweden, in the province of Smaland; 43 miles N.N.W. of Calmar.

NYBORG, or NYEBORG, a ſea-port town of Denmark, on the E. coaſt of the iſland of Funen, in a bay of the Great Belt, ſurrounded with a rampart and a ditch. The fortifications, as well as the caſtle, are now in a ſtate of dilapidation; and a palace which was formerly the reſidence of the kings of Denmark, is in ruins. The inhabitants derive their ſubſiſtence partly from paſſengers who daily croſs from and to Corſoer in Zealand, and partly from an inconſiderable commerce. The ſhips that navigate the Great Belt pay toll here, for which purpoſe a man of war is always ſtationed in the Belt; 16 miles W. of Corſoer. N. lat. 55° 22'. E. long. 10° 48'.

NYBY, a town of Sweden, in Eaſt Gothland; 28 miles W. of Linkioping.

NYCHINTA, a town of Bengal; 30 miles N. of Mauldah.

NYCLEE, a town of Hindooſtan, in Bahar; 15 miles N.W. of Chuprah. N. lat. 26°. E. long. 84° 31'.

NYCTAGES, or NYCTAZONTES, derived from νυξ, *night*, a religious ſect, diſtinguiſhed by their inveighing againſt the practice of waking in the night, to ſing the praiſes of God; in regard, ſaid they, the night was made for reſt.

NYCTAGINES, in *Botany*, a natural order of plants in Juſſieu, the 3d of his 7th claſs, named from his *Nyctago*, the *Mirabilis* of Linnæus, which is one of the number.

This 7th claſs conſiſts of dicotyledonous plants without a corolla, whoſe ſtamens are inſerted below the germen. Their *calyx* is inferior, of one or many leaves. *Corolla* generally none; ſometimes there are petal-like ſcales, below the germen, either bearing the ſtamens, or alternate with them; ſometimes there is even a petal-like inferior tube, not bearing the ſtamens, often withering; or bearing the ſtamens, being formed of their combined filaments. *Stamens* inferior, that is inſerted below the germen, definite in number, their filaments diſtinct, or more rarely monadelphous. *Germen* ſuperior, ſimple; ſtyle one, or ſeveral, of a definite number, or wanting; ſtigma either ſimple or manifold. *Seed* either ſolitary, or the capſule ſuperior, of one or two cells, with one or ſeveral ſeeds.

The *Nyctagines* are thus defined.

Calyx tubular, reſembling a corolla, either naked externally, or ſurrounded by a ſmall outer calyx. *Germen* one; ſtyle one; ſtigma ſimple. *Stamens* definite, inſerted into a gland which ſurrounds the germen, and originates from the receptacle. *Seed* one, covered by the gland, as well as by the bottom of the tube of the calyx, both of them being permanent. *Corculum* furrounding a farinaceous maſs. *Stem* either ſhrubby or herbaceous. *Leaves* oppoſite or alternate. *Flowers* axillary and terminal.

The genera are *Nyctago* (which is *Jalapa* of Tournefort, *Mirabilis* of Linnæus, *Nyctage* of Van Royen, a multiplicity of names to little purpoſe); *Abronia*, Juſſ. 448. Lamarck Illuſtr. t. 105. (*Tricratus* of Willd. Sp. Pl. v. 1. 807.); *Boerhavia*; *Piſonia*; and *Buginvillæa* of Commerſon, Lamarck Illuſtr. t. 294. To theſe are to be added *Oxybaphus* of L'Heritier, Willd. Sp. Pl. v. 1. 185. Curt. Mag. t. 434. See OXYBAPHUS.

NYCTAGO, ſo called by Juſſieu, from νυξ, νυκτος, *the night*, and αγω, *to bring*, or *to be concerned with*, becauſe the flowers expand, and are fragrant at that time only, whence the French name of Belle-de-nuit for the ſame plant. See MIRABILIS and NYCTAGINES.

NYCTALOPIA, νυκταλωπια, in *Medicine*, ſignifies, in the writings of the more accurate authors, *night-blindneſs*, or that affection of the ſight, which renders the patient incapable of perceiving objects after ſun-ſet. The word ſtands in oppoſition to HEMERALOPIA, or *day-blindneſs* (which ſee); and is probably derived from νυξ, *the night*, and αλαω, which conſiſts of αω with the privative α.

We have ſtated, however, in the article juſt referred to, that there is a wide difference in the acceptation, in which both ancient and modern writers have uſed this term; ſome conſidering the *nyctalopia* as night-*blindneſs*, while others interpret it night-*ſight*, and both of courſe uſing the word *hemeralopia*, in like manner, in oppoſite ſignifications. Galen, Paul of Ægina, Aëtius, Pliny, and Celſus, conſider the term in the light in which we have defined it. Hippocrates, on the contrary, had ſpoken of *nyctalopes*, as perſons who ſaw moſt perfectly in the night: οἱ δὲ τῆς νυκτὸς ορῶντες, ὡς δὴ νυκτάλωπες καλέομεν. Προρρ. II. Again, the author of Med. Definit., aſcribed to Galen, defines *nyctalopia*, night-ſight; while the author of the Iſagoge, attributed to the ſame, affirms that it is properly uſed in either ſenſe.

The night-blindneſs appears to ariſe from a diminution of ſenſibility in the retina of the eyes, ſo that the impreſſion of a ſtrong light only is capable of producing the ſenſation of viſion. Hence profeſſor Scarpa has conſidered the diſeaſe as an "imperfect amauroſis." In the complete amauroſis, the retina is altogether inſenſible to the impreſſions of light; the patient is totally blind under all circumſtances, although no material morbid appearance is viſible in his eyes. But in the nyctalopia, he ſees perfectly well during the broad day-light only; and, as the duſk of evening advances, he finds all objects begin to appear indiſtinct, as if a gradually thickening miſt were interpoſed between them and his eyes; and the light of candles, or of the moon, is altogether imperceptible. He remains, therefore, *blind* until the approach of ſun-riſe in the morning, when objects again begin to appear to him, enveloped in a miſt, which gradually vaniſhes, as the ſun advances to the horizon; after which his ſight becomes as perfect as that of other individuals, during the light of day.

This morbid condition of the retina is ſometimes congenital, and therefore conſtitutional, and altogether beyond the

reach of any curative meaſures. It has ſometimes been hereditary, and ſometimes, as in an inſtance known to the writer of this article, it has occurred in two children of the ſame family. A caſe of congenital nyctalopia, which had continued many years without change, and independently of any diſeaſe, is related by Dr. Parham. See Med. Obſervat. and Inquiries, vol. i. p. 122, *note*.

Moſt commonly, however, the nyctalopia is a diſeaſe of the retina, induced by temporary and accidental circumſtances, and capable of being removed by medicine. It is brought on, in theſe caſes, by various cauſes which debilitate the conſtitution, in individuals of very irritable habit; and is ſometimes one among the various ſymptoms, called *nervous*, which occur in hyſterical and hypochondriacal patients. Moſt frequently, however, it ſeems to be occaſioned by ſympathy with a deranged ſtate of the ſtomach and bowels, or of the hepatic ſyſtem; and the German practitioners, eſpecially the able ſurgeons Schmucker and Richter, and after them the celebrated Italian ſurgeon, Scarpa, have ſhewn, that the diſeaſe is readily removed by correcting the condition of theſe abdominal viſcera, particularly by the free uſe of purgatives, after emetics. (See Scarpa on the Diſeaſes of the Eyes, tranſlated by Briggs, chap. 19.) In this view of the ſubject, the nyctalopia is to be conſidered as analogous to the vertigo, head-ache, ringing of the ears, and other nervous affections of the head, which accompany indigeſtion, and requires to be treated by ſimilar means. (See INDIGESTION.) The recommendation of ſtrong emetics, which the foreign ſurgeons direct to be repeatedly adminiſtered, is perhaps the reſult of hypothetical notions, relative to the *ſaburra* of the ſtomach, rather than of careful obſervation; and it is probable that their active ſtomachic purgatives, compoſed of rhubarb and antimony, with ſtimulant gums, were the moſt valuable remedies.

In conſequence of the *periodical* returns of the blindneſs every evening, ſome practitioners have ſuggeſted the propriety of adminiſtering the Peruvian bark, which is peculiarly remedial in intermittent diſorders in general. But theſe practitioners have failed to obſerve, that there is no periodical or intermittent change in the organ of viſion; the intermiſſions are excluſively confined to the external circumſtances, *viz.* to the abſtraction and return of the light. Accordingly Scarpa has juſtly remarked: "with reſpect to the *imperfect periodical amauroſis*, every practitioner would be diſpoſed to believe that the cinchona ought to be the ſpecific; experience, however, has proved the contrary, and convinced us that this excellent remedy, which is ſo efficacious in intermittent fevers, and other periodical diſeaſes, rather aggravates this complaint, and renders its attacks more frequent, and of longer duration than before. It is, on the contrary, moſt frequently cured in a ſhort time, by emetics and internal reſolvents, *after* which corroborants and bark become uſeful."

NYCTANTHES, in *Botany*, derived from νυκτος ανθος, *the flower of the night*, becauſe, ſays Gerarde, "its moſt odoriferous and ſweet-ſmelling floures flouriſh and ſhew themſelves only in the night time, and in the day time looke withered and with a mourning cheere." Linn. Gen. 9. Schreb. 12. Willd. Sp. Pl. v. 1. 35. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 1. 15. Juſſ. 104. Lamarck Illuſtr. t. 6. (Parilium; Gærtn. t. 51. Scabrita; Linn. Mant. 3. Schreb. 66. App. 819.) Claſs and order, *Diandria Monogynia*. Nat. Ord. *Sepiariæ*, Linn. *Jaſmineæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, truncated, entire, permanent. *Cor.* of one petal, ſalver-ſhaped; tube cylindrical, the length of the calyx; limb five-cleft, ſpreading, the ſegments two-lobed. *Stam.* Filaments two, in the centre of the tube, very ſhort; anthers oblong, as long as the tube. *Piſt.* Germen ſuperior, nearly ovate; ſtyle thread-ſhaped, the length of the tube; ſtigmas two, acute. *Peric.* Capſule obovate, compreſſed, with an emarginate point, coriaceous, two-celled; cells parallel, compreſſed, without valves. *Seeds* ſolitary, obovate, convex on one ſide, flat on the other, attached to the bottom of the cell.

Obſ. The corolla is uſually five-cleft, but Schreber has ſeen it with ſix, or even ſeven, ſegments, and Linnæus with only four. The latter found four ſtamens.

Eſſ. Ch. Corolla ſalver-ſhaped, with truncated ſegments. Capſule two-celled, margined. Seeds ſolitary.

1. N. *Arbor triſtis*. The Sorrowful tree, or Indian Mourner. Linn. Sp. Pl. 8. (Arbor triſtis; Cluſ. Exot. 225. 279. Ger. em. 1527. Myrto ſimilis; Bauh. Pin. 469. Manjapumeran; Rheede Hort. Malab. v. 1. 35. t. 21.)—Native of ſandy deſerts in the Eaſt Indies; and introduced at Kew in 1781, by ſir Joſeph Banks. This *tree* riſes to the height of more than twenty feet, with thick and ſhady, but widely ſcattered *branches*. *Trunk* from one to two feet in diameter, covered with an aſh-coloured *bark*. *Branches* ſquare and knotty. *Leaves* oppoſite, nearly ſeſſile, ovate, pointed, entire, rugged. *Flower-ſtalks* axillary, oppoſite, ſolitary, about half as long as the leaf, ſaffron-coloured, terminated by three ſmall bunches of *flowers*, of a white or yellowiſh colour, like thoſe of Jaſmine, and very highly fragrant at night.

Gerarde tells us "there is made of the ſplinters of the wood certain tooth-picks, and many prety toies for pleaſure." The flowering branches are uſed in the Eaſt for garlands and crowns, and a fragrant water may be diſtilled from them.

Linnæus founded his *Nyctanthes* upon the number of ſegments of the corolla being about eight, without regard to the fruit, of which he was in moſt caſes ignorant. Recent authors with more propriety refer to *Jaſminum* all the ſpecies that have a pulpy fruit; the diviſions of the corolla being found variable in both genera.

NYCTANTHES, in *Gardening*, compriſes plants of the ſhrubby exotic flowering kind, of which the ſpecies cultivated is the ſquare-ſtalked nyctanthes (N. arbor triſtis); but other ſpecies may be cultivated for variety.

Method of Culture.—This plant may be increaſed by layers and cuttings. The layers may be laid down in the early part of the ſummer, in the uſual method, being made from the young branches, plunging the pots containing them in a bark hot-bed. And the cuttings ſhould be taken from the young ſhoots, be planted out at the ſame time, and managed in the ſame manner.

The plants, when fully rooted in either way, may be removed into ſeparate pots. They ſhould have due ſupplies of water, and be pruned and removed into larger pots, as there may be occaſion.

Theſe plants are very ornamental and fragrant among other potted tender plants.

NYCTELIA ORGIA, formed from νυξ, *night*, and τελειν, *to perform*, feaſts in honour of Bacchus; ſo called, becauſe held in the night-time.

A great part of the ceremony conſiſted in running through the ſtreets with the bottle and glaſs in hand, and drinking: but there was no impurity unpractiſed in them.

The Athenians celebrated the nyctelia every three years, at the beginning of the ſpring.

NYCTHEMERON, Νυχθημερον, the natural day. See DAY.

NYCTICORAX, in *Ornithology*, a ſpecies of Ardea. See HERON.

NYCTOSTRATEGI, Νυκτοστρατεγοι, among the *Ancients*, officers appointed to prevent fires in the night-time.

At Rome they had the command of the watch, and, from their number and office, were called *nocturni triumviri*.

NYD, in *Geography*, a river of Norway, which runs into the North ſea, in the bay of Drontheim.

NYDALA, a town of Sweden, in the province of Smaland; 26 miles S. of Jonkioping.

NYDAU, a town of Switzerland, in the territory of Bienne, at the N.E. extremity of the lake of Bienne, on the S. ſide of the Tiel canal, oppoſite to Bienne.

NYE, PHILIP, in *Biography*, an eminent Engliſh nonconformiſt divine, who diſtinguiſhed himſelf by his zeal in ſupport of the parliament againſt king Charles I., and during the diſcuſſions in the aſſembly of divines at Weſtminſter, was deſcended from a good family in Suſſex, and born about the year 1596. He was educated and took his degrees at Oxford. Afterwards he entered holy orders, and was appointed, in 1630, to officiate at St. Michael's church, Cornhill, in London. In this ſituation he continued till he became obnoxious to the cenſures of the epiſcopal court, by his refuſing to comply with the impoſitions of archbiſhop Laud. To eſcape perſecution, he fled into Holland, in 1633, and continued abroad during about ſeven years. When the parliament ſeemed to prevail over the intereſt of the king, he returned, and immediately, under the patronage of the earl of Mancheſter, became miniſter of Kimbolton, in Huntingdonſhire. In 1643 he was zealouſly active in Scotland, in procuring the aſſiſtance of the natives, that the taking of the ſolemn league and covenant might be expedited, and after his return, he ſat as a member in the famous aſſembly of divines at Weſtminſter, in the ſelection of whom he had a conſiderable influence. When the reſolution for taking the covenant paſſed the aſſembly and both houſes of parliament, Mr. Nye was one of the perſons appointed to officiate before thoſe bodies. On the day fixed for ſubſcribing it, the two houſes, and the aſſembly being met in the church of St. Margaret, Weſtminſter, he ſpoke in juſtification of taking the covenant from ſcripture precedents, and diſplayed the advantages which the church had received from ſuch ſacred combinations. He then read it from the pulpit with an audible voice, article by article, each perſon ſtanding uncovered, with his right hand lifted up bare to heaven, worſhipping the name of God, and ſwearing to the performance of it. For his great ſervices on this occaſion, and as a reward for his journey into Scotland, he was preſented to the rectory of Acton, near London. Mr. Nye was one of the committee who drew up the preface to the Directory, which was ordered to be ſubſtituted in the room of the Common Prayer book; but when it was determined to eſtabliſh a Preſbyterian form of government, he openly avowed and vindicated his diſſent from it, and contended for the ſcheme of independency, *viz.* "that every particular congregation of Chriſtians has an entire and complete power of juriſdiction over its members, to be exerciſed by the members thereof within itſelf." Mr. Nye intereſted himſelf much in political affairs, and he was often conſulted by men in power. In 1647 he was appointed one of the chaplains who attended the commiſſioners empowered to treat with king Charles I. in the Iſle of Wight; and Anthony Wood ſays, that about the ſame time he was employed to obtain ſubſcriptions from the London apprentices, &c. againſt a perſonal treaty with the king, while the citizens of the metropolis were petitioning for one. In the year 1653 he was appointed one of the *tryers* for examining into the qualifications and characters of miniſters; and in 1654 he was nominated one of the aſſiſtants to the commiſſioners for ejecting inſufficient miniſters and ſchoolmaſters. He was one of the principal managers in the aſſembly of the congregational churches appointed to meet in the Savoy, in 1658, which conſiſted of miniſters and meſſengers from more than a hundred churches in England: the reſult of their meetings was, "A Declaration of the Faith and Order owned and practiſed in the Congregational Churches in England, &c." Soon after the reſtoration of king Charles II. he was ejected from his living, and afterwards preached privately to a congregation of diſſenters, as opportunity offered, till the year 1672, when he died, about the age of ſeventy-ſix. He was author of many works, the titles of which may be ſeen in the Biog. Brit. and Gen. Biog. to which, and to Toulmin's Neal. we refer our readers.

NYEBYE, in *Geography*, a town of Denmark, on the E. coaſt of the iſland of Taaſinge. N. lat. 54° 57′. E. long. 10° 40′.

NYED, a town of Sweden, in the province of Warmeland; 18 miles N.N.E. of Carlſtadt.

NYEKIOBING, an ancient town of Denmark, in the iſland of Falſter, on a narrow channel oppoſite to Laland. This large and well-built town is ſituated in the ſtrait which divides Falſter from Moen; fortified on the land ſide by a wall and ditch, and carrying on a conſiderable trade. The royal palace is a great ornament to the town. N. lat. 54° 46′. E. long. 11° 51′.—Alſo, a town of Denmark, on the N. coaſt of the iſland of Zealand, in the gulf of Iſefiord, having a good harbour and conſiderable commerce. N. lat. 55° 55′. E. long. 11° 41′.

NYEVRE, or NIÉVRE, formerly *Nivernois*, one of the nine departments of the central region of France, in N. lat. 47° 10′, deriving its name from that of a river, which riſes near Champlemy, and runs into the Loire at Nevers, and bounded on the N. by the department of the Yonne, on the E. by the departments of the Côte d'Or, and Sâone and Loire, on the S. by the departments of the Sâone and Loire, and the Allier, and on the W. by the department of the Cher. It is 24 French leagues in length, and 23 in breadth, comprehends 7365 kiliometres, or 362 ſquare leagues, and 251,158 inhabitants, and is divided into 4 circles, 25 cantons, and 330 communes. The circles are Coſne, including 57,788 inhabitants; Clamecy, 65,465; Nevers, 77,596; and Chateau-Chinon, 50,309. According to Haſſenfratz, the number of circles is 9, of cantons 47, and of inhabitants 235,699. The capital is Nevers. Its contributions, in the 11th year of the French era, were 2,145,555 fr., and its expences 218,836 fr. 66 cents. The ſoil of this department, in general, yields grain, wine, flax, fruits, and paſtures; but that of Chateau-Chinon is of a bad quality. It has mines of iron and coal, marble quarries, and mineral ſprings.

NYFFE′, a country of Africa, S. of Caſhna, united with Cabi.

NYKEE, a town of Africa, and capital of a diſtrict in Melli, ſituated on the road from Kong to Caſhna. N. lat. 14° 45′. E. long. 9° 20′.

NYKIRKE, a town of Sweden, in Eaſt Gothland; 24 miles N.W. of Linkioping.

NYKOPING, a town of Sweden, in Sudermanland; 49 miles S.W. of Stockholm. N. lat. 58° 45′. E. long. 16° 53′.

NYKYL, a town of Sweden, in Eaſt Gothland; 16 miles S.S.W. of Linkioping.

NYKYRKA, a town of Sweden, in the government of Abo; 30 miles N.W. of Abo.

N Y M

NYLACKY, one of the Banda iſlands. S. lat. 4° 11′. E. long. 130° 33′.

NYLAND, the S.E. province of Finland, lying in N. lat. 60° 30′; and being from 15 to 18 leagues from N. to S., and 40 from W. to E., along the N. coaſt of Finland gulf. It is a level, fertile, and, in general, well-cultivated country. Its capital is Helſingfors. The inhabitants of this province ſubſiſt by agriculture, grazing, and fiſhing.

NYL-GHAU, in *Zoology*, an animal brought from the Eaſt Indies, and deſcribed for the firſt time by Dr. Hunter. The name denotes a blue cow, or rather a bull, *ghau* or *gau* being a maſculine. Moſt of theſe animals that have been brought to England have been received from Surat or Bombay; and it is conjectured, that they are indigenous in the province of Guzerat. The nyl-ghau is larger than any ruminant of this country, except the ox; its fleſh will probably be found delicious; and if it ſhould prove docile enough to be eaſily trained to labour, its great ſwiftneſs, with conſiderable ſtrength, might be applied to valuable purpoſes. In ſize it ſeems to be a mean between black cattle and deer; being as much ſmaller than the one, as it is larger than the other; and in its form there is a very evident mixture of reſemblance to both. Its body, horns, and tail, are not unlike thoſe of a bull, and the head, neck, and legs, are very like thoſe of a deer. Some have made this animal a ſpecies of the antelope, (the *Antilope picta*,) but Mr. Hunter, who diſſected it, apprehends that it is a new ſpecies. The colour, in general, is aſh or grey, from a mixture of black hairs and white: moſt of them are half white towards the root, and half black; the height of the back is about four feet, and the trunk, from the root of the neck to the pendulous tail, is about the ſame length; along the ridge of the neck and back the hair forms a ſhort and thin upright mane; the legs are ſmall in proportion to their length; the neck is long and ſlender as in the deer, and when the head is raiſed, it reſembles the Italic *S*; at the throat there is a ſhield-like ſpot of beautiful white hair; and lower down, on the beginning of the convexity of the neck, there is a mane-like tuft of long black hair. There are ſix grinders on each ſide of the jaw; and four inciſores in each half of the lower jaw; the horns are ſeven inches long, and of a triangular ſhape. The nyl-ghau eats oats, is fonder of graſs and hay, and more fond of wheat bread. When thirſty, it would drink two gallons of water. It is vicious and fierce in the rutting ſeaſon, but at other times tame and gentle. The female differs ſo much from the male, that we ſhould ſcarcely ſuppoſe them to be the ſame ſpecies. She is much ſmaller, both in height and thickneſs. In her ſhape and yellowiſh colour ſhe very much reſembles deer, and has no horns; yet has four nipples, and is ſuppoſed to go nine months with young; ſhe has commonly one at a birth, and ſometimes twins. The young male nyl-ghau is like the female in colour, and therefore like a fawn.

The firſt of theſe animals that were ever brought to England, were ſent from Bombay to lord Clive, in 1767: they were male and female, which bred every year. For a more minute deſcription of this animal, ſee Phil. Tranſ. vol. lxi. part i. art. 21.

NYLODESE, or New Lodese, in *Geography*, a town of Sweden, in Weſt Gothland, ſituated on the North ſea; formerly flouriſhing and governed by its own laws; but being burnt by the Danes in 1611, the inhabitants withdrew to Almgſahs.

NYMPH, Nympha, in *Mythology*, a ſort of heathen divinity, ſuppoſed to preſide over waters, rivers, and fountains.

The word comes from *νυμφη*, *a bride*, or *woman newly married*; and was applied to theſe deities becauſe repreſented under the figure of young maids. Though others derive nymph from *lympha*, *water*, on account of their inhabiting near the waters. See Lymphati.

Some extend the name nymph farther, and compriſe under it the goddeſſes of the fountains, foreſts, and trees; called particularly, Oreades, Dryads. and Hamadryads; as well as thoſe of the ſea, called Nereids, and thoſe of the air, called Auræ.

Meurſius is of opinion, the Greeks borrowed their notion of theſe divinities from the Phœnicians; for *nympha*, the ſame with *nephar*, in their language, ſignifying *ſoul*. The Greeks imagined that the ſouls of the ancient inhabitants of Greece wandered much about the tombs where their bodies were interred, or in the places which they had frequented during their abode in this world; and accordingly were become nymphs; particularly, that the ſouls of thoſe who had inhabited the woods were called Dryads; thoſe who had inhabited the mountains, Oreades; thoſe who had dwelt on the ſea-coaſts, Nereids; and, laſtly, thoſe who had their place of abode near rivers or fountains, Naiads.

This opinion is confirmed by the prevalent notion, that the ſtars and higher parts of the univerſe were ſo many animated beings; and that tutelar deities were aſſigned to the earth, the groves, the mountains, and the rivers. Accordingly, this is ſuppoſed to be the original of thoſe divinities; but in later ages, women of all ſorts, from the lady of diſtinction to the ſimple ſhepherdeſs, who had been concerned in any adventure, were denominated nymphs. According to Servius, the number of the nymphs was reduced to 200. Heſiod reckons 300 of them, and, indeed, their number ſeems to have been indefinite. Thus our poets, faithful copiers of the reveries of the ancients, frequently give the name of nymphs to the illuſtrious women who enter into the ſubjects of their poems. Diodorus (l. 3.) ſays, that the wives of the Atlantides were commonly called nymphs; whence it has been concluded, that this was the country where the opinion of the exiſtence of thoſe goddeſſes took its riſe, becauſe the place where the ſouls of heroes were ſaid to dwell after death was in the delightful gardens of Mauritania Tingitana, or near mount Atlas. The Pagans did not believe theſe pretended divinities to be immortal; but they were ſuppoſed to be very long-lived. Heſiod makes them live ſeveral thouſand years. Plutarch has determined the number of years to be 9720. The nymphs, napeæ, and naiads, had their ſacrifices, ſometimes of goats and lambs that were offered them, with libations of wine, honey, and oil; frequently of nothing but milk, fruits, and flowers.

Nymph-*Animal*, in *Natural Hiſtory*, one of the terms uſed by Swammerdam, in his claſſing the inſects according to their ſtates and productions. It expreſſes thoſe creatures, which are produced in their perfect form from the egg, and are ſubject to no changes of any kind afterwards. See Entomology and Insects.

NYMPHA is ſometimes uſed for the little ſkin with which inſects are incloſed; both while they are in the egg, and after they have undergone the firſt apparent transformation. See Insects.

Nympha is more frequently uſed by naturaliſts for the inſects themſelves, while they have yet only the form of worms or maggots.

The word properly ſignifies bride or a new-married woman; it being now, when it has laid aſide its former ſkin, that it begins to ſhew all its parts diſtinctly. In this change it loſes its motion for a while, as when in the egg; ſo that theſe inſects are twice in their nympha ſtate, firſt in the

maggot, which is their firſt nympha; and again in this change, which is their ſecond. See AURELIA.

The only difference between the two nympha ſtates conſiſts in this, that in the latter the members appear more diſtinctly. Swammerdam calls this latter nympha aurea or aurelia, and chryſalis; and the former ſimply nympha. The nymphæ are otherwiſe diſtinguiſhed into vermiformes and oviformes. See ENTOMOLOGY.

NYMPHÆ, in *Anatomy*. See GENERATION.

NYMPHÆA, in *Botany*, νυμφαια of Theophraſtus and Dioſcorides, was ſo called, with much taſte, in alluſion to the nymphs, ſuppoſed to inhabit the pure and limpid waters in which it grows; nor was it an unworthy emblem of the elegance and delicacy attributed to thoſe imaginary beings. Linn. Gen. 264. Schreb. 352. Willd. Sp. Pl. v. 2. 1151. Mart. Mill. Dict. v. 3. Sm. Prodr. Fl. Græc. v. 1. 360. Fl. Brit. 569. Dryand. in Ait. Hort. Kew. ed. 2. v. 3. 292. Juſſ. 68. Lamarck Illuſtr. t. 453. f. 1. Gærtn. t. 19, alba. (Caſtalia; Saliſ. in Ann. of Bot. v. 2. 71.)—Claſs and order, *Polyandria Monogynia*. Nat. Ord. *Hydrocharides*, Juſſ. *Nymphæeæ*, Saliſ.; an order between the *Ranunculaceæ* and *Papaveraceæ* of Juſſieu. Linnæus placed this genus in his 54th order, moſt juſtly termed *Miſcellaneæ!* He next in manuſcript referred it to his *Rhoeadeæ*, which he afterwards eraſed, ſubjoining a ſuſpicion of its affinity to *Aſarum*. In his *Prælectiones*, publiſhed by Giſeke, it ſtands next to *Sarracenia*, (always in his idea nearly connected with it,) in the *Succulentæ*, to which ſurely it is little related. We heartily concur with Mr. Saliſbury's deciſion concerning the affinity of the genus, though not in the name, which he has transferred from the true plant of the ancients, and replaced by *Caſtalia*, a word incorrect in etymology as well as meaning, and altogether ſuperfluous. See NUPHAR.

Gen. Ch. *Cal.* Perianth inferior, of four or five large, oblong permanent leaves, coloured on the upper ſide. *Cor.* Petals numerous, nearly the length of the calyx, oblong, ſpreading, inſerted in ſeveral rows, upon the lower part of the germen. Nectary globoſe, ſeſſile, in the middle of the ſtigma. *Stam.* Filaments very numerous, inſerted upon the germen, in ſeveral rows, above the petals, linear, flat ſpreading; anthers oblong, on the upper ſide of each filament, opening by two linear fiſſures above. *Piſt.* Germen ſuperior, large, globoſe; ſtyle none; ſtigma orbicular, many-cleft, radiated above, permanent, bearing the nectary. *Peric.* Berry globoſe, with a hard coriaceous coat, internally ſpongy, with numerous cells. *Seeds* very numerous, roundiſh, poliſhed.

Eſſ. Ch. Calyx of four or five leaves. Petals numerous, inſerted into the germen below the ſtamen. Stigma radiated, many-cleft, ſeſſile, with a central nectary. Berry ſuperior, of many cells. Seeds numerous.

Obſ. Many of the diſtinctions between this genus and *Nuphar* were perceived by Linnæus, and all of them are detailed in the *Flora Britannica*, except what regards the nectaries, for which we are indebted to Mr. Saliſbury. No genera can be better defined. As the flowers of *Nuphar* are always yellow, thoſe of *Nymphæa* are white with more or leſs inclination to red or blue; in ſome inſtances of a very fine crimſon. In the *Prodr. Fl. Græc.* we have ſaid that *Nymphæa* is gynandrous, but it is beſt perhaps to reſtrict that term to flowers whoſe ſtamens or anthers grow really out of the ſtyle or ſtigma, altogether above the germen.

1. N. *alba*. Common White Water-Lily. Linn. Sp. Pl. 729. Willd. n. 3. Ait. n. 1. Engl. Bot. t. 160. Fl. Dan. t. 602. Matth. Valgr. v. 2. 245. Camer. Epit. 634. Ger. em. 819. (N. candida; Fuchſ. Hiſt. 535. Nenuphar ſecunda; Brunf. Herb. v. 1. 37.)—Leaves heart-ſhaped, entire; even beneath. Petals elliptic-oblong. Stigma of ſixteen aſcending rays. Root horizontal, creeping.—Native of clear pools, the margins of lakes and of quiet rivers, throughout Europe, flowering in June and July. This is unqueſtionably the true νυμφαια of Dioſcorides, who compares its white flowers to a lily, and mentions the ſaffron-like threads in the middle, as well as the reſemblance of its fruit to a round apple, or poppy-head. The modern inhabitants of Zante call it νεροκολοκυθιὰ, or Water Gourd. Dr. Sibthorp found it frequently in Greece and the neighbouring countries. In England it often occurs in ſtill pools on heaths, or under the ſhade of trees, completely mantling over the water with its broad floating, or partly immerſed *leaves*, which are of an elliptical outline, with a deep ſtraight notch at the baſe, to receive the footſtalk. The *flower-ſtalks* are all radical and ſimple, as in the genus *Nuphar*, each being one large, concave, moſt elegant white *flower*, four or five inches wide, of numerous elliptical petals lying over each other. The upper ſide of the *calyx* is often tinged with a bluſh-colour. The *ſtamens* and *piſtil* are yellow. Theſe *flowers* have little or no ſcent. They are celebrated for cloſing in the afternoon, and lying down upon the water, or ſinking ſomewhat below its ſurface during the night. In the middle of the forenoon they riſe ſome inches above the ſurface, and expand. This phenomenon is chiefly obſervable in hot bright weather, and is doubtleſs owing to the action of light upon the flower, which eaſily riſes or falls in conſequence of the oblique direction of the long and ſlender ſtem. Since the fact has, for ſome reaſon or other, been controverted, we have carefully verified it.

2. N. *odorata*. Sweet White Water-Lily. Willd. n. 4. Ait. n. 2. Sims in Curt. Mag. t. 819. Andr. Repoſ. t. 297.—Leaves heart-ſhaped, entire; the nerve and veins prominent beneath. Petals linear-oblong. Stigma of ſixteen to twenty upright rays, inflexed at their points. Root horizontal, creeping.—Native of North America; not unfrequent here in the more curious gardens, but ſcarcely hardy enough to bear a ſucceſſion of our winters. It flowers in June and July. This is rather ſmaller in all its parts than the foregoing, and is diſtinguiſhed by the ſweet hawthorn-like ſcent of the *flowers*, which have not been obſerved to ſink under water at night, in this country. The prominent veins of the *leaves* diſtinguiſh them, even when dried, from the *N. alba*, and their outline is rather more orbicular than elliptical.

3. N. *nitida*. Siberian, or Cup-flowered, Water-Lily. Sims in Curt. Mag. t. 1359. Ait. n. 3. (N. n. 11; Gmel. Sib. v. 4. 183. t. 71; excluding the ſynonyms.)—Leaves heart-ſhaped, entire; the nerve and veins not prominent beneath. Stigma of twelve to twenty upright rays, inflexed at their points. Root vertical.—Native of Siberia. Mr. W. Anderſon introduced it, in 1809, to the collection of James Vere, eſq., where the plant was found to require heat to keep it alive. In the *Hort. Kew.* it is marked hardy, flowering in July and Auguſt, and ſaid to come from Siberia, as we preſume, on the authority of Gmelin's ſynonym. This much reſembles the laſt, but the *flowers* are leſs expanded, without ſcent, the veins of the *leaves* rather ſunk or furrowed, and the tuberous part of the *root*, as Mr. Anderſon obſerves, not horizontal nor creeping, but perpendicular, and aſcending.

4. N. *pygmæa*. Pigmy Water-Lily. Ait. n. 4. (Caſtalia pygmæa; Saliſ. Parad. t. 68.)—Leaves heart-ſhaped, entire. Stigma of ſeven or eight inflexed rays.—Native

of

of China; introduced in 1805. *Ait.* We received it at Kew in May 1811, when it was flowering plentifully in a tub in the ſtove. This ſpecies is but about half the ſize of any other one as yet diſcovered. Of its *root* we have no information. The *leaves* are about two inches broad, with uſually diſtant lobes; their veins ſunk. *Stalks* ſlender. *Flowers* white, with a ſlight ſweetneſs. *Stamens* yellow, the outer ones much dilated, or obovate, below the anther, and gradually becoming broader and paler, till they aſſimilate entirely with the *petals*, as is the caſe more or leſs in others of this genus.

5. N. *Lotus*. Egyptian Lotus Water-Lily. Linn. Sp. Pl. 729. Willd. n. 6. Ait. n. 5. Sims in Curt. Mag. t. 797. Waldſt. and Kitaib. Hung. v. 1. 13. t. 15. (Lotus ægyptia; Alpin. Exot. 213—229. Λωτος αιγυπτιος, Dioſc. book 4. chap. 114.)—Leaves ſomewhat peltate, ſharply toothed, ſmooth on both ſides, without dots; the veins prominent and reticulated.—Native of Egypt and Hungary. Mr. Loddiges, who obtained ſeeds from the laſt-mentioned country in 1802, was informed that it inhabited warm ſprings, equal to the 95th degree of Fahrenheit. Our Egyptian ſpecimen, from Dr. Delile, is far more luxuriant than what is drawn in the Bot. Mag. This ſpecies differs from all we have hitherto deſcribed, in the ſtrong ſharp teeth of the edges of its *leaves*, whoſe veins moreover are very much branched, elevated on both ſides, and ſtrongly reticulated. The outline of the *leaf* is elliptical, or nearly orbicular, cloven at the baſe into two deep parallel lobes, whoſe diviſion ſeldom extends quite ſo far as the inſertion of the *footſtalk*. Both ſurfaces are ſmooth; the upper poliſhed. *Flowers* larger than in our *N. alba*, white; the *calyx* ribbed; the outer *petals* tinged ſometimes with a faint red, and furniſhed with a green keel. *Stamens* ſomewhat dilated. Rays of the *ſtigma* 27 in our wild ſpecimen, apparently ſpreading. The ancients record the ſinking of the *flowers* under water at night, as in the *N. alba*. The Egyptians fed upon the *roots* and *ſeeds*, both of which abound with farinaceous matter. We have always conceived that this *flower* became ſacred to ſuperſtitious veneration, in that country, in conſequence of its reſemblance to the true Eaſt Indian Lotus, ſee CYAMUS and NELUMBO. The latter, from the mode of its vegetation, was adopted, in the moſt remote ages, to ſerve as an emblem of fertility; but our *N. Lotus* exhibits nothing which could originally have excited ſuch an idea. It ſeems therefore a ſort of ſubſtitute or type; and, if we miſtake not, ſtrengthens the theory of the mythology of Egypt having migrated thither from India. The *Cyamus* plant was indeed brought to Egypt, but has never perpetuated itſelf there to any great extent, nor is it now to be found in that part of the world. In the herbarium of the younger Linnæus is a ſpecimen marked *N. Lotus Americana*, which appears really to belong to this ſpecies. The *leaf* meaſures two feet acroſs. The *anthers* are remarkably long and narrow. We preſume that this ſpecimen came from the Weſt Indies. No mention of any thing like it occurs in Michaux, Walter, or Swartz, but it ſeems the plant of Sloane and Browne, cited by Linnæus under *N. Lotus*.

6. N. *pubeſcens*. Indian Lotus Water-Lily. Willd. n. 7. Ait. n. 6. (N. Lotus; Andr. Repoſ. t. 391. N. indica, foliis amplis, elegantèr ad ambitum crenatis, ſubtùs fulvâ lanugine tectis flore albo ſimplici, é Maderaſpatan; Pluk. Almag. 267. Ambel; Rheede Hort. Malab. v. 11. 151. t. 26.)—Leaves ſomewhat peltate, ſharply toothed; downy, with prominent reticulated veins, beneath; even above; their lobes divaricated, acute.—Native of the Eaſt Indies, from whence ſir Joſeph Banks procured it for Kew garden in 1803. We had ſpecimens from N. E. Kinderſley, eſq. in 1793. This differs eſſentially from the laſt, in having the back of the *leaves* clothed with fine denſe velvet-like down; and the veins not prominent on the upper ſurface. Their *flowers* ſeem nearly to agree. The rays of the *ſtigma* in the preſent are inflexed. We cite Mr. Andrews on the authority of Hort. Kew. only, as there is nothing in his account to verify the ſynonym. On the contrary, he copies from Willdenow the characters of *N. Lotus*, which do not ſuit our plant, nor is the very peculiar character of the downineſs of the *leaves* indicated, though their divaricated ſharp lobes are well expreſſed. Probably the able writer of his letter-preſs ſaw the drawing only, not the plant.

7. N. *rubra*. Red Water-Lily. Ait. n. 7. Andr. Repoſ. t. 503. Sims in Curt. Mag. t. 1280.—*β*, with paler flowers; Sims in Curt. Mag. t. 1364. - Leaves ſomewhat peltate, ſharply toothed; downy, with prominent reticulated veins, beneath; and prominent ribs above; their lobes divaricated and acute.—Native of the Eaſt Indies, from whence it was ſent by the indefatigable and intelligent Dr. Roxburgh. It is cultivated in the ſtove, increaſing much by root, and blooming freely in July and Auguſt. The vivid crimſon of the *petals*, which however appears by the Bot. Mag. to vary in intenſity, at once diſtinguiſhes this from the laſt, with which the pubeſcence of the *leaves* accords. Their colour and ſtains ſeem to us variable. If the prominence of the ribs, and, more or leſs, of the veins, on their upper ſide does not prove a ſufficient ſpecific character, we know not, as yet, of any better. The *ſeeds* and *roots* are ſaid to be eatable, and the *flower* to be held in ſuperſtitious veneration in Hindooſtan, which may ariſe from its affinity to the *Cyamus*, the ſacred *Tamarà* of that country.

8. N. *verſicolor*. Changeable Water-Lily. Ait. n. 8. Sims in Curt. Mag. t. 1189.—Leaves ſomewhat peltate, bluntly toothed, bliſtered on both ſides; their lobes approximated and rounded.—Found in the Eaſt Indies by Dr. Roxburgh, and raiſed by Mr. W. Anderſon at Mr. Vere's in 1807, where it flowers in the ſtove about Auguſt. We have ſeen no ſpecimen, but by the Bot. Mag. this is evidently a moſt diſtinct ſpecies. The *root* propagates itſelf by tubers, like the potatoe, each tuber flowering but once. The *leaves* are nearly orbicular, bluntly toothed; their lobes meeting, or lying over each other, and both their ſurfaces covered with glandular puſtules. The *petals* are pale bluſh-coloured, longer and narrower than in *N. Lotus* or *rubra*, ſeveral of the outer ones green and furrowed at the back, with green ribs on the upper ſide.

9. N. *cærulea*. Blue Water-Lily. Dryand in Ait. n. 9. Andr. Repoſ. t. 197. Curt. Mag. t. 552. Venten. Malmaiſ. t. 6. (N. flore cæruleo odoratiſſimo; Breyn. Prodr. faſc. 2. 86.)—Leaves ſomewhat peltate, very ſlightly and bluntly toothed, ſmooth and even on both ſides. Rays of the ſtigma very numerous, inflexed.—Native of Egypt, from whence we have a ſpecimen, gathered by Dr. Delile, and of the Cape of Good Hope, from which country it was ſent to Kew, in 1792. This elegant ſpecies is now not uncommon in ſtoves or greenhouſes, where it blooms from May to September, being eaſily kept in a tub, without being plunged into the bark-bed. The *leaves* are very ſmooth and even, elliptical in their outline, their lobes ſomewhat pointed, their margin more or leſs wavy, or bluntly crenate, ſcarcely toothed. The large and beautiful blue *flowers* are delightfully fragrant; their *ſtamens* and *piſtil* yellow. *Petals* in three rows, about twenty, and rays of the *ſtigma* as many.

10. N. *ſtellata*. Star-flowered Water-Lily. Willd. n. 5. Ait. n. 10. Andr. Repoſ. t. 330. (N. malabarica; Lamarck Dict. v. 4. 457. Citambel; Rheede Hort. Malab.

v. 11. 53. t. 27.)—Leaves ſomewhat peltate, entire, ſmooth and even on both ſides. Rays of the ſtigma about ten, ſpreading.—Native of the Eaſt Indies. Sonnerat found it in the iſland of Mauritius. Mr. W. Anderſon raiſed this, in 1803, from ſeeds ſent to Mr. Lambert by Dr. Roxburgh, and the plants bloſſomed the ſame ſummer. The whole plant is much ſmaller than *N. cærulea*, and requires more heat. The *leaves* are entire, or ſlightly waved, purple beneath, with rather divaricated lobes. *Petals* blue, ſcarcely more than ten, all in a ſimple row. Rays of the *ſtigma* as many, ſpreading, broad and ſhort. Poiret in Lamarck ſays a decoction of the flowers, with ſugar, is uſed to allay coughs, and ſtop vomiting.

Nymphæa, in *Gardening*, compriſes plants of the herbaceous flowery aquatic kind, of which the ſpecies are; the yellow water-lily (N. lutea); the white water-lily (N. alba); the Egyptian water-lily (N. lotus); and the peltated water-lily (N. nelumbo). See the preceding article.

In the ſecond ſort, it is remarked by Linnæus, that the flower raiſes itſelf out of the water, and expands about ſeven o'clock in the morning, and cloſes again, repoſing upon the ſurface, about four in the evening.

From the third ſpecies a bread was formerly made of the ſeed when dried and ground.

And in the fourth kind the Chineſe have the roots not only ſerved in ſummer with ice, but laid up in ſalt and vinegar for winter: the ſeeds are ſomewhat of the ſize and form of an acorn, and of a taſte more delicate than that of almonds; the ponds in China are generally covered with it, and exhibit a very beautiful appearance when it is in flower; and the flowers no leſs fragrant than handſome.

Method of Culture.—The two firſt ſorts of theſe plants may be beſt increaſed by procuring ſome of their ſeed-veſſels, juſt as they become ripe and ready to open, and throwing them into canals, ponds, ditches, or other ſtanding waters, where the ſeeds, ſinking to the bottoms, afford plants in the following ſpring, floating upon the ſurface of the waters. And when they have been once fixed to the place this way, they multiply greatly, ſo as to cover ſuch places in a ſhort time. They are alſo capable of being cultivated in large troughs or ciſterns of water, having earth at the bottoms, flouriſhing very well, and producing annually large quantities of flowers.

But the third and fourth ſpecies, as being tender, ſhould be kept in ſuch troughs or ciſterns, and be ſet in a corner of the ſtove. In their native ſituations they are increaſed both by their roots and ſeeds as the common ſorts in this climate.

NYMPHÆUM, in *Ancient Geography*, a town of the Tauric Cherſoneſus, which had a good port on the Euxine ſea, and lay on the route from Theodoſia to Panticapæa.

Nymphæum *Promontorium*, the name given by Ptolemy to the promontory of mount Athos.

NYMPHÆUS, a port on the weſtern coaſt of the iſland of Sardinia, between the promontory Hermæus and the town of Tilium, according to Ptolemy.—Alſo, a river of Aſia, in Armenia, which, according to Procopius, formed a ſeparation between the Roman and Perſian empires. It ran from N. to S., entered the town of Martyropolis, and diſcharged itſelf into the Tigris, S.E. of Amida.

NYMPHAGOGI, Νυμφαγωγοι, among the *Ancients*, an appellation given to thoſe who led the bride from her father's houſe to that of the bridegroom.

NYMPHARENA, in *Natural Hiſtory*, the name of a ſtone found in the beds of ſome rivers, and having the appearance of a ſea-horſe's tooth. Doubtleſs it was a petrified tooth of that or ſome other ſuch animal, ſuch things being often found now, though in thoſe early ages they were little known or regarded.

NYMPHARIUM, in *Botany*, a name given by the Greek writers of the later ages to the water-lily.

NYMPHARUM Oculi, in *Natural Hiſtory*, a name given by ſome of the ancient writers to a ſtone we call oculus beli, and ſometimes to the operculum of a ſhell-fiſh, common on the ſea-ſhores in many places, and called umbilicus Veneris. We are told of Caligula, that he carried his ſoldiers armed to the ſea-ſide, to pick up the nympharum oculi, and ſhells. It is certain, in this place, the word only means umbilicus Veneris, for the other oculi nympharum are found only on the ſhores and in the beds of ſome particular rivers, not on the ſea-ſhores, among ſhells.

NYMPHEA, in *Geography*, a ſmall iſland in the Mediterranean, near the N. coaſt of the iſland of Sardinia; 13 miles W. from the iſland of Roſſa.

NYMPHEUM, Νυμφειον, derived from νυμφη, *bride*, among the *Ancients*, a public hall, or building, magnificently adorned and diſpoſed for banquetting and entertainment; where thoſe, who wanted conveniencies at home, held their marriage-feaſts, &c.

Some authors rather take the ancient nympheum to have been a grotto adorned with ſtatues, jets, and other ornaments; and that it had its name by corruption, from *lymphæum*, of *lympha*, *water*. In which ſenſe it muſt have been a public bath.

NYMPHOIDES, in *Botany*, or rather, as it ought to have been, *Nymphæoides*, a name given by Tournefort, to a genus which Linnæus united with Menyanthes; ſee that article. It alludes to the likeneſs of the plants in queſtion to *Nymphæa*, in habit at leaſt, though not at all in fructification.

NYMPHOMANIA, in *Medicine*, by many writers termed *Furor uterinus*, a rare ſpecies of diſeaſe in women, characteriſed by an uncontrollable deſire for venereal intercourſe. It is ſimilar to the ſatyriaſis of men. It is ſometimes connected with a morbid condition of the uterus or the vagina, eſpecially with a prurigo of the latter; and ſometimes it is a mere inſanity. In a work of this nature, however, it appears to be unneceſſary to enter into a minute detail upon ſuch a ſubject. Sauvages has followed Sennertus, and deſcribed four ſpecies of the diſeaſe, namely, 1. Nymphomania *falacitas*; 2. N. *furibunda*; 3. N. *fervor uteri*; and 4. N. *pruriginoſa*. See his Noſol. Method. Claſs viii. Ord. ii. Gen. 14.

NYMPHOTOMIA, (from νυμφα and τεμνω, *feco*). In warm countries, the nymphæ are particularly ſubject to a morbid enlargement, in ſuch a degree as to prove troubleſome and inconvenient, and to require the performance of an operation for the removal of the redundant parts. It is to this proceeding that the ancients have applied the term nymphotomia. In this country, ſurgeons occaſionally meet with inſtances, in which the nymphæ are conſiderably increaſed in ſize, and it becomes neceſſary to remove a portion of them.

NYO, in *Geography*, a town of New Mexico, in the province of Cinaloa; 10 miles S.W. of Cinaloa.

NYONS, a town of France, and principal place of a diſtrict, in the department of the Drôme; 21 miles S.E. of Montelimart. The place contains 2724, and the canton 10,145 inhabitants, on a territory of 220 kiliometres, in 16 communes. N. lat. 44° 2′. E. long. 5° 13′.

NYORDBYE, a ſmall iſland of Denmark, near the N. coaſt of Moen, E. of Zealand. N. lat. 55° 3′. E. long. 12° 13′.

NYQUAM, a town of Sweden, in the province of Upland; 10 miles E. of Waſteges.

NYSA, in *Ancient Geography.* See SCYTHOPOLIS.—Alſo, a town of Thrace, ſituated between the rivers Meſtus and Strymon, in that part of Thrace called Pæonia, afterwards united to Macedonia.—Alſo, a town of the iſland of Naxos.—Alſo, a town of Aſia Minor, in Caria, ſituated near the Meander.—Alſo, a town of Cappadocia, in the route from Ancyra to Cæſarea, between Parnaſſus and Oſiana.—Alſo, a town of Arabia Felix, on the confines of Egypt.—Alſo, a town of Bœotia, on mount Helicon.—Alſo, a town of India, between the rivers Cophenes and Indus. By Mela and Pliny it is written Neſſa.—Alſo, a town of Lybia.—Alſo, a town of Egypt.—Alſo, a town of Eubœa.

NYSAIS, or NYSÆA *Regio*, a country of Aſia Minor, between Caria and Phrygia, beyond the Meander.

NYSAND, in *Geography*, a town of Sweden, in the province of Warmeland; 18 miles S.S.E. of Chriſtiania.

NYSATRA, a town of Sweden, in Weſt Bothnia; 32 miles N.N.E. of Umea.

NYSLOT, a town of Ruſſia, in the government of Viborg, on the lake Saima. Its caſtle ſtands on a rock in a river near the town, and is well fortified both by art and nature; 50 miles N.W. of Viborg.

NYSSA, in *Botany*, was ſo called by Linnæus, becauſe, as he ſays in the *Hortus Cliffortianus*, "it grows in the waters." In his *Philoſophia* he mentions the name as that of a nymph. Hence profeſſor Martyn gives it as the appellation of a water-nymph; but we have ſought in vain for any ſuch perſonage in poetic ſtory. We are equally ignorant of the meaning of the American name, Tupelo tree.—Linn. Gen. 551. Schreb. 737. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 1. v. 3. 446. Juſſ. 75.—Claſs and order, *Polygamia Dioecia*, Linn. rather *Decandria Monogynia*. Nat. Ord. *Holeraceæ*, Linn. *Elæagni*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, five-cleft, ſpreading, with a flat baſe. *Cor.* none. *Stam.* Filaments ten or five, awl-ſhaped, erect, ſhorter than the calyx; anthers two-lobed, the length of the filaments. *Piſt.* Germen inferior, ovate; ſtyle awl-ſhaped, curved inwards, longer than the ſtamens; ſtigma acute. *Peric.* Drupa roundiſh. *Seed.* Nut elliptical, acute, angular, ſomewhat irregular, longitudinally grooved.

Eſſ. Ch. Calyx five-cleft. Corolla none. Stamens ten or five. Drupa roundiſh, inferior.

Obſ. Some flowers have ſmall and abortive anthers.

1. N. *integrifolia.* Mountain Tupelo. Ait. Hort. Kew. ed. 1. v. 3. 446. (N. aquatica; Linn. Sp. Pl. 1511, excluding the firſt ſynonym of Cateſby, but retaining his v. 1. t. 41.)—Leaves entire. Nut roundiſh, ſtriated. Native of North America, and cultivated, in 1750, by the duke of Argyle.—This *tree* riſes to the height of thirty or forty feet, and is furniſhed with many, horizontal, depending *branches.* *Leaves* obovate, ſomewhat pointed, dark green and ſhining above, lighter and hairy underneath. *Flowers* in axillary cluſters, ſmall. *Drupas* dark purple, about the ſize of a ſmall cherry. The timber of this tree is ſaid to be hard and cloſe-grained, ſo as to be much in requeſt with wheel-wrights and other ſuch artificers.

2. N. *dentieulata.* Water Tupelo. Ait. Hort. Kew. ed. 1. v. 3. 446. (Arbor in aquâ naſcens, foliis latis acuminatis et dentatis, fructu Elæagni majore; Cateſb. Car. v. 1. 60. t. 60.)—Leaves remotely toothed. Nuts oblong, grooved, ſomewhat wrinkled.—Native alſo of North America, in wet ſwamps or near large rivers, and introduced into this country in 1735, by Mr. Peter Collinſon.—This *tree* is from eighty to an hundred feet high, and much branched towards its ſummit. *Leaves* rather large, oval or ſpear-ſhaped, ſlightly toothed, downy beneath; their footſtalks long and ſlender. *Drupa* in ſhape and ſize like ſmall olives, indeed they are preſerved by the French inhabitants of the Miſſiſippi like that fruit. The *timber* is light and compact.

Profeſſor Martyn tells us that Marſhall, in his American Grove, adds a third ſpecies from Bartram's catalogue, which he calls *Nyſſa Ogeche.* This is deſcribed as a *tree* of great ſingularity and beauty, riſing to the height of thirty feet, whoſe *fruit* is of a deep ſcarlet colour, and the ſize of a Damaſcene plum. It has an agreeable acid taſte, whence it is called the Lime-tree.

NYSSA, in *Gardening*, a plant of the aquatic ornamental tree kind, of which the ſpecies are; the mountain tupelo (N. integrifolia); and the water tupelo (N. denticulata).

Method of Culture.—Theſe trees may be increaſed by ſowing the ſeeds procured from the places where they grow naturally, putting them into the ground as ſoon as they are procured, as they lie long before they vegetate. They ſhould be ſown in pots filled with light loamy earth, placing them where they may have only the morning ſun; and during the firſt ſummer the pots ſhould be kept clean from weeds, being well watered in dry weather. The pots ſhould be plunged into the ground in the following autumn; and, if the winter prove ſevere, cover them with old tan, peas-haulm, or other ſimilar light covering. And in the following ſpring they ſhould be plunged into a moderate hot-bed, hooped and covered over with mats; keeping the earth conſtantly moiſt. By this means the plants are brought up in the ſpring, when they ſhould be gradually hardened to bear the open air; and during the following ſummer, the pots again plunged into an eaſtern border, watering them in dry weather, carefully removing them into a frame in the autumn, where they may be ſcreened from froſt; but in mild weather be expoſed to the open air. In the ſpring following, before they begin to ſhoot, they ſhould be parted carefully, planting each in a ſmall pot filled with loamy mould; and when they are plunged into a moderate hot-bed, it will promote their putting out new roots; after which they may be plunged in an eaſtern border, and be ſheltered again in winter, under a frame. In the third ſpring, ſuch plants as have made the greateſt progreſs may be planted out in a loamy ſoil, in a ſheltered ſituation, where they may be capable of enduring the cold of this climate. They make the greateſt progreſs where the ſoil is inclined to be moiſt.

And they may likewiſe be propagated by layers and cuttings, planted out in the autumn or ſpring in the uſual manner.

Theſe plants afford ornament and variety in the ſhrubbery and other parts, where the ground is of a moiſt quality.

NYSSANTHES, in *Botany*, received that appellation from Mr. R. Brown, in alluſion to the ſpinous nature of the calyx-leaves and bracteas, the chief characteriſtic diſtinction between this genus and *Achyranthes;* the word being derived from νυσσω, *to prick*, or *wound*, and ανθος, *a flower.* Brown. Prodr. Nov. Holl. v. 1. 418.—Claſs and order, *Tetrandria Monogynia.* Nat. Ord. *Amaranthi*, or *Amaranthaceæ*, Juſſ. Brown

Eſſ. Ch. Calyx in four deep ſegments; the two outer ones unequal, hardening into ſpines. Stamens two or four, combined at the baſe, with intermediate ſcales. Anthers of

two

two cells. Stigma capitate. Capſule membranous, not burſting. Seed ſolitary.

The *ſtem* in this genus is either herbaceous or ſomewhat ſhrubby. *Leaves* oppoſite. *Spikes* denſely cluſtered, axillary and terminal. The four-cleft and irregular, as well as ſpinous, *perianth* diſtinguiſhes *Nyſſanthes* from *Achyranthes*, to which it is otherwiſe nearly allied.

1. N. *erecta*.—Stamens four. Segments of the calyx downy, five-ribbed; the awn of the lower one ſcarcely ſo long as itſelf. Leaves oblong-lanceolate, acute; with a very ſhort weakiſh point. Stem erect.—Gathered by the author, near Port Jackſon, New South Wales.

2. N. *media*.—Stamens two. Segments of the calyx downy, three-ribbed; the awn of the lower one longer than itſelf. Leaves oval-oblong, bluntiſh; with a pungent point. From the ſame country.

3. N. *diffuſa*.—Stamens two. Segments of the calyx ſmooth, five-ribbed; awns longer than themſelves. Leaves of the branches oval-oblong; with a pungent point. Stem diffuſe.—Gathered by Mr. Brown in the tropical part of New Holland. The *leaves* are ſcarcely half an inch long.

NYSTADT, in *Geography*, a ſea-port town of Sweden, pleaſantly ſituated on the coaſt of the gulf of Bothnia, in Finland. Its harbour is commodious, and it has a conſiderable trade in all kinds of wooden veſſels; 32 miles N.W. of Abo. N. lat. 61° 5′. E. long. 21° 20′.

NYSTED, or NYESTED, a large but not flouriſhing town of Denmark, in the iſland of Laland. Its extent has been much reduced by fire. Its trade to the duchy of Mecklenburg and other provinces of Germany is conſiderable. In this town are the remains of a ſtately monaſtery, built in 1286; 19 miles S.E. of Naſkow. N. lat. 54° 48′. E. long. 11° 45′.

NYWICHWANNAK, a river of America, being one of the branches of the Piſcataqua.

O.

O

O The fourteenth letter of the alphabet; and the fourth vowel.

The grammarians call it a cloſe vowel; becauſe pronounced with the mouth ſhut.

Among the Latins, the O bore ſo great an affinity to the U, that they frequently confounded them; writing *conſol*, and pronouncing *conſul*. See Gruter's Inſcript.

Thus, alſo, they wrote *æquom* for *æquum*, *aorelius* for *aurelius*, *compaſcuos*, *duomvir*, &c.

The Greeks had two O's; *viz.* omicron, ο, and omega, ω; the firſt pronounced with the tip of the lips with a ſharper ſound; the ſecond in the middle of the mouth, with a fuller ſound, equal to *oo* in our language. The long and ſhort pronunciation of our O are equivalent to the two Greek ones; the firſt as in ſuppoſe; the ſecond, as in obey.

O is uſually denoted long by a ſervile *a* ſubjoined, as *moan*; or by *e* at the end of the ſyllable, as *bone*; when theſe vowels are not uſed, it is generally ſhort.

O, among the *Ancients*, was a numerical letter ſignifying eleven; as in the verſe,

"O numerum geſtat, qui nunc undecimus extat."

When a daſh was added at the top, as $\overline{O}$, it ſignified eleven thouſand.

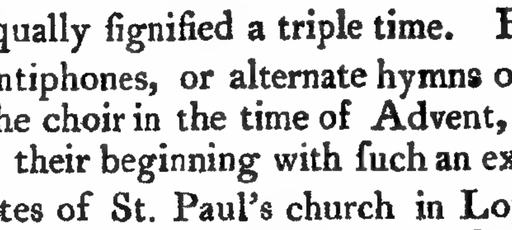
Among the Iriſh, the letter O, at the beginning of the name of a family, is a character of dignity, annexed to great houſes. Thus, in the hiſtory of Ireland, we frequently meet with the *O Neals*, *O Carrols*, &c. conſiderable houſes in that iſland.

Camden obſerves, that it is the cuſtom of the lords of Ireland to prefix an O to their names, to diſtinguiſh them from the commonalty.

A majuſcule O, in *Muſic*, is a note of time, called by us *ſemibreve*, by the Italians, *circolo*, making what they call *tempo perfetto*.

The ancients uſed O as a mark of triple time; from a notion that the ternary, or number three, was the moſt perfect of numbers, and therefore properly expreſſed by a circle, the moſt perfect of figures.

It is not, ſtrictly ſpeaking, the letter O, but the figure of a circle ○, or double CↃ, by which the modern ancients in muſic uſed to expreſs what they call *tempo perfetto*, or triple time. Hence the Italians call it *circolo*. This circle was ſometimes pointed, and ſometimes barred thus,



But theſe equally ſignified a triple time. Broſſard.

The ſeven antiphones, or alternate hymns of ſeven verſes, &c. ſung by the choir in the time of Advent, were formerly called O, from their beginning with ſuch an exclamation.

In the ſtatutes of St. Paul's church in London, there is one chapter, De Faciendo O. Lib. Stat. MSS. f. 86.

O is an adverb of calling, or interjection of ſorrow or wiſhing.

O. NI., in the *Exchequer*. As ſoon as the ſheriff enters into, and makes up his accounts for iſſues, amerciaments, and mean profits; the practice is to mark on his head *O. ni.* which ſignifies, *Oneratur, niſi habeat ſufficientem exonerationem*: and immediately he becomes the king's debtor, and a debet is

is ſet on his head.—Upon which the parties become debtors to the ſheriff, and are diſcharged to the king.

OACCO, in *Geography*, a town of Africa, in the kingdom of Benguela; the capital of a province of the ſame name, bordering on Malemba.

OACHATE, a harbour at the ſouth point of the iſland of Ulietea. S. lat. 16° 55′. W. long. 151° 24′.

OAHABA, a river of America, in Louiſiana, which diſcharges itſelf into the Miſſiſippi, in N. lat. 39° 10′, 7 miles N. of Riviere au Beuf.

OAHOONA, the northernmoſt of the cluſter of iſlands called Ingraham iſles; about two leagues N.E. of Nooheeva; called Waſhington by Capt. Ingraham, and Maſſachuſetts by Capt. Roberts.

OAITIPIHA, or AITIPIHA *Bay*, a bay near the N.E. end of the leſſer peninſula of the iſland of Otaheite, with good anchorage in twelve fathoms. S. lat. 17° 46′ 28″. W. long. 149° 13′ 24″.

OAK, in *Botany*, &c. See QUERCUS.

OAK *of Jeruſalem*. See CHENOPODIUM.

OAK-*Tree*, in *Agriculture* and *Planting*, the general name of a well-known hard-wooded foreſt-tree, much cultivated for the purpoſe of timber; particularly in ſhip-building, and in other caſes where much expoſure to the weather is required.

It has many ſpecies, but that which is of moſt importance as a timber-tree is the Engliſh oak, which grows to a great ſtature, and lives to a very great age; and which is deſcribed as being from ſixty to a hundred feet in height, with a very large trunk, a very ſpreading head, oblong leaves, broadeſt towards the top, the edges acutely ſinuated with obtuſe angles.

It has been ſtated by Mr. Marſhall, that "the root of the oak ſtrikes deep, eſpecially the middle or tap-root, which has been traced to a depth nearly equal to the height of the tree itſelf: nor do the lateral roots run ſo ſhallow and horizontal as thoſe of the aſh and other trees; but perhaps the roots of very few trees range wider than thoſe of the oak. The ſtem of the oak is naturally ſhort, and if left to itſelf, in an open ſituation, it will generally feather to the ground. It has not that upright tendency as the aſh, the eſculus, and the pine-tribe: nevertheleſs, by judicious pruning, or by planting in cloſe order, the oak will acquire a great length of ſtem; in this caſe, however, it rarely ſwells to any conſiderable girt."

And farther, that "the Engliſh oak admits of ſome varieties: indeed, if we attend minutely to particulars, we ſhall find them almoſt infinite. There is one variegation under the name of the ſtripe-leaved oak: but the moſt intereſting variety of the Engliſh oak is the Lucombe, or Devonſhire oak. In the ſixty-ſecond volume of the Philoſophical Tranſactions, a particular account is given of this oak; ſetting forth that Mr. Lucombe, a nurſery-man near Exeter, having, about the year 1765, ſowed a parcel of acorns ſaved from a tree of his own growth, and obſerving that one of the ſeedling plants preſerved its leaves through the winter, he paid particular attention to it, and propagated, by grafting, ſome thouſands from it. Its being a ſub-evergreen is not the only peculiarity of this variety; it has a ſomewhat more upright tendency, and ſeems to be of a quicker growth than oaks in general. The plants, however, which he has ſeen, do not anſwer altogether the deſcription given in the account above-mentioned.

The *Willow-leaved Oak* likewiſe grows to be a large timber-tree. It receives its name from its leaves reſembling very much thoſe of the common willow. Theſe long narrow leaves have their ſurface ſmooth, and their edges entire; their acorns being almoſt covered with their large cups. And it has ſeveral varieties; ſome having ſhorter leaves, others broader, and hollowed on the ſides; ſome large acorns, others ſmaller, &c. all of which are included under the appellation of willow-leaved oaks.

The *Cheſnut-leaved Oak* alſo grows to be a large timber-tree, and in North America, where it grows naturally, the wood is of great ſervice to the inhabitants. It is ſo called becauſe the leaves greatly reſemble thoſe of the Spaniſh cheſnut-tree. They are about the ſame ſize, ſmooth, and of a fine green colour.

There are likewiſe two or three varieties of it; but the leaves of all of them prove that they are of the ſpecies called the cheſnut-leaved oak; ſo that nothing more need be obſerved, than that the leaves of ſome ſorts are larger than thoſe of others; that the acorns alſo differ in ſize, and grow like thoſe of our Engliſh oak, on long or ſhort footſtalks, as it may happen in particular caſes.

The *Black Oak* is a tree of lower growth, ſeldom riſing to more than thirty feet in height. The bark of this tree is of a very dark colour, which occaſioned its being named the black oak. The leaves are ſmooth, very large, narrow at their baſe, but broad at their top, being in ſhape like a wedge: they have indentures at the top, ſo as to occaſion its having an angular look; they are of a ſhining green colour, and grow on ſhort footſtalks on the branches.

And there are varieties of it, particularly with *trifid* leaves, and ſlightly trilobate, called the black oak of the plains, the leaves and cups of all which are ſmall.

The *Red Virginia Oak* grows to be a timber tree of ſixty or ſeventy feet high, and the branches are covered with a very dark coloured bark. It is called the red oak, from the colour of its leaves, which in the autumn decline to a deep red colour.

It has ſeveral varieties, the leaves of which differ in ſize and figure; but thoſe of the larger ſort are finely veined, and exceedingly large, being often found ten inches long, and five or ſix broad. They are obtuſely ſinuated, having angles, and are of a fine green colour in the firſt part of the ſummer, but afterwards change by degrees to red, which marks theſe trees to be of this ſort. There are alſo ſeveral ſubvarieties of it, which exhibit a manifeſt difference in the ſize of the leaves, acorns, and cups. That is the beſt which is commonly called the Virginian ſcarlet oak; and the bark is preferred for the tanners' uſe before that of all the other ſorts.

The *White Oak* does not grow to the ſize of the former, ſeldom being found higher than forty feet, even in Virginia, where it grows naturally. But though the timber is not ſo large, yet it is more durable, and conſequently of greater value for building to the inhabitants of America, than any of the other ſorts. The branches of this tree are covered with a whitiſh bark; the leaves alſo are of a light colour. They are pretty large, being about ſix inches long, and four broad: they have ſeveral obtuſe ſinuſes and angles, and are placed on ſhort footſtalks.

This has a variety or two, and the acorns are like thoſe of our common oak.

The *Italian Oak* grows to about the height of thirty feet; the branches are covered with a dark purpliſh bark. The leaves are ſmooth, and ſo deeply ſinuated as to have ſome reſemblance of pinnated leaves; and each has a very ſhort footſtalk. The fruit of this ſpecies ſits cloſe to the branches. The cups are in ſome degree prickly and rough, and each contains a long ſlender acorn, that is eatable. In the places

where theſe trees grow naturally, the acorns are, in times of ſcarcity, ground into flour, and made into bread.

The *Spaniſh Oak* grows to be as large a tree as our common oak, and is in no way inferior to it in ſtatelineſs and grandeur; for the branches will be far extended all around, cauſing, with the leaves, a delightful ſhade. Though the bark of theſe branches is of a whitiſh colour, yet they are nevertheleſs ſpotted with browniſh ſpots. The leaves are of an oblong-oval figure, but not very long, ſeldom being longer than three inches, and two broad. They are ſmooth, and have their edges deeply ſerrated: theſe ſerratures are acute, and chiefly turn backwards. Their upper ſurface is of a fine light green colour, and their under of an hoary caſt; and with theſe beautiful leaves each branch is plentifully ornamented all over the tree. The cups are moſt peculiar and ſingular; for they are very large, and compoſed of ſeveral rough, black, large ſcales, that lap over one another like the ſcales of a fiſh. They almoſt cover the acorn, though they are pretty large, narrow at the bottom, but broader higher, and have their top flat. The acorns are uſed in dyeing.

The *Auſtrian Oak* is of lower growth than the preceding ſpecies, ſeldom riſing more than forty feet high. The leaves are of two colours; their upper ſurface being of a fine green colour, and their under downy. Their figure is oblong; but they are ſo indented about the middle, as to make them have the reſemblance of a lyre. They are wing-pointed, tranſverſely jagged, and ſtand on ſlender footſtalks on the branches. The cups of this ſort alſo are ſmaller and prickly, and the acorns proportionally ſmaller than thoſe of the preceding part.

It may be noticed, that there are ſome other ſorts mentioned by writers on rural economy; but they are not of much conſequence to the planter or timber dealer.

Manner of raiſing the Plants.—Theſe, in all the ſorts of oaks, are raiſed from the ſeeds or acorns, which ſhould be ſown as ſoon as poſſible after they are ripe; for if they are kept too long out of the ground, they ſeldom grow at all.

And the manner of ſowing the acorns, if deſigned for a ſmall plantation, or to be removed, is to prepare ſome beds of freſh earth, neither too ſtrong and heavy nor too light and dry. In theſe beds the acorns ſhould be placed in rows one foot aſunder, and about two inches diſtance in the rows, covering them about two inches thick with the ſame freſh earth. In the ſpring, when the plants begin to appear, they muſt be carefully cleared from weeds; and if the ſeaſon proves dry, refreſhed now and then with a little water, which greatly promotes their growth. In theſe beds the plants ſhould remain until the following autumn, obſerving conſtantly to keep them clear from weeds; at which time, a ſpot of good freſh earth, in ſize proportionable to the quantity of the plants, ſhould be trenched and levelled for preſerving them: then towards the middle or latter end of October, the plants ſhould be carefully taken up, ſo as not to injure their roots, and be planted out in rows three feet aſunder, and eighteen inches diſtance plant from plant; obſerving never to ſuffer the plants to abide long out of the ground before they are planted, as their roots would dry, and endanger their growth. And when they are planted, a little littery dung ſhould be laid upon the ſurface of the ground, near the roots, to prevent the earth from drying too faſt; and if the ſeaſon ſhould prove very dry, little water ſhould be given to ſettle the earth to their roots.

As ſoon as the plants have taken root, they will require little more care than to keep them clear from weeds, and dig the ground between the rows every ſpring; in doing of which, ſuch roots as extend very far from the trunk of the trees ſhould be cut off, which will render them better for tranſplanting again: alſo prune off ſuch ſide-branches as extend themſelves very far, and would retard the upright ſhoot; but not by any means all the ſmall lateral branches, ſome of which are abſolutely neceſſary to be left in, to detain the ſap for the augmentation of the trunk: for, where trees have been thus cloſely pruned, their heads have overgrown their bodies, ſo that they have bent downward, and become crooked.

After theſe trees have remained in the nurſery three or four years, they will be large enough to tranſplant to the places where they are to remain: for it is not proper to let them grow very large before they are planted out, as they are very hazardous trees to remove when old, or after they have taken deep root.

The beſt ſeaſon for this work is in the autumn; at which time, if they are carefully taken up, there will be little danger of their ſucceeding. When they are planted, the ſurface of the ground ſhould be littered about their roots, to prevent its drying too faſt; and if the ſeaſon is very dry, they ſhould be watered, to ſettle the earth to their roots, which may be repeated two or three times in very dry weather: but carefully avoid giving them too much water, which is very injurious to theſe trees, when newly removed. They ſhould alſo be ſtaked, to prevent their being ſhaken and diſturbed by the winds, which would retard their rooting. In tranſplanting of the trees, by no means cut their heads, which is too much practiſed: all that ſhould be done is to cut off any bruiſed or ill-placed branches, which ſhould be taken off cloſe to the place where they are produced. But there can be no greater injury done to theſe trees than to ſhorten their ſhoots; for when the leading bud, which is abſolutely neceſſary to draw and attract the nouriſhment, is taken off, the branch often decays entirely, or, at leaſt, down to the next vigorous bud. The trees, thus raiſed and managed, when planted in a proper ſoil, grow to a conſiderable magnitude, and are very proper for a wilderneſs in large gardens, or to plant in clumps in parks, &c. The directions here given are, however, deſigned only for ſmall plantations, in places which are only for pleaſure.

Raiſing Oaks for Timber.—In caſes where theſe trees are cultivated with a view to profit in timber, the acorns ſhould be ſown where the trees are deſigned to grow: in order to which, provide in autumn a ſufficient quantity of acorns, which ſhould be always taken from ſtraight, upright, vigorous growing trees. Theſe ſhould be gathered from under the trees as ſoon as may be after they are fallen, and, if poſſible, in a dry time; laying them thin in ſome open room to dry. Thoſe which are tranſplanted will never grow to the ſize of thoſe which ſtand where they are ſown, nor will they laſt near ſo long ſound: for in ſome places, where theſe trees have been tranſplanted with the greateſt care, and have grown very faſt for ſeveral years after, they are now decaying; while thoſe which remained in the places where they came up from the acorns are ſtill very thriving, and have not the leaſt ſign of decay: therefore, whoever deſigns to cultivate theſe trees for timber, ſhould never think of tranſplanting them, but ſow the acorns on the ſame ground where they are to grow; for the timber of all thoſe trees which are tranſplanted is not near ſo valuable as that of the trees from acorns. In this buſineſs, the firſt thing to be done is that of fencing the ground very well, in order to keep out cattle, hares, and rabbits; for if theſe animals can get into the ground, they ſoon deſtroy all the young trees. In a few years, the trees grow to be out of danger from the hares and rabbits; but it will be many years before they be paſt injury from the cattle, if they are permitted to get into

the plantation: therefore, durable fences ſhould be put round the ground. If, in the beginning, a pale fence is made about the land, cloſe at the bottom, and open above, and within it a quick hedge planted, the latter will become a good fence, by the time the paling decays, againſt all ſorts of cattle; and when the trees will have got above the reach of hares and rabbits, ſo that they cannot injure them.

As ſoon as the ground has been well fenced in, it ſhould be prepared by ploughing it three or four times; and after each ploughing, harrowing it well to break the clods, and cleanſe the ground from couch, and the roots of all bad weeds. If the ground is broken up from the green ſward, it will be better to have one crop of beans, peaſe, or turnips, off the ground, before the acorns are ſown, provided theſe crops are well hoed, to ſtir the ſurface, and deſtroy the weeds. If this is properly done, the crop will improve the land for ſowing; but in this caſe, the ground ſhould be ploughed as ſoon as poſſible after the crop is taken off, the acorns being ſown as ſoon as they can after they are ripe: for although they may be preſerved in ſand for ſome time, they will be apt to ſprout, by which the ſhoots are in danger of being broken and ſpoiled. And in making choice of acorns, thoſe ſhould be preferred which are taken from the largeſt and moſt thriving trees; but thoſe of pollard trees always rejected, though the latter are generally the moſt productive of acorns. Thoſe obtained from the large trees commonly produce the ſtrongeſt and moſt thriving plants.

Sowing the Acorns.—The ground having been thus ploughed, levelled, and brought into order, the acorns ſhould be ſown in drills made acroſs the ground, at about four feet aſunder, and two inches deep; being ſcattered in at two inches diſtance. Theſe drills may be drawn either with a drill-plough, or by hand, with an hoe; but the former is the moſt expeditious method; therefore, in large plantations, ſhould be preferred. In the drawing of the drills, if the land has any ſlope to one ſide, theſe ſhould be made the ſame way as the ground ſlopes, that there may be no ſtoppage of the wet by the rows of the plants croſſing the hanging of the land. This ſhould be particularly obſerved in all wet ground, or where the wet is ſubject to lie in winter. When the acorns are ſown, the drills ſhould be carefully filled in, ſo as to cover the acorns ſecurely; for if any of them are expoſed, they will entice the birds and mice; and if either of theſe once attack them, they will make great havock and deſtruction. The reaſon for directing the drills to be made at this diſtance, is for the more convenient ſtirring of the ground between the rows, to keep the young plants clean from weeds; as, if this is not carefully done, it cannot be expected that the young plants ſhould make much progreſs; and yet this is generally neglected by many who pretend to be great planters, who are often at a large expence to plant, but ſeldom regard them after; ſo that the young plants have the difficulty to encounter the weeds, which frequently are four or five times the height of the plants, and not only ſhade and draw them, but alſo exhauſt all the goodneſs of the ground, and conſequently ſtarve the plants; therefore, whoever hopes to have ſucceſs in their plantations of this ſort, ſhould determine to be at the expence of keeping them clean for eight or ten years after ſowing, by which time the plants will have obtained ſtrength enough to keep down the weeds; the neglecting of this has occaſioned many young plantations to miſcarry. About the end of March, or beginning of April, the young plants will appear above ground; but before this, if the ground ſhould produce many young weeds, it will be good huſbandry to ſcuffle the ſurface over with Dutch hoes, in a dry time, either the latter end of March, or the beginning of April, to deſtroy the weeds, whereby the ground will be kept clean, until all the plants are come up ſo far as to be plainly diſcerned; by which time it may be proper to hoe the ground over again; for by doing it early, while the weeds are ſmall, a man will perform more of this work in one day than he can in three or four when they are grown large; beſides, there will be great hazard of cutting off or injuring the young plants, when they are hid by the weeds; and ſmall weeds, being cut, are ſoon dried up by the ſun, but large weeds often take freſh root, and grow again, eſpecially if rain ſhould fall ſoon after, and then they will grow faſter for being ſtirred; therefore it is not only the beſt method, but alſo the cheapeſt huſbandry to begin cleaning early in the ſpring, and to repeat it as often as the weeds are produced. In the firſt ſummer, while the plants are young, it will be the beſt way to perform theſe hoeings by hand; but afterwards it may be done with the hoe-plough; for as the rows are four feet aſunder, there will be room enough for this plough to work; and as this will ſtir and looſen the ground, it will be of great ſervice to the plants; but there will require little hand labour where the plough is uſed, in order to deſtroy the weeds, which will come up in the rows between the plants; for theſe will be out of reach of the plough, and, if they are not deſtroyed, they will ſoon overgrow and injure the young plants.

As ſoon as the plants have had two years' growth, it will be proper to draw out ſome of them, where they are too cloſe; in doing which, great care ſhould be had not to injure the roots of thoſe that are left; for as the plants which are drawn out are only fit for plantations deſigned for pleaſure, ſo theſe ſhould not be ſo much regarded in their being moved, as to ſacrifice any of thoſe which are deſigned to remain. In theſe thinnings the plants at firſt ſhould be left about one foot aſunder, which gives them room enough to grow two or three years longer; by which time it may be eaſy to judge which are likely to make the beſt trees. Theſe may be then fixed on, as ſtandards, to remain; though it will be proper to have a greater number at this time marked than can be permitted to grow, becauſe ſome of them may not anſwer the expectation; and, as it will be improper to thin theſe trees too much at one time, ſo the leaving double the number intended at the ſecond thinning will not be amiſs. If they are left at about four feet diſtance in the rows, they will have room enough to grow three or four years longer; by which time, if the plants have made good progreſs, their roots will have ſpread over the ground, when it will be proper to take up every other tree in the rows. But, by this, it is not meant to be exact in the removing, but to make choice of the beſt plants to ſtand, whichever rows they may be in, or if they ſhould not be exactly at the diſtance here aſſigned. When the plants have been reduced to the diſtance of about eight feet, they will not require any more thinning. But in two or three years time, thoſe which are not to remain will be fit to cut down, to make ſtools for underwood, and thoſe which are to remain, will have made ſuch progreſs as to become a ſhelter to each other; for this is what ſhould principally be attended to, whenever the trees are thinned; therefore, in all ſuch places which are much expoſed to the wind, the trees ſhould be thinned with great caution, and by ſlow degrees; for if the air is let too much at once into the plantation, it will give a ſudden check to the trees, and greatly retard their growth; but, in ſheltered ſituations, there need not be ſo great caution uſed as in thoſe places; the plants will not be in ſo much danger of ſuffering from expoſure to the cold winds.

The proper diſtance which ſhould be allowed to thoſe trees which are deſigned to remain for timber, is from twenty-

twenty-five to thirty feet, or more, which will not be too near, where the trees thrive well; in which caſe their heads will ſpread, ſo as to meet in about thirty, or thirty-five years; nor will this diſtance be too great, ſo as to impede the upright growth of the trees. This diſtance is intended that the trees ſhould enjoy the whole benefit of the ſoil.

And after one crop of the underwood, or, at the moſt, two are cut, the ſtubbing up the ſtools is adviſed, that the ground may be entirely clear, for the advantage of the growing timber, which is what ſhould be principally regarded; but, in general, moſt planters have more regard for the immediate profit of the underwood than the future good of the timber, and, frequently, by ſo doing, ſpoil both; for, if the underwood is left after the trees are ſpread ſo far as that their heads meet, the underwood will not be of much worth; and yet by their ſtools being left, they will draw away a great ſhare of the nouriſhment from the timber trees, and retard them in their progreſs very conſiderably.

Quality of Soil.—The ſoil in which the oak makes the greateſt progreſs, is uſually a deep rich loam, in which the trees grow to the largeſt ſize; and the timber of thoſe trees which grow upon this land, is generally more pliable than that which grows on a ſhallower or drier ground; but the wood of the latter is much more compact and hard. Indeed there are few ſoils in which the oak will not grow, provided there be proper care taken in their cultivation; though this tree will not thrive equally in all ſoils; but yet it might be cultivated to a national advantage upon many large waſtes in many parts of the kingdom, as alſo to the great profit of the eſtates where theſe tracts of land now lie uncultivated, and produce nothing to the owner; as, ſhould the preſent practice of deſtroying this ſort of timber continue, and little care be taken to raiſe a future ſupply; this country, which has been ſo long eſteemed for its naval ſtrength, may be obliged to ſeek for timber abroad.

In ſpeaking of the culture of the oak, Mr. Yates has ſtated that an opinion is generally prevalent, that the oak is particularly ſlow in its growth, and requires a great number of years before it affords any advantage. This idea too often deters from planting, on account of the very great length of time it is ſuppoſed the land muſt be occupied before any return of valuable produce can be obtained from it, after a conſiderable expence may have been incurred in forming plantations. But this opinion he conſiders as entirely founded in error, and to have taken its riſe in a great meaſure from the want of proper management which has hitherto commonly prevailed in the raiſing of oaks. It is conceived, however, on the ground of experience, that the oak may be rendered very rapid in its growth, and that conſequently land may be employed to great advantage in its cultivation, as a very conſiderable and profitable produce may, in a much ſhorter time than is generally ſuppoſed, be derived from proper parts of an eſtate thus employed. And that oak-timber in this country, for the moſt part, appears in trees of a conſiderable extent of head, but ſeldom more than twenty or thirty feet in ſtem; and this, in many inſtances, the growth of a century. Now, by the courſe of management here propoſed, it is conceived that trees, of at leaſt double this magnitude, may be obtained in about half that time; but it is not his intention to attempt a proof of this propoſition by theoretical deductions, but to appeal for its confirmation to the indubitable teſt of fact, which, from the event of repeated trials, impreſſes a conviction, that experience will be found to ſupport and eſtabliſh in the moſt unequivocal manner. And in proof of this it is ſtated that the oak, in the progreſs of its growth, ſpreads numerous roots near the ſurface of the ground, and in an horizontal direction; theſe aſſiſt in ſupporting and preſerving the tree in its poſition, but ſeem to contribute very little to its increaſe and magnitude. The oak appears to derive its chief nutriment and ſtrength from a root that always deſcends at right angles to the horizon, and is called the tap-root. The firſt thing, therefore, to be obſerved, is, that upon a judicious attention to this peculiarity, the planter's ſucceſs principally depends; and the neglect of this care is the conſtant ſource of error and diſappointment. In all climates, and upon all ſoils, to preſerve this tap-root from injury, and as much as poſſible to aſſiſt its growth, is, he conceives, a general, and indeed the moſt eſſential principle in the cultivation of oak. With a due regard to this circumſtance, the management of a plantation may be reſolved into the three following practical directions:

1. Previouſly to planting the acorns, looſen the earth intended for their reception, by deep trenching.

2. Never tranſplant, or in any way diſturb the ſaplings intended for timber.

3. Keep the plant carefully pruned, till arrived at a proper height.

In order more fully to elucidate the ſubject, and to prevent the poſſibility of miſapprehenſion, it may be proper to give a more detailed ſtatement. And that in determining on a ſpot to form a plantation of oaks for timber, it muſt always be recollected that the plants are to remain without removal in their firſt ſituation: the clearing and fencing may then be attended to as uſual; and in the courſe of the winter, from September to March, the particular ſpots intended for the reception of acorns, be prepared for that purpoſe, by digging a trench about three feet in width, and from three to ſix feet in depth, according to the cloſeneſs and tenacity of the ſoil. If graſs ground, the firſt ſpit ſhould be placed at the bottom of the trench; and if more than one trench be neceſſary, they ſhould be prepared in the ſame manner, preſerving a diſtance of ten yards between each, if it be intended to employ the intermediate ſpace in underwood, or for any other purpoſe. Then having made a careful ſelection of acorns that are perfectly ſound, and in good preſervation, they are to be planted about the middle of March. For this purpoſe it is adviſed to draw a drill in the centre of the trench; two inches in depth, if the ſoil be heavy and loamy; but three inches in a light and ſandy earth: and in this caſe to place the acorns two inches aſunder, and cover them carefully with mould. When the plants appear, they muſt be weeded by hand in the rows, and the earth of the trench round them cleaned with a hoe, once a month during the ſummer. In October it is ſuppoſed neceſſary to inſpect the rows, and thin them by pulling up every other plant: attention will of courſe be paid to remove the weak and crooked plants, and leave thoſe that are talleſt and ſtraighteſt. In the ſecond year, the operation of thinning muſt be repeated, at the ſame time and in the ſame manner; and, ſhould any of the remaining plants have made ſide-ſhoots ſtronger than the general character, they muſt be ſmoothly cut off with a ſharp knife, cloſe to the leading ſtem. In the third year the thinning is again to be repeated, and the general pruning commenced, by cutting off cloſe to the leading ſtem all the ſide-ſhoots of the firſt year; thus leaving the branches of two years to form the head of the following year. The removal of every alternate plant muſt be continued yearly, till the trees are about thirty feet apart, at which diſtance they may remain for timber. The pruning is to be continued, by removing every year, very ſmooth and cloſe to the main ſtem, one year's growth of ſide branches, till the plants are arrived at a ſtem

a ſtem of forty, fifty, or ſixty feet, and they may then be permitted to run to head without further pruning. But the particular arrangement here recommended may be varied according to any peculiarities of ſituation, regard being conſtantly had to the general and moſt important principle of looſening the ground very deep previouſly to planting the acorns. By this mode of culture, oaks may be raiſed in almoſt any ſoil; but, where it is poſſible, a loam or marle is always to be choſen. Oaks thrive much the beſt in ſuch earth; and when aſſiſted by deep trenching and judicious pruning, attain in a few years to an immenſe ſize. It is added that thoſe who have been accuſtomed to notice the ſlow growth and ſtunted appearance of oak-trees, when denied the aſſiſtance of art, and left to themſelves in the common way, would obſerve with aſtoniſhment the vigorous and rapid increaſe of plants under the management here pointed out. And further, that the plants thinned out the firſt three or four years, though not fit to be depended upon for timber, as tranſplanting generally injures materially the future growth, may be replanted in the intermediate ſpaces between the rows, for the purpoſe of being afterwards removed; or they may be uſefully placed in hedges, or other ſpare and unoccupied ſpots of ground. They ſhould be headed down at the time of tranſplanting, as this operation aſſiſts the proceſs of nature, in reproducing or remedying any injury the tap-root may have received from the removal: and if proper attention be given to looſening the ſoil for their reception, and pruning them as they advance, in moſt inſtances an adequate profit will be derived from the labour beſtowed upon them. After a few years, the produce of the timber plantation will be found very advantageous. The young trees that are to be removed yearly, will always find a ready market for a variety of purpoſes, unneceſſary here to enumerate. And in addition to theſe advantages by this treatment of deep trenching previous to planting, and annual careful pruning during the growth, timber can be produced in about fifty years of equal quality, and much ſuperior in ſize to that which has been above one hundred years growing under improper management, or without the aſſiſtance of cultivation; it will doubtleſs be allowed that a moſt beneficial, if not abſolutely the beſt poſſible method of raiſing oaks, is here pointed out and aſcertained. But this method of cultivation may perhaps be thought to occaſion ſo much expence in manual labour as to prevent its being generally adopted: it might perhaps be ſufficient to obſerve, that if the work be conducted with judgment and economy, the future produce would afford ample returns for all neceſſary expenditure: it ſhould alſo be recollected, that the previous preparation of the ground, and the ſubſequent pruning of the plants, are both to be performed at that ſeaſon of the year when a ſcarcity of work will enable the planter to obtain aſſiſtance upon eaſier terms; with this additional advantage alſo, of providing employment for the labourer at thoſe times when the general ſtate of agricultural buſineſs renders it difficult for him to find maintenance for himſelf and family without charitable relief.

In ſupport of this practice it is ſtated, that in 1750, at Ingeſtrie in Staffordſhire, the ſeat of lord Chetwynd, ſome plantations were formed and managed in a great meaſure according to theſe principles, and the growth of the plants was ſo uncommonly rapid, and ſo extraordinary, that it could not but attract the notice of all concerned in the conduct of them.

On the whole it is concluded, from the ſtatements made here, and from what may be ſeen in every part of the kingdom, in the character and appearance of oaks growing without cultivation, that it ſeems aſcertained, that acorns ſet with the ſpade or dibble, without digging or tillage, can never be depended on to form good timber; and even in the moſt favourable circumſtances of this caſe, the growth will be exceedingly ſlow and precarious. The ſame may be ſaid of young plants, previouſly raiſed in nurſeries and tranſplanted; for if the tap-root be cut, broken, or in any degree injured, which in tranſplanting it is almoſt impoſſible to avoid, that plant will ſeldom become a vigorous and flouriſhing tree.

Tranſactions of the Society for the Encouragement of Arts, &c. vol. xx. and the facts recorded by Mr. Majendie in the ſame Tranſactions, ſtrongly confirm the propriety of the above principles and practice. It is there ſtated that he planted five thouſand three hundred oaks in two ſeparate incloſures, and that the firſt plantation, containing four thouſand ſix hundred oaks, was formed on part of the ancient Home Park, ſurrounding the caſtle: the ſoil was dug one full ſpit, and the turf inverted; the plants were two-years old ſeedlings, removed with the greateſt care from the ſeed-bed, by undermining the roots; ſo as to bring them up undamaged and entire in the ſtricteſt ſenſe: the ſub-ſoil of the intended plantation being a rich tender loam, holes were bored into it with an iron inſtrument, uſed in the country for fixing hop-poles into the earth: into theſe the trees were planted, uſing great caution that each ſeedling ſhould have a hole ſuitable to the length of its tap-root, which they were careful to ſet upright, and without doubling it: the tap-roots of theſe plants were from eighteen to thirty-ſix inches in length. His motives for planting the trees without ſhortening their tap-roots, were theſe: it has long been aſſerted, that the oak ſuffers greatly in value from tranſplanting, and that the timber of ſuch trees is of an inferior quality to that produced by ſowing the acorn. Theſe facts were long ſince well known to Millar and Hanbury. It is further ſtated, that a common practice in planting oaks, is to ſow the acorns in a bed; and, after one or two years to tranſplant the ſeedlings into rows in a nurſery, where they remain two or three years longer; when the young trees are taken up, and their tap-roots, being previouſly ſhortened, are finally planted out. Now by this proceſs, it is plain the tree undergoes two removals before it is finally planted. To avoid this, he determined to plant out his oaks at once from the ſeed-bed, with an idea that, by their receiving only one check inſtead of two, and this at ſo early an age, they would ſoon recover it, ſo as in the end to ſuffer no ſort of detriment; more particularly as by preſerving their tap-roots entire, the trees were planted as much as poſſible in a natural ſtate. And that, with ſome it is not unuſual to plant out young oaks immediately from the ſeed-bed, but they are for the moſt part *tapped* at the time of removal; or, this operation is previouſly effected by an inſtrument introduced beneath the ſoil that divides the root, whilſt the tree is ſtill growing: after which it is ſuffered to remain in the ground ſeveral years before it is finally removed: but in both theſe inſtances the intentions of nature in reſpect to this tree ſeem to be violated.—Would it not be preferable, upon all occaſions of tranſplanting, with a view to timber, to remove the trees at as early an age as poſſible, and without any mutilation, from the ſeed-bed to the ſoil where they are to grow? By which, if the ſeminary (as it ever ſhould be) is at no great diſtance from the land intended to be planted, and that the eſſential requiſite of taking up the trees with the utmoſt care is attended to, the removal will be hardly, if at all, felt: and, at all events, until the queſtion is decided, whether it is beſt, in order to procure

procure timber of the firſt quality, to ſow acorns where they are to remain, or to tranſplant oaks, it is but reaſonable that the practice of tranſplanting (generally conſidered as inferior to that of ſowing) ſhould be conducted with as few deviations from nature as poſſible.

It is ſuggeſted, that at the time of forming this plantation (December 1786), he made the following experiments, with a view to a compariſon between young oaks planted with their roots entire, and thoſe whoſe roots had been *tapped*. On the 5th of that month, he ſelected from his ſeedling-oaks twenty-four of the ſtraighteſt, and which were of an equal length, namely, three feet ſix inches from the extremity of the tap-root to the top of the plant, the root alone being twenty-ſeven inches, and the plant fifteen inches in length; twelve of theſe were planted in the ſame manner as the reſt of the oaks in the encloſure with entire roots, and at the diſtance of five feet from each other: contiguous to theſe, and at the ſame time and diſtance, the remaining twelve were planted, taking off previouſly eighteen inches from their tap-roots, ſo that nine inches only of root remained. And as he wiſhed to obſerve the progreſs of theſe trees, at the expiration of a few years; on the 6th of December 1791, he cauſed one of each to be carefully dug up, which he found in the manner deſcribed below.

But it is not pretended at preſent to draw any accurate concluſion from this experiment; for indeed it muſt require long experience, and a courſe of years, to form decided opinions concerning a tree of ſuch ſlow growth as the oak. He purpoſes, however, continuing his remarks upon theſe trees thus experimentally planted, by digging up others from time to time, in order to obſerve the comparative progreſs of their roots. His intention in thus planting theſe trees, and remarking at various periods the degrees of difference between their growths, was with a view of aſcertaining hereafter, whether the planting of perfect oak ſeedlings, without dividing their tap-roots, might not be the means of inſuring better timber than by the uſual method of planting thoſe which have been previouſly *tapped* for admitting the oak, from the unremoving acorn, in all caſes, to arrive at a ſuperiority of timber to that of the tranſplanted tree, at however early an age it is removed: ſtill, as long as the practice of tranſplanting oaks is in uſe, it may be preſumed that a ſeedling removed with proper care from the ſeminary, and planted entire, will prove ſuperior to one whoſe root has been mutilated; as having ſuſtained in its treatment a leſs deviation from nature. For that, in the perfect tree, alluded to above, the tap-root has acquired a regularity of thickneſs in its general growth, and that its lateral ſhoots are moſtly fibrous; becauſe the tree, having remained in poſſeſſion of its natural ſource of nouriſhment, was enabled, ſoon after being tranſplanted, to vegetate as before: on the other hand, the mutilated tree has thrown out a number of thick woody horizontal roots near the place where the tap-root was ſhortened, as if nature, to preſerve her produce, had been intent on repairing the damage ſhe had ſuſtained; after which, the root reſumes its natural downward tendency, with a regularity that might almoſt induce an idea that the root had never been at all divided. But, to remove the moſt diſtant doubt on this head, others of theſe trees have been taken up, in which, after the moſt careful examination, the ſame diſtinct modes of growth appear, as in theſe. It may be farther remarked, that theſe trees have not ſucceeded ill with him, when it is conſidered they have only been planted five years, and were at that time only fifteen inches in height from the ground.

It is ſtated that, on digging up the trees the following were the

Admeaſurements of each:

Oaks planted with an entire Root.

	Feet.	Inches.
Extreme height from the bottom of the tap-root	11	2½
Height from the ground	7	7
Circumference cloſe to the ground	0	6¼

Oaks planted with a tapped Root.

	Feet.	Inches.
Extreme height from the bottom of the tap-root	10	3
Height from the ground	6	9
Circumference cloſe to the ground	0	6½

This planter could have ſelected larger trees from his plantation, but preferred the above for the ſake of accuracy, as they were both planted the ſame day.

And it is ſtated that the ſecond incloſure, at ſome conſiderable diſtance from the former, and part of the ancient great park of the eſtate, was planted with ſeven hundred oaks; and has in all reſpects received a ſimilar treatment with the firſt. Both plantations are ſecurely fenced, and in a very flouriſhing condition, the trees ſeeming ſuited to the ſoil. They have been carefully attended, and judiciouſly pruned; whereby they have acquired an upright growth, which, together with their being planted tolerably thick, will enſure a length of ſtem. And it is concluded that, under a continuation of the preſent treatment, he can have no room to doubt the future ſucceſs of the plantations. In fact, theſe different ſtatements clearly demonſtrate the great advantage of the method of ſowing the acorns in the ſituations where the trees are to remain, and that where this cannot be done, the next beſt mode is that of removing the plants when young, with their tap-roots entire. It is obvious likewiſe, that, where theſe trees are cultivated on an extenſive ſcale, the land may be well prepared by means of the trenching plough with much leſs expence and with greater convenience than by manual labour in moſt caſes.

In Mr. Smith's trials in Yorkſhire, much advantage has been found from the young oaks having ſhelter afforded by firs which have obtained a year's growth, as in a plantation made in 1792, and which was laſt year joined to this, by another piece of land about three acres then taken in. The oaks were there ſet at the ſame time as the firs, but on one part were not mixed with them; and in that part they thrived ſo ill, as to make no progreſs, until ſome Scotch firs were planted among them; ſince which they have aſſumed a different appearance, and are now growing tolerably well. But another advantage he has obſerved in planting, ariſes from having the holes made the year before the plants are put in: by this method the froſt ameliorates the ſod, and makes it, particularly in bad land, finer, which encourages the fibres of the young plants to ſhoot more freely. It is noticed that two lands in his plantation were not ploughed; and the reaſon that induces him to mention the circumſtance, is the ſuppoſition that the trees would grow beſt upon the land that was ploughed. In this he has not been diſappointed; thoſe that were ſet upon the two lands not ploughed, having made leſs ſhoots than the other; and though they grow tolerably well, yet an evident difference is obſervable in the luxuriancy of their appearance,

pearance, which certainly is an additional proof that ploughing the land, and making the holes the year preceding the planting of trees, is of material conſequence in the ſucceſs of an undertaking of this nature. This is the caſe, not only with the oaks, but other ſorts of timber trees in general.

Mr. Nichol has contended that nothing aſſiſts more in the propagation and preſervation of timber than thorns and buſhes, eſpecially where there are no fences to keep off cattle. Underwood never fails to bring a ſtock of timber on a favourable ſoil: and the deſtruction of buſhes in lands not incloſed, will aſſuredly prevent a ſucceſſion of timber, by depriving the young plants of their nurſes, and leaving the acorns that are caſually dropped expoſed to various enemies. The conſtant cutting, therefore, of underwood by the keepers in foreſts, under pretence of browſe for the deer, is attended with the moſt miſchievous conſequences to the growth of timber. The unlimited mowing of fern is alſo extremely injurious to the growth of timber; for the fern ſhades the roots, and keeps the young plants moiſt and cool: and by cutting it up, the young trees are cut up with it as ſoon as they ariſe. On this ground, he adviſes the making plantations without any previous preparation, as being the cheapeſt, and anſwering the purpoſe extremely well. This may be an uſeful mode in foreſts, and waſtes full of buſhes. He has invented a good inſtrument for introducing and planting acorns among the buſhes. But in raiſing a new wood, it muſt be much more effectual to prepare and clean the ground well, and to ſet the acorns in drills, that the young plants may be kept clean by horſe-hoeing till they can bid defiance to weeds and other annoyances.

In ſpeaking of the compariſon between ſown and planted oaks, Mr. Plampin, of Chadacre, in Suffolk, affirms, that the latter are ſo inferior to the former, as to induce him to give a general condemnation of planting for timber. But Mr. Marſhall endeavours to reconcile the diſpute about ſowing and planting, by obſerving that where the ſtrength of the lands lies in the ſubſtratum, while the ſurface of the ſoil is of an ungenial nature, we ſhould ſow, in order that the roots may ſtrike deep: but on the contrary, when the top ſoil is good, and the bottom of an oppoſite quality, to plant, and thereby give the roots the full enjoyment of the productive part of the ſoil; or, under theſe laſt circumſtances, ſow, and tap the young plants as they ſtand, and thereby check their downward tendency, as well as ſtrengthen their horizontal roots. And it has been remarked, that in raiſing oaks for timber, draining ſhould be well attended to; nothing contributing more to their growth and health, than keeping the land dry, if it is in the leaſt inclinable to be ſwampy or retentive of moiſture.

In the ſecond volume of the Rural Economy of Norfolk, oaks are obſerved to grow beſt, and make the fineſt plants and the moſt beautiful trees, when they are raiſed undiſturbed from the acorn. The oak having naturally a ſtrong tap-root, it is almoſt certain death to remove a large plant which has not been tranſplanted or tapped whilſt young: nevertheleſs, if the tap-root has been properly taken off from the ſeedling plant, it may afterwards be removed at pleaſure, with ſafety. Oaks may, however, be tapped by taking up the plants and taking off the tap-root with a knife, or it may be done as they ſtand, with a tapping-iron, or even a common ſpade ground to an edge. This, being introduced at a proper depth beneath the ſurface of the ground, cuts off the tap-root; leaving the principal part of the lateral horizontal fibres undiſturbed. When the plants have got large (four or five years old for inſtance), this is perhaps the ſafeſt way of treating them; for the lateral ſhoots in this caſe receive no check whatever, but continue to throw up a regular ſupply of ſap to the plant: whereas, by taking them up and removing them into a freſh ſituation, they are ſeveral days before they begin to work; in which time the plant may receive irrecoverable injury.

It is ſtated, that a ſeed-bed of oaklings, five years old, was treated in this manner; in March and April the planter tapped them all with common ſpades, ground ſharp; pruned ſuch as were in any degree ſtraight; and headed down the reſt near the ground, to throw out ſhoots to be trained. Not a plant is dead. Had there been more of them cut down the effect would have been ſtill better. And a ſtriking inſtance of ſucceſs in tranſplanting large oaks for ſtandards, occurs on Gunton Common. Scarcely a plant, of ſome thouſands, has miſcarried, and there are very few which do not flouriſh. A perſon who had ſome ſhare in the buſineſs of this plantation, tells him that it was the employment of two men and a couple of horſes, almoſt all the firſt ſummer after they were planted, to water them; not by a pailful, but by a hogſhead at once; which ſerved for the ſummer. This was a rational method; a pailful only tantaliſes and baulks the plant; whereas a hogſhead depoſited at its root affords a natural and regular ſupply, to be drawn up leiſurely by the ſun during the courſe of the ſummer. It is likewiſe obſerved, that upon ſome eſtates it is the practice to put in, when a new hedge is planted, a holly at every rod, and an oak plant at every two or three rods, among the white-thorn layer. This is an excellent practice, provided the young oaks be trained to a proper height before they be ſuffered to form their heads. For, in this caſe they will become a valuable ſource of timber, without injuring, in any material degree, the incloſures they grow between. They are the roots of the aſh and elm, and the tops of low pollards and tall overgrown hedge-woods, which are injurious to the farmer. A timber-oak, of from fifteen to twenty feet ſtem, does very little, if any, injury either to the crop, or the hedge growing under it. But if, on the contrary, the oaklings thus planted be ſuffered to riſe with more than one ſtem, as ſtubwood, or riſingly (which is ſeldom the caſe in a young hedge), they be permitted to form their heads at eight or ten feet high, with flat wide ſpreading tops, they loſe their intended value, and become nuiſances, not only to the adjoining incloſures, but to the hedge in which they grow. Eligible, therefore, as it is to plant young oaks among hedge-wood, the advantage to be obtained from it reſts wholly on the after-management which is purſued.

In the Annals of Agriculture, Mr. Young ſtates, that oaks are of ſlow growth, but if you put them at proper diſtances amongſt the quick growing trees, they will ſometimes be drawn up beyond your expectations, and he cautions you to watch them, and to cut out ſuch trees as crowd upon them, by tranſplanting them every third year into a nurſery; they may be put out from ſix to ten feet high. And that land that will let at from 12*s.* to 18*s.* *per* acre, for any given time, pays better than with wood, if you calculate the compound intereſt on the annual rent; but who is there that is ſo careful as to make it, or that can make it, on very ſmall ſums? He conſiders the appropriating of 50 acres out of every thouſand, as laying by a ſmall part of the income of an eſtate, that will not be miſſed, at compound intereſt, as an accumulating fund that frequently comes in very ſeaſonable to ſtop a large gap. And he has now, of his grandfather's ſowing, about 26 acres of as fine young oak-timber as can be ſeen, which may be worth, in 25 or 30 years, 4000*l.* He has likewiſe, of his

father's ſowing, 20 acres to ſucceed them. His anceſtors have done ſo much; he has only added about ten acres to the fund, chiefly of Scotch fir, on a poor ſoil where other trees have been tried, and failed; the thinning of theſe woods likewiſe pays a fair rent, after a time. He made a purchaſe upon which were 14 acres of wood-land; there are 400 oak-trees upon it, that in 30 years, from the time of the purchaſe, will ſell for as much as the eſtate coſt him, 1000*l.*

Thinning of.—It may be noticed, that one of the moſt eſſential things to be obſerved in the management of oak-woods is the judicious thinning of them. When they are thinned ſo as to be about two feet diſtant, they may ſtand twelve or fourteen years, when every ſecond plant may be taken out and ſold for hoops or ſmall poles; only obſerving, that if the ground be good, and the trees take to growing well, they will want thinning ſooner. In ſeven or eight years more, the healthieſt trees muſt be marked for timber, and the others cut down for poles, and the ſtools left for underwood. In thirty years they will be uſeful for ſmall ſcantlings, ſpars, rafters, battings, rails, props, &c. not quartered. And, that during this time, according to the opinion of ſome, they ſhould never on any account be touched with the knife, axe, or pruning-hook. Some recommend the cutting off ſide ſhoots; others cutting them to the ground to make the better ſhoots. But this is probably the reaſon why, when oaks are cut up in expectation of finding them clean timber, that a variety of rotten knots grown over with ſound wood appear in them, being the places where boughs had been cut off. It is certainly the caſe where they are advanced in growth, but in their infant ſtate it is generally allowed, that they require judicious pruning. Mr. Marſhall contends, that to hack off a large bough from an aged tree, is a crime of the deepeſt dye in the management of timber. But what relation has this mad act to the ſalutary operation of removing a twig from the ſtem of a young growing tree, or of pruning the boughs, or even removing the leader of a tree in a youthful growing ſtate? In that caſe, the ſize of the wound and the exhauſted ſtate of the tree unite to prevent the healing, and a defect in the timber conſequently takes place; whilſt in this, the wound is inconſiderable, and the vigorous ſtate of the tree enables it to cicatrize the ſore, in a few months perhaps after the operation is performed. And by freeing the ſtems of young trees from ſide ſhoots, and keeping their leaders ſingle, a length of ſtem is obtained; which by afterwards checking their upright growth, and throwing the main ſtrength of the head into one principal bough, by checking, not removing the reſt, a crookedneſs of timber is had; and what is equally neceſſary in ſhip-timber, a cleanneſs and evenneſs of contexture. The dangerous and too often fatal defect cauſed by the decayed ſtumps of dead ſtem boughs being overgrown and hid under a ſhell of ſound timber, a defect which every fortuitous tree is liable to, is by this provident treatment avoided; the timber from the pith to the ſap becoming uniformly ſound, and of equal ſtrength and durability. So that nothing, it is ſuppoſed, but prejudice of the moſt inveterate kind, can reject a practice founded on the moſt obvious principles of nature and reaſon. The miſchief done to hedge-row trees by injudicious lopping too generally obſervable, has ariſen from the practice of taking large boughs from the ſtems of aged trees; not from training young trees during the early ages of their growth, which ſhould always be done. See Wood.

Oak-*Bark*, the cortical ſubſtance ſtripped from the boll and branches of the oak-tree. It is uſed in tanning of leather, and afterwards as a manure, and has lately become a very expenſive article. See Bark and Tan.

Every part almoſt of the oak is aſtringent; but it is only the bark that is officinal; and as the epidermis is perfectly inert, it is taken for medicinal purpoſes from the ſmaller branches, the epidermis of which is thin and ſcarcely cracked. The bark which is cut in ſpring is preferable to that cut in winter, as it contains four times the quantity of the aſtringent principle or tannin. Oak-bark yields its virtues to both alcohol and water. The watery infuſion is affected by all thoſe teſts which indicate the preſence of gallic acid, tannin, and extractive. Sir Humphrey Davy found (ſee Phil. Tranſ. 1803) that ʒj of the inner cortical part of young oak-bark affords by lixiviation grs. iii. of ſolid matter, of which 77 are tannin; the cellular integument, or middle coloured part, yields grs. 43 only of ſolid matter, of which 19 are tannin; and the epidermis furniſhed ſcarcely any quantity either of tannin or extractive. The quantity of tannin varies according to the ſize and age of the trees, and the ſeaſon at which they are barked. Oak-bark is tonic and aſtringent; it has been given united with bitters and aromatics with ſeeming advantage in intermittents; but it is inferior to cinchona, and cannot be depended on. It is uſeful, however, in obſtinate diarrhœa and alvine hæmorrhagies; and it is ſtrongly recommended in the malignant coryza (ſnuffles) of infants, when in ſpite of keeping the bowels regular, and the uſe of cordials, the child becomes weak and pallid. Its principal uſe is as a local aſtringent. The doſe in ſubſtance may be from grs. xv. to grs. xxx; but it is ſeldom given in this form, on account of the difficulty of pulverizing it. The officinal preparation of the "Quercus pedunculata," the bark of which has been above deſcribed, is the "Decoctum quercus" of the London diſpenſatory. This is prepared by boiling an ounce of oak-bark, in two pints of water down to a pint, and ſtraining it. As a local aſtringent, this is uſed in form of a gargle in cynanche and relaxation of the uvula; as an injection in paſſive uterine hæmorrhagies, in leucorrhœa, and the gleety diſcharge which often remains after miſcarriages. It is alſo an uſeful waſh in piles and procidentia recti. Thomſon's Diſpenſatory.

Oak-*leaf Galls*. Theſe are of ſeveral kinds; the remarkable ſpecies called the muſhroom gall is never found on any other vegetable ſubſtance but theſe leaves; and beſide this there are a great number of other kinds.

The double gall of theſe leaves is very ſingular, becauſe the generality of productions of this kind affect only one ſide of a leaf or branch, and grow all one way; whereas this kind of gall extends itſelf both ways, and is ſeen on each ſide of the leaf, in form of two protuberances, oppoſite the one to the other. Theſe are of differently irregular ſhapes, but their natural figure ſeems that of two cones, with broad baſes, and very obtuſe points, though ſometimes they are round, or very nearly ſo.

Theſe make their firſt appearance on the leaf in April, and remain on it till June or longer. They are at firſt green, but afterwards yellowiſh, and are ſofter to the touch than many other of the productions of this kind; they are uſually about the ſize of a large pea, but ſometimes they grow to the bigneſs of a nut. When opened, they are found to be of that kind which are inhabited each by one inſect only, and each contain one cavity. The cavity in this is, however, larger than in any other gall of the ſize, or even in many others of three times the ſize; the ſides of it being very little thicker than the ſubſtance of the leaf.

It is not eaſy to aſcertain the origin of the ſeveral ſpecies of flies, which are, at times, ſeen in this manner to come out of the ſame ſpecies of galls. It ſeems the common courſe of nature, that only one ſpecies of inſect forms one

kind of gall; yet it may be, that two or three kinds may give origin to the ſame kind. There is, however, another occaſion of our ſeeing different ſpecies come out of different galls of the ſame kind; and this is the effect of the enemies of the proper inhabitants.

It might appear that the parent fly, when ſhe had formed a gall for the habitation of her worm offspring, had placed it in an impregnable fortreſs; but this is not the caſe; for it frequently happens, that a fly, as ſmall perhaps as that which gave origin to the gall, produces a worm which is of the carnivorous kind, as the other feeds on vegetable juices. This little fly, well knowing that where there is one of theſe protuberances on a leaf, there is a tender and defenceleſs inſect within, pierces the ſides of the gall, and depoſits her egg within it. This, when it hatches into a worm, feeds upon the proper inhabitant, and finally, after devouring it, paſſes into the chryſalis ſtate, and thence appears in the form of its parent fly, and is ſeen making its way out of the gall, in the place of the proper inhabitant.

On opening theſe leaf-galls, which are properly the habitation only of one animal, it is common to find two, the ſtronger preying upon the body of the other, and ſucking its juices as it does thoſe of the leaf; often it is found wholly employed in devouring its unoffending neighbour at once: this is probably the caſe when its time of eating is nearly over; and, in fine, when we find the gall inhabited by only one inſect, or containing only one chryſalis, as it ought in its natural ſtate to do, we are never certain that this is the proper inhabitant, as it may be one of theſe deſtroyers who has eaten up the other, and ſupplied its place.

OAK-*leaved Myrtle*, in *Botany*. See MYRICA.

OAK, *Miſletoe of the*. See VISCUM.

OAK, *Poiſon*. See POISON-*Wood*.

OAK *Puceron*, a name given by naturaliſts to a very remarkable ſpecies of animal of the puceron kind. The generality of ſuch animals live on the ſurface of the branches and leaves of trees and plants; but theſe bury themſelves in the clefts of the oak, and ſome other trees, and getting into the crevices, where the bark is a little ſeparated from the wood, they there live at eaſe, and feed to their fill, without being expoſed to their common enemies.

Theſe are the largeſt of all the ſpecies of pucerons; the winged ones are nearly of the ſize of the common houſe-fly, and the naked, or ſuch as have no wings, though leſs than theſe, are yet much larger than any other ſpecies of pucerons; the winged and naked kinds in theſe, as well as in the other ſpecies of pucerons, are all mothers, and great numbers of young ones may be preſſed out of the body of either kind, when gently ſqueezed. The winged ones are black, and the others of a deep brown or coffee colour; they have the moſt remarkable trunk of any animal in the world; it is more than twice the length of their bodies, and has not its origin at the extremity of the head, as in other inſects, but is fixed into the breaſt, near the origin of the firſt pair of legs. When the creature is walking, it carries this ſtraight along the belly, and trailing a conſiderable length behind it, but with the point turned up, that it may be out of the way of accidents, and be ready to ſuck. When the creature has a mind to ſuck a part of the tree that is juſt before it, it draws up, and ſhortens the trunk, till it brings it to a proper length and direction; but when it ſucks in the common way, it crawls upon the inner ſurface of the bark, and the turned up end of the trunk, which reſembles a tail, fixes itſelf againſt the wood that is behind it, or contiguous to its back, and ſucks there. The extremity of this trunk holds ſo faſt by the wood, that when it is pulled away, it frequently brings a ſmall piece of the wood away with it.

The ants are as fond of theſe as of the other ſpecies of pucerons, and that for the ſame reaſon, not feeding upon them, but on their dung, which is a liquid matter of a ſweet taſte, and is the natural juice of the tree, very little altered. Theſe creatures are the ſureſt guides where to find this ſpecies of puceron; for if we at any time ſee a number of theſe crawling up an oak to a certain part, and there creeping into the cleft of the bark, we may be aſſured that in that place there are quantities of theſe oak pucerons. Reaumur's Hiſt. Inſ. vol. vi. p. 64. 76.

The ants are ſo extremely fond of the juices of the tree, when prepared for them by paſſing through the body of this animal, that when the puceron has a drop not yet evacuated, but hanging only in part out at the paſſage, an ant will often ſeize on it there.

OAK, *Sea*. See FUCUS, and WRECK.

OAK-*Snake*, in *Zoology*. See CROTALUS.

OAK-*Webb*, in *Agriculture*, a provincial word applied to the May bug in ſome places.

OAK *Bay*, or the *Devil's Heel*, in *Geography*, lies in the bay of Fundy, 9 leagues S.S.E. of Mooſe iſland.

OAK *Cove*, a cove on the W. coaſt of North America, in the gulf of New Georgia.

OAK *Iſland*, a long narrow iſland on the coaſt of North Carolina, at the mouth of Cape Fear river. N. lat. 33° 52'. W. long 78° 20'.

OAKFUSKEE. See TALLAPOOSE *River*.

OAKFUSKIES, the name of an Indian tribe in the weſtern part of Georgia.

OAKHAM, a market-town in the ſoke of Oakham, and county of Rutland, England, is ſituated in the centre of a rich valley, called the vale of Catmoſe. This place is divided into two townſhips, or manors, the one denominated the Lord's-hold, and the other, the Dean's-hold. The former belongs to the earl of Winchelſea, who, as ſuperior lord, holds an annual court for the election of the pariſh-officers, at which every inhabitant within its extent is required to appear, and pay one penny, or be amerced at the diſcretion of the clerk; and all free-holders, copy-holders, and waſte-holders, muſt beſides pay their acknowledgments. The latter manor is under the dean of Weſtminſter, by whom a ſimilar court is held every third year.

Oakham is the county-town of Rutlandſhire; the aſſizes and ſhire-courts being always held here. The market-days, according to charter, are Monday and Saturday, but that on Monday is now diſcontinued. In the reign of king John an hoſpital was founded in this town by Walter Dalby, of Exton, for twelve poor men, and two chaplains. It is ſtill ſupported, though comparatively much decayed and impoveriſhed, as well as altered from its original deſign. The free-ſchool, and Chriſt's-hoſpital, both owe their origin to Mr. Johnſon, clergyman of North Luffenham, who built and endowed them by ſubſcription, with the aſſiſtance of ſome lands, which he obtained from queen Elizabeth. The biſhops of London and Peterborough, the deans of Weſtminſter and Peterborough, the archdeacon of Northampton, and the maſters of Trinity and St. John's colleges, Cambridge, are perpetual governors of the hoſpital laſt mentioned. The church here is dedicated to All-Saints, and is a ſpacious ſtructure, conſiſting of a nave, chancel, and ſide-aiſles, with a lofty tower and ſpire, which is ſeen at a conſiderable diſtance. The living is a vicarage, in the patronage of the earl of Winchelſea. Adjoining the church are ruins of an ancient caſtle, ſaid to have been built in early Norman times by Walkelin de Ferrars, ſon of the earl of Derby. It

afterwards belonged to the lords Tatteſhal, but when king Richard II. advanced Edward, ſon of the duke of York, to the earldom of Rutland, he gave him this caſtle for his baronial reſidence. In the reign of Henry VIII. it was beſtowed upon Thomas Cromwell, when he was elevated to the dignity of baron Cromwell of Oakham; and it is now the property of the earl of Winchelſea. There has long been a cuſtom eſtabliſhed here, that the firſt time a peer of the realm comes within the precinct of the manor, he forfeits a ſhoe from his horſe, to be nailed to the caſtle wall, and ſhould he refuſe to give it, the bailiff of the lordſhip is empowered to take it by force. This due is now generally compounded for with money, and a ſhoe, made larger or ſmaller in proportion to the ſum given in commutation, with the donor's name and titles cut on it, is fixed up in lieu of that from the horſe's foot. Several horſe-ſhoes, gilt and of curious workmanſhip, in conſequence appear on the caſtle hall door, ſome of them of conſiderable antiquity, and others of recent donation. This cuſtom ſeems to have been derived from the circumſtance of the arms of the original owners of the caſtle bearing three horſe-ſhoes.

The hall of this caſtle is now appropriated as a court-room, in which the aſſizes are held, and all the public buſineſs of the town or county is tranſacted. According to the parliamentary returns of 1811, the conjunct population of the two manors or pariſhes, with the ſmall townſhips of Barley-thorpe and Leighfields, in the ſuburbs, was eſtimated at 1709 perſons, and the houſes at 367 in number.

Burleigh houſe, the ſeat of the earl of Winchelſea, is ſituated about two miles to the north-eaſt of Oakham, on an eminence near the village, whence it derives its name. This noble manſion is conſtructed of freeſtone, which was brought from Clipſtone, the moſt northerly point of the county, and is of an oblong form; the ſouth and north fronts being 196 feet in length, and thoſe facing the eaſt and weſt 96 feet, each ſubtending ſide reſembling its oppoſite, both in elevation and deſign. On the ſouth ſide the grand terrace commands a fine proſpect of a rich country; and this appendage is thought to exceed every thing of the kind in the kingdom. Each end of it leads by ſeveral flights of ſteps into an extenſive vale ſkirted by hanging woods. The grand entrance to this manſion, which is placed on the north front, is at once ſingular and grand. A noble court is entered by two handſome lodges, ſituated about 800 feet in a ſtraight line from the hall door, to the left of which is ranged a very extenſive and uniform row of ſtables, and on the right are other ſuitable offices. From this court, a beautiful circular colonnade, ſupported by Doric columns, runs up to the houſe. On the firſt floor of this edifice is a noble painted room, called the ſaloon, which is no leſs admired for magnificence and fine proportion than for its paintings, which repreſent the hiſtory and wars of Julius Cæſar. Theſe were executed by Lanſcroon, pupil of Verrio, who painted many rooms and detached pictures at Burgley, near Stamford. The library here is very extenſive, and contains, beſides a valuable collection of books, ſeveral curious preparations in anatomy and natural hiſtory, together with many valuable family pictures. Wright's Hiſtory and Antiquities of the County of Rutland, &c. Lond. 1684, folio. Camden's Britannia, by Gough, folio.

OAKHAM, a townſhip of America, in Worceſter county, Maſſachuſetts; 15 miles N.W. of Worceſter, incorporated in 1762, and containing 801 inhabitants.

OAKHAM, *Ockham*, or *Oakum*, in the *Sea Language*, denotes the matter of old ropes untwiſted, and pulled out again into looſe hemp, like hurds of flax, to be uſed in the cauking of ſhips.

White oakum is formed of untarred ropes.

OAKHAMPTON, in *Geography*, a borough and market-town in the hundred of Lifton, and county of Devon, England, is ſituated in a valley ſurrounded by hills, 22 miles diſtant from Exeter, and 195 miles from London. At the time of the Domeſday ſurvey, it was held by Baldwin de Brioniis, a Norman, whoſe exertions in the ſervice of the Conqueror were rewarded by the office of hereditary ſheriff of Devonſhire, and a large grant of land which he conſtituted into the barony of Oakhampton, and built a caſtle here for his principal reſidence. This caſtle is mentioned in Domeſday book, which alſo records, that the town had then a market and four burgeſſes. In the reign of Henry II., the barony became veſted in Reginald de Courtenay, by his marriage with Hawiſe, a deſcendant and co-heireſs of Richard, eldeſt ſon of Brioniis, and continued in the poſſeſſion of the Courtenays till the time of Edward IV., when their attachment to the cauſe of Henry VI. rendered them the objects of Edward's rancour: earl Thomas was beheaded at Pontefract, after the battle of Towton-field in the year 1461; his brother John fell in the field of Tewkſbury. Their poſſeſſions were confiſcated to the crown; and Oakhampton caſtle was conſtituted a royal fortreſs, till Henry VII. reſtored it to the Courtenay family, with their other honours and eſtates; but his relentleſs ſucceſſor, having diſcovered a ſecret correſpondence between Henry de Courtenay and cardinal Pole, by one act of tyranny deprived de Courtenay of his head, and by another reduced the magnificent caſtle of Oakhampton to ruins, and devaſtated its noble and extenſive park. The remains of the caſtle became the property of the Mohuns, from whom they deſcended to Chriſtopher Harris, eſq. of Heynes. The ruins of the caſtle are ſituated about one mile ſouth-weſt of the town, on a high maſs of rock; the extenſive area which they include, the ſolidity of their ſtructure, and the advantages of ſituation, prove that this fortreſs, before it was diſmantled, muſt have been ſtrong and important. A lofty keep riſes magnificently from a large conical elevation, which is oppoſed on the other ſide of the ſtream by a ſteep wooded bank. The river Oke meanders through the valley, and runs immediately beneath the ruined walls.

The pariſh church, like the caſtle, is ſituated on an eminence at ſome diſtance from the town. In the market place is an old chantry chapel, the only building within the town worthy notice.

Oakhampton, though a town before the Conqueſt, was not incorporated till the reign of James I., by whoſe charter the civil government is veſted in a mayor, eight aldermen, eight common-councilmen, a recorder, and a town-clerk. Previous to this charter, the chief officer was the portreeve; an office now held by the mayor for the time being, whereby the feudal and corporate powers are united in the ſame perſon. The earlieſt return to parliament for this borough was made in the twenty-eighth year of Edward I.; it was again repreſented in the ſeventh of Edward II. It then ceaſed to ſend members till the year 1640, when the privilege was reſtored; and two members have ſince been regularly choſen. The right of election is in the freeholders and freemen; the number of voters being about 180. The population of the pariſh in the year 1811, as ſtated in the parliamentary ſurvey, was 1440 perſons, occupying 227 houſes. The chief ſupport of the inhabitants is derived from the manufacture of ſerges, and the expenditure of travellers; the turnpike road from Exeter to Launceſton,

Falmouth, &c. paſſing through the town. Four fairs are annually held, and a market weekly on Saturday. Warner's Walk through the Weſtern Counties, 8vo. 1800. Beauties of England, vol. ii. by J. Britton, and E. W. Brayley.

OAKHAMSTON HEAD, a cape of Scotland, on the S.E. coaſt of the county of Caithneſs. N. lat. 58° 15′. W. long. 3° 8′.

OAKINGHAM. See WOKINGHAM.

OAKMULGES, a river of America, which is the ſouthern great branch of the Alatamaha, in the ſtate of Georgia, and, with the confluence of the Oconee, forms this great river.

OALALDA, a town of Africa, in the country of the Foulis; 30 miles E.S.E. of Sibbé.

OAMI, a town of Japan, in the iſland of Niphon; 25 miles S.W. of Moriſa.

OAMY, in *Agriculture*, a provincial term applied to ſuch ploughed lands as are light, porous, and flowery in the nature of their ſoil.

OANDA, in *Geography*, a town of Africa, in the country of the Foulis, on the Senegal; 70 miles S.E. of Goumel.

OANUS, in *Ancient Geography*, a town of Aſia, in Lydia.

OAR, in *Navigation*, a long piece of timber, flat at one end, and round or ſquare at the other, whereby a boat, barge, galley. &c. is rowed, or advanced along the water.

That part of the oar which is out of the veſſel, and which enters into the water, is called the blade, or waſh; and that which is within-board is termed the loom, whoſe extremity, being ſmall enough to be graſped by the rowers, is called the handle.

In a veſſel with oars, the water is to be conſidered as the point of ſupport, or fulcrum; the oar as a lever; the boat as the burden to be moved; and the rower's hand as the moving power. See LEVER, and MECHANIC *Power*.

The burden is to be conſidered as applied to that point of the lever where the oar reſts on the boat; which point, in large veſſels, is called the *row-port*, but in lighters and boats it is always termed the *row-lock*. The greater, therefore, the diſtance of the hand from that point, and the leſs the diſtance of the water from that point, the greater effect will the oars have.

OARS, *To ſhip the*, is to fix them in the row-locks ready for rowing.

OAR, in *Natural Hiſtory*. See ORE.

OARACTA, in *Ancient Geography*, a large iſland of the Perſian gulf, ſituated upon the coaſt of Caramania, and inhabited, according to the journal of Nearchus's navigation.

OARII, in *Geography*, a province of Angola, on the N. bank of the Coenza.

OARISTUS, or OARISTYS, a term in the *Greek Poetry*, ſignifying a dialogue between a huſband and his wife; ſuch as that in the ſixth book of the Iliad, between Hector and Andromache.

Scaliger obſerves, that the oariſtus is not properly any particular little poem, or entire piece of poetry; but always a part of a great one. He adds, that the paſſage now cited in Homer, is the only proper oariſtus extant in the ancient poets.

OARUS, in *Ancient Geography*, a river of Scythia, which, according to Herodotus, ſprung from the country of the Thyſſagetæ, traverſed that of the Mæonæ, and diſcharged itſelf into the Palus Mæotis.

OASIS, derived from the Coptic word *Ouahe*, ſignifying a habitable place, a fertile iſland in the midſt of the ſandy deſert of Africa. Of theſe Oaſes, which are called iſlands, becauſe they appear like ſuch in the midſt of an ocean of ſand, there are ſeveral that lie at the diſtance of 100 miles or more from the Nile, to the W. of it. The Arabian geographers were acquainted with theſe detached fertile ſpots, and called them "Elouah," "Ellouah," or "El-wah." Abulfeda ſays, theſe Elouahs are dependent on the Saïd, and that they are iſlands in the middle of ſand. On quitting the Nile, this author ſtates that it takes three days' journey acroſs the deſert to arrive at them. Jacout, who reckons three of them, places them in the weſt of Lower Egypt, beyond the chain of mountains, parallel with the river. Abulfeda adds, that the firſt is well cultivated; that it poſſeſſes abundant rivulets, hot ſprings, fields covered with harveſts, and other ſurpriſing things, but that the people there are wretched. Ptolemy places the largeſt of them, "Oaſis Magna," or "El-wah," under the parallel of 27°; the ſecond in 25° 45′, *i. e.* over-againſt Behnéſé; and the moſt northerly in 29° 30′, under the parallel of lake Mœris. The ſandy deſert in which theſe Oaſes are ſituated, is occaſionally traverſed by the Muggrebin Arabs, who form a ferocious tribe, and might ſend forth, if they could be united, 30,000 men capable of bearing arms; but as the tribes are divided by inteſtine enmities, their parties ſeldom exceed 4 or 500. The Leſſer Oaſis, "Oaſis Parva," now "El-wah-el-Ghurbi," forms a kind of capital ſettlement of the Muggrebin Arabs, who extend even to Fezzan and Tripoli. They are dreſſed in a linen or cotton ſhirt, over which is wrapped a blanket of fine flannel; all have fire-arms, and are good markſmen, and their muſkets are their conſtant companions. Their chief employment conſiſts in breeding horſes, the males of which they ſell, uſing the mares in their warlike expeditions, camels, and ſheep. They are very hardy and abſtemious; a ſmall cake of bread and leathern bottle of water ſupplying a man with ample proviſion for a day. At El-wah-el-Ghurbi, it is ſaid, that ſeveral ruins are to be found. The "Oaſis Magna," called "El-wah," is at ſome diſtance from the other. Mr. Brown (ſee his Travels in Africa) received information from the Muggrebins at El-wah, that Charjé, the moſt northern village of that diſtrict, was but two days' journey from the neareſt part of "El-wah-el-Ghurbi," that is, about forty miles. Oaſis Magna, he ſays, ſeems rightly to correſpond with the latitude of Dendera, and of courſe that of the ſouthern extremity of Oaſis Parva ſhould be a little to the ſouth of that of Aſſiût, and not far north of Tino des Mons, in D'Anville's map; apparently the chain on the E. of both the Oaſes. On the W. he obſerved no mountains, nor on the ſouth. The moſt northern Oaſis known near Egypt is that of Siwah, or Seewah. According to Ptolemy, who, in the opinion of Rennell, is more correct than Abulfeda in ſettling the ſituation of El-wah, or the Great Oaſis, its diſtance from Ptolemais on the Nile, in the direction of weſt, ſomewhat ſouthwardly, is 105 miles. This iſland, according to Arrian, is not more than forty ſtadia in extent; Diodorus makes it fifty; that is, ſix or ſeven miles. All accounts agree, that it has one or more fountains of waters, and that it was planted with divers kinds of fruit trees: Arrian particularly notices the palm and olive. What appeared to be a very great natural curioſity was a fountain, which, according to Arrian, varied in its temperature in a very ſingular manner; being very warm or hot at midnight, and very cold in the heat of the day. Rennell ſuppoſes that the fountain, being a deep-ſeated ſpring, would preſerve a mean degree of temperature at all ſeaſons; ſo that, in effect, it was the atmoſphere that underwent the change,

and with it, the bodies of thoſe who made the obſervations. This fountain was called the fountain of the Sun. The ſcite of the ancient temple of Jupiter Ammon, (ſee AMMON,) was four or five days' journey inland from the plain of Gegabib, famous for its dates; and Gegabib is ſeven days' journey from Augela, N. lat. 29° 20', towards Cairo, and theſe diſtances are ſanctioned by the authority of Herodotus, Strabo, Pliny, and Arrian. Herodotus (l. 4.) ſays, that the temple is ſituated ten days from Ægila (Augela); frequented by the Naſamones, on account of the dates, and on the road from Thebes to Ægila. Arrian ſays, on the authority of Ariſtobulus, that Alexander went to it from the ſcite of his new city of Alexandria, along the ſea-coaſts of Egypt and Marmorica, to Parætonium; which latter was ſituated, according to the ſame authority, 1600 ſtadia from Alexandria. Pliny aſſigns to it 200 Roman miles. Theſe accounts are perfectly concluſive; and the poſition of Parætonium is alſo clear in Ptolemy, and is known to the moderns under the name of Al Bareton. Arrian ſays further, that Alexander ſtruck inland from Parætonium, and entered the deſert; but he does not ſay how far the temple lay from the ſea-coaſt. This is ſupplied by Strabo (lib. 17.), who gives the diſtance at 1300 ſtadia. Allowing theſe to produce 130 or 140 miles; and taking Herodotus's ten days from Augela at 170, the meeting of theſe lines of diſtance places the temple in latitude 29° and a ſmall fraction, and in a ſouth-weſterly direction from Parætonium. Pliny ſays, that the temple is 400 (Roman) miles from Cyrene; that is, twice as far as Parætonium is from Alexandria; and this agrees with the former poſition. Ptolemy places it at 195 geographical miles from Parætonium, or by correction 166; and from Cyrene 340. The ſeveral authorities above recited do not vary among themſelves more than thirty miles; and they may, therefore, be conſidered as concluſive. Upon the whole it may be concluded that the ſcite of the temple of Jupiter Ammon ſhould be at leaſt twelve days from El-wah.

The temple was ſurrounded by a triple wall, forming three diſtinct diviſions: one of which was appropriated to the uſe of the monarch. In the time of Herodotus, when probably the temple was in its glory, the dominion of the Ammonites reached within 10 days' journey of the city of Thebes: the people were a colony of Egyptians or Ethiopians, and ſpoke a mixed language. Ammon, or Hammon, was the Egyptian name of Jupiter: and the image of the god, ſimilar to that at Thebes; that is, it had the head of a ram. (See AMMON.) In the time of Strabo, about 450 years after Herodotus, the temple was almoſt deſerted; as the oracle was grown out of faſhion. It is probable, ſays major Rennell, that ſome remains either of the triple wall, or of the temple, may be found at this day; although the materials may have undergone a different kind of arrangement. See-wah appears to be the neareſt town to this Oaſis; and is probably no more than ſix days' journey on the N.E. of it: the ſpring, together with the ruins of the temple and the triple wall, might aſcertain to a curious inquirer the preciſe ſpot.

Under the ſovereigns of the lower empire, the Oaſis became a place of exile: and both Sectaries and Catholics were ſent thither alternately. Neſtorius and Athanaſius were exiled thither. Theſe habitations, become famous on account of the baniſhment of the moſt learned perſonages of the lower empire, were little known by the Perſians. Cambyſes, after ravaging Egypt, wiſhed to carry off the ſpoils of the temple of Jupiter Ammon. The troops he ſent againſt the Ammonians left Thebes and arrived at the city of Oaſis, ſays Herodotus, inhabited by the Samians of the tribe of Eſcrionia. This country, diſtant ſeven days' march from the capital of Egypt, is called by the Greeks, "the Iſle of the Happy." It is reported that the army reached their place of deſtination, but the Ammonians alone knew what become of it, for it has never ſince been heard of. It is ſaid alſo, that being on their march towards the temple of Jupiter, and having got half way, it was ſwallowed by torrents of burning ſand blown up by the ſoutherly wind.

The Oaſis of Ammon is little known by the modern Egyptians. They are better acquainted with the ſecond, where Abulfeda places a city called Behnéſé, different from that on Joſeph's canal. He marks another higher up, correſponding with that of Achmounain, around which are obſerved magnificent remains of antiquity.

The great Oaſis, which is the moſt frequented of the three, being on the road of the caravans of Abyſſinia, contains a great number of inhabitants. The bey of Girgé ſends a cachef there as governor, and to collect a tribute. The geographer of Nubia deſcribes the country of the Elouah, ſituated to the weſt of Aſſouan, as having been formerly much peopled. At preſent, he ſays, it has no inhabitants. We meet with abundant ſprings there, and fruit trees, with cities buried under ruins.

OASITES NOMOS, nomes of which there are two in Egypt, placed by Ptolemy near the lake Mœris.

OAST. See OOST.

OASY. See OAZY.

OAT, AVENA, in *Botany*. See AVENA.

OAT, in *Agriculture*, the name of a well-known ſpecies of grain, of which there are ſeveral varieties cultivated in different diſtricts of the kingdom. But the moſt common ſorts cultivated in England, are the *white*, the *black*, the *brown*, or *red* oat; the *blue*, the *Poland*, the *Friezland* or *Dutch*, the *Siberian* or *Tartarian* oat, the *Eſſex ſhort ſmall*, the *Churche's* oat, and the *potatoe* oat.

The *white* is met with in the ſouthern parts of the iſland; it makes the whiteſt meal, but is chiefly cultivated where the inhabitants live much upon oat cakes.

The *black* is more generally cultivated in the northern parts of England, and is eſteemed a hearty food for horſes. It bears a wet harveſt well, and anſwers on the wetteſt ſoils more perfectly than the other ſorts.

The *red* oat is much cultivated in Derbyſhire, Staffordſhire, and Cheſhire, but is rarely ſeen in any of the counties near London; though as it is a very hardy ſort, and gives a good increaſe, it would be well worth propagating, eſpecially on ſtrong land: the ſtraw is of a browniſh-red colour, as is alſo the grain, which is very full and heavy, and eſteemed better food for horſes than either of the former ſorts.

The *blue* or *bled* oat is ſaid to have been ſown about Kighley in Yorkſhire. It is probably the ſame with what is cultivated in Lincolnſhire, &c. under the name of *Scotch* greys.

The *Poland* oat has a ſhort plump grain, but the thickneſs of the ſkin ſeems to have brought it into diſrepute among farmers. The grains are moſtly ſingle, it has no awn, and the ſtraw is ſhort. It anſwers beſt on dry warm ſoils and ſituations.

The *Friezland* or *Dutch* oat affords more ſtraw, and is thinner ſkinned than the above kind. The grains are moſtly double, the larger one ſometimes awned, with the awn placed high. It is not ſo much ſown as formerly.

In the *Siberian* or *Tartarian* oat, which is conſidered by Mr. Marſhall as a diſtinct ſpecies, each flower frequently contains three perfect florets, never leſs than two, with a pedicelled

pedicelled rudiment of a third. The panicle differs eſſentially from all the other varieties, the grains are thin and ſmall, the largeſt awned, the ſmall ones awnleſs; the ſtraw is tall and reedy, and of courſe not ſo valuable as fodder.

The *Eſſex ſhort ſmall* is, according to Mr. Young, remarkably ſhort and plump, and weighs better than moſt other kinds. It does well on any land that is tolerably dry.

The *Churche's* oat yields well; it is white, and comes into ear more early than any other oat.

The *potatoe* oat, which is but lately introduced, is very heavy and yields largely, but the ſtem is reedy.

In addition to theſe ſpecies and varieties, there is another ſpecies ſometimes grown, which is the *naked* oat, which Linnæus has obſerved, is very nearly allied to the foregoing, differing in little elſe, except that the grains quit the huſks, and fall naked when they are ripe.

It is ſaid to be ſown in Cornwall in the pooreſt croft-land, that has been tilled two or three ſeaſons before with potatoes, and for the uſes of the poor anſwers all the purpoſes of oatmeal. It is a ſmall yellow grain, and for fattening calves accounted ſuperior to any other nouriſhment.

The oat has an annual fibrous root with the culm of ſtraw two feet high and upwards, having the panicle various in the different varieties, but always looſe with the ſubdiviſions of it on long peduncles and pendulous. And the two glumes or chaffs of the calyx are marked with lines, pointed at the end, longer than the flower, and unequal. There are uſually two flowers and ſeeds in each calyx: they are alternate, conical, the ſmaller one is awnleſs, the larger puts forth a ſtrong, two-coloured bent awn from the middle of the back; both are cartilaginous and fertile.

A late practical writer ſtates that this ſort of grain is hardy, and may be cultivated upon almoſt any kind of ſoil; but, as in others, it is the moſt productive on ſuch as are ſtrong, rich, and adheſive, and which have been newly broken up from the ſtate of graſs. It is ſuggeſted by the author of the report of Middleſex, that though this ſort of grain generally ſells lower than barley, yet, from its being a more certain crop, the ſuperior utility of the ſtraw for the food of cattle, and the increaſe in the quantity of produce, it is equal to barley for medium loams. And that for ſtronger ſorts of lands, and thoſe of the fen kind, it is generally ſuperior to it, though apt to leave the land in a more foul and compact condition. On the cold, tenacious, fenny, and wet deſcriptions of ſoils, the oat may, indeed, in many caſes be ſown with more advantage than any other kinds of crop, and likewiſe where lands cannot be put in a proper condition for barley crops. It is added that oats ſucceed well, after almoſt every ſort of green and root crops, but ſhould not be cultivated after wheat, rye, or barley, where it can poſſibly be avoided, as the ſoil by ſuch cropping would be too greatly exhauſted. It has been obſerved by the author of Modern Agriculture, that, in diſtricts where improved methods of huſbandry are adopted, oats are generally ſown upon ſuch lands as have been newly broken up from the ſtate of graſs, and that the practice is ſhewn to be perfectly correct by the abundance of the produce in ſuch caſes.

The author of the Calendar of Huſbandry, after obſerving that white oats ſhould be ſown in March in preference to any other ſeaſon, remarks, that in the general conduct of them the farmer ſhould by all means avoid the common error of ſowing them after other corn crops, by which they exhauſt the land. They ſhould always receive the ſame preparation as barley, nor ought a good huſbandman to think of their not paying him as well for ſuch attention as that crop. It is a very miſtaken idea to ſuppoſe it more profitable to ſow barley on land in good order than oats. He is from divers experiments inclined to think that oats will equal, and in many caſes exceed barley. The ſuperior quantity of the produce will ever be found to more than anſwer the inferiority of the price; which, however, ſometimes exceeds that of barley. What good reaſons are to be offered for ſowing oats on land in ſuch bad order that barley is not to be ventured in, he knows not. The common argument is their hardineſs, which will give a middle produce, about ſufficient to pay expences and leave a trifling profit, when no other crop will do the like. But this is only proving them to be aſſiſtants to bad huſbandry; nor is ſuch a paltry profit, granting falſe premiſes (for he is well perſuaded that common oat crops, among bad farmers, are but ſo much loſs), an object that ever ought to influence good huſbandmen. Why ſhould a good farmer be at all ſolicitous to gain 10*s.* an acre, profit by oats after barley, &c.? Suppoſe his courſe to be, 1, turnips; 2, barley; 3, oats: or, 1, fallow; 2, wheat; 3, oats: in either of theſe courſes, or in any other, where the oats follow another crop of corn, the profit of them muſt be ſmall. What compariſon with ſowing clover with the barley, which will pay far more profit, and at the ſame time prepare, in the beſt manner, for that moſt beneficial crop, wheat? What but a fallow, or a fallow crop, can ſucceed the oats? How unprofitable, compared to the clover ſyſtem! For theſe reaſons he cannot but recommend that oats ſhould be conſidered in the ſame light as barley, and never ſown unleſs the land be in proper order for barley, or to ſow them after a fallow crop, and clover with them, in the ſame manner as barley. And to the practice of ſowing them after turnips, the ſame obſervations which have been made on barley, are equally applicable. The farmer ſhould, in the diſtribution of his farm, conſider which of theſe two crops is likely to pay him beſt. This will very much depend on the ſoil. Warm forward ſands yield as many quarters of barley, perhaps, as of oats; but upon various other ſoils, the produce of oats, compared with that of barley, will be four to three, and on ſome as five to three. He ſhould alſo take into conſideration, the greater ſteadineſs of price which oats have for many years yielded, in compariſon of the price of barley; circumſtances which may reaſonably induce him to ſow them in a larger proportion than is common among his neighbours. On the other hand, it is not to be forgotten that they exhauſt more in general.

In regard to the method of putting oats on lays, which is very common huſbandry both on one ploughing of old graſs, and on layers of ſhorter duration; the method is to plough the land before the froſts, and to dibble in the ſpring, as ſoon as the weather is dry enough; but the ſoil muſt, from its nature, or from rolling, be in ſuch temper as to permit the holes to ſtand, and not to moulder in, when the dibble is removed. In ſome caſes, the ſafeſt way is, to plough, roll, and dibble immediately. This practice is but little uſed at preſent. But in very many caſes (poſſibly in all) it is better to put peaſe in on light land, beans on ſtiff ſoils, and to follow theſe with oats or wheat, according to circumſtances; he has known oats which had produced inferior crops followed by oats again the next year, and produce largely; which proved that they wanted tilth. Peaſe or beans will rather improve than exhauſt land when put in thus in layers, whereas two crops of oats will ſcourge the land too much. Let it, however, be well remembered, that theſe obſervations are made (ſo far as they relate to old graſs) on the ſuppoſition that the farmer will not or is not allowed to pare and burn, a method vaſtly ſuperior, and which ought to be purſued in all caſes where it is practicable. The cuſtom of cultivating oat crops in ſucceſſion for ſeveral years is, therefore, without doubt,

doubt, equally abſurd and improper, and ſhould be generally exploded and reprobated as highly miſchievous.

Preparation.—In the preparation of the land for this ſort of crop, it is recommended in the Middleſex report, that when it is intended to be grown, after cole, tares, early peas, or ſuch other crops as do not come off the ground later than the beginning of June, on ſoils that are too wet to admit of being ploughed in the winter ſeaſon, to make a clean baſtard fallow, laying the land up into ridges proper for being ſown in the early ſpring. Or when, after ſuch clean crops as come off too late to admit of baſtard fallowing, to plough only once, which ſhould be as early as the buſineſs of the farm will admit, into ridges proper for putting the ſeed in. Where the land is inclined to be moiſt, the beſt mode is probably that of ploughing the land on to proper ridges, in the autumn, in order to its being rendered fine and mellow for putting in the crop in the early ſpring, by means of ſcarifying and ſcuffling without any further ploughing, as has been ſhewn in ſpeaking of barley. See BARLEY.

But Mr. Donaldſon ſtates, that whatever may have been the nature of the crop that preceded this, it is but in very few caſes that more than one clean furrow is afforded. In ſome diſtricts it is, he aſſerts, the common practice to plough the lands over that are intended for oats, in the autumn, in a particular manner, ſo as to expoſe as large an extent of ſurface to the influence of the atmoſphere as poſſible. This in ſome places is termed by farmers *rib-furrowing*, and in others *ſlob-furrowing*; it is performed by turning over the furrows at the diſtance of from twelve to eighteen inches from each other on the unbroken land. In this way one-half of the ſuperficial part of the land remains unmoved, and the furrows being thrown on it, much ſurface is expoſed, and the ſoil greatly improved, at the ſame time that the root weeds are deſtroyed. If this proceſs be accompliſhed in the moſt perfect manner, and in the autumnal ſeaſon, the ſoil is conſiderably ameliorated and improved by the froſts during the winter; and by being well broken down by the harrow in the ſpring, having a complete ploughing immediately before the ſeed is put in, the ſoil becomes in an excellent condition for this ſort of crop, even where the land is of the ſtiff and heavy kind. On which the author of Practical Agriculture has remarked, that there can indeed be little doubt but that, by the land's undergoing a more full and complete preparation than is uſual for this crop, the quantity of produce may be greatly increaſed, as the fibrous roots of the plants are more enabled to extend themſelves in the looſe earth, and thereby to afford a more perfect ſupport to the plants. In ſome caſes, as where the land has been much reduced and exhauſted by the previous crops, or in breaking up thin poor ſoils, where the proportion of turfy material is conſiderable, and when the prices of other ſorts of grain are low, it may be advantageous to have recourſe to the uſe of manure, as by ſuch means it is probable that a third more produce at leaſt might be grown.

Time of ſowing.—In ſpeaking of the time of ſowing, or putting this ſort of crop into the ground, the ſame writer ſtates, that it is neceſſary to keep in mind that the earlier the ſeed is put into the ground, the ſooner, in general, the crop will be ready to cut. In the more ſouthern parts of the kingdom, it is often the caſe to put this ſort of ſeed into the earth towards the latter end of February, when the ſeaſon is dry and fine; but March is, in general, the oat-ſeed ſeaſon. On ſuch ſoils as are naturally dry and parching, it is however by much the beſt practice to ſow early, in order that the crop may be well eſtabliſhed before the hot weather commences. And beſides, there may be a greater chance of the grain eſcaping the ravages of the worm that often attacks ſuch crops; and when this inſect is preſent, its ravages may be more eaſily prevented. As this ſort of crop is liable to be injured by very ſevere winters, it can ſeldom be ſafe to put it in in the autumn, eſpecially in the northern parts of the iſland; but in the ſouthern diſtricts it may be done with propriety in particular caſes, as where the land is of a very dry and friable nature, large crops having been aſſerted by Mr. Middleton to have been grown in this way in combination with tares in ſome inſtances. But in many caſes this kind of crop may be ſown ſtill more early: Mr. Young adviſes that, in January, if the weather be open, the young farmer ſhould examine ſuch fields as he intends ſowing with oats, that he may conſider if he has any apprehenſion of having his hands full of buſineſs in February and March, whether he ſhould leſſen the work of thoſe more buſy ſeaſons by ſowing ſome oats at this period. The temper of the ſoil muſt govern him: but it is neceſſary that he ſhould know that oats ſown ſo early ſucceed well. And this has been fully ſhewn by the intereſting experiments made by the late Mr. Macro, of Suffolk, and the preſent earl of Winchelſea, and detailed in the Annals of Agriculture. The firſt ſtates, that having tried early and late ſowing of barley, in the year 1784 and in 1785, he had a mind, the following ſeaſon, to try the ſame experiment with white oats; and began by ſowing one acre, in December 1785, with one coomb of ſeed, harrowed in upon a wheat ſtubble, with one earth. Value of land 10*s.* an acre.

And in January 1786, he ſowed exactly another acre by the ſide of it, with the ſame quantity of ſeed, and dreſſed it in the ſame manner. In February another acre the ſame, except half a buſhel leſs ſeed. In the beginning of March he ploughed the remaining part of a piece of land a ſecond time; and, about the middle of that month, ſowed it, at the rate of three buſhels of ſeed an acre, ploughing in one caſt, or half the ſeed, and harrowing in the other half; and marked out another acre for the experiment. This laſt acre had three clean earths.

The produce of the four acres was as below:

		C.	B.	P.
On that ſown in December		8	2	0
——— January		8	3	2
——— February		6	2	1
——— March		6	2	2

On ſeed deducted:

		C.	B.	P.
On that ſown in December		7	2	0
——— January		7	3	2
——— February		5	2	3
——— March		5	3	2

It is added that that ſown in December, though it came up thick enough at firſt, loſt ſo much of its plant, by the winter froſts, that it was expected it muſt have been ploughed up, and ſown again in the ſpring; but obſerving the plants that were alive beginning to flouriſh very early, he gave them time, yet it never got to be a full plant, nor did he expect, though the ſtraw was very ſhort, and the hawes, or ears, very fine ones, that it would have turned out ſo well. Thoſe ſown in January and February both loſt ſome of their plants, ſo that that ſown in March, with the leaſt ſeed, was the fulleſt and eveneſt plant of any.

The latter of the above gentlemen ſtates, that he was induced to make the following trial, from having ſeen upon two very capital farms in Kent and Eſſex, great crops of oats, ſown as early as Chriſtmas week, and from being informed

formed by the gentlemen who occupied thoſe farms, that they always ſowed their oats as early as that, if the ſeaſon admitted of it; and that they thought it the beſt time for ſowing that grain. He wiſhed to aſcertain whether this plan would anſwer in this more northern county. The general time of ſowing oats here is from the beginning of March to the end of April; and it is the opinion of moſt people here, that oats ſown much earlier would be liable to be deſtroyed by ſpring froſts. The laſt winter was very favourable for the experiment, as the weather was open at Chriſtmas for ſowing, and the froſt in the ſpring not ſevere. He divided a field of eight acres equally: one-half was ſown the day after Chriſtmas day; the other half the middle of March. Five buſhels *per* acre were ſown broadcaſt on each part, and the ſame oats: the ſort a ſmall white oat, here called *ſhort ſmalls*. The early ſown were ripe and cut one week before the others; they were harveſted equally well, without being expoſed to any bad weather. He had a rood of each ſet out very carefully in the middle of the field, reaped, and threſhed as ſoon as carried. The produce and weight were as follow:

	Winch. Buſh.		Qrs.	P.
Early ſown -	22	*per* acre -	11	0
Late ſown - -	19	ditto -	9	4

And the weight *per* Wincheſter buſhel as ſoon as threſhed:

Early ſown -	44½lb.
Late ſown -	42½lb.

The crop was very good. The land yielded potatoes the preceding year, 450 buſhels *per* acre, and was not manured for that of the oat crop: it had before that been in graſs for ſix or ſeven years. The ſoil a red loam. He is inclined to think that the early ſowing will anſwer here, as this field is very high and much expoſed.

It would ſeem that there can be little doubt from the tolerably hardy nature of this ſort of grain, but that in many inſtances it may be put into the ground at ſuch early periods with great advantage. And in all late ſituations it would probably be more beneficial to put the crops in at much earlier periods than is uſually the caſe in moſt places.

Quantity of Seed.—In regard to the quantity or proportion of ſeed that may be required, it muſt obviouſly differ according to the difference of the circumſtances that have been ſtated above; but on ſoils of middling quality, Dr. Dickſon ſuppoſes four buſhels may be ſufficient for the more early ſowings, and five for the later ones, where they are put into the ground in the broadcaſt method, which ſhould conſtantly be the caſe where the firſt modes of preparation are adopted. In ſome of the ſouthern diſtricts, the *Poland* oat is ſown at the rate of about four buſhels the acre for the firſt ſowings; and it has been found in practice that the earlieſt ſown crops conſtantly afforded the moſt perfect ſample, and in general the moſt abundant produce. With the oats, clover may be ſown when neceſſary, the ſeeds being covered by harrowing ſuitably to the condition of the land; and where the ſoil is very light or mellow, a roller ſhould be paſſed over it as ſoon after as poſſible, in order to preſs the mould to the ſeeds: but in other circumſtances it may be more adviſable to defer the rolling until the ſeaſon is dry, and the crop ſomewhat advanced in its growth. The practice of ſowing oats under furrow, though it has been attempted on the lighter and more dry ſorts of land, is not by any means to be adviſed, as in ſuch a method, the ſeed is apt to be depoſited to too great a depth, and to be in danger of either being in ſome meaſure deſtroyed, or of coming up in an irregular manner. It is added, that the uſe of the drill has not been ſo much practiſed with this ſort of crop, as to fully aſcertain the utility of it; nor has that of dibbling been tried with that ſort of attention that is neceſſary to determine the propriety of it. According to Mr. Young, Mr. Walker, near Belvoir Caſtle, Lincolnſhire, ſows eight buſhels of oats *per* acre, and finds the crop much better, and the ſample more equal than with leſs ſeed; the oats are leſs *taily*, no tillers to give different degrees of ripeneſs, and the crop ready to cut four or five days ſooner than with thinner ſowing. Mr. Ducket is of the ſame opinion, and holds no idea cheaper than that of recommending the drill huſbandry as ſaving ſeed; he drills five buſhels of oats *per* acre on his land.

And the ſame practical writer further ſtates, that as this kind of grain is ſuppoſed to be more liable than moſt others to degenerate, by being too long continued on the ſame land; it has been the practice of ſome diſtricts to change it for ſuch as has been imported from other countries. It is probable, however, that by collecting and ſowing the beſt and moſt perfect of our own produce, this expenſive practice may be rendered unneceſſary. By ſimilar attention, moſt of the different ſorts of oats are alſo capable of being greatly improved both in the quality and appearance of the grain or ſample.

It is alſo added, that where this ſort of grain is cultivated on ſuch lays as are nearly broken up, there may frequently be danger, eſpecially where the land has been long in the ſtate of graſs, both from the deſtructive attacks of inſects, and the ſoil becoming too light, open, and porous, from the decay of the graſſy material, for the ſupport of the plants. The firſt may probably in ſome meaſure be obviated, by eating ſuch lands very cloſe with ſheep previous to their being broken up, as by ſuch a method the ova of ſuch inſects may be much deſtroyed, and their propagation prevented. And the treading the crops by ſheep, as well as the roller, may likewiſe be beneficial in both reſpects. According to Mr. Banniſter, horſes have alſo been turned in for the ſame purpoſe. For the above reaſons, it has been ſuggeſted as improper to put oat crops in on newly broken upland, or what in ſome diſtricts is termed a *lea breech*. For to ſow oats on a lay newly broken up, eſpecially if ſuch ground has been many years in graſs, is at all times very hazardous, and frequently cauſes a total deſtruction of the crop, an inſtance of which he experienced in the ſpring of the year 1771. The preceding winter had been very ſevere, with a continuation of unkindly weather till late in the ſpring, for at the cloſe of the month of April, the ponds were covered with ice, and ſharp froſty nights intervened till the 10th of May. Early in the month of March he ſowed with oats a ſainfoin lay, that had been ploughed up ſome months before, and covered in the ſeed with the large two-horſe harrow, and as ſoon as poſſible cloſed the ſoil with a five-horſe roll, ſo that the ground ſeemed to lie as cloſe as one could deſire; but the dry froſty weather above mentioned, ſetting in for a month afterwards, rendered the ſurface very porous, and the ſoil was become dry as aſhes, and by far too light for the purpoſes of vegetation. Towards the middle of April, the oats, by favour of ſome kindly ſhowers, began to make their appearance, but before they were all fairly out of the ground, the worm ſeized on the fibrous roots below the ſurface. The land being at that time not ſufficiently dry to admit the uſe of a roll, he endeavoured to cloſe the lightened ſoil by treading it with horſes. His primary views were to have trodden the upper part of the field only, the lower ſide remaining at that time unhurt by the worm; but in a few days theſe inſects ſpread over the whole cloſe, and although he omitted no oppor-

opportunity of treading and rolling throughout the ſpring, the crop at harveſt was very ſlender, as well in ſtraw as grain. From hence we may learn how hazardous it is to ſow ſuch lay ground, in the firſt year after breaking up with oats, or indeed of cropping it with any other grain, than either peaſe or beans; for though in a very kindly year, ſuch corn may not be totally deſtroyed by the worm, as it turned out in the event, with the greateſt part of his oats; yet there is no doubt but (maugre all his care and pains) the huſbandman will then find cauſe to repent of his conduct, and ſhould a dry froſty time ſucceed, the deſtruction of the crop is inevitable. Still more hazardous is it to ſow this grain on what is termed a lay breech, as the worm will in ſuch a ſeaſon be more likly to deſtroy the crop, than even after the firſt breaking up of the lay ground. Peas and beans, according to the nature of the ſoil, are generally conſidered as the moſt proper ſorts of crops in theſe caſes.

Sowing ſeeds with.—In general it is conſidered as a better and more correct practice to ſow graſs ſeeds with this crop than barley, as the tillage requiſite for the latter may diſpoſe it to become rank and be lodged, by which the graſs will be drawn up weak through it, and in that way be greatly injured, as well as the barley, by the humidity thus produced, require a long time in the field, and in that way be expoſed to more danger in caſe of a wet ſeaſon ſucceeding, while with oats there is little riſk in theſe reſpects, as the ſtraw is much ſtiffer and more firm. Where oat crops are thin upon the ground, they grow ſtrong, and are conſequently better capable of ſupporting themſelves without falling on the ground or lodging.

Culture afterwards.—In regard to the culture that is afterwards neceſſary for this ſort of crop while growing, it is merely that of keeping it as clean and free from weeds as poſſible, by means of hoeing and hand-weeding, throughout the month of May. The crops, that are drilled, ſhould be well cleaned in the rows by the hand as well as the hoe. The author of Practical Agriculture ſtates, that it is alſo a practice in ſome places to paſs a light roller over the crop, after it has advanced a few inches in height, when the ground has been ſlightly moiſtened by rain; by which the cloddineſs of the ſurface is reduced, and the plants in ſome meaſure earthed up, and the progreſs of the crop not only much promoted, but where thin, the plants rendered more thick upon the land by the tillering that is thus produced. And he adds, that it is ſometimes a practice in this ſort of crop, as well as that of wheat, where there is danger of its being too rank or luxuriant in its growth, to feed it down with ſheep in the ſpring months. This is not however a method that is to be adopted, except in particular circumſtances, as where there is a great difficulty in procuring ſheep feed at ſuch periods, or where the worm is committing its ravages upon the plants; as this ſort of grain is not in general apt to be injured either by the luxuriancy of its growth, or by being lodged on the ground.

Reaping the Grain.—It may be ſtated, that oat crops are ready for the ſcythe or ſickle, when the ſtraw exhibits a yellowiſh caſt, the grain becomes hard, and the chaff opens in ſuch a manner, as to render it in ſome degree naked. This ſort of crop does not require to be ſo dry when put into the ſtack, as thoſe of either the wheat or barley kinds. The reaping of this ſort of crop, where cut low, is a good practice, as in other modes, what is left in the field, is loſt to the farm-yard. The ſheaves in wet harveſts ſhould not be made too large, or be bound up when in a damp ſtate. It is ſeldom that this ſort of crop need be kept out in the field any great length of time after it is cut.

General Application.—With reſpect to the application of this ſort of crop, in the northern counties, the meal is frequently made into a wholeſome bread, and uſed in other articles of human food; but in the ſouthern diſtricts its principal uſe is for the food of horſes, for which purpoſe it is reckoned very nutritive, being ſweet and of an opening nature: but it muſt not be given them before it has ſweated in the mow, or been otherwiſe dried, leſt it ſhould prove of too laxative a quality.

Oat, in the *Materia Medica.* Some phyſicians have formerly recommended a diet drink made of oats, in various diſtempers. The method of preparing the drink is as follows: take of recent oats, entire and well waſhed, one pound and a half; of the freſh root of ſuccory, cut into ſlices, one handful; ſpring water, twelve pints; boil all together in a clean earthen veſſel to the conſumption of half, and then ſtrain the liquor through a linen cloth, and add to it ſix ounces of coarſe ſugar, and half an ounce of ſal prunellæ; let it boil again, and afterwards be taken off the fire, and ſet by, for a day and a night, in a cool place; then pour off the clear liquor, and keep it in a cellar in veſſels cloſe ſtopped.

Two ordinary cupfuls of this liquor, given twice a-day, three hours before, and as many after dinner, have been ſaid to perform wonders in the cure of all kinds of fevers, colic pains, pleuriſies, itches, cutaneous tumours, and hypochondriacal diſorders; as alſo in cleanſing the kidnies from ſand, and opening the obſtructed viſcera. The uſe of it is ordered to be continued thirteen days, and, if the patient be cachochymic, a gentle purge is to be given before it is taken. It is accounted a great preſervative againſt illneſs, if taken thrice a-year, in ſpring, in autumn, and in the dog days; and the inventor of it, Joannes de St. Catherina, is ſaid to have kept himſelf alive by it to the age of an hundred and twenty years, without any diſeaſes.

Dr. Lower having tried it, and found its good effects, by repeated experience, made it public, and the celebrated Hoffman has written an expreſs treatiſe about it, in which he recommends it both in intermittent and continued fevers, but adviſes purified nitre to be uſed inſtead of the ſal prunellæ, and obſerves that the two boilings, ordered by Dr. Lower, are not neceſſary, but that the ſugar and nitre may be added at firſt. It muſt be kept carefully in ſummer, otherwiſe it ſoon becomes ſour and unfit for uſe.

Thoſe who deſire to have it coloured may boil in it an ounce of alkanet root, and two ounces of red ſanders, which will give it a fine red colour, without at all affecting its virtues.

Oats, when freed from their cuticle, are called *groats*; in which ſtate, as well as when ground into meal, they are uſed both dietetically and medicinally. In both ſtates they yield to water by coction the fecula they contain, and form a nutritious amylaceous gruel, which is beſt made by putting three ounces of groats into four pints of water, and boiling ſlowly until the water be reduced one-half; then ſtraining through a ſieve to ſeparate the undiſſolved part of the groats from the gruel. The nutrient qualities of oats are well known. The meal conſtitutes the chief ſupport of the poor; and for infants, deprived of their natural and proper nouriſhment, the breaſt-milk, no better ſubſtitute can be adopted than thin groat gruel mixed with good cow's milk. The gruel ſhould not be kept longer than 48 hours, as it becomes aceſcent after that period.

Oats have not been chemically examined; but the greater part of their ſubſtance appears to conſiſt of fecula or ſtarch.

For medical purpoſes, gruels, or decoctions of groats or of oatmeal, are excellent demulcents, and they are therefore very frequently preſcribed in inflammatory diſeaſes, diarrhœa, cholera, dyſentery, calculus, and in moſt febrile affections. They may be ſweetened, acidified, or uſed plain. They are alſo uſed locally in glyſters; and the meal boiled with water into porridge forms an excellent ſuppurative poultice. Thomſon's Lond. Diſp.

OAT-*Graſs*, in *Agriculture*, the name of a coarſe ſort of graſs, that may perhaps ſometimes be cultivated to advantage. See AVENA.

OAT-*Snail*. See SNAIL.

OATS, *Wild*, a ſpecies of this ſort of grain, which is a weed, and difficult to be extirpated, where it has once taken poſſeſſion; as ripening before harveſt, and ſcattering its ſeed which remains in the ground till it is ploughed up again, though for a whole year or more, and will then come up with the corn. Some adviſe, as the ſureſt way for deſtroying it, to lay the ground down to clover, and mow the oats and clover together before they are ripe.

OATARA, in *Geography*, one of the ſmall Society iſlands, abounding with wood, S.E. of Ulietea.

OATES, TITUS, in *Biography*, a very ſingular character, who flouriſhed in the ſeventeenth century, was born about the year 1619. He was educated at Merchant-Taylors' ſchool, from whence he removed to Cambridge. When he left the univerſity, he obtained orders in the church of England, though in his youth he had been a member of a Baptiſt church in Virginia-ſtreet, Ratcliffe-Highway, and officiated ſome time as aſſiſtant to his father; he then held a vicarage in Kent, and afterwards in Suſſex. In 1677 he became a convert to the church of Rome, and entered himſelf a member of the ſociety of Jeſuits. He is chiefly known as the informer of the Popiſh plot, of which a full account is given in Hume's Hiſtory of England, vol. viii. ch. lxvii. For this pretended diſcovery he received a penſion of 1200*l. per annum*, was lodged in Whitehall, and protected by the guards; but ſcarcely had king James aſcended the throne, when he took ample revenge of the ſufferings which his information had occaſioned to the monarch's friends: he was thrown into priſon, and tried for perjury with reſpect to what he had aſſerted as to that plot. Being convicted, he was ſentenced to ſtand in the pillory five times a-year during his life, to be whipt from Aldgate to Newgate, and from thence to Tyburn, which ſentence, ſays Neal, was exerciſed with a ſeverity unknown to the Engliſh nation. "The impudence of the man," ſays the hiſtorian Hume, "ſupported itſelf under the conviction; and his courage under the puniſhment. He made ſolemn appeals to heaven, and proteſtations of the veracity of his teſtimony. Though the whipping was ſo cruel, that it was evidently the intention of the court to put him to death by that puniſhment, yet he was enabled by the care of his friends to recover, and he lived to king William's reign, when a penſion of 400*l.* a-year was ſettled upon him. A conſiderable number of perſons adhered to him in his diſtreſſes, and regarded him as a martyr to the Proteſtant cauſe." He was unqueſtionably a very infamous character, and thoſe who regard the pretended Popiſh plot as a mere fiction, ſay that he contrived it out of revenge to the Jeſuits, who had expelled him from their body. After having left the whole body of Diſſenters for thirty years, he applied to be admitted again into the communion of the Baptiſts, having firſt returned to the church of England, and continued a member of it ſixteen years. In 1698, or 1699, he was reſtored to his place among the Baptiſts, from whence he was excluded in a few months as a diſorderly perſon and a hypocrite: he died in the year 1705. He is deſcribed by Granger as a man "of cunning, mere effrontery, and the moſt conſummate falſehood." And Hume deſcribes him as "the moſt infamous of mankind; that in early life he had been chaplain to colonel Pride; was afterwards chaplain on board the fleet, whence he had been ignominiouſly diſmiſſed on complaint of ſome unnatural practices: that he then became a convert to the Catholics; but that he afterwards boaſted, that his converſion was a mere pretence, in order to get into their ſecrets and to betray them." Hume Hiſt. Toulmin's Edition of Neal, vol. iv. and v.

OATH, JUSJURANDUM, is uſually defined a religious aſſertion or aſſeveration; wherein a perſon invokes the Almighty, renounces all claim to his mercy, or even calls for the divine vengeance upon himſelf, if he ſpeak falſely.

Some civilians look on this definition as too lax, ſince it may agree to perjury; and would have this eſſential to an oath, that the thing affirmed be true. But this is arbitrary.

An oath is eſteemed a kind of civil medium, between the perſon that gives it, and him to whom it is given; by which ſome controverſy or other matter, which could not otherwiſe be determined, is brought to an iſſue. Its form, and the ceremonies with which it is attended, are arbitrary, and various in different countries.

The oaths we make to God are called *vows*, and in ſome caſes *ſacraments*.

OATH, in a legal ſenſe, is a ſolemn action, whereby God is called to witneſs the truth of an affirmation given before one or more perſons empowered to receive the ſame.

The forms of oaths, like other religious ceremonies, have been always various, but conſiſting, for the moſt part, of ſome bodily action, and of a preſcribed form of words. Amongſt the Jews, the juror held up his right hand towards heaven, which explains a paſſage in the 144th Pſalm, "Whoſe mouth ſpeaketh vanity, and *their right hand is a right hand of falſhood*." The ſame form is retained in Scotland ſtill, amongſt the ſame Jews. An oath of fidelity was taken, by the ſervant's putting his hand under the thigh of his lord (ſee Gen. xxiv. 2.); and hence, with no great variation, is perhaps derived the form of doing homage at this day, by putting the hands between the knees, and within the hands of the liege. Amongſt the Greeks and Romans, the form varied with the ſubject and occaſion of the oath. In private contracts, the parties took hold of each other's hand, whilſt they ſwore to the performance; or they touched the altar of the god, by whoſe divinity they ſwore. Upon more ſolemn occaſions it was the cuſtom to ſlay a victim; and the beaſt being *ſtruck down*, with certain ceremonies and invocations, gave birth to the expreſſions, τεμνειν ορκον, *ferire pactum*, and to our Engliſh phraſe, tranſlated from theſe, of "ſtriking a bargain." The forms of oaths in Chriſtian countries are alſo very different; but in no country in the world, as archdeacon Paley believes, worſe contrived, either to convey the meaning, or impreſs the obligation of an oath, than in our own. Legal oaths end with, "So help me God;" anciently with, "So help me God, at his holy *dome*, *i. e.* judgment." More frequently, the ſubſtance of the oath is repeated to the juror, by the perſon who adminiſters it, adding in the concluſion, "So help you God." The energy of the ſentence reſides in the particle *ſo; ſo*, that is, *hâc lege*, upon condition of my ſpeaking the truth, or performing the promiſe, and not otherwiſe, "May God help me." The juror, whilſt he hears or repeats the words of the oath, holds his right hand upon a bible, or other book, containing the four goſpels. He then kiſſes the book;

book; the kiſs being rather an act of reverence to the contents of the book, as, in the Papiſts' ritual, the prieſt kiſſes the goſpel before he reads it, than any part of the oath.

This, according to our law-books, is called a *corporal oath*; becauſe, as it has been commonly ſaid, the party, when he ſwears, touches the goſpels with his right hand. This opinion, however, ſays archdeacon Paley, appears to be a miſtake: for the term is borrowed from the ancient uſage of touching, upon theſe occaſions, the *corporale*, or cloth which covered the conſecrated elements.

But in ſome old cuſtoms of Anjou and Maine, it appears that *corporal* oath was anciently a ſimple affirmation, or vow of faith and fidelity, made by a vaſſal who has no liege, by lifting up his hand; in contradiſtinction to that made by a liege vaſſal, which was made by laying his hand on the goſpel.

An oath is called *canonica purgatio*, becauſe allowed of by the canons; to diſtinguiſh it from *vulgares purgationes*, *viz.* by battle, fire ordeal, &c. which the church always diſcouraged. In ſmall matters, which the plaintiff could not prove, or, if he could, if his proof were ſet aſide, the defendant might purge himſelf by his own oath: this was called *jurare propria manu*.

But in matters of more weight, he was to bring other credible perſons, uſually of the ſame quality with the plaintiff, to ſwear that they believed the defendant had ſworn the truth.

Theſe were called *compurgators*, or *ſacramentales*; and their number was greater or leſs, according to the quality of the defendant, and the nature of the thing in queſtion. Hence, *jurare duodecima manu*. See Compurgators.

The obſcure and elliptical form of an oath, above-mentioned, together with the levity and frequency with which it is adminiſtered in our country, has occaſioned a general inadvertency to the obligation of oaths, that is much to be lamented, both in a religious and political view; and it merits public conſideration, ſays Paley, whether the requiring of oaths on ſo many frivolous occaſions, eſpecially in the cuſtoms, and in the qualifications for petty offices, has any other effect than to make them cheap in the minds of the people. This ingenious writer ſuggeſts, that the law may continue its own ſanctions, without adding the ſolemnity of an oath: and where it is neceſſary, let it annex to prevarication penalties proportioned to the public conſequence of the offence. Whatever be the form of an oath, the ſignification is the ſame. It is the calling upon God to witneſs, *i. e.* to take notice of what we ſay, and invoking his vengeance, or renouncing his favour, if what we ſay be falſe, or what we promiſe be not performed. The Quakers and Moravians refuſe to ſwear upon any occaſion; founding their ſcruples concerning the lawfulneſs of oaths upon our Saviour's prohibition, Matt. v. 34, "I ſay unto you, Swear not at all." In order to reconcile with this paſſage of ſcripture the practice of taking oaths, when required by law, the writer now cited ſuggeſts the following obſervations. It does not appear, that ſwearing "by heaven," "by the earth," "by Jeruſalem," or "by their own head," was a form of ſwearing ever made uſe of amongſt the Jews in judicial oaths; and, therefore, it is not probable, that our Saviour refers in the caſes to which we have above alluded, to judicial oaths. As to the ſeeming univerſality of the prohibition, "Swear not at all," the emphatic clauſe "not at all" is to be read in connection with what follows, neither "by the heaven," nor "by the earth," &c. So that "not at all" does not mean upon no occaſion, but by none of theſe forms. When our Saviour himſelf was "abjured by the living God" to declare whether he was the Chriſt, the Son of God, or not, he condeſcended to anſwer the high-prieſt, without making any objection to the oath (for ſuch it was) upon which he examined him. Beſides, St. Paul, when he ſays to the Romans "God is my witneſs," and to the Corinthians, "I call God for a record upon my ſoul," uſes expreſſions which contain the nature of oaths: and the epiſtle to the Hebrews ſpeaks of the cuſtom of ſwearing judicially, without cenſure or diſapprobation: "Men verily ſwear by the greater, and an oath, for confirmation, is to them an end of all ſtrife." Upon theſe grounds our Saviour's words are underſtood as relating, not to judicial oaths, but to the practice of vain, wanton, and unauthorized ſwearing, in common diſcourſe. Our author further obſerves, that oaths are nugatory, or carry with them no force or obligation, unleſs we believe that God will puniſh falſe ſwearing with more ſeverity than a ſimple lie or breach of promiſe. See Perjury.

As oaths are deſigned for the ſecurity of the impoſer, it is manifeſt they muſt be *interpreted*, and performed in the ſenſe in which the impoſer intends them; otherwiſe they afford no ſecurity to him: and this is the meaning and reaſon of the rule "jurare in animum imponentis." This rule our author applies to the explication of certain particular oaths, the nature and obligation of which he inveſtigates.

In explaining the oath of allegiance, (ſee Allegiance,) he conſiders what it excludes and what it permits. It excludes all intention to ſupport the claim or pretenſions of any other perſon or perſons, to the crown and government, than the reigning ſovereign; and all deſign at the time, of depoſing the reigning prince, for any reaſon whatever. It forbids the taking up of arms againſt ſuch prince, with views of private advancement, or from motives of perſonal reſentment or diſlike. On the other hand, this oath permits reſiſtance to the king, when his ill behaviour or imbecility is ſuch as to make reſiſtance beneficial to the community; and it does not require obedience to ſuch commands of the king, as are unauthorized by law, nor that we ſhould continue our allegiance to the king, after he is depoſed, driven into exile, carried away captive, or otherwiſe rendered incapable of exerciſing the regal office, whether by his fault or without it. As to the oath againſt bribery in the election of members of parliament, our author obſerves, that the ſeveral contrivances to evade this oath, ſuch as the elector's accepting money under colour of borrowing, and giving a promiſſory note or other ſecurity for it, which is annulled after the election; receiving money from a ſtranger, or a perſon in diſguiſe, or out of a drawer, or purſe, left open for the purpoſe, or promiſes of money to be paid after the election; or ſtipulating for a place, living, or other private advantage of any kind; if they eſcape the legal penalties of perjury, they incur the moral guilt; for they are manifeſtly within the miſchief and deſign of the ſtatute which impoſes the oath, and indeed within the terms of the oath itſelf. For the oath againſt ſimony, ſee Simony. Many oaths are impoſed on members of colleges in the univerſities, and on other ancient foundations, requiring the obſervance of their reſpective ſtatutes, which obſervance is become, in ſome caſes, unlawful, in others impracticable, in others uſeleſs, in others inconvenient. The "animus imponentis," ſays our author, which is the meaſure of the juror's duty, ſeems to be ſatisfied, when nothing is omitted, but what, from ſome change in the circumſtances under which it was preſcribed, it may fairly be preſumed that the

founder himſelf would have diſpenſed with. In connection with the ſubject of oaths, the obligation of ſubſcription to articles of religion is conſidered; for which we refer to the article SUBSCRIPTION. Paley's Principles of Moral and Political Philoſophy, vol. i.

OATH is alſo uſed for a ſolemn promiſe faithfully to execute or obſerve ſomething. See JURY and TRIAL.

In this ſenſe we ſay, *ſtate oaths*, the *oaths of* SUPREMACY, *oath of* ALLEGIANCE, *oath of* ABJURATION; which ſee reſpectively. All that bear offices in the government, peers, and members of the houſe of commons, eccleſiaſtical perſons, members of colleges, ſchoolmaſters, preachers, ſerjeants at law, counſellors, attornies, ſolicitors, advocates, proctors, &c. are enjoined to take the oaths of allegiance, ſupremacy, and abjuration: and perſons neglecting or refuſing are declared incapable to execute their offices and employments, diſabled to ſue in law or equity, to be guardians, executors, &c. or to receive any legacy, or deed of gift, to be in any office, &c. and to forfeit 500*l.* (See CONTEMPT and PRÆMUNIRE.) We have frequently acts paſſed for indemnifying perſons, who have omitted to qualify themſelves for offices and promotions, within the time limited by law, and for allowing farther time for that purpoſe.

Kings and princes ſwear to the performance of the treaties they make; though, anciently, they did not ſwear of themſelves, but others ſwore in their name.

OATH, *Coronation*, is, by 1 W. & M. ſtat. 1. cap. 6. to be adminiſtered to every king and queen, who ſhall ſucceed to the imperial crown of theſe realms, by one of the archbiſhops or biſhops of the realm, in the preſence of all the people: it is conceived in the following terms: the archbiſhop or biſhop ſhall ſay, Will you ſolemnly promiſe and ſwear to govern the people of this kingdom of England, and the dominions thereto belonging, according to the ſtatutes in parliament agreed on and the laws and cuſtoms of the ſame? The king or queen ſhall ſay, I ſolemnly promiſe ſo to do. Archbiſhop or biſhop. Will you, to your power, cauſe law and juſtice, in mercy, to be executed in all your judgments? King or queen. I will. Archbiſhop or biſhop. Will you, to the utmoſt of your power, maintain the laws of God, the true profeſſion of the goſpel, and the Proteſtant reformed religion, eſtabliſhed by the law? And will you preſerve unto the biſhops and clergy of this realm, and to the churches committed to their charge, all ſuch rights and privileges, as by law do or ſhall appertain to them, or any of them? King or queen. All this I promiſe to do. After this the king or queen, laying his or her hand upon the holy goſpels, ſhall ſay, The things which I have here before promiſed, I will perform and keep. So help me God. And then ſhall kiſs the book. Blackſt. Com. book i.

OATH *ex Officio*, an oath ſo called, which was formerly made uſe of in the ſpiritual courts, as well as in criminal caſes of eccleſiaſtical cognizance, as in matters of civil right; of which the high commiſſion court (ſee COURT), in particular, made a moſt extravagant and illegal uſe: forming a court of inquiſition, in which all perſons were obliged to anſwer in caſes of bare ſuſpicion, if the commiſſioners thought proper to proceed againſt them "ex officio" for any ſuppoſed eccleſiaſtical enormities. But when the high commiſſion court was aboliſhed by ſtatute 16 Car. II. c. 11. this oath "ex officio" was aboliſhed with it; and it is alſo enacted by ſtatute 13 Car. II. ſt. 1. c. 12. "that it ſhall not be lawful for any biſhop or eccleſiaſtical judge to tender to any perſon the oath "ex officio," or any other oath which the party may be charged or compelled to con-

feſs, accuſe, or purge himſelf of any *criminal* matter." (See EX OFFICIO.) But this doth not extend to oaths in a civil ſuit, and therefore it is ſtill the practice, both in the ſpiritual courts, and in equity, to demand the perſonal anſwer of the party himſelf upon oath.

OATH, *Falſe*. See PERJURY.

OATH, *Teſt*. See TEST.

OATMEAL. (See OAT.) The ſelling of corrupt oatmeal is puniſhable by ſtatute, which ſhall be forfeited for the ſecond offence, &c. See 51 Ed. I.

OAXACA. See GUAXACA.

OAXIS, in *Ancient Geography*, a river of Aſia, in Meſopotamia.—Alſo, a river of Scythia.

OAXOS, or OAXUS, a town on the northern ſide of the iſle of Crete. It was the capital of a kingdom, which had its appropriate ſovereign, ſaid to have been founded by Oaxus, the ſon of Apollo.

OAYCACHI, in *Geography*, a town of South America, in the audience of Quito; 25 miles E.N.E. of Quito.

OAZY, or OASY *Ground*, a name given by the ſeamen to ſoft, ſlimy, or muddy ground.

OB, in *Geography*. See OBY.

OBA, a town of Perſia, in the province of Adirbeitzan, on the weſt coaſt of the Caſpian ſea; 150 miles N.E. of Tauris.

OBACH, a town of the duchy of Wurzburg; 3 miles N.W. of Schweinfurt.

OBADIAH, or the *Prophecy of* OBADIAH, a canonical book of the Old Teſtament, which is contained in a ſingle chapter, and is partly an invective againſt the cruelty of the Edomites, who mocked and derided the children of Iſrael, as they paſſed into captivity; and, with other enemies, their confederates, invaded and oppreſſed thoſe ſtrangers, and divided the ſpoil among themſelves: and partly a prediction of the deliverance of Iſrael, and of the victory and triumph of the whole church over her enemies.

The time of this prophet is wholly uncertain. St. Jerom, with the Hebrews, believes, that he was the ſame with the governor of Ahab's houſe, mentioned 1 Kings, xviii. 3. who hid and fed the 100 prophets, whom Jezebel would have deſtroyed. Some ſay, he was that Obadiah, whom Joſiah made overſeer of the works of the temple, mentioned 2 Chron. xxxiv. 12. But moſt authors make him contemporary with Hoſea, Amos, and Joel. Laſtly, ſome believe him to be contemporary with Jeremiah, after the taking of Jeruſalem. It is more probable, ſays Du Pin, that he lived in the time of Ahaz, when the Edomites, in conjunction with the Iſraelites, made war againſt the tribe of Judah, becauſe his prophecy is wholly againſt the Edomites, or Idumæans. The greater part of his book is included in one of the prophecies of Jeremiah. Compare Ob. 1—9. with Jer. xlix. 14, 15, 16. 7. 9. 10.

OBAI, or ROBAI, in *Botany*, the Japaneſe name of a charming ſhrub, called by ſyſtematic botaniſts *Calycanthus præcox*, and figured in Ait. Hort. Kew. ed. 1. v. 2. 220. t. 10, as well as in Kæmpf. Am. Exot. t. 879. (See CALYCANTHUS.) Juſſieu juſtly doubts the propriety of its reference to that genus; but he is miſled by Kæmpfer's plate to ſuppoſe the ſtyle ſimple, though he rightly learned from thence that the ſtamens are but five. The fruit however ſeems to be that of a true *Calycanthus*. This ſhrub, long treated as a ſtove plant, proves hardy in our gardens, flowering in January, before the leaves appear. The flowers have a yellow calyx, and dark purple petals, and ſmell like a Jonquil. The plant is ſtill very little known in England, and we have found a great obſtacle to its preſervation,

tion, in the ſnails and ſlugs, which deſtroy its leaf-buds, as ſoon as they appear.

OBAMA, in *Geography*, a town of Japan, in the iſland of Ximo; 25 miles E. of Nangaſaki.

OBAMENE, a harbour on the eaſt coaſt of the iſland of Otaha.

OBAN, a ſea-port in the pariſh of Kilmore, and county of Argyle, Scotland, is ſituated on the ſhore of a fine bay, in the ſound of Mull, and ſecured from the weſtern ocean by the ſmall iſland of Kerrara. This bay is of a ſemicircular form, and has two openings; one on the north, and another on the ſouth. It is ſufficiently extenſive to afford anchorage for 500 ſail of veſſels, and is well defended from the weſtern winds. To theſe favourable circumſtances the town owes both its exiſtence, and its rapid riſe from a ſmall beginning. The firſt houſe of any conſequence was built about 50 years ago, by a trading company belonging to Renfrew, who uſed it for a ſtore-room. The example being followed by other mercantile adventurers, Oban ſoon became a conſiderable place; and about ten years ſubſequent to its foundation, was made one of the ports belonging to the cuſtom-houſe. The duke of Argyle, Mr. Campbell of Dunſtaffnage, and other perſons who poſſeſſed property around the new eſtabliſhment, rightly judging that its proſperity would much enhance the value of their eſtates, gave every encouragement in their power to promote its increaſe, eſpecially by granting building-leaſes upon the moſt liberal terms. It was particularly indebted to two brothers of the name of Stevenſon, who ſettled in it in 1778; and by their induſtry and ſpirited exertions, not only accumulated handſome fortunes for themſelves, but highly promoted the good of the neighbouring country. Oban is admirably adapted for trade, and is peculiarly well ſituated for a fiſhing ſtation. Theſe, however, are but inferior conſiderations to the great national benefits, which might be derived from its excellent harbour and road-ſtead. It ſeems formed by nature, and a combination of many important advantages, to become the principal place of trade for the Highlands of Scotland, and the middle diſtrict of the weſtern iſles. Knox recommends this place to be made a royal dock and arſenal. There is a regular ferry from Oban to Kerrara iſland, and thence to Achnacraig, in the iſland of Mull; and by the formation of the canal between Loch-Gilp and Loch-Crinan, the navigation from this town to the Clyde has been rendered both direct, and free from the danger of the more circuitous paſſage round the Mull of Cantire.

In the immediate vicinity of Oban are immenſe rocks of breccia, or pudding-ſtone, compoſed of different ſorts and ſizes of rounded pebbles. Some of the pebbles are quartzoſe, others porphyritic, granitic, ſchiſtous, and calcareous; and the whole are cemented together very firmly by a black lava. Other ſpecimens of volcanic minerals are abundant in this neighbourhood. A few rocks of this ſort are excavated to a vaſt depth, particularly one about half a mile ſouth from the town. This indeed ſeems to indicate recent volcanic irruptions. According to the parliamentary returns of 1811, the pariſh of Kilmore, which is of ſmall extent, contains 175 houſes, and 821 inhabitants, who are chiefly reſident in Oban. Beauties of Scotland, vol. v. Pennant's Tour in Scotland, 3 vols. 4to. Lond. 1790.

OBANA, in *Ancient Geography*, a town of Aſia, in Aſſyria. Ptol.

OBARENI, a people who inhabit a conſiderable part of Armenia, near the river Cyrus.

OBBA, a town of Africa, in Mauritania Cæſarienſis.

OBBEDIN, in *Geography*, a town of Walachia; 4 miles N.W. of Krajova.

OBDORSKOI, a town of Ruſſia, in the government of Tobolſk, on the Oby, near its mouth, whither the Samoiedes bring their tribute; 508 miles N. of Tobolſk. N. lat. 66° 10′. E. long. 67° 14′.

OBEAH, a ſuperſtitious practice, or a kind of ſorcery or witchcraft, as the term imports, prevalent among the Negroes in Jamaica, and which has ſo powerful an effect as to bias, in a conſiderable degree, their general conduct, diſpoſitions, and manners. Mr. B. Edwards has given a particular account of this practice, deduced from the reſearches and detail of Mr. Long. The term *obea*, *obiah*, or *obia*, is ſuppoſed to be the adjective, derived from the noun ſubſtantive *obe*, or *obi*; and the words *obea*-man or woman denote thoſe who practiſe *obi*. The etymology of this term is traced, by means of Mr. Bryant's Mythology, to *ob*, or *oub*, which, in the Egyptian language, ſignified a ſerpent. Moſes, by divine authority, forbids the Iſraelites ever to inquire of the demon *Ob*, tranſlated in our Bible charmer or wizard, divinator aut ſorcilegus: and the woman at Endor is called *Oub* or *Ob*, tranſlated Puthoniſſa; and *Oubaios* was the name of the baſiliſk or royal ſerpent, emblem of the ſun, and an ancient oracular deity of Africa. The term, ſuppoſed to be thus derived, is now generally uſed in Jamaica to denote thoſe Africans who in that iſland practiſe witchcraft or ſorcery, comprehending alſo the claſs of perſons, called "Myal-men," or thoſe who, by means of a narcotic potion, made with the juice of an herb, ſaid to be a ſpecies of ſolanum, which occaſions a trance or profound ſleep of a certain duration, endeavour to convince the deluded ſpectators of their power to reanimate dead bodies. According to the reſult of the inquiries of the author now cited, the profeſſors of Obi are, and always were, natives of Africa, and none other; and they have brought the ſcience with them from thence to Jamaica, where it is ſo univerſally practiſed, that there are few of the large eſtates poſſeſſing native Africans, which have not one or more of them. The oldeſt and moſt crafty are thoſe who uſually attract the greateſt devotion and confidence: beſides the advantage derived from their hoary heads, and harſh forbidding aſpect, they poſſeſs ſome ſkill in plants of the medicinal and poiſonous ſpecies, which has qualified them for ſucceeding in their impoſition on the weak and credulous. The Negroes in general, whether Africans or Creoles, revere, conſult, and fear them. To theſe oracles they reſort, with the moſt implicit faith, on all occaſions, for the cure of diſorders, the obtaining of revenge for injuries or inſults, the conciliating of favour, the diſcovery and puniſhment of the thief or the adulterer, and the prediction of future events. The trade which theſe impoſtors carry on is extremely lucrative: they manufacture and ſell their obies, adapted to different caſes, and at different prices. A veil of myſtery is ſtudiouſly thrown over their incantations, to which they allot the midnight hours. The deluded Negroes, who are unſuſpecting believers in their ſupernatural power, become voluntary accomplices in this concealment; and the ſtouteſt of them tremble at the ſight of the ragged bundle, the bottle, or the egg-ſhells, which are ſtuck in the thatch, or hung over the door of a hut, or upon the branch of a plantain-tree, to deter marauders. In caſes of poiſon, the effects of it are by the ignorant Negroes aſcribed wholly to the potent workings of Obi. When a negro is robbed of a fowl or a hog, he applies immediately to the obeah-man or woman: it is then made known among his fellow Blacks, that "Obi is ſet" for the thief; and as ſoon as the latter hears the dreadful news, his terrified imagination induces him to ſeek the only reſource that is left in the ſuperior ſkill of ſome more eminent obeah-man of the neighbourhood, who may

counteract the magical operations of the other; but if no ſuch perſon can be found, he falls into a decline under the inceſſant horror of impending calamities. The ſlighteſt painful ſenſation in the head, the bowels, or any other part, as well as any caſual loſs or hurt, confirms his apprehenſions, and he believes himſelf to be the devoted victim of an inviſible and irreſiſtible agency. Sleep, appetite, and cheerfulneſs forſake him; his ſtrength decays; his features aſſume the ſettled gloom of deſpondency; the moſt nauſeous and unwholeſome ſubſtance becomes his only food: he contracts a morbid habit of body, and gradually ſinks into the grave. A Negro, who is taken ill, inquires of the obeah-man the cauſe of his ſickneſs, whether it will prove mortal or not, and how long it will be before he either dies or recovers. The oracle generally aſcribes the diſtemper to the malice of ſome particular perſon, and adviſes to ſet Obi for him; but if no hopes be given of recovery, immediate deſpair takes place, which no medicine can remove, and death is the certain conſequence. As numerous occaſions ariſe which provoke the Negroes to exerciſe the powers of Obi againſt each other, a conſiderable portion of the annual mortality amongſt thoſe of Jamaica is aſcribed to this faſcinating miſchief. The Obi is uſually compoſed of a farrago of materials, moſt of which are enumerated in the Jamaica law, paſſed in 1760, with a view to its ſuppreſſion, *viz.* blood, feathers, parrots' beaks, dogs' teeth, alligators' teeth, broken bottles, grave-dirt, rum, and egg-ſhells. For a further account of this ſuperſtitious practice, ſee Edwards's Hiſt. of the Weſt Indies, vol. ii.

OBED'S RIVER, in *Geography*, a river of America, in Tenneſſee, which runs ſouth-weſt into Cumberland river, 290 miles from its mouth by the courſe of the ſtream. Cumberland river is thus far navigable for large veſſels.

OBEDACH, or OBDACH, a town of the duchy of Stiria; 9 miles S.W. of Judenburg.

OBEDIENCE, OBEDIENTIA, is ſometimes uſed, in the *Canon Law*, for an office, or the adminiſtration of it.

In our *Ancient Cuſtoms*, *obedientia* was uſed in the general for every thing that was enjoined the monks, by the abbot.

OBEDIENCE *to Parents*. See PARENT.

OBEDIENTIA, in a more reſtrained ſenſe, was applied to the farm belonging to the abbey, to which the monks were ſent *vi ejuſdem obedientiæ*, either to look after the farm, or collect the rents. Hence, alſo, thoſe rents themſelves were called *obedientiæ*.

OBEIDIA, in *Geography*, a town of Aſiatic Turkey, in the province of Diarbekir, on the Khabur; 80 miles E. of Racca.

OBELIAS, among the ancients, a kind of ſmall cakes, which were toaſted on little ſpits, and ſerved at table as a deſert, to be eaten dipped in ſweet wine, called *paſſum*.

OBELISCOTHECA, in *Botany*, ſo called by Vaillant, on account of the quadrangular, and ſomewhat pyramidal, caſes for the ſeeds, formed by the ſcales of the receptacle. See RUDBECKIA.

OBELISCUS MARMOREUS, in *Natural Hiſtory*, the name of a very remarkable ſpecies of a ſhell-fiſh, unknown to us in its recent ſtate, but met with very frequently foſſile in the Swediſh ſtone uſed for pavements, and ſome other kinds, and more accurately named by late authors *polythalamium*, and *orthoceratites*, and by Klein *tubulus marinus concameratus*.

OBELISK, OBELISCUS, a quadrangular pyramid, very ſlender, and high; raiſed as an ornament, in ſome public place, or to ſhew ſome ſtone of enormous ſize; and frequently charged with inſcriptions, and hieroglyphics.

Borel derives the word from the Greek ὀβελος, *a ſpit*, *broach*, *ſpindle*, or even a kind of *long javelin*. Pliny ſays, the Egyptians cut their obeliſks in form of ſun-beams; and that in the Phœnician language, the word obeliſk ſignifies *ray*.

The Egyptian prieſts called their obeliſks the *ſun's fingers*; becauſe they ſerved as ſtyles, or gnomons, to mark the hours on the ground. The Arabs call them *Pharaoh's needles*: whence the Italians call them *aguglia*; and the Engliſh *Cleopatra's needles*. See CLEOPATRA's *Needles* and ALEXANDRIA.

The difference between obeliſks and pyramids, according to ſome, conſiſts in this, that the latter have large baſes, and the former very ſmall ones, compared with their height. Though Cardan makes the difference to conſiſt in this, that obeliſks are to be all of a piece, or conſiſt of a ſingle ſtone; and pyramids of ſeveral.

The proportions of the height and thickneſs are nearly the ſame in all obeliſks; that is, their height is nine, or nine and a half, ſometimes ten times their thickneſs; and their thickneſs, or diameter, at top, is never leſs than half, nor greater than three-fourths, of that at bottom.

This kind of monument appears to have been very ancient; and, we are told, was firſt made uſe of to tranſmit to poſterity the principal precepts of philoſophy, which were engraven on them in hieroglyphic characters. In after-times they were uſed to immortalize the actions of heroes, and the memory of perſons beloved.

The firſt obeliſk we know of was that raiſed by Rameſes, king of Egypt, in the time of the Trojan war. It was 40 cubits high, and, according to Herodotus, employed 20,000 men in the building. Phius, another king of Egypt, raiſed one of 45 cubits; and Ptolemy Philadelphus another of 88 cubits, in memory of Arſinoe. See PORPHYRY.

Auguſtus erected an obeliſk at Rome, in the Campus Martius, which ſerved to mark the hours on an horizontal dial, drawn on the pavement.

F. Kircher reckons up fourteen obeliſks, celebrated above the reſt; *viz.* that of Alexandria, that of the Barberins, thoſe of Conſtantinople, of the Mons Eſquilinus, of the Campus Flaminius of Florence, of Heliopolis, of Ludoviſio, of S. Mahut, of the Medici, of the Vatican, of M. Cælius, and that of Pamphylia.

One of the uſes of obeliſks among the ancients was to find the meridian altitudes of the ſun, at different times of the year. Hence they ſerved inſtead of very large gnomons. One of the obeliſks now ſtanding at Rome, that of St. John's Lateran, is in height 108 Engliſh feet, without the pedeſtal; and the other obeliſk, brought to Rome by Auguſtus, buried under the Campus Martius, wants but little of the ſame height. Pliny gives us a deſcription of this gnomon, lib. xxxvi. ſect. 15. From him it appears, that there was laid down, from the foot of the obeliſk northward, a level pavement of ſtone, equal in breadth to the breadth of the obeliſk itſelf, and equal in length to its ſhadow at noon, upon the ſhorteſt day; that is to ſay, that its length was to the height of the obeliſk, almoſt as 22 to 10, and that under this pavement, there were properly let in parallel rulers of braſs, whoſe diſtance from the point, directly under the apex of the obeliſk, were reſpectively equal to the length of the ſhadow thereof at noon, on the ſeveral days of the year, as the ſame lengths decreaſed from the ſhorteſt day to the longeſt, and again increaſed from the longeſt day to the ſhorteſt. Vide Phil. Tranſ. N° 482. art. 5. vol. xiiv. p. 365. where we alſo find ſome remarks by Mr. Folkes on Hardouin's Amendment of a Paſſage in Pliny's Natural Hiſtory, lib. ii. ſect. 74. Edit. Pariſ. 1723. fol. about the length of the

the ſhadows of gnomons in different latitudes. See GNOMON.

OBELISK, in *Grammar*, is a character in form of a dagger (†), ſerving to refer the reader to ſome note, or other matter, in the margin.

OBELUS, in *Antiquity*, denotes a little line or ſtroke, like a needle; whence its name ὀβελος, which ſignifies *needle*. The word is chiefly uſed in ſpeaking of Origen's Hexapla; wherein he diſtinguiſhes, with an aſteriſk or ſtar, the ſupplements he makes to the texts of the Septuagint, where it falls ſhort of the Hebrew meaning; and with an obelus or lineola (—), thoſe places where the Septuagint had any thing not in the Hebrew.

St. Jerom ſays, the obelus was only uſed in thoſe places where ſomething was to be retrenched from the Septuagint, as ſuperfluous, and the aſteriſk in thoſe that were defective. Theſe marks frequently occur in ancient manuſcripts. Uſually the obelus is accompanied with two dots, the one above, the other underneath, as (÷); and the aſteriſk is a St. Andrew's croſs, cantoned with four points.

OBENBERG, in *Geography*, a town of Auſtria; ſix miles E.N.E. of Sleyregg.

OBER, a river which flows from a lake on the borders of Poland and Sileſia, and runs into the Oder, four miles S. of Zullichan.

OBERBACH, a town of the duchy of Wurzburg; 10 miles N W. of Kiſſingen.

OBERBERG, a bailiwick of Switzerland, belonging to the abbey of St. Gall.

OBERDORF, a town of Bavaria; 32 miles S. of Augſburg.

OBERGESTLEN, a town of Switzerland, in the Valais; 48 miles E. of Sion.

OBERHAUSBERGEN, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diſtrict of Straſburg, three miles N.W. of it. The place contains 329, and the canton 11,720 inhabitants, on a territory of 120 kiliometres, in 18 communes.

OBERINGELHEIM, a town of France, in the department of Mont Tonnerre, and chief place of a canton, in the diſtrict of Mayence. The place contains 1658, and the canton 10,623 inhabitants, in 18 communes.

OBERKIRCH, a town of the duchy of Baden; 12 miles E. of Straſburg. N. lat. 48° 33′. E. long. 8° 10′.

OBERKOTZAU, a town of Germany, in the principality of Bayreuth; 13 miles S. of Hof.

OBERLAND, a province of Pruſſia, formerly called "Hockerland," fertile and well cultivated. Before Pruſſia was invaded by the Teutonic knights, this province could furniſh for the field 10,000 effective men, conſiſting of horſe and foot; but as the inhabitants had exerciſed great cruelties towards the Chriſtians, the Teutonic knights, in 1273, laid the country waſte, and took poſſeſſion of it.—Alſo, a territory in the duchy of Courland, lying between the town of Seelburg and Lithuania.

OBERMOSCHEL. See MOSCHEL.

OBERNAI, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diſtrict of Barr. The place contains 4391, and the canton 13,164 inhabitants, on a territory of 110 kiliometres, in 11 communes.

OBERNBURG, a town of Germany, in the circle of the Lower Rhine; 16 miles E. of Darmſtadt.

OBERNDORF, a town of Germany, in the county of Hohenberg, on the Neckar; eight miles E. of Schramberg.—Alſo, a town of Bavaria, in the biſhopric of Bamberg; ſeven miles N. of Bamberg.—Alſo, a town of Germany, in the county of Henneberg; eight miles S.E. of Meinungen.—Alſo, a town of Bavaria, on the Inn; 12 miles S.S.W. of Paſſau.

OBERNHAU, a town of Saxony, in the circle of Erzgebirg; ſix miles W. of Lauterſtein.

OBERNKIRCHEN, a town of Auſtria; eight miles W. of Freyſtadt.

OBERROSLA, a town of Germany, in the principality of Culmbach; 13 miles S. of Hof.

OBERSDORF, a town of Bohemia, in the circle of Chrudim; 14 miles E.N.E. of Leutmiſchl.—Alſo, a town of Bavaria; 62 miles S. of Augſburg.

OBERSEE, a lake of Bavaria, one mile S. of Konigſee.—Alſo, a lake of Carinthia, one mile W. of Welach.

OBERSTADT, a town of Germany, in the county of Henneberg; ſeven miles E.N.E. of Meinungen.

OBERSTENFELD, a town of Wurtemberg; nine miles S.E. of Heilbronn.

OBERWALD, a town of Switzerland, in the Valais; 50 miles E. of Sion.

OBERWELS, or OBERWOLTZ, a town of the duchy of Stiria; 24 miles W. of Judenburg. N. lat. 47° 13′. E. long. 14°.

OBESITY, OBESITAS, in *Medicine*, the ſtate of a perſon too much loaded with fat and fleſh, otherwiſe called *corpulency*. See CORPULENCE.

OBEY, in the *Manege*. A horſe is ſaid to obey the hand and heels, to obey the aids or helps, when he knows and anſwers them according to demand.

OBIAN, in *Geography*, a navigable river of America, in Tenneſſee, which runs into the Miſſiſippi, 70 yards broad, at the diſtance of 17 miles from its mouth.

OBIDOS, a town of Portugal, in Eſtremadura, ſeated on a river which runs into the Atlantic, and forms a bay at its mouth called "Lagoa de Obidos." The town is defended by a ſtrong caſtle on a rock; 38 miles N. of Liſbon. N. lat. 39° 20′. W. long. 8° 59′.

OBJECT, derived from *objicere, to ſet before*, which is compoſed of *ob* and *jaceo, I lie againſt*, in *Philoſophy*, ſomething apprehended, or preſented to the mind, by ſenſation, or by imagination.

An object is ſomething that affects us by its preſence, that moves the eye, ear, or ſome other of the organs of ſenſe; or, at leaſt, is repreſented to us by the imagination.

The ſchool-philoſophers define object to be that about which a power, act, or habit, is employed. Thus, good is the object of the will; truth of the underſtanding; ſo colour is the object of ſight; ſound, of hearing, &c.

Objects are uſually divided into *next*, *proxima*, which are thoſe on which the power or habit is immediately employed; in which ſenſe colour is the next object of ſight. And *remote*, which are thoſe only perceived by means of the former: in which ſenſe, the wall is the remote object of ſight, ſince we only ſee it by means of its colour, &c.

Ideas are the immediate objects of the mind in thinking: bodies, their relations, attributes, &c. are the mediate objects.

Hence it appears, that there is a ſort of ſubordination of objects. But note, that a next object, with regard to a remote one, is properly a ſubject, not an object.

They alſo diſtinguiſh objects *per ſe*, which are what properly move or affect our ſenſes: ſuch are the ſenſible qualities; and objects *per accidens*, which are ſubſtances, and only affect us by being inveſted with ſenſible qualities.

Again, they diſtinguiſh between *common* objects, which are ſuch as affect divers ſenſes; as are motion, figure, &c. and *proper* objects, which only affect one ſenſe.

There

There are ſeveral conditions requiſite to an object of *ſenſe*; as, that it be material; that it be within a certain diſtance of a competent extent; its ſenſible qualities ſufficiently intenſe, &c.

It is the object that reflects or emits the rays of light, which occaſion viſion. Objects, of themſelves, are inviſible; we only ſeem to perceive them, becauſe the different texture of their ſurface, diſpoſing them to reflect differently coloured rays, occaſions in us ſeveral ſenſations of colour, which we attribute to them.

The objects of the eye, or viſion, are painted on the retina; though not there erect, but inverted, according to the laws of optics. This is eaſily ſhewn, from Cartes's experiment of laying bare the vitreous humour on the back part of the eye, and putting over it a bit of white paper, or the ſkin of an egg, and then placing the fore-part of the eye to the hole of a darkened room. By this means is had a pretty landſcape of the objects abroad, painted invertedly on the back of the eye.—How, in this caſe, the objects which are painted inverted ſhould be ſeen erect, is matter of controverſy. See CAMERA *Obſcura*, and VISION.

OBJECT-*glaſs* of a teleſcope or microſcope is the glaſs placed at the end of the tube which is next the object.

To prove the regularity and goodneſs of an object-glaſs, ſtrike two concentric circles on paper, the one having its diameter the ſame with the breadth of the object-glaſs; the other half that diameter; divide the inner circumference into ſix equal parts; and making ſix fine ſmall holes in it with a needle, cover one ſide of the glaſs with this paper; then expoſing it to the ſun, receive the rays that paſs through theſe ſix holes on a plane, at a juſt diſtance from the glaſs; and, by withdrawing or approaching this plane, from or to the glaſs, we ſhall find whether the rays, that paſs through theſe ſix holes, unite exactly together at any diſtance from the glaſs; if they do, we may be aſſured of the regularity of the glaſs, that is, of its juſt form; and, at the ſame time, we obtain exactly the glaſs's focal length.

Indeed, there is ſcarcely any better way of proving the excellency of an object-glaſs, than by placing it in a tube, and trying it with ſmall eye-glaſſes, at ſeveral diſtant objects; for that object-glaſs which repreſents objects the brighteſt and moſt diſtinct, which bears the greateſt aperture, and moſt convex and concave eye-glaſs, without colouring or hazineſs, is always the beſt.

A circular object-glaſs is ſaid to be truly centered, when the centre of its circumference is ſituated in the axis of the glaſs; and to be ill-centered, when the centre of its circumference lies beſide the axis.

To prove whether object-glaſſes be well-centered, hold the glaſs at a due diſtance from the eye, and obſerve the two reflected images of a candle; where thoſe images unite, or coaleſce, there is the true centre. If this be in the middle, or central point of the glaſs, then it is known to be truly centered.

There are various methods of finding the true centre of an object-glaſs: the following was the method uſed by Mr. George Graham. Let a couple of ſhort cylindrical tubes be turned in wood or braſs, and let the convexity of the narrower be ſo exactly fitted to the concavity of the wider, as juſt to turn round in it with eaſe, but without waddling; and let the planes of the baſes of the tubes be exactly perpendicular to their ſides. Place the baſe of the narrower tube upon a ſmooth braſs plate, or a wooden board, of an equal thickneſs, and with any ſharp-pointed tool, deſcribe a true circle upon the board round the outward circumference of the baſe; and upon the centre of this circle, to be found when the tube is removed, deſcribe a larger circle upon the board.

Theſe two circles ſhould be ſo proportioned, that the one may be ſomewhat greater, and the other ſomewhat ſmaller than any of the glaſſes intended to be centered by them. Then having cleared out all the wood within the inner circle, put the end of the tube into this hole, and there faſten it with glue, ſo that the baſe of the tube may lie in the ſurface of the board: then having fixed the wider tube very firmly, in a hole made in a window-ſhutter, and having darkened the room, lay the glaſs to be centered upon the board fixed to the narrower tube; and having placed the centre of it as near as you can gueſs over the centre of the hole, fix it to the board with two or three lumps of pitch, or ſoft cement, placed at its circumference. Then put the narrower tube into the wider as far as it can go, and fix up a ſmooth ſcreen of white paper to receive the pictures of objects that lie before the window; and when they appear diſtinct upon the ſcreen, let the inner tube be turned round upon its axis; and if the centre of the glaſs happens to be in this axis, the picture will be perfectly at reſt upon the ſcreen; if not, every point of it will deſcribe a circle. With a pencil mark the higheſt and the loweſt places of any one circle, deſcribed by ſome remarkable point in that part of the picture which appears moſt diſtinct; and when this point of the picture is brought to the higheſt mark, ſtop the circular motion of the tube, and keeping it in that poſition, depreſs the object-glaſs till the point aforeſaid falls exactly in the middle between the two marks. Then turn the tube round again, and the point of the picture will either reſt there, or will deſcribe a much ſmaller circle than before, which muſt be reduced to a quieſcent point by repeating the ſame operation. Then the centre (of refraction) of the glaſs will lie in the axis of the tube, and by conſequence will be equidiſtant from the circumference of the large circle deſcribed upon the board fixed to it. Now, to deſcribe a circle upon the glaſs *f g h*, (*Plate* XV. *Optics*, *fig.* 19.) about its centre of refraction, let a long ſlender braſs plate *a c b* be bent ſquare at each end, as repreſented in the figure, leaving a piece in the middle, equal in length to the diameter of the large circle *a d b e*, that was deſcribed upon the board; and let the ſquare ends of the plate be filed away, ſo as to leave a little round pin in the middle of each. Then having laid it over the glaſs, along any diameter of the large circle *a d b e*, make two holes in the board to receive the pins *a*, *b*; and find the centre of this circle upon the long plate; and with this centre, *c*, deſcribe as large a circle as you can, upon the glaſs underneath, with a diamond-pointed compaſs; and grind away all the margin as far as this circle *f i k*, in a deep tool for grinding eye-glaſſes; and then the glaſs will be truly centered. If the pitch, or cement, be too ſoft to keep the glaſs from ſlipping, while the circle is deſcribing, it may be fixed firmer with wax, or harder cement. Smith's Optics, book iii. chap. 3.

Mr. Savery gives the following rule, which is very convenient for the uſe of the glaſs-grinder, and will enable him expeditiouſly to try whether a convex lens is well centered. Provide a round plate of braſs (or hardened ſteel, if it can be prevented from ruſting), conveniently thick, and well hardened by hammering, having many notches round it, one a little wider than the next, and numbered 1, 2, 3, &c. in their proper order, each of them being wider at the bottom than at the entrance. (*Plate* XV. *Optics*, *fig.* 20.) Fit one of theſe notches to the thickeſt ſide of the object-glaſſes, ſo that the edge may reach to about half its depth; and if the oppoſite ſide paſs to the bottom of the notch, grind the lens narrower on the thinneſt ſide, till you find it at that part

as thick as where you firſt tried it in the notch. After this manner reduce the glaſs to an equal thickneſs on its four quarters, and then grind off from other places what is needful to make it circular: let care be taken, when the lens is tried in the notch, that it be not warmer on one ſide than the other by grinding, but ſtay till it is quite cold; and obſerve likewiſe not to thruſt it in harder on one ſide than on the oppoſite ſide. (Phil. Tranſ. vol. xlviii. p. 177, &c.) The chief advantage of having a glaſs well-centered is this, that the rays coming through any given hole or aperture, whoſe centre coincides with the axis of the glaſs, will form a more diſtinct image than if that centre lay beſide the axis; becauſe the aberrations of the rays from the geometrical focus of the pencil, are as the diſtances of their points of incidence from the centre of refractions in the glaſs.

As object-glaſſes are commonly included in cells that ſcrew upon the end of the tube of a teleſcope, one may examine whether they be well-centered, by fixing the tube, and obſerving while the cell is unſcrewed, whether the croſs-hairs keep fixed upon the ſame lines of an object ſeen through a teleſcope. See CENTERING.

OBJECT is alſo uſed for the matter of an art or ſcience; or that about which it is employed.

In which ſenſe the word coincides with *ſubject*.

The ſchool philoſophers diſtinguiſh divers kind of objects in the ſame ſcience; *viz. material*, which is the thing itſelf that is conſidered, or treated of; and thus it is the human body, which is the object of medicine: *formal*, which is the manner of conſidering it; and thus the ſame human body, conſidered with a view to the healing of it, is the *formal* object of medicine.

OBJECTION, in *Reaſoning*, ſomething urged to overthrow a poſition; or a difficulty raiſed againſt an allegation, or propoſition, of a perſon with whom we are diſputing.

The anſwering of objections comes under that branch of oratory, or that part of an oration, called *confirmation*, or *confutation*.

OBJECTION, *Over-ruling an*. See OVER-RULING.

OBJECTIVE, OBJECTIVUS, is uſed in the ſchools in ſpeaking of a thing which exiſts no otherwiſe than as an object known.

The eſſe, or exiſtence of ſuch a thing, is ſaid to be objective. Others call it *ratio objectiva*.

OBJECTIVE is alſo uſed for the power, or faculty, by which any thing becomes intelligible. And for the act itſelf, whereby any thing is preſented to the mind, and known.

Hence a thing is ſaid *to exiſt objectively*, *objectivè*, when it exiſts no otherwiſe than in being known, or by being an object of the mind.

This ſome will have to be real eſſe; others deny it.

OBJECTIVE *Evidence*. See EVIDENCE.

OBJECTIVE *Line*. See LINE.

OBJECTIVE *Notion*. See NOTION.

OBJECTIVE *Plane*. See PLANE.

OBJECTUM *quod complexum*, of an art, is the aggregate whole, or a collection of all the objective concluſions, or conſequences found in the ſcience.

OBJECTUM *quod incomplexum*, is a collection of all the ſubjects of the objective concluſions. Thus, therefore, air, as elaſtic, is the *complex* object of one branch of phyſics; and air itſelf, or the ſubject of the concluſion, the *incomplex* object of the ſame branch.

OBJECTUM *quo complexum*, is a collection of all the objective antecedents of the ſcience.

OBJECTUM *quo incomplexum*, is a collection of all the mediums, or arguments, contained in thoſe antecedents, and whereby thoſe concluſions are proved.

In theſe caſes, the object is ſaid to be *complex*, inaſmuch as it includes both an affirmation and negation; and *incomplex*, as it includes neither: *quod*, as being that which (*quod*) is ſhewn in the ſcience; and *quo*, as being that whereby (*quo*) the concluſions therein are proved.

Schoolmen alſo diſtinguiſh other objects, which it is needleſs to mention.

OBIIT NUPER. See NUPER.

OBILA, in *Geography*, a province of the interior parts of Africa.

OBIONE, in *Botany*, Gærtner, v. 2. 198. t. 126, a genus formed by that author, of the Linnæan *Atriplex ſibirica*, becauſe its male flowers are four-cleft and tetrandrous, and, more eſpecially, on account of the inverted poſition of the ſeed and its embryo. This plant is ſo perfectly an *Atriplex* in every other reſpect, that we preſume to think the laſt-mentioned character is not always infallible any more than the others, at leaſt when the embryo is circular.

OBIT, OBITUS, in our *Ancient Cuſtoms*, was a funeral ſolemnity, or office for the dead; commonly performed when the corpſe lay uninterred in the church.

OBIT is alſo an anniverſary office or maſs, held yearly, in the Romiſh church, on a certain day, in memory of ſome perſon deceaſed.

One of the moſt ancient obits in Europe is that of king Childebert, founded in the abbey of St. Germains Deſprez, and ſaid on the eve of St. Thomas's day.

The tenure of obit, or chantry-lands, held of the ſubject by ſuch ſervice, is decreed to be extinct with us, by ſtat. 1 Edw. VI.

OBITEREA, in *Geography*, an iſland of the Pacific ocean, 100 leagues S. of the Society Iſlands. S. lat. 22° 40′. W. long. 150° 50′. This iſland has no good anchorage.

OBITUARY, OBITARIUM, a funeral regiſter, in which are written the names of the dead, and the days of their burial; for whom obits, or anniverſaries, are to be performed.

Theſe, in ſome places, are alſo called *mortuaries*; but more frequently *necrologies*, or *calendars*.

OBITUARY is more particularly uſed for a book containing the foundation or inſtitution of the ſeveral obits in a church or monaſtery.

This is more frequently called the *Martyrology*.

OBLADA, in *Ichthyology*, a name given by ſome to the melanurus of authors, a fiſh of the ſparus kind, diſtinguiſhed by Artedi by the name of the ſparus variegated with longitudinal lines, and with a large black ſpot on each ſide near the tail. See SPARUS *Melanurus*.

OBLATA, things given, or voluntarily offered, particularly to the king by any of his ſubjects.

They are thus called, becauſe the oblata, or offerings to our kings, were ſo ſtrictly looked to in the reigns of king John and Henry III., that they were entered in the fine-roll under the term oblata; and, if not paid, were put in charge to the ſheriff.

OBLATA, in the *Exchequer*, ſignify old debts; brought, as it were, together, from preceding years, and put to the preſent ſheriff's charge.

OBLATA is alſo a word uſed by ſome authors to expreſs a ſort of purging tablet, made of fine flour and ſugar, with ſome purging ingredients.

OBLATÆ is alſo uſed to ſignify the conſecrated wafers, or hoſts, diſtributed to the communicants in the maſs or ſacrament of the altar; and ſometimes the cuſtomary treats in religious houſes have been called by the name of *oblatæ*.

OBLATI, anciently, were ſecular perſons, who be-

ſtowed themſelves and their eſtates on ſome monaſtery, and were admitted as lay-brothers.

There were ſome of the oblati, properly called *donati*, who gave their perſons, their families, and effects; and even entered into a kind of ſervitude themſelves, and their deſcendants.

They were admitted by putting the bell-ropes of the church round their necks, and, as a mark of ſervitude, a few pence on their heads.

The donati took religious habits, but different from thoſe of the monks.

In the archives of the abbey of St. Paul de Verdun is a permiſſion given, in 1360, to a man of that abbey to marry a wife; on condition, that, of the children ariſing from the marriage, one-half ſhould belong to the abbey, in quality of oblati; the other half to the biſhop. This kind of oblati are ſaid to have taken their firſt riſe in the eleventh century.

In the earlier times, thoſe only are called oblati, whom their parents engaged from their infancy to the monaſtic life. Thoſe who embraced it themſelves, when at an age capable of choice, were called *converts*, *converſi*.

The oblati made no profeſſion; yet kept the celebate, lived in obedience to the ſuperiors, and did the drudgery of the monaſtery: yet they differed from the ſervants of the houſe, who were allowed to marry.

The oblati and donati were, properly, ſervants by devotion, as the others were by condition.

Helyot ſays, the oblati differed from converts, inaſmuch as the latter made the profeſſion, and wore the habit, which the former did not.

Oblati were alſo, in France, a kind of lay-monks, anciently placed by the king in all the abbies and priories in his nomination; to whom the religious were obliged to give a monk's allowance, on account of their ringing the bells, and ſweeping the church, and the court.

Theſe offices were uſually filled with lame ſoldiers, and invalids, ſome of whom had penſions on benefices, without any duty. But theſe oblati, with their penſions, have ſince been all removed to the hotel of the Invalids at Paris.

OBLATIONS, Offerings, properly denote things offered to God.

In the canon law, oblations are defined to be any thing offered by godly Chriſtians to God, and the church, *i. e.* to the prieſts, whether they be moveables, or immoveables.

Oblations, were anciently of various kinds, *viz. oblationes altaris*, which the prieſts had for ſaying maſs: *oblationes defunctorum*, given by the laſt wills of the faithful to the church: *oblationes mortuorum*, thoſe given by the relations of the dead, at their burials: *oblationes pœnitentium*, thoſe given by penitents: and *oblationes pentecoſtales*, or Whitſun-offerings.

Till the fourth century, the church had no fixed revenues, nor any other means of ſubſiſtence but alms, or voluntary oblations.

Under this term are now comprehended not only thoſe ſmall cuſtomary ſums commonly paid by every perſon, when he receives the ſacrament of the Lord's Supper, at Eaſter, which in many places is 2*d.* from every communicant, and in London 4*d.* a houſe; though it does not appear on what their opinion of a groat a houſe for London is founded; but alſo the cuſtomary payments for marriages, chriſtenings, churchings, and burials. The four offering days are Chriſtmas, Eaſter, Whitſuntide, and the feaſt of the dedication of the pariſh church. It hath been decreed, with regard to Eaſter offerings, that they are due of common right, and not by cuſtom only. Offerings may be recovered before the juſtices of the peace, by the ſmall tythe act of 7 and 8 Will. cap. 6.

Offerings are made at the holy altar by the king and queen twelve times in the year on feſtivals called "Offering days," and diſtributed by the dean of the chapel to the poor. The money in lieu of theſe accuſtomed offerings is now fixed at 50 guineas a year, and paid by the privy purſe annually to the dean or his order; for the diſtribution of which offertory money, the dean directs proper liſts of poor people to be made out.

OBLAY, in *Geography*, a town of Lithuania, in the palatinate of Wilna; 12 miles S. of Braſlau.

OBLIGATION, an act whereby a perſon engages, or binds himſelf, or is bound by another, to do ſomething; as to pay a ſum of money, to be ſurety, or the like.

The acceptance of a bill of exchange is a kind of obligation to pay it.

All obligations ariſe from contracts, or quaſi-contracts; from crimes, or quaſi-crimes; and, in the Roman law, were either civil, or prætorian; *i. e.* either approved by the civil law, or introduced by the prætor.

There are three kinds of obligations; *natural*, *civil*, and *mixt*.

Natural obligations are founded on the mere bond of natural equity, without any civil neceſſity, and without producing any action of conſtraint. Such are the obligations a minor is under.

Civil obligation is that ſupported by civil authority alone, and which induces a conſtraint, without any principle or foundation in natural equity. Such is the obligation on a man condemned unjuſtly.

Mixt obligation, or an obligation both natural and civil, is that which, being founded in natural equity, is farther confirmed and enforced by civil authority.

There are alſo *perſonal* obligations, *hypothecary* obligations, obligations of goods, body, &c.

Obligation, in a more ſtrict ſenſe, denotes a bond containing a penalty, with a condition annexed, for payment of money at a certain time; or for performance of covenant, or the like. See Bond.

A bond, or obligation, is ſaid to differ from a bill, in that the latter is commonly without a penalty, and without condition. Yet a bill may be obligatory. Coke on Littleton.

Till the Conqueſt, writings were rendered obligatory by certain marks of gold croſſes, &c. The Normans firſt introduced the cuſtom of making bills and obligations with a print or ſeal in wax, ſet to every one's ſignature, atteſted by three witneſſes.

Obligation, *Moral*, or *Obligation of virtue*, in *Ethics*. See *Moral* Philosophy, and Virtue.

OBLIGATO, in the *Italian Muſic*, ſignifies *for*, *on purpoſe for*, or *neceſſary*, as *doi violini obligato*, on purpoſe for two violins; and ſo of other things, as *con fagotto obligato*, that muſt be played with a baſſoon, &c.

Sometimes it ſignifies confined, or reſtrained, by certain rules, ſubjected to certain limits or laws, in order to perform ſome particular thing, to give ſome particular expreſſion of a paſſion, action, &c. In this ſenſe we ſay, *contrapunto obligato*, *fuga obligata*, &c. We alſo ſay, the baſe is obligato, when it is only a ground of a certain number of bars, which are to be repeated over and over; ſuch is the baſe to chacones, &c. and every baſe in which airs are confined to a certain ſeries of notes often repeated to different trebles. See Ground.

OBLIGE', Fr. Obligato, Ital. the part of a compoſition ſaid to be obligato, is in general the principal treble; but it is likewiſe applied to any part which cannot be omitted without injuring the harmony, melody, and deſign. What

diſtinguiſhes

diſtinguiſhes it from all the other ſubordinate parts, that are only added to enrich the harmony, is, that if retrenched, the piece will be mutilated. Thoſe who perform the ripieno parts, may ſtop whenever they pleaſe, and the piece nevertheleſs will go on; but the performer to whom an obligato part is aſſigned, cannot ſtop a moment without being miſſed.

OBLIGEE, in *Law*, is the party to whom an obligation, or bond is made.

OBLIGOR, the party who enters into or executes an obligation, or bond.

OBLIQUATION, in *Catoptrics*. *Cathetus of obliquation* is a right line drawn perpendicular to a mirror, in the point of incidence, or reflection of a ray. See CATHETUS.

OBLIQUE, in *Geometry*, ſomething aſſant, indirect, or that deviates from the perpendicular.

OBLIQUE *Angle*. See ANGLE.

OBLIQUE-*Angled Triangle*, is that whoſe angles are oblique; *i. e.* either obtuſe, or acute.

OBLIQUE *Arches*. Whenever high roads run oblique to the courſe of any river, rivulet, drain, or canal, neceſſary to be paſſed over by a bridge, the direction of the *former* is generally varied ſo as to be rectangular to the courſe of the *latter*; unleſs in ſmall ſtreams, over which, when their courſe is not made to ſuit the road, there are ſeveral inſtances of the conſtruction of what are uſually termed *ſkew-bridges*. Theſe, with the exceptions which will be afterwards mentioned, have been built in the uſual manner of laying each courſe of ſtones or bricks of the arch parallel to the line of the abutment, and bevelling off their ends, on each exterior face of the arch, in a line correſpondent with the intended direction of the road over the bridge, as ſhewn in *fig.* 1. In this figure it is obvious, that ſo far as one abutment of the bridge extends beyond the rectangular line from the extremity of the other, ſuch a portion of arch, *viz. a b*, has no ſupport from the oppoſite abutment, unleſs what may be derived from the interlapping or breaking joint of the bricks or ſtones compoſing the arch; and from the goodneſs of the mortar, tending to cement them into one maſs: therefore, accordingly as theſe circumſtances have operated, and alſo in proportion to the ſmallneſs of the arch, in which the parapet covers a larger ratio of the unſupported part of it, the ſkew-bridges thus built have ſtood more or leſs firm, with an obliquity of 10° to 15° from a rectangle with the abutment; and in many inſtances, that portion of the arch has cracked or given way. Theſe circumſtances have prevented cautious builders from adopting this method; and induced them, in a few inſtances, to build the arch ſquare to its abutments, and run the parapets oblique, to coincide with the line of road; leaving alternate triangles of the arch on the outſide, which has a diſagreeable appearance, and has ſeldom been uſed; therefore, in general, unleſs the courſes of ſtreams or canals were made rectangular to the road, the line of the latter has been altered ſo as to admit of a direct paſſage over the water, which upon high roads, when not curved for a conſiderable diſtance, is inconvenient if not dangerous; and particularly ſo to travellers in the night time; from which cauſe the ſkew-bridges deſcribed were, with all their imperfections, occaſionally had recourſe to; and the writer of this article has never heard of any alteration in their form prior to the year 1787. At this time he had the direction of the county of Kildare canal, a branch from the Grand Canal of Ireland to the town of Naas.

In the courſe of conducting the work, ſeveral of the directors of that canal were anxious to have the line of the roads unvaried; therefore our author was led to conſider whether the uſual imperfect method could not be ſet aſide, by the ſubſtitution of one on ſound principles; and it then occurred that its leading feature muſt be, that the joints of the voiſſoirs, whether of brick or ſtone, ſhould be rectangular with the face of the oblique arch, in place of parallel with its abutment; and, conſequently, the bridges over the county of Kildare canal were made to ſuit the line of road, although the obliquity of one of them was carried to an extent beyond what he deemed eligible in practice, as will appear from the obſervations made on Finlay bridge, near the town of Naas, which deviated 51° from a rectangle with the canal, and conſequently formed the acute angle of 39° with its abutments. Its ſpan, in that oblique direction, was 25 feet, and its pitch 5 feet 6 inches, or nearly $\frac{2}{9}$ths of its ſpan. The plan of this bridge is given in *fig.* 2, and in *fig.* 3. the elevation of its arch, more to ſhew the extent to which it has been carried than to recommend its propriety; principally becauſe of the difficulty of forming the voiſſoirs of the impoſt courſe; and alſo, becauſe to retain the ſame breadth of roadway, the bridge muſt be enlarged as the ſecant of the angle of obliquity is to radius, *viz.* as *a b* to *a c*, which in the preſent inſtance is as 159° to 100°; likewiſe, for general purpoſes, one breaſt-wall on each ſide muſt be conſiderably extended to coincide with its oppoſite one, or nearly ſo; alſo, the impoſt courſe muſt be ſerrated, as ſhewn in the explanation of *fig.* 8; and as the lines, in which the beds of the voiſſoirs run, are obviouſly ſpiral lines, it follows that the ſoffit of each ſtone muſt be curved in that direction, and likewiſe it muſt be twiſted in its ſommering, which, although not inſuperable difficulties, are ſo in ſuch a degree, as, combined with the indented form of the impoſt, to render it adviſable to uſe bricks, both for the impoſt and arch, or at moſt to be contented with the uſe of ſtone only for the quoins and their neceſſary impoſts, in the forming of which intelligent ſtone-cutters will be requiſite, as will appear from *fig.* 3, where a part both of the intrados and extrados of the arch is ſhewn as viewed from an infinite diſtance, not being reduced in perſpective. It is there apparent that the head of each voiſſoir on that ſide of the arch where its face forms an acute angle with its abutment, muſt make an obtuſe angle with its ſoffit, decreaſing in their approach to the crown of the arch, and thenceforward becoming acute, and increaſing as they advance to the other impoſt, where the face of the arch forms an obtuſe angle with its abutment; therefore the different ſides of the ſame voiſſoir muſt form different angles of elevation or depreſſion from the rectangle with its head.

A geometric mode of forming each voiſſoir would be complicated, as will appear from the following diagrams, *viz.* let the lines *a b*, *b d*, and *d c*, in the diagram, *fig.* 4, include a portion of the ſpace to be covered by the arch, *a b* and *e d* being the lines of its abutments: then let the diſtance intercepted between *d b*, and its parallel line *x y*, which likewiſe extends between the abutments, expreſs the extent to be covered by any given number of the voiſſoirs forming that portion of the ſoffit, ſuppoſe every alternate one:—let the circular arcs raiſed upon each of theſe lines expreſs the elevation of the arch at each place reſpectively; *u* and *v* will then ſhew the crowns of their ſoffits. The line *t t*, drawn at right angles with the face of the arch, and with its reſpective extremities equidiſtant from the points *u* and *v*, will repreſent a joint on the ſoffit, which muſt neceſſarily be horizontal at its extremities; becauſe equidiſtant from the crown of each arc, although on alternate ſides; then if equal ſpaces on each ſide of the point, *t*, be ſet off on each reſpective arc, it will ſhew upon each where the joints of the ſame voiſſoirs will coincide. Four of theſe ſpaces in the

arc *d u b*, which repreſents the front of the arch, reach from *t* to *d*, *viz.* to the abutment on the ſide, where it forms an obtuſe angle with that front, whilſt the ſame number of ſimilar ſpaces *in the like direction* extend only from *t* to 4, in the arc *x v y*, repreſenting the internal end or extreme extent of the voiſſoirs ſeen on the face of the arch. The ſame circumſtances are reverſed on the ſide where the front forms an acute angle with the abutment, as ſhewn by the ſimilar references on the other ſide of *t t*: conſequently the joint 4, in front of the arch, will fall into the impoſt at *y* on the rear line. The radiating lines riſing above each arc, drawn from their reſpective centres *h* and *g*, ſhew the twiſt or different ſommering lines at each extremity of the ſame joint: the difference of theſe divergencies would be more clearly ſeen by exhibiting ſimilar lines upon the arc *r v s*, which repreſents that of *x v y*, upon the ſame level as the front arc *d u b*, preſerving an equal lateral diſtance between them, which as it may be eaſily conceived is left undone, becauſe they would interfere with the lines requiſite for the further explanation of the ſubject. The points, *r* and *s*, upon the laſt deſcribed arc, correſpond with *x* and *y* upon that for which it is ſubſtituted, every remaining letter or figure of reference being the ſame in both.

The vertical ſpaces on the acute ſide of the arch intercepted between 4 *s*, 3 3, &c. until they become horizontal at *t*, ſhew the proportionate depreſſion of the ſoffit of the joints they repreſent; and on the other ſide, *d* to 4, on the lower dotted arc; 3 3, &c. ſhew the riſe on each voiſſoir abutting on theſe points. The horizontal baſe between the extremities of each joint is ſhewn by the lines *d n*, *z m*, *k k*, &c. which extend between the chords *d b* and *x y*, from the points found by the interſection of the ordinates from the correſpondent numbers of their reſpective curves. The horizontal baſe, *k k*, is the only one that is rectangular to the chord of the arc; all the other baſes diverging towards that abutment which forms an obtuſe angle with the arch, and increaſing towards the haunches. At the firſt view of the diagram they appear to diverge both ways, but on inveſtigation it will be ſeen that the letter *n*, on the ſide of the acute angle, has reference to the front arc, and on the other ſide refers to that repreſenting the inner end of each joint. From theſe data we ſhall proceed to ſhew the longitudinal ſection or ſide elevation of a voiſſoir at *t t*, and other parts of the arch: *k k*, *fig.* 5, correſpondent with *k k*, *fig.* 4. but on a larger ſcale, expreſs the baſe of the voiſſoir, and *k r*, its height of face, or its width of bed, which latter may be aſſumed to be ſimilar in the others, *viz. d i*, *fig.* 6. and 4 *i* *fig.* 7. The riſe of the curve in the ſoffit between *k* and *k*, muſt obviouſly be equal to the difference between the ordinates *t k* and *u e*, *fig.* 4, becauſe the crown of the arch ſhewn by the line *v u*, muſt be interſected at half-way between *t*, *t*, the extremes of the voiſſoir; one end of the ſtone being on that ſide of the crown deſcending to the left, and the other extremity equidiſtant on the ſide deſcending to the right. The breaſt-wall is ſhewn riſing rectangular from this voiſſoir. *Fig.* 6. upon the principles already explained, ſhews on the ſide where the front line of the arch makes an obtuſe angle with its abutment, the voiſſoir riſing from the ſpringing point at *d* to 4, on the poſterior arc which correſponds with its inner extremity; and *fig.* 7. exhibits, on the ſide where the front is acute with its abutment, the bed of a voiſſoir commencing at 4, on the front arc *d u b*, and deſcending to the abutment at *s*, on the arc repreſenting the other extremity. By theſe diagrams it appears, that under equal widths of bed the ſpace between the intrados and extrados increaſes upon the face of the arch as the haunches of the arch are approached: therefore the rough blocks for the voiſſoirs muſt be increaſed in their breadth of face to allow for the further divergency of their ſommering lines, ariſing from their height of face, or difference between intrados and extrados, being increaſed as the ſecants of their angles of deviation from a rectangle with a line between each extremity of their ſoffit: *viz.* as *d z* is to *d i*, *fig.* 6, or 4 *r* to 4 *i* in *fig.* 7. And if the twiſt of the ſommering lines be attended to, the long voiſſoirs muſt have a ſtill greater width of block between their beds than the ſhort ones: therefore, previouſly to the fitting each ſtone to its individual place, as the work advances nothing more can eaſily be done than giving due allowance to the firſt of theſe variations, which will be ſufficient in practice where the arch, excepting its quoins, is formed of brick; becauſe the facility of making the brick ſheeting break joint with the ſtone voiſſoirs of the face, will render it unneceſſary to twiſt the beds of the latter, and with the precaution mentioned, and the neceſſary aid of a bevil rule with a moveable joint, and its long arm formed of ſhort jointed links to ſuit the curve of the ſoffit, in the direction of each ſtone and towards the haunches on each joint of it, the operations of fitting each voiſſoir to its place will not be difficult.

Fig. 6. ſufficiently ſhews the danger of the breaſt or face-wall ſliding outwards on the acute angles of the ſoffit; therefore, when the obliquity of the arch is carried near to that of Finlay bridge, which theſe diagrams repreſent, either the breaſt-wall ſhould be curved, where it forms an obtuſe angle with the abutment, or the voiſſoir ſhould have offsets, which may be of the breadth of a brick, if the wall be built of that material, to form a ſtop to its ſlipping forward, as ſhewn by the dotted lines under it in *fig.* 6.

We ſhall now point out ſome anomalies from the leading principle, which are neceſſary to be adverted to, for a due knowledge of the mode of conſtructing oblique bridges.

A ſemicircular arch obviouſly covers a ſemi-cylinder; and a leſſer portion of the arc of a circle will conſequently cover a ſimilar portion of it. If it be ſuppoſed, in either inſtance, that the cylindric ſegment, lying horizontally on its plane, with its axis in the direction of its abutments, is longer than neceſſary for the road-way over it, in any given oblique direction; we then, to obtain an oblique arch, have only to conceive the convex face of the cylindric ſegment to be cut down between two parallel vertical planes, in the direction required. But this arch, from the nature of cylindric ſections, will be elliptic; which is not ſo eligible in practice, becauſe of its quicker riſe at the haunches of the arch, the inconveniencies of which have already been explained; and they obviouſly militate not only againſt the elliptic form, but alſo any near approach to a ſemicircle.

We have obſerved that the leading principle of theſe oblique arches is, that each courſe of voiſſoir ſhould run rectangular to the face of the arch. This, however, muſt be taken in a limited ſenſe; becauſe if the ſheeting, or bed of the arch, were unfolded, or laid into a plane, its faces on the two extremities, bounding the paſſage over it, would not be ſtraight lines parallel to each other, like the parapet walls; but would form two curved lines, each convex where the line of the arch is acute with the abutment, and concave when it approaches the other ſide where the intercepted angle is obtuſe. This irregularity neceſſarily ariſes from the circumſtance, that each front line of the ſheeting, *m g p*, and *n h q*, *fig.* 8, in its courſe from the crown of the arch, in a direction oblique to *g h*, (the axis of the vault tranſverſe to the abutments,) muſt not, in its ſpiral gyration along the ſurface of the cylindric ſegment on each ſide of

g h,

g h, advance through equal ratios of the axis, in equal portions of the arc, but ſimply as the reſpective horizontal baſes of theſe portions: therefore its deviation from a line rectangular with the axis becomes progreſſively leſs in its approach to each abutment.

The greater or leſs curvature of the two faces of the arch, when drawn out as a plane, muſt depend on the greater or leſs pitch of the arch, as ſhewn in *fig.* 8; where *r s* and *t d* are the abutments of the bridge, and, conſequently, *r s d t* the baſe of the arch. The angle of obliquity is here 51°, as in the preceding diagram: the line *g h* paſſes along the crown of it; and the curved lines, *g m* and *h n*, terminated by the line *m n*, exhibit half the arch of Finlay bridge, drawn out as a horizontal plane; *m n* and *t d* being parallel to, and rectangular from each other; and their diſtances from the crown of the arch, *g h*, in their reſpective lines, *g m*, *h n*, and *g t*, *h d*, being in one the length of the ſemi-arc, and the other that of its baſe. On the other ſide of the line *g h*, the curved lines, *g p* and *h q*, connected by the right line *p q*, ſhew the form of half a ſemicircular arch of the ſame baſe, drawn out into a plane. In both exhibitions, it is clear that lines drawn perpendicular to different parts of the face of the arch, to ſerve as guide-lines to the joints of the ſoffit, would in one part converge to each other, and form triangles; and in the other part, where the face-line extended on a plane is concave, would diverge, ſo as, in both inſtances, to occaſion great irregularity and difficulty in cloſing of the arch; which actually takes place in practice, unleſs due attention be paid to its leading principles, which have been pointed out in the explanation of *fig.* 4, ſo far as that diagram enabled them to be; which, although not to the extent requiſite for the conſtruction of the arch, may be made perfectly comprehenſible to any practical man, by attention to the following inſtructions, *viz.* after the centres, which are placed parallel to the face of the arch, and diagonally to its abutment, are put up, and covered with their plank-ſheeting, carefully ſet off their bounding-lines, *m p* and *q n*, as in any other arch; ſo that every part of theſe face-lines ſhall be perpendicular to, or directly under, a horizontal line ſtretched from *r* to *t*, or from *s* to *d*, upon the level of the crown of the arch. Then, equidiſtant from each abutment, *viz.* along the crown of the arch, ſtrike the line *g h*, which will of courſe be a ſtraight line. Divide it into any given number of equal parts: if very oblique, ten or twelve may be ſufficient; and in arches of ſmall obliquity, a few diviſions will do. The preſent diagram (*fig.* 8.) is more oblique than will probably be adopted; but the ſcale being minute, the line *g h* is divided into only ſix parts, as the purpoſe of explanation will be equally well attained.

The figures 1, 2, 3, &c. in ſucceſſion from *h* to *g*, ſhew the diviſions on that line; and *a*, *b*, *c*, &c. exhibit correſpondent ſpaces cloſe to each abutment. Theſe diviſions being made, ſet out, on the ſheeting, ſo many parallel lines to the outer faces, *m g p*, and *n h g*, *viz.* *a* 1 *a*, *b* 2 *b*, &c.: *k* 1 repreſents a line of joint near the crown of the arch, and rectangular to its face; which commencing at the diſtance of *h k*, will interſect *h g*, the line of the crown, at the diſtance of *h* 1, from the face of the arch; and will repreſent half the line, *t t*, in diagram, *fig.* 4.

By the theory laid down for theſe arches, the joints on their ſoffit are to run parallel to each other; or rather they are to interſect equal portions of parallel equidiſtant arcs, ſtanding in a line oblique to their common axis. This end may obviouſly be obtained, by ſetting off on each face of the arch, and on each of the parallel equidiſtant lines, *a* 1 *a*, *b* 2 *b*, &c. ſpaces ſimilar to *h k*, in ſucceſſion after each other from the points *h* 1, 2, 3, 4, 5, and *g*, towards each abutment; and then to mark upon the ſheeting ſtrong lines, to direct the courſe of the joints, ſuch as ſhewn by *k* 1, 1 *u*, *u v*, &c. which will form a polygonic curve, more or leſs approaching to a regular curve, according to the obliquity of the arch, and its approximation to a ſemicircle, and the number of diviſions between *h* and *g*. The horizontal baſes of the ſoffit joints near the abutments, on each ſide of the arch, are, as ſhewn in *fig.* 4, inclined from the line of the face towards that abutment which forms with it an *obtuſe* internal angle: notwithſtanding which, theſe joints, when drawn on the plane of the ſheeting, deviate from the rectangle, with its face line *towards* the abutment which forms an *acute* internal angle with the line of the arch, and *from* the abutment on the oppoſite ſide, as ſhewn by thoſe lines in *fig.* 8.

Theſe excentricities, although they render it difficult to form all the voiſſoirs prior to the commencement of the arch, are eaſily got over by forming them in ſucceſſion, as deſcribed.

As the lines, *a* 1 *a*, *b* 2 *b*, &c. over the curve of the arch will be rather troubleſome to form correctly, the beſt mode in practice will be to mark off on each face, and each ſide of the arch, a continuation of the ſpaces, *q i* and *h k*, towards each abutment. Then as the progreſſive correſpondent points from *g* and *h*, *viz.* *i f*, *o l*, &c. will have right lines between them, ſtraight chalk-lines can eaſily be ſtruck; and when the ſpaces, *h* 1, *h* 2, &c. are ſet off upon each of them, the interſecting points ſimilar to *u*, *v*, *x*, &c. will be found the ſame as upon the lines *a* 1 *a*, *b* 2 *b*, which, therefore, have no occaſion to be formed.

Had the number of diviſions on the line *h q* been greater, the curvature of the joint lines would have appeared more material on that ſide of the diagram, exhibiting a ſemicircular arch expanded; but on the other ſide, where the arch is of the flat pitch deſcribed, but with great obliquity, the deviation from right lines is ſo much leſs ſo, that in brick-work the joint-lines may eaſily be followed. In ſimilar arcs of moderate obliquity, the divergency is of courſe leſs; but yet it will, unleſs the arch approach within about 20° of a rectangle with its abutments, be ſufficient to occaſion conſiderable irregularity, if the joint-lines be continued acroſs, rectangular from either face.

We had frequent opportunities of ſeeing, for ſeveral years after it was built, the bridge from which moſt of the diagrams have been drawn, and never obſerved any crack in it; but yet from the uncertainty of obtaining careful and intelligent overſeers, and good materials, and likewiſe becauſe of the greater expence, and not having inveſtigated the ſubject in all its bearings, ſo as to lay down ſufficiently plain inſtructions, we did not then, in ſeveral bridges over the Grand Canal of Ireland, which we directed to be built obliquely, and in other bridges, ſubſequently, over wide drains in the Eaſt Riding of Yorkſhire, venture to exceed 40° of obliquity, and rarely 30°, although the angle of interſection of the road and water was generally more conſiderable. It is clearly evident that this extent of angle would often be highly uſeful, as it would rarely leave much to be made up by the deviation of the road from its uſual direction. The wing-walls of Finlay bridge were curved one more than the other on the ſame ſide, to give a paſſage along each bank of the canal; but where not over a canal, if the line of direction of the road coincide with that of the bridge, the wing-walls may terminate more nearly ſquare with the road, or completely ſo, as in *fig.* 9, which ſhews one of theſe bridges under an obliquity of about 40°, with the *arch uncloſed*, ſo as to ſhew the wood ſheeting ſupporting

it,

it, and the mode of closing it without unequal pressure on each side of the centres.

From what has already been explained, it necessarily follows that each impost of the arch, in place of being simply sommered to the radiating line of the incumbent curve, must also, as appears in *fig.* 3, be serrated (as shewn between *e* and *e*, *fig.* 8.) to suit the adjoining bed of the stones, or bricks, forming the arch.

The casual utility of these arches is obvious, and the theoretic and practical mode of forming them has been explained to such extent, as to make the process easy to any intelligent mason. Since the period we have mentioned, the plan has in a few instances been followed; and the same idea may have occurred to others, although we have never heard of it.

The principal use of these bridges will be where lines of projected canals intersect high roads with obliquity; in which case, the road, if curved for a sufficient extent to fall in with a rectangular passage over the canal in so gentle a manner as it ought, would require a considerable length of double curve, *viz.* alternately outwards and inwards on one side, or both, accordingly as the bridge might be placed, an instance of the latter of which is shewn in sketch N° 10. Under this predicament, where the land is valuable, or houses interfere to interrupt the change of road, it may often be found advantageous, because more economical to incur the increase of expence attendant on the construction of an oblique bridge; which, under moderate angles of departure from the right line across, is not very material; and where it becomes so, will sometimes be greatly inferior to the advantages acquired by it. We have been indebted for the preceding article to — Chapman, esq a well-known and ingenious engineer, to whom we have already referred under the article CANAL.

OBLIQUE *Circle*, in the stereographical projection of the sphere, any circle that is oblique to the plane of projection.

OBLIQUE *Leaf*, in *Botany*, is so twisted, that one part becomes vertical, while the other is horizontal. The term *obliquum* is sometimes, less correctly, applied to a leaf unequal at the base, or sides, as in *Begonia* and *Eucalyptus*; in both which it was unfortunately chosen for a specific name, being afterwards necessarily changed, when the character proved common to almost every species of those now numerous genera.

OBLIQUE *Line*, a line which, falling on another, makes an oblique angle.

A line falling obliquely on another makes the angle on one side obtuse, and that on the other acute.

OBLIQUE *Percussion*, is that wherein the direction of the striking body is not perpendicular to the body struck, or is not in a line with its centre of gravity. See PERCUSSION.

The ratio an oblique stroke bears to a perpendicular one, is demonstrated to be as the sine of the angle of incidence to the radius.

OBLIQUE *Planes*, in *Dialling*, are such as recline from the zenith, or incline towards the horizon.

The obliquity, or quantity of this inclination, or reclination, is easily found by a quadrant; it being an arc of some azimuth, or vertical circle, intercepted between the vertex of the place and of that plane. This azimuth, or vertical circle, is always perpendicular to the plane. See DIALLING.

OBLIQUE *Powers* or *Forces*. See MOTION, DIRECTION, &c.

OBLIQUE *Projection*, in *Mechanics*, is that where a body is impelled in a line of direction, which make an oblique angle with the horizontal line. See PROJECTION.

OBLIQUE *Sailing*, in *Navigation*, is when the ship, being in some intermediate rhumb between the four cardinal points, makes an oblique angle with the meridian, and continually changes both its latitude and longitude.

Oblique sailing is of three kinds; viz. *plain sailing*, *Mercator's sailing*, and *great circle sailing*. See SAILING.

The seamen also call the application of the method of calculating the parts of oblique plain triangles, in order to find the distance of a ship from any cape, head-land, &c. by the name of oblique sailing.

OBLIQUE *Sphere*, in *Geography*, is that whose horizon cuts the equator obliquely; and one of whose poles is raised above the horizon, by an elevation equal to the latitude of the place.

It is this obliquity that occasions the inequality of days and nights.

Those who live under an oblique sphere (as we, and all those in the temperate zone, do) never have their days and equal, except in the equinoxes.

OBLIQUE *Ascension*, in *Astronomy*. See ASCENSION.

OBLIQUE *Descension*. See DESCENSION.

To find the oblique ascension and descension by the globe, see GLOBE.

OBLIQUE *Cases*, in *Grammar*, are all the cases of the declensions of nouns, besides the nominative. See CASE.

OBLIQUE *Distillery*, in *Chemistry*. See DISTILLATION.

OBLIQUE *Flanks*, in *Fortification*. See FLANK.

OBLIQUITY, that which denotes a thing *oblique*.

The obliquity of the sphere is the cause of the inequality of the seasons of nights and days.

OBLIQUITY *of the Ecliptic*, is the angle which the ecliptic makes with the equator. See ECLIPTIC.

OBLIQUO, in the *Italian Music*, signifies two breves tied together, which make but one body, whence it is named in Italian *nota d'un corpo solo*; sometimes there is a tail, on the right or left side, either ascending or descending. (See NOTE and LIGATURE.) However it be, the two extremes mark the sound, the middle serves only to tie them, thus:

OBLIQUUS, in *Anatomy*, an epithet applied to several muscles of the human body.

The *obliqui abdominis* are two large muscles of the abdomen. As the muscles of this part are much connected together, and cannot be well understood, when described in an insulated way, we shall give an account of the whole in this article.

The sides or parietes of the abdominal cavity are composed almost entirely of muscles: the diaphragm separates it above from the chest, (see DIAPHRAGM.) and the levator ani shuts it up below (see INTESTINE). At the front and sides its boundaries are formed by the *abdominal* muscles properly so called, which fill up all the space between the inferior aperture of the chest and the superior margin of the pelvis. The contractions of these muscles change the dimensions and form of the abdomen, move the viscera in different directions, and execute many of the movements of the trunk. The details concerning these points will be found in the present article, in those just referred to, and in the article LUNGS.

The abdominal muscles are five on each side of the body: three of these are very broad, and placed in succession, one within the other, at the side of the abdomen. They end in front, in broad and thin aponeuroses or sheets of tendon, which occupy all the front of the trunk between the chest and pelvis. The formation of these muscles is therefore peculiar, and the peculiarity arises from their being placed on

the ſurface of a cavity, and having an expanſion in breadth neceſſary to cover that cavity. Their aponeuroſes form a firm ſupport and protection to the contained viſcera. In tracing the aponeuroſes of the three lateral muſcles from the ſide, towards the middle of the abdomen, we find them ſeparating from each other, ſo as to form a tendinous ſheath, diſpoſed lengthwiſe on the front of the abdomen, and including the rectus and pyramidalis abdominis; they then unite again, and are firmly interwoven, along the middle line of the abdomen, with thoſe of the oppoſite ſide, to form the linea alba, which is conſequently a common point of inſertion for the three broad muſcles of each ſide.

When the integuments are ſtripped from the front of the belly, the expoſed ſurface is entirely aponeurotic, between two perpendicular lines, drawn from the anterior ſuperior ſpines of the oſſa innominata to the correſponding points of the cheſt. The *linea alba* is a white depreſſed line, running perpendicularly along the middle of the belly, from the enſiform cartilage to the pubes, and ſeparating from each other the right and left recti and pyramidales. It is made up of tendinous fibres, cloſely compacted, and interwoven with each other. It is fixed above to the enſiform cartilage, below to the ſymphyſis pubis; its anterior ſurface is covered by the ſkin, the poſterior by the peritoneum. Its ſides are the points of attachment of the broad muſcles of the abdomen. A little below its middle, there is a round opening in it, called the navel or umbilicus. Through this the veſſels of the umbilical chord paſs in the fœtus, and the fibrous remains of the ſame veſſels occupy it after the chord has been ſeparated. The aperture is larger at the former period: it gradually diminiſhes in ſize after birth, and is filled by a denſe ſubſtance with the remains of the veſſels already mentioned, to which an inflected cicatrix of the ſkin firmly adheres. In umbilical ruptures the contents of the abdomen are generally protruded at this opening. The linea alba varies in breadth at different parts. At the enſiform cartilage the recti nearly touch each other: but they diverge below this point, ſo that the line is about half or three quarters of an inch broad at the navel. It again grows narrower below the navel, and is a mere line for ſome inches above the pubes.

On each ſide of the linea alba the aponeuroſis is elevated by the recti muſcles; and a ſemilunar line is deſcribed by the outer margin of each of theſe, where the aponeuroſes ſeparate, in order to include the rectus: hence ariſe the two *lineæ ſemilunares* of the abdomen, the right and left. There are three or four ſhorter lines placed tranſverſely, and croſſing from the linea alba to the ſemilunaris on each ſide: they are formed by the adheſion of the aponeuroſis to the tendinous interſections of the recti, and are ſometimes called *lineæ tranſverſæ*.

The *obliquus externus abdominis* (obliquus deſcendens, grand oblique, coſto-abdominien) is the largeſt and moſt ſuperficial of the abdominal muſcles, of inconſiderable thickneſs in compariſon to its breadth. It extends from the lower and anterior part of the cheſt to the criſta of the ilium, and to the pubes; and from the lumbar region behind to the linea alba in front. We conſider in it an external and an internal ſurface, and four edges.

The external ſurface is covered by the ſkin, except for a ſmall extent behind, where the latiſſimus dorſi lies on it: a conſiderable ſtratum of fat lies between the integuments and this muſcle. The internal ſurface covers the anterior part of the ſeven or eight lower ribs, and of their cartilages, the intercoſtal muſcles, the upper part of the rectus, the obliquus internus, the cremaſter muſcle and ſpermatic chord. A thin ſtratum of cellular tiſſue ſeparates it from the obliquus internus behind; but in front the aponeuroſes are blended into one layer in the greateſt part of their breadth.

The front edge of the aponeuroſis is attached to the linea alba in its whole length: the poſterior margin of the muſcle is extended from the cartilage of the laſt falſe rib to the criſta ilii, and is unattached: it is covered by the latiſſimus dorſi.

The ſuperior edge may be divided into two parts: the anterior, which is ſhort, extends horizontally from the ſeventh or eighth rib to the middle of the enſiform cartilage, and is covered by and connected to the pectoralis major; the poſterior is much longer, directed obliquely downwards and backwards, and commonly called the origin of the muſcle. This part is attached to the ſeven or eight lower ribs, and ſometimes only to ſix, by an equal number of angular portions, of different length and breadth, ſeparate from each other, and called digitations. The middle portions are broader and longer than the ſuperior and inferior. We may diſtinguiſh in each an upper and lower edge and a point: indeed they exactly reſemble the teeth of a ſaw on a large ſcale. The upper margin is fixed to the bony part of the rib, obliquely from above downwards, and from before backwards: and the fibres meet, in the four or five ſuperior ones, with thoſe of the lower margins of the ſerrated portions of the ſerratus magnus: the lower margin is connected by cellular tiſſue to the upper edge of thoſe ſerrated portions. The apex is generally elongated, and fixed to the under edge of the rib. The four or five ſuperior digitations of the obliquus externus are received into the intervals of the origin of the ſerratus. The three or four lower pieces are covered by the latiſſimus dorſi, and decuſſate with it. The firſt digitation is fixed near the cartilage of the rib; but the ſucceeding ones recede farther and farther from this point to the fifth; from which they again advance to the front of the ribs, ſo that the laſt ariſes from the cartilage as well as from the bone. It will follow from this deſcription that the breadth of the obliquus externus is greateſt at its middle, and that it becomes narrower from this part towards either the upper or lower edge.

The inferior margin is fixed, by fleſhy and aponeurotic fibres, to the anterior third part of the outer edge of the criſta ilii: from the ſpine of the bone it is extended, nearly in a ſtraight line, over the broad concavity in the front of the os innominatum, to the pubes, to which it is attached, and it is connected between thoſe two points to the faſcia lata of the thigh.

The muſcle is compoſed of fleſhy fibres, and an aponeuroſis; a line drawn perpendicularly from the cheſt to the anterior ſuperior ſpine of the ilium would very nearly mark the diſtinction, all in front being aponeurotic, and all behind muſcular. The latter fibres vary in length and direction; the upper ones are the ſhorteſt, and nearly horizontal, they grow longer to the middle, and paſs from above forwards and downwards: the lower ones become again ſhorter, and their direction is nearly vertical. The two inferior digitations end in the criſta ilii; but all the reſt terminate in the aponeuroſis.

The latter is broader below than above; it is thin, but ſtrong, and made up chiefly of oblique fibres, following the ſame direction as thoſe of the muſcular part: ſome weaker fibres occaſionally croſs theſe. Irregular openings in it ſerve to tranſmit ſmall nerves and blood-veſſels. That part of the aponeuroſis, which is ſtretched from the ilium to the pubes, is thicker and ſtronger than the reſt, and is deſcribed, as if it were a diſtinct part, under the name of Fallopius's or Poupart's ligament, or the crural arch. By the attachment of the faſcia lata it is firmly

braced

braced down on the ſubjacent organs, and it is rendered a litle convex towards the thigh. When the limb is extended and rolled outwards, the aponeuroſis is drawn as much as poſſible downwards, and rendered tenſe: by bending and rotating the thigh inwards, it is relaxed. Through the ſpace under the crural arch, the pſoas magnus and iliacus internus, the anterior crural nerve, the femoral artery and vein, and the great abſorbent trunks of the lower limb, paſs. For a more particular account of the crural arch, ſee the article HERNIA, under the diviſion *Crural hernia:* and for the attachment of the faſcia lata to it, ſee FASCIA.

When the aponeuroſis approaches the pubes, it ſeparates into two portions, which conſtitute the pillars or columns of the abdominal ring. The upper or inner of theſe is fixed to the ſymphyſis pubis, decuſſating with the correſponding one of the oppoſite ſide: the lower or outer (which is indeed the above-mentioned ligament of Poupart, or the crural arch) is attached to the ſpine and criſta of the bone. The ſeparation of theſe tendinous columns leaves a triangular ſpace, called the abdominal ring, or ring of the external oblique muſcle. The pubes conſtitutes the baſe of the triangle, the two pillars form its ſides; and the apex is the part at which theſe ſeparate from each other. It is not however pointed; ſince ſome tranſverſe fibres, which connect the two columns together, round off this upper part of the opening. The abdominal ring is directed obliquely upwards and outwards; the upper part of it pointing towards the ſpine of the ilium: this part is often mentioned under the name of the external angle of the ring. The baſe of the triangle is ſituated downwards and inwards, with reſpect to the apex; and the two ſides, of which one is external and the other internal, are continued from the apex obliquely downwards and inwards to the baſis.

The ſpermatic chord and round ligament of the uterus, and the contents of inguinal hernia or bubonocele, paſs through this opening.

The *obliquus internus abdominis* (obliquus aſcendens, petit oblique, ileo-abdominien) is ſmaller than the former, under which it is placed at the lateral and anterior part of the belly. It extends from above downwards from the lower edge of the cheſt to the upper margin of the pelvis; and from before backwards from the vertebral column to the linea alba. It is broad and thin, and much narrower behind than in front.

The external ſurface is covered behind by the latiſſimus dorſi, and in the reſt of its extent by the obliquus externus. Its internal ſurface lies on the common maſs of the ſacro-lumbalis and longiſſimus dorſi, on the tranſverſus, and the rectus.

The inferior edge of this muſcle, or its origin, is fixed to the anterior three-fourths of the criſta ilii, between the obliquus externus and the tranſverſus, and to the outer half of the poſterior ſurface of the crural arch, by fleſhy fibres. From the latter it is extended, behind the ring of the obliquus externus to the pubes, to which it is attached. Between the latter bone and the crural arch the edge of the muſcle is unattached; the ſpermatic chord paſſes under it, and receives a thin faſciculus of fibres from it, conſtituting the *cremaſter* muſcle, which ſee. In the female the round ligament of the uterus takes the ſame courſe.

The back edge is connected by an aponeuroſis, common to it with the ſerratus poſticus inferior and latiſſimus dorſi, to the ſpines of the lumbar vertebræ and ſacrum. The upper margin is attached by fleſhy fibres to the cartilages of the four lower falſe ribs, and is continuous, at the two laſt intercoſtal intervals, with the internal intercoſtal muſcles. At the edge of the rectus it becomes aponeurotic, and divides into two layers; an interior going in front of that muſcle, and united to the aponeuroſis of the obliquus externus; and a poſterior paſſing behind it, fixed to the cartilage of the firſt falſe, and the laſt true rib, as high as the enſiform appendix, and confounded with the aponeuroſis of the tranſverſus. The front edge of the muſcle is fixed to the whole length of the linea alba.

The obliquus internus is compoſed of a poſterior and an anterior aponeuroſis, and of muſcular fibres between theſe. The former is attached to the back of the criſta ilii, and to the ſpines of the ſacrum and lumbar vertebræ. The muſcular fibres ariſe from the poſterior aponeuroſis, from the criſta ilii, and from the crural arch, and are, for the moſt part, directed obliquely upwards and forwards; the lower ones however approach to the horizontal direction, and the very loweſt go a little downwards. They all end in front in a broad aponeuroſis, which commences farther forward on the abdomen than that of the obliquus externus. This aponeuroſis, at firſt ſimple, divides at the edge of the rectus into two layers, an anterior, which becomes inſeparably connected to that of the obliquus externus; and a poſterior, joined in the ſame way to the aponeuroſis of the tranſverſus. The rectus is interpoſed between theſe, both of which end at the linea alba. The lower fourth part of the aponeuroſis goes entirely in front of the rectus; and its inferior end is fixed to the pubes.

Tranſverſus abdominis, (tranſverſalis, lombo-abdominien.) This, like the preceding, is a very broad and thin muſcle, much broader before than behind, placed under the two obliqui, at the ſide and back of the abdomen, extending from the lower edge of the cheſt to the upper edge of the pelvis, and from the lumbar vertebræ to the linea alba. Externally it is covered, in nearly its whole extent, by the obliquus internus; the common maſs of the ſacro-lumbalis and longiſſimus dorſi, the ſerratus inferior poſticus, and the latiſſimus dorſi, cover a ſmall part of it behind. The internal ſurface is in contact with the peritoneum, with the faſcia tranſverſalis, and, for a ſmall ſpace, with the front of the rectus, and of the pyramidalis. The ſuperior edge is fixed, by ſeparate fleſhy attachments, to the internal ſurface of the cartilages of the 6th and 7th true, and of all the falſe ribs; theſe meet, on the cartilages, with the origins of the diaphragm. It is continuous above with the triangularis ſterni. The poſterior edge is attached to the tranſverſe and ſpinous proceſſes of the four upper lumbar vertebræ. The lower margin is fixed to the inner edge of the criſta ilii, and to the outer half of the crural arch. From the latter it is ſtretched, juſt behind the obliquus internus to the pubes; here indeed the two muſcles are generally ſo cloſely connected, that they can hardly be ſeparated without cutting through the fibres. The front edge terminates in the whole length of the linea alba. The tranſverſus is compoſed of an anterior and poſterior aponeuroſis, and of muſcular fibres between them.

The poſterior aponeuroſis conſiſts of three portions; a middle, which is thickeſt, and fixed to the tranſverſe proceſſes of the lumbar vertebræ, behind the quadratus lumborum; an anterior, which is very thin, and goes in front of the quadratus to the ſame proceſſes; and a poſterior, which joins the common aponeuroſis of the latiſſimus dorſi, ſerratus inferior, &c. The muſcular fibres are all horizontal, and parallel, excepting the inferior, which deſcend a little; they paſs from the cartilages of the ribs, from the poſterior aponeuroſis, from the criſta ilii, and from the crural arch to the anterior aponeuroſis. The middle ones are the longeſt, and the length diminiſhes from above downwards. The anterior aponeuroſis commences by a ſemilunar edge, of which

the convexity is turned outwards; it proceeds, together with the poſterior layer of the obliquus internus, behind the rectus to the linea alba; but it is ſplit tranſverſely at about the midway between the navel and pubes, and the lower part goes over the rectus to the linea alba: this is inſerted below in the pubes.

Faſcia tranſverſalis.—Behind the crural arch, the inferior edge of the obliquus internus and tranſverſus is placed, extending from the middle of that arch to the pubes, and covering behind a part of the ring of the external oblique. A thin faſcia, called tranſverſalis, is extended from the crural arch behind the tranſverſus muſcle, on the ſurface of which it is gradually loſt. By this the ring of the external oblique is cloſed towards the abdomen; and, but for this there would be a direct opening into the belly behind that ring; it alſo ſhuts up the ſlit under the inferior edges of the muſcles juſt mentioned. It conſiſts of a thin and delicate expanſion, yet has often a very diſtinct fibrous texture near the crural arch. If we trace it from this part upwards, we ſhall find it divided immediately into two portions, an internal and external, which have between them a conſiderable interval, juſt in the middle of the crural arch. The former of theſe is connected, by its inner edge, to the outer margin of the rectus abdominis, and to the inferior margin of the tendon of the obliquus internus and tranſverſus; and both are gradually loſt above between that muſcle and the peritoneum. The poſterior ſurface of this aponeuroſis is lined by the peritoneum.

The diviſion of the faſcia tranſverſalis into two portions would leave a wide opening above the crural arch; but the lower part of the obliquus internus and tranſverſus ſhuts up this, except in a ſmall part in the immediate neighbourhood of the arch. Through this aperture the ſpermatic veſſels, and round ligament of the uterus, eſcape from the abdomen; they then go obliquely downwards and forwards, between the faſcia and the aponeuroſis of the external oblique, and finally emerge through the opening in the tendon of the external oblique.

If, under the term abdominal ring, we include the whole paſſage through the abdominal parietes, we muſt deſcribe it as a canal, and not as a ſimple opening. The upper or inner aperture (formed by the faſcia tranſverſalis, and the lower border of the internal oblique and tranſverſus muſcles,) is rather nearer to the pubes than to the ilium; the lower or outer opening is the triangular aperture in the obliquus externus; and the canal itſelf extends obliquely between theſe points, being cloſed in front by the aponeuroſis of the external oblique, and behind by the faſcia tranſverſalis.

The *rectus abdominis* (ſterno-pubien) is a long muſcle, of a flattened figure, meaſuring about three fingers' breadths acroſs, and extending along the front of the abdomen, from the cheſt to the pelvis. Its anterior ſurface is covered above by the aponeuroſis of the obliquus externus, in the greateſt part of its extent by the anterior layer of the obliquus internus, and below by the tranſverſus and pyramidalis. The poſterior ſurface covers the cartilages of the three laſt true ribs, a ſmall part of thoſe of the two firſt falſe ribs, the enſiform cartilage, the poſterior layer of the internal oblique, the internal mammary and epigaſtric arteries, and, at the lower part, the peritoneum. Thus the rectus is incloſed in an aponeurotic ſheath, in which we diſtinguiſh two layers. The anterior is formed in its upper three-fourths by the aponeuroſis of the obliquus externus, with the anterior layer of that of the obliquus internus; and it is connected above with the pectoralis major. The inferior fourth part is formed by the aponeuroſis of the obliquus externus, with the whole of that of the internus, and tranſverſus. The poſterior layer is compoſed of the poſterior layer of the obliquus internus, and by the tranſverſus. In the lower fourth part this layer is deficient, and the muſcle reſts on the peritoneum. The anterior layer is connected to the muſcle by cellular tiſſue, except at its tendinous interſections; and the poſterior by a looſe cellular texture.

The ſuperior extremity conſiſts of three fleſhy portions attached to the cartilages of the three laſt true ribs; it deſcends along the front of the abdomen, ſeparated from the oppoſite muſcle only by the linea alba. It preſerves its original breadth through the upper three-fourths of its length, then is contracted by a ſloping inwards of its outer edge, and terminates in a flattened tendon, inſerted in the upper part of the pubes behind thoſe of the three broad abdominal muſcles.

The fleſhy fibres of the rectus are interrupted on the front by tranſverſe portions of tendon, extending from one ſide to the other, called tendinous enervations or interſections, and varying from three to five. One is oppoſite to the navel, one below, and two or three above; or that below the navel may be wanting. The latter of them extends only half way acroſs. Their breadth varies, but does not exceed a quarter or half an inch; and their direction is zigzag. The front layer of the tendinous ſheath adheres ſo cloſely to theſe interſections, that it cannot be ſeparated without cutting them.

The *pyramidalis* (pubo-ombilien) is a ſmall muſcle of a triangular figure, placed at the lower and middle part of the abdomen, and extending from the pubes to the linea alba. Its baſis is placed downwards, and attached by fleſhy fibres to the upper and front part of the pubes, in front of the rectus. Its internal edge is parallel to the linea alba, to which it is attached in its upper third part, and is ſeparated by that line from the oppoſite muſcle. The outer margin is oblique from below upwards. Nearly the whole of the muſcle is fleſhy. The internal fibres are the ſhorteſt, and they gradually increaſe in length towards the outer edge. The aponeuroſis of the obliqui and tranſverſus cover it in front; and it covers behind the inferior extremity of the rectus.

The pyramidalis varies conſiderably in ſize; and ſometimes is altogether deficient; ſometimes it is found on one ſide only.

Motions produced by the abdominal Muſcles.—Theſe organs may be conſidered as protecting the abdominal viſcera, and as the cauſe of various movements affecting the cheſt, abdomen, and pelvis.

The firmneſs of their reſiſtance in front depends much on the broad aponeuroſes which cover this part of the abdomen; when theſe are rendered tenſe by the action of the abdominal muſcles, violent blows can be ſupported without injury; but an inconſiderable ſtroke will produce very ſerious effects when the parts are relaxed. Bichat regards the pyramidalis as a tenſor of theſe aponeuroſes. The thickneſs of the muſcles at the ſides, and the different courſe of their fibres, make them a very effectual protection for the viſcera, and the muſcles of the vertebral hollows are added behind.

If the pelvis and cheſt are fixed, the abdominal muſcles contract the cavity of the belly, and preſs on the viſcera: the tranſverſus and internal oblique have the greateſt effect in this way. The rectus and the external oblique cannot concur any further than when they repreſent ſtraight lines from the cheſt to the pelvis. The enlargement and diminution of the abdomen go on almoſt entirely in front; the belly riſes at that part in inſpiration and ſinks again in expiration. In this function all the abdominal viſcera are conſtantly changing their poſition from the action of the diaphragm and abdominal muſcles. See the deſcription of the motions of the cheſt, in the article LUNGS.

The abdominal muſcles concur further in expiration by drawing the ribs downwards; the tranſverſus approximates them horizontally. In this caſe we ſuppoſe the vertebral column to be fixed; but if the latter be moveable, the cheſt will be bent forwards upon the pelvis. This flexion is direct if the right and left recti, pyramidales, and obliqui act together (the tranſverſi have no concern in it); the trunk is bent laterally if the muſcles of one ſide act ſeparately. The obliquus externus, by drawing the ribs downwards and forwards, twiſts the trunk to the oppoſite ſide; the obliquus internus to its own ſide; the rectus and pyramidalis will alſo incline it to the ſame ſide. The ſterno-cleido-maſtoidei generally act with the recti to fix the ſternum; and the recti act with them for the ſame purpoſe; thus, if a perſon lying down attempt to raiſe his head, and bend it forwards, the recti become quite tenſe.

The abdominal muſcles will move the pelvis on the cheſt, if the latter part be fixed; and either directly, or obliquely, accordingly as thoſe of both ſides act together, or as they act ſeparately on one ſide. This effect may be obſerved in climbing, tumbling, &c.

Obliqui *Arytenoidei*, a name given to ſome ſlender muſcular fibres in the larynx. See Larynx.

Obliquus *capitis inferior* (grand oblique, atloido-axoidien). This muſcle is placed at the upper and back part of the neck, between the ſpinous proceſs of the ſecond vertebra, and the tranſverſe proceſs of the firſt; it is elongated, and nearly round, larger in its middle than at the extremities. Ariſing at the ſide of the point of the ſpinous proceſs of the vertebra dentata, below the rectus major, it goes obliquely outwards, forwards, and upwards, and is fixed to the poſterior and inferior part of the tranſverſe proceſs of the atlas. Its two extremities are more or leſs tendinous; and the reſt of the muſcle is fleſhy. Its anterior ſurface covers the ſecond vertebra of the neck, and the vertebral artery; the muſcle is covered behind by the complexus.

The obliquus inferior, by drawing the tranſverſe proceſs of the atlas to the ſpinous proceſs of the ſecond vertebra, rotates the atlas on the latter bone. In this motion the head is carried along with the atlas; and the face is turned towards the ſhoulder of that ſide, on which the muſcle reſts.

Obliquus *ſuperior capitis* (petit oblique, atloido-ſous-maſtoidien). This is a ſmall flattened muſcle, at the upper, back, and lateral part of the neck, extending from the tranſverſe proceſs of the atlas to the occiput. Its inferior extremity is fixed to the upper and back part of the apex of the tranſverſe proceſs of the atlas, in front of the preceding muſcle, to which it is united. It paſſes upwards, backwards, and a little inwards, and is fixed to the outer part of the occiput. Its extremities are tendinous, and the middle is chiefly muſcular. Its poſterior ſurface is covered by the trachelo-maſtoideus, ſplenius, and complexus; and its anterior ſurface covers the vertebral artery and the occiput. It extends the occiput on the atlas, and inclines it to one ſide.

Obliquus *oculi ſuperior*,
Obliquus *oculi inferior*, } two muſcles of the eye. See Eye.

OBLIZESZTI, in *Geography*, a town of Walachia; 40 miles E. of Buchareſt.

OBLONG, in *Geometry*, a figure longer than it is broad. Thus a rectangled parallelogram, whoſe ſides are unequal, is an oblong: ſo an ellipſis is alſo an oblong.

OBNUNCIATION, Obnunciatio, in *Roman Antiquity*. See Nunciation.

OBOCZ, in *Geography*, a town of the duchy of Warſaw; 15 miles N.N.W. of Kaliſch.

OBODOWKA, a town and fortreſs of Poland, in the palatinate of Braclaw; 28 miles S. of Braclaw.

OBOE, Ital. a performer on the *Hautbois*; which ſee.

OBOIAN, in *Geography*, a town of Ruſſia, in the government of Kirſk; N. lat. 51° 10′. E. long. 35° 54′.

OBOISTA, Ital. a performer on the hautbois.

OBOLARIA, in *Botany*, was ſo called by Linnæus, from *obolus*, a ſmall ancient coin; this name being therefore equivalent to *Money-wort*, and applied to the preſent plant, in alluſion to the orbicular ſhape of the ſegments of its calyx. Siegeſbeck had choſen the ſame appellation for a plant with rounded leaves, now become far more famous by another name, *Linnæa*.—Linn. Gen. 321. Schreb. 421. Willd. Sp. Pl. v. 3. 346. Mart. Mill. Dict. v. 3. Juſſ. 101. Lamarck Dict v. 4 509.—Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. *Perſonatæ*, Linn. *Pediculares*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, in two deep, large, rounded ſegments. *Cor.* of one petal; tube inflated, about the length of the calyx; limb in four deep, elliptic-oblong, rather unequal, entire, ſpreading ſegments, ſomewhat ſhorter than the tube. *Stam.* Filaments four, awl-ſhaped, inſerted into the tube between the ſegments of the corolla, much ſhorter than the limb, the two neareſt rather the longeſt; anthers ſmall, roundiſh. *Piſt.* Germen ſuperior, ovate, compreſſed; ſtyle nearly cylindrical, the length of the ſtamens; ſtigma thickiſh, cloven, permanent. *Peric.* Capſule nearly ovate, compreſſed, ſomewhat tumid, of two valves oppoſite to the partition, and two cells? *Seeds* numerous, very minute.

Eſſ. Ch. Calyx in two deep rounded ſegments. Corolla four-cleft, nearly equal; tube inflated. Stamens between the ſegments of the limb. Capſule of two valves, with many ſeeds.

1. O. *virginica*. Linn. Sp. Pl. 881. (O. virginiana, radice fibroſâ, ſummo caule foliis ſubrotundis; Pluk. Phyt. t. 209. f. 6 Moriſ. ſect. 12. t. 16. f. 23.)—Native of Virginia and Pennſylvania. We received very perfect ſpecimens from the Rev Dr. Muhlenberg, which have enabled us to amend the generic character, except what regards the capſule being of one or two complete cells, a point we have not materials to determine. The plant appears to be very little known. Linnæus had no ſpecimen; Michaux paſſed it over in ſilence; nor does Juſſieu, or Lamarck, appear to have ſeen it, there being no figure of the genus in the "Illuſtrations" of the latter. Plukenet's repreſentation, copied by Moriſon, is very good. The *root* conſiſts of ſeveral thick fibres, and is probably annual and paraſitical. *Stem* ſolitary, ſimple, three or four inches high, wavy, rather angular, ſmooth. *Leaves* none, except a few pair of oppoſite, ſmall, rounded ſcales upon the ſtem. *Cluſter* terminal, ſomewhat branched, denſe. The large ſegments of the *calyx*, ſaid to be purple beneath, give it a leafy aſpect. The *corolla* much reſembles that of an *Exacum*, in the dried ſtate. Clayton deſcribes it as of a pale red, and he ſays the plant flowers in April.

OBOLATA Terræ, in our *Ancient Law Books*, is a certain quantity of land, which ſome authors fix at half an acre; though others make it but half a perch.

According to Thomaſius, the obolus terræ contains ten feet in length, and five in breadth.

OBOLLAH, in *Geography*, a town of Perſia, in the province of Irak, on the Tigris. Although this town be not large, it is ſtrong and well peopled, and its ſituation is peculiarly delightful; near Baſſora.

OBOLUS, in *Coinage*, an ancient ſilver money of Athens, the ſixth part of a *drachm*; which ſee.

The word comes from the Greek, οβολος, of οβελος, *ſpit*, or *broach*, either becauſe it bore ſuch an impreſſion, or becauſe, according to Euſtathius, it was in the form of it: but thoſe now in the cabinets of the antiquaries are round.

They alſo ſtruck ſilver pieces of one, two, three, four, and five oboli, of half, and of one-fourth of an obolus. (See DRACHM.) In Greece, they had alſo braſs and copper oboli. The braſs obolus, which was at firſt equal in ſize to the Roman ſeſtertius, or large braſs, leſſens by degrees to about the ſize of a ſilver drachma. One of the latter occurs in Geſſner, Pl xlviii. N° 19, in which is a coin of Nyſa, with an ear of wheat on one ſide, NΙΣΑΙΩΝ; reverſe, a youth on the prow of a ſhip, holding a coin in his hand, and oBoΛoΣ. Although the era of the above coins cannot be preciſely aſcertained, the period of declenſion in ſize muſt have been from Auguſtus down to Gallienus: and we may ſafely ſuppoſe that the copper obolus, at firſt above the ſize of large braſs, was uſed in Greece about the time of her firſt ſubjection to Rome: accordingly Vitruvius, who lived in the time of Auguſtus, ſpeaks of copper oboli, lib. iii. c. 1. When the lepta ceaſed, the chalci came in their room, with the dichalcus, and hemiobolion of braſs. See CHALCHOS.

OBOLUS was alſo uſed, among our *Anceſtors*, for half a noble or florin; where the noble was eſteemed as the penny, and its quarter part a farthing.

In effect, in the old hiſtories and accounts of coins, we are to underſtand by the word denarius, the whole coin, be it angel, rial, &c.; by the obolus, its half; and by quadrans, its fourth part.

OBOLUS, in *Medicine*, is uſed for a weight of ten grains, or half a ſcruple.

Du Cange ſays, the obolus weighs three carats, or four grains of wheat; others divide it into ſix areolæ, and the areola into ſeven minutes; others into three ſiliquæ, each ſiliqua into four grains, and each grain into a lentil and a half.

Among the Sicilians obolus alſo denoted a weight of a pound.

OBONA, in *Geography*, a town of Spain, in Aſturia; 24 miles W. of Oviedo.

OBORKOW, a town of Poland, in the palatinate of Belcz: 12 miles N.N.W. of Belcz.

OBORNIKI, a town of the duchy of Warſaw; 20 miles from Poſen.

OBORNOI, a cape on the coaſt of Ruſſia, in the government of Archangel, in the Frozen ſea; 200 miles S.E. of Kola N. lat. 67° 50'. E. long. 50° 34'.

OBOVATUM FOLIUM, in *Botany*. See LEAF.

OBOXINTA, in *Geography*, a town of Japan, in the iſland of Niphon; 22 miles S. of Meaco.

OBRA, a town of the duchy of Warſaw; 26 miles S. of Poſen.

OBRANG, in *Botany*, the name given by the people of Guinea to a very ſingular and remarkable plant, the virtues of which they greatly praiſe. They boil it in water, and uſe the decoction by way of fomentation, to take down ſwellings of the teſticles. Its leaves have ſome faint reſemblance to thoſe of our liquorice, whence Petiver has called it glycyrrhizæ folio ſingulari frutex Guineenſis ſpinis gemellis.

OBRAWA, or BOBROWA, in *Geography*, a town of Moravia, in the circle of Brunn; 26 miles N.W. of Brunn.

OBRECHT, ULRIC, in *Biography*, a learned philologiſt and civilian, was born in 1647 at Straſburg, where his grandfather had been profeſſor of the law. His taſte for literature and general knowledge was diſplayed at a very early period, and at the age of nineteen he printed a commentary upon the "Somnium Scipionis," and "A Diſſertation on the Principles of Wiſdom." He afterwards publiſhed "Animadverſiones in Diſſertationes de Ratione Status in Imperio," which was an anſwer to a celebrated work of that time, againſt the claims of the houſe of Auſtria. He was made profeſſor of law at Straſburg, and by his induſtry, and economy of time, he found means to compoſe various works beſides fulfilling the duties attached to his office. One of theſe was a "Prodromus Rerum Alſaticarum," being a ſketch of a great work which he meditated upon the province of Alſatia. After the capture of Straſburg by Lewis XIV., Obrecht, who had hitherto been a Lutheran, became a Catholic, and went to Paris in 1684, where he abjured Lutheraniſm before Boſſuet, who complimented him with the title of an "Epitome of all the Sciences." On his return he was appointed by the king to preſide in the ſenate of Straſburg. After this he was ſent by his majeſty to Frankfort as his commiſſioner for ſupporting the rights of the princeſs-electoral Palatine to the inheritance of her anceſtors, and he wrote an elaborate work, entitled "Excerpta Hiſtorica de Natura Succeſſionis in Monarchia Hiſpaniæ," for the purpoſe of proving the hereditary title of Philip V. to the crown of Spain. He died in the year 1705, in the 58th year of his age. Moreri.

OBRECHT. See HOBRECHT.

OBRECKHEIM, in *Geography*, a town of Germany, in the palatinate of the Rhine; 19 miles E. of Heidelberg.

OBREPTITIOUS, OBREPTITIUS, a quality of letters patent, or any other inſtrument which confers a favour, title, or conceſſion; denoting it obtained of a ſuperior by ſurprize, or by concealing from him the truth, which was neceſſary to have been expreſſed, in order to render it valid.

In which ſenſe the word ſtands oppoſed to *ſurreptitious*, where ſome falſehood has been expreſſed, in order to procure it the more eaſily. Obreption annuls the grant, wherever found.

By the canon law, a perſon demanding a benefice, without expreſſing thoſe he is already poſſeſſed of, forfeits, &c. by obreption.

OBRIEN'S BRIDGE, in *Geography*, a ſmall town of the county of Clare, Ireland, where there is a bridge over the river Shannon. Near it is Montpellier, where there is an excellent ſulphurous ſpring. This place is eight miles N.E. of Limerick.

OBRINE, *Knights of Obrine*, a military order inſtituted in the 13th century by Conrade, duke of Mazovia and Cujavia, whom ſome authors call alſo duke of Poland.

He firſt gave them the name of *Knights of Jeſus Chriſt*. Their firſt grand-maſter was Bruno. Their chief end was to defend the country from the Pruſſians, who were yet idolaters, and committed great cruelties.

Duke Conrade putting them in poſſeſſion of fort Obrine, they hence took a new name; and it was agreed between them, that whatever lands they conquered from the Pruſſians, ſhould be equally divided with him.

But the Pruſſians blocking up the fort, ſo that none of the knights could get out, the order became uſeleſs, and was ſoon ſuppreſſed. Upon this, Conrade called in the Teutonic knights.

OBRITZ, in *Geography*, a town of Auſtria, on the Taya; 6 miles W. of Sonneberg.

OBRIZUM, in *Antiquity*, a kind of gold. Pliny ſays, that they call the gold that has been ſeveral times purified in the fire, *obrizum*. "Auri experimento ignis eſt ut ſimili colore rubeat quo ignis; atque ipſum *obrizum* vocant."

Abriz in Arabic, or Perſian, ſignifies fine gold without mixture, which the Greeks and Latins call *obrizum*.

OBSANG, in *Geography*, a town of Germany, in the principality of Culmbach; 9 miles N.W. of Bayreuth.

OBSCURA, CAMERA. See CAMERA *Obſcura*.

OBSCURA *Clara*. See CLAIR-OBSCURE.

OBSCURE, ſomething that is dark, or that only receives and returns a little light.

OBSCURE is alſo uſed, in a figurative ſenſe, for a thing that is not clear, expreſs, and intelligible; that one does not fully apprehend; or that may be conſtrued into divers ſenſes.

OBSCURE *Notion*, or *Idea*. See NOTION, or IDEA.

OBSCURE, *Clair*. See CLAIR-OBSCURE.

OBSCURITY, that which denominates a thing obſcure.

Obſcurity is a fault that may either be in the perception, or the diction.

Obſcurity in the perception ariſes chiefly hence, that we do not conceive things as they are, or as we find them; but as we judge them to be before we know them: ſo that our judgment precedes our knowledge, and is made the rule or ſtandard of our conceptions. Whereas nature and reaſon direct, that things ſhould be judged of according as they are known; and that they are to be known, not as they are in themſelves, but only in ſuch manner as God was pleaſed to have them known.

Obſcurity in the diction may ariſe, firſt, from the ambiguity of the ſenſe of words; ſecondly, from the figures or ornaments of rhetoric; thirdly, from the novelty or obſoleteneſs of the words.

OBSECRATION, OBSECRATIO, in *Rhetoric*, a figure by which the orator implores the aſſiſtance of God, or man. This figure Cicero makes admirable uſe of, for K. Deiotarus, to Cæſar. "Per dexteram te iſtam oro, quam regi Deiotaro hoſpes hoſpiti porrexiſti: iſtam, inquam, dexteram non tam in bellis & in præliis, quam in promiſſis & fide firmiorem." Thus Virgil:

> "Quod te per cœli jucundum lumen, & auras,
> Per genitorem oro, per ſpem ſurgentis Iuli,
> Eripe me his, invicte, malis"———

OBSEQUENS, JULIUS, in *Biography*, a Latin writer, who is ſuppoſed to have flouriſhed in the reign of Honorius, and wrote a book entitled "De Prodigiis;" from the ſubject of which he is conjectured to have been a heathen. It contains an account of the prodigies occurring in the Roman hiſtory, ſuch as thoſe narrated by Livy, whoſe very words he frequently borrows. Notwithſtanding its trifling and deluſive ſubject it has been frequently reprinted. The earlier part of the work is loſt, which was ſupplied, in a ſupplement, by Conrad Lycoſthenes, a corrector of the preſs at Baſil. The ſupplementary articles were diſtinguiſhed by different characters in the edition of Scheffer, 1679; the ſubſequent editions are thoſe of Hearne, 1703; Oudendorp, 1720; and of Kappius and Erhard in 1772.

OBSEQUIES, funeral ſolemnities, or ceremonies performed at the burials of eminent perſonages.

The word is derived from the Latin *obſequium*, *obedience*; theſe obſequies being the laſt devoirs we can render to the deceaſed. See BURIAL and FUNERAL.

OBSERVANCE literally denotes the act of obſerving, or complying with, a rule, law, or ceremony.

Hence obſervance is ſometimes alſo uſed for a rule, ſtatute, or ordinance to be obſerved.

OBSERVANCE, *Obſervantia*, is particularly underſtood, in a monaſtic ſenſe, of a community of religious, who are bound to the perpetual obſervation of the ſame rule. In which ſenſe the word coincides with *congregation* or *order*.

The Cordeliers denominated themſelves, *Religious of the Obſervance*; the *great*, and the *leſſer obſervance*. See CORDELIERS.

Thoſe Franciſcans are called *Brethren of the Obſervance*, who religiouſly obſerve the primitive laws and inſtitution of their founder, in oppoſition to *Conventuals*; which ſee. See alſo FRIARS *Obſervant*.

Among the Bernardines, there are monks of the *ſtrict obſervance*, who eat nothing but fiſh.

OBSERVANTINES, religious Cordeliers of the obſervance. In Spain there are barefooted Obſervantines.

OBSERVATION, in the *Sea Language*, the taking of the ſun's, or any ſtar's, meridian altitude, in order thereby to find the latitude.

For the method of making an obſervation, ſee LATITUDE and LONGITUDE.

The finding of a latitude from the meridian altitude obſerved, they call *working an obſervation*.

OBSERVATIONS, in *Aſtronomy*. See CHRONOMETER, CIRCLE, CŒLESTIAL *Obſervations*, LUNAR *Obſervations*, &c.

OBSERVATORY, a building furniſhed with inſtruments for obſerving the heavenly bodies. It is generally defined, "a building in the form of a tower, erected on an eminence, and covered with a terrace, for making aſtronomical obſervations." But this deſcription, though it may apply to ancient obſervatories, does not agree with modern practice, where firmneſs of foundation, and a convenient diſpoſition of inſtruments, are conſidered of more importance than any particular form of ſtructure, or eminence of ſituation.

Fixed obſervatories are thoſe where inſtruments are fixed in the meridian, by which, with the aid of aſtronomical clocks, the right aſcenſions and declinations of the heavenly bodies are determined, and motion, time, and ſpace made to meaſure each other. Such buildings and apparatus only are called *regular* obſervatories, although very uſeful operations are ſometimes performed, and important diſcoveries made, where there are no inſtruments fixed in the meridian.

As navigation eſſentially depends on the determinations made in obſervatories, ſuch eſtabliſhments have been conſidered of great national importance, eſpecially in maritime ſtates; and hence they have been liberally endowed by different governments. Even private obſervatories have been, in many places, erected at a conſiderable expence, and their number has been greatly increaſed of late years; a circumſtance which, while it marks the progreſs of ſcience, does honour to the age in which we live.

Beſides the important advantages of improving nautical aſtronomy, obſervatories are, in themſelves, objects of the higheſt intereſt to every ſcientific and liberal mind. Here the inventions and diſcoveries of the greateſt men in all ages are united, and applied to the moſt grand and uſeful purpoſes. Here theory is reduced to practice, and ſcience illuſtrated by art; or, in the words of the poet, (applied to an obſervatory,)

> "Here truths ſublime and ſacred ſcience charm,
> Creative arts new faculties ſupply,
> Mechanic powers give more than giant's arm,
> And piercing optics more than eagle's eye:
> Eyes that explore creation's wond'rous laws,
> And teach us to adore the great deſigning Cauſe."

In ſhort, an obſervatory may be conſidered as affording the moſt ſublime diſplay of the works of God and man.

Impreſſed with the importance of this ſubject, we ſhall here endeavour to give a more full account of obſervatories than has been hitherto attempted in works of this kind.

Hiſtory of Obſervatories.—All nations where aſtronomy has been ſtudied or improved, boaſt of having had obſervatories at an early period, although ancient hiſtory affords but little information on the ſubject. It was not, indeed, until conſiderable progreſs had been made both in aſtronomy and the mechanical arts, that any attempts ſucceeded either in conſtructing inſtruments, or erecting edifices for aſtronomical purpoſes.

"The firſt obſervatories of man," ſays the eloquent Bailly, "were the fields, and his eyes his inſtruments, and his progreſs with theſe aids alone was aſtoniſhing." From the ſame intereſting writer, as well as from other good authorities, we learn that the inſtruments of ancient aſtronomers were very large and of rude conſtruction, moſtly of wood, and ſome of ſtone. They conſiſted chiefly of gnomons, dials, and aſtrolabes; and long tubes were uſed in the way of teleſcopes. Deep wells were alſo ſunk in dry places, from the bottom of which the ſtars might be ſeen in the day-time. Moſt buildings for aſtronomical obſervations were of great altitude, and were chiefly erected in very high ſituations.

In Chaldæa, a country celebrated in the early annals of aſtronomy, the lofty temple of Belus was uſed as an obſervatory; and in Egypt, the famous tomb of Oſymandias was applied to the ſame purpoſe. This building is ſaid to have contained a golden circle for celeſtial obſervations, which was 365 cubits in circumference, and one cubit in thickneſs. Little credit, however, can be given to ſuch extravagant deſcriptions.

The pyramids of Egypt are, by ſome writers, ſuppoſed to have been originally obſervatories, and in ſupport of this opinion it is argued, that they were built to face the four cardinal points. But this practice was very general in ancient times, even in the conſtruction of dwelling-houſes, which were moſtly made to front the eaſt: and our Chriſtian churches alſo have been generally built with a ſimilar attention to the points of the compaſs. The great height of the pyramids was, however, favourable for making celeſtial obſervations, particularly for the purpoſe of aſtrology, which was a leading ſtudy in thoſe times, and which chiefly required an accurate view of the riſing and ſetting of ſtars. It is, however, certain, that practical aſtronomy was much improved in Egypt, particularly in the famous ſchool of Alexandria, where an obſervatory was built 300 years before the Chriſtian era, and continued for more than five centuries under a ſucceſſion of celebrated names, among which may be mentioned Ariſtellus, Hipparchus, Ptolemy, &c.

The Gentoo nations appear to have made a very early progreſs both in the theory and practice of aſtronomy. Theſe people have traditions and veſtiges of ancient obſervatories, upon which ingenious diſquiſitions may be found in Bailly's "Hiſtoire de l'Aſtronomie Indienne," and in the "Aſiatic Reſearches," by ſir William Jones, Meſſrs. Hunter, Bentley. Colebrooke, and others. We ſhall, however, no longer dwell upon conjectures concerning antiquity, but ſhall give an account of obſervatories of more modern date in India; from the ſtructure and apparatus of which, an idea may be formed of their antecedent eſtabliſhments of the kind, as they differ, in almoſt every particular, from European obſervatories.

Theſe Hindu inſtitutions, five in number, were conſtructed nearly at the ſame period, about 200 years ago. They were built by order of the emperor Mahommed Shah, with a view to reform the calendar by means of aſtronomical obſervations; and he choſe for his principal aſtronomer Jeyſing, or Jayaſinha, the rajah of Ambhere. Theſe obſervatories were built at Delhi, Benares, Matra, Oujein, and Suvai Jeypoor, and all under the direction of Jeyſing. The obſervatory at Benares has been minutely deſcribed by ſir Robert Barker in the Philoſophical Tranſactions for 1777, in which he has given ſeveral plates both of the buildings and inſtruments: and as all the other obſervatories were built and furniſhed nearly on the ſame plan, his deſcription may be deemed here ſufficient for the whole, and we therefore make the longer extract from it.
